7.4. Display Data RAM (DDRAM)	44
7.5. Display Data Format	45
7.5.1. 3-line Serial Interface.....	45
7.5.2. 4-line Serial Interface.....	47
7.5.3. 8-bit Parallel MCU Interface	49
7.5.3.1. 8-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color	50
7.5.3.2. 8-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	51
7.5.4. 9-bit Parallel MCU Interface	52
7.5.5. 16-bit Parallel MCU Interface	53
7.5.5.1. 16-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color	54
7.5.5.2. 16-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	55

7.5.6. 18-bit Parallel MCU Interface	56
7.5.6.1. 18-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color	57
7.5.7. 16-bit Parallel RGB Interface.....	58
7.5.8. 18-bit Parallel RGB Interface.....	58
7.6. Z-inversion.....	59
7.8.1 Z-inversion concept.....	60
7.8.2 Z-inversion Odd/Even Gate data input method.....	61
7.8.3 Z-inversion data input method.....	62
7.8.3.1 Z-inversion RED Data display	63
7.8.3.2 Z-inversion GREEN Data display	64
7.8.3.3 Z-inversion BLUE Data display	65
8. Command.....	66
8.1. Command List	66
8.2. Command Description.....	71
8.2.1. NOP (00h).....	71
8.2.2. Soft Reset (01h)	72
8.2.3. Read display identification information (04h)	73
8.2.4. Read Number of the Errors on DSI (05h).....	74
8.2.5. Read Display Status (09h).....	75
8.2.6. Read Display Power Mode (0Ah).....	77
8.2.7. Read Display MADCTL (0Bh).....	79
8.2.8. Read Display Pixel Format (0Ch).....	81
8.2.9. Read Display Image Mode (0Dh)	82
8.2.10. Read Display Signal Mode (0Eh)	84
8.2.11. Read Display Self-Diagnostic Result (0Fh)	86
8.2.12. Sleep IN (10h)	88
8.2.13. Sleep OUT (11h).....	89
8.2.14. Partial Mode ON (12h).....	90
8.2.15. Normal Display Mode ON (13h)	91
8.2.16. Display Inversion OFF (20h).....	92
8.2.17. Display Inversion ON (21h)	93
8.2.18. Display OFF (28h)	94
8.2.19. Display ON (29h)	95
8.2.20. Column Address Set (2Ah)	96
8.2.21. Page Address Set (2Bh)	98
8.2.22. Memory Write (2Ch)	100
8.2.23. Memory Read (2Eh)	102
8.2.24. Partial Area (30h).....	104
8.2.25. Vertical Scrolling Definition (33h)	106

8.2.26. Tearing Effect Line OFF (34h)	109
8.2.27. Tearing Effect Line ON (35h)	110
8.2.28. Memory Access Control (36h)	112
8.2.29. Vertical Scrolling Start Address (37h)	114
8.2.30. Idle Mode OFF (38h)	116
8.2.31. Idle Mode ON (39h)	117
8.2.32. Interface Pixel Format (3Ah).....	119
8.2.33. Memory Write Continue (3Ch).....	120
8.2.34. Memory Read Continue (3Eh).....	122
8.2.35. Write Tear Scan Line (44h).....	124
8.2.36. Read Scan Line (45h).....	125
8.2.37. Write Display Brightness Value (51h)	126
8.2.38. Read Display Brightness Value (52h).....	127
8.2.39. Write CTRL Display Value (53h).....	128
8.2.40. Read CTRL Display Value (54h)	130
8.2.41. Write Content Adaptive Brightness Control Value (55h).....	131
8.2.42. Read Content Adaptive Brightness Control Value (56h)	132
8.2.43. Write CABC Minimum Brightness (5Eh).....	133
8.2.44. Read CABC Minimum Brightness (5Fh).....	134
8.2.45. Read First Checksum (AAh).....	135
8.2.46. Read Continue Checksum (AFh)	136
8.2.47. Read ID1 (DAh)	137
8.2.48. Read ID2 (DBh)	138
8.2.49. Read ID3 (DCh)	139
8.2.50. Interface Mode Control (B0h)	140
8.2.51. Frame Rate Control (In Normal Mode/Full Colors) (B1h).....	142
8.2.52. Frame Rate Control (In Idle Mode/8 colors) (B2h)	144
8.2.53. Frame Rate control (In Partial Mode/Full Colors) (B3h)	145
8.2.54. Display Inversion Control (B4h).....	146
8.2.55. Blanking Porch Control (B5h)	147
8.2.56. Display Function Control (B6h).....	149
8.2.57. Entry Mode Set (B7h)	153
8.2.58. Power Control 1 (C0h).....	156
8.2.59. Power Control 2 (C1h).....	158
8.2.60. Power Control 3 (For Normal Mode) (C2h)	159
8.2.61. Power Control 4 (For Idle Mode) (C3h)	160
8.2.62. Power Control 5 (For Partial Mode) (C4h).....	161
8.2.63. VCOM Control (C5h)	162
8.2.64. CABC Control 1 (C6h)	165

8.2.65. CABC Control 2 (C8h)	166
8.2.66. CABC Control 3 (C9h)	167
8.2.67. CABC Control 4 (CAh)	169
8.2.68. CABC Control 5 (CBh)	170
8.2.69. CABC Control 6 (CCh)	172
8.2.70. CABC Control 7 (CDh)	173
8.2.71. CABC Control 8 (CEh)	174
8.2.72. CABC Control 9 (CFh)	175
8.2.73. NV Memory Write (D0h)	176
8.2.74. NV Memory Protection Key (D1h)	177
8.2.75. NV Memory Status Read (D2h)	178
8.2.76. Read ID4 (D3h)	179
8.2.77. PGAMCTRL(Positive Gamma Control) (E0h)	180
8.2.78. NGAMCTRL (Negative Gamma Correction) (E1h)	181
8.2.79. Digital Gamma Control 1 (E2h)	182
8.2.80. Digital Gamma Control 2 (E3h)	182
8.2.81. SPI Read Command Setting(FBh)	183
9. Display Data RAM	184
9.1. Configuration	184
9.2. Memory to Display Address Mapping	185
9.3. MCU to memory write/read direction	186
10. Tearing Effect Information	189
10.1. Tearing Effect Line	190
10.1.1. Tearing Effect Line Modes	190
10.1.2. Tearing Effect Line Timing	191
11. Sleep Out – Command and Self-Diagnostic Functions	192
11.1. Register loading Detection	192
11.2. Functionality Detection	193
12. Power ON/OFF Sequence	194
12.1. Case 1 – RESX line is held High or Unstable by Host at Power ON	194
12.2. Case 2 – RESX line is held Low by Host at Power ON	194
12.3. Uncontrolled Power Off	196
13. Power Level Definition	197
13.1. Power Levels	197
13.2. Power Flow Chart	198
13.3. LCM Voltage Generation	199
14. Reset	200
14.1. Registers	200
14.2. Output Pins, I/O Pins	201

14.3. Input Pins	201
14.4. Reset Timing	202

1. Introduction

ILI9486L is a 262,144-color single-chip SoC driver for a-Si TFT liquid crystal display with resolution of 320RGBx480 dots, comprising a 960-channel source driver, a 480-channel gate driver, 345,600bytes GRAM for graphic data of 320RGBx480 dots, and power supply circuit.

The ILI9486L supports parallel CPU 8-/9-/16-/18-bit data bus interface and 3-/4-line serial peripheral interfaces (SPI). The ILI9486L is also compliant with RGB (16-/18-bit) data bus for video image display.

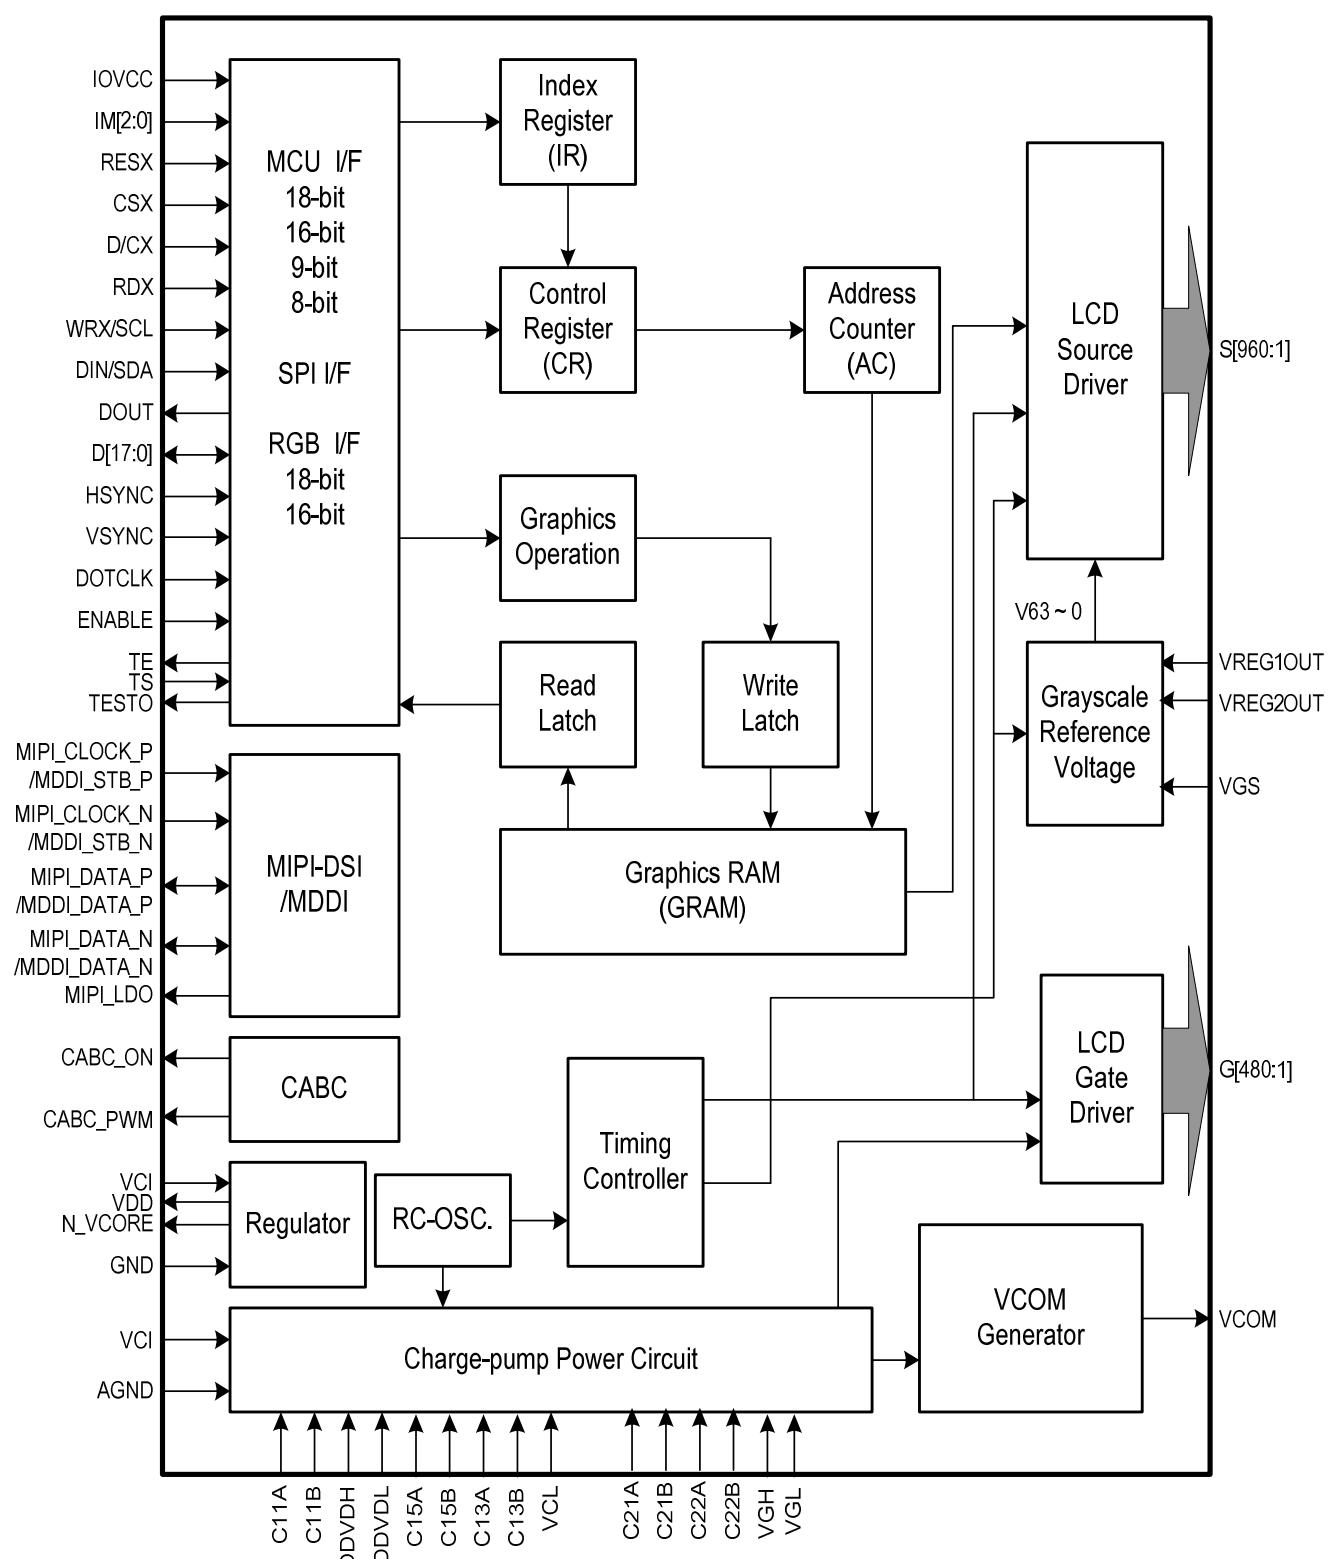

ILI9486L can operate with 1.65V I/O interface voltage and support wide analog power supply range. ILI9486L also supports a function to display in 8 colors and a sleep mode, allowing for precise power control by software and these features make the ILI9486L as an ideal LCD driver for medium or small size portable products such as digital cellular phones, smart phone, MP3 and PMP where long battery life is a major concern.

2. Features

- ◆ Display resolution: [320xRGB](H) x 480(V)
- ◆ Output:
 - 960 source outputs
 - 480 gate outputs
 - Common electrode output
- ◆ a-TFT LCD driver with on-chip full display RAM: 345,600 bytes
- ◆ Interface
 - 8-bits, 9-bits, 16-bits, 18-bits interface with 8080-series MCU
 - 16-bits, 18-bits RGB interface with graphic controller
 - 3-line / 4-line serial interface
- ◆ Display mode:
 - Full color mode (Idle mode OFF) : 262K-colors, 65K-colors.
 - Reduce color mode (Idle mode ON) : 8-color.
- ◆ Power saving mode:
 - Deep-standby mode
 - Sleep mode
- ◆ On chip functions:
 - DC VCOM generator and adjustment
 - Timing generator
 - Oscillator
 - DC/DC converter
 - Dot/Column/Z inversion
 - Separate RGB Gamma correction
 - CABC(Content adaptive brightness control)
- ◆ MTP (4 times):
 - 8-bits for ID1
 - 8-bits for ID2
 - 8-bits for ID3
 - 7-bits for VCOM adjustment
- ◆ Low -power consumption architecture
 - Low operating power supplies:
 - IOVCC = 1.65V ~ 3.6V (Digital)
 - VCI = 2.5V ~ 3.6V (Analog)

- ◆ LCD Voltage drive:
 - Source/VCOM power supply voltage
 - DDVDH - GND = 4.5V ~ 6.0V
 - VCL - GND = -2.0~ -3.0V
 - VCI1 - VCL \leq 6.0V
 - Gate driver output voltage
 - VGH - GND = 10.0V ~ 20.0V
 - VGL - GND = -5.0V ~ -15.0V
 - VGH - VGL \leq 32.0V
 - VCOM driver output voltage
 - VCOM = 0~-2.0V
- ◆ Operate temperature range: -40°C to 85°C
- ◆ a-Si TFT LCD storage capacitor : Cst on Common structure only

3. Block Diagram

4. Pin Descriptions

Bus Interface Pins																																																		
Pin Name	I/O	Type	Descriptions

- The external reset input. - Initializes the chip with a low input. Be sure to execute a power-on reset after supplying power.																																																		
- A chip select signal. Low: the chip is selected and accessible High: the chip is not selected and not accessible Fix to IOVCC or DGND level when not in use.																																																		
- Parallel interface (D/CX): The signal for command or parameter select. Low: Command. High: Parameter. Fix to IOVCC or DGND level when not in use.																																																		
- 8080 system (WRX): Serves as a write signal and writes data at the rising edge. - 3/4-line serial interface (SCL): The pin used as serial clock pin. Fix to IOVCC or DGND level when not in use.																																																		
- 8080 system (RDX): Serves as a read signal and read data at the rising edge. Fix to IOVCC or DGND level when not in use.																																																		
DIN/SDA	I/O	MPU	- Serial data input / output. Fix to IOVCC or DGND level when not in use.																																															
DOUT	O	MCU	- Serial data output Leave the pin to open when not in use.																																															
TE	O	MPU	- Tearing effect output. Leave the pin to open when not in use.																																															
CABC_PWM	O	VCI	- Back light control pin. Leave the pin to open when not in use.																																															
CABC_ON	O	VCI	- Back light control pin. Leave the pin to open when not in use.																																															
MIPI_CLOCK_P	I	MIPI	Leave the pin to open.																																															
MIPI_CLOCK_N	I	MIPI	Leave the pin to open.																																															
MIPI_DATA_P	I/O	MIPI	Leave the pin to open.																																															
MIPI_DATA_N	I/O	MIPI	Leave the pin to open.

<i>Fix to DGND level when not in use.</i>																	
VSYNC I MPU Frame synchronizing signal for RGB interface operation. <i>Fix to DGND level when not in use.</i>																	
HSYNC I MPU - Line synchronizing signal for RGB interface operation. <i>Fix to DGND level when not in use.</i>																	
ENABLE I MPU - Data enable signal for RGB interface operation. Low : access enabled. High : access inhibited. <i>Fix to DGND level when not in use.</i>																	
DOTCLK I MPU - Dot clock signal for RGB interface operation. <i>Fix to IOVCC level when not in use.</i>																	

LCD Driving Signals			
Pin Name	I/O	Type	Descriptions
S961~S1	O	LCD	- Source output voltage signals applied to liquid crystal. <i>Leave the pin to open when not in use.</i>
G480~G1	O	LCD	- Gate line output signals. VGH: the level selecting gate lines VGL: the level not selecting gate lines <i>Leave the pin to open when not in use.</i>
VCOM	O	-	- The power supply of common voltage in DC VCOM driving. - The voltage range is set between -2V to 0V.
VREG1OUT	O	-	- Internal generated stable power for source driver unit. - The voltage level can be set by VRH1[4:0]. - VREG1OUT is a positive grayscale reference voltage of source driver. - VREG1OUT =3.6~5.5V
VREG2OUT	O	-	- Internal generated stable power for source driver unit. - The voltage level can be set by VRH2[4:0]. - VREG2OUT is a negative grayscale reference voltage of source driver. - VREG2OUT =-3.6~-5.5V
VGS	I	-	Reference level for grayscale generating circuit.

Charge-pump and Regulator Circuit			
Pin Name	I/O	Type	Descriptions
VCI	P	Power supply	- A supply voltage to the analog circuit. Connect to an external power supply of 2.5 ~ 3.6V.
DDVDH	O	Stabilizing capacitor	- Power supply for the source driver and VCOM driver. - Connect to a stabilizing capacitor between DDVDH and GND.
DDVDL	O	Stabilizing capacitor	- Power supply for the source driver and VCOM driver. - Connect to a stabilizing capacitor between DDVDL and GND.
VGH	O	Stabilizing capacitor	- Power supply for the gate driver. - Connect to a stabilizing capacitor between VGH and GND.
VGL	O	Stabilizing	- Power supply for the gate driver..

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

		capacitor	- Connect to a stabilizing capacitor between VGL and GND.
VCL	O	Stabilizing capacitor	- VCOML driver power supply. - VCL = 0.5 ~ -VCI, place a stabilizing capacitor between VCL and GND.
C11A, C11B C15A, C15B	O	Step-up capacitor	- Capacitor connection pins for the step-up circuit 1
C13A, C13B C21A, C21B C22A, C22B	O	Step-up capacitor	- Capacitor connection pins for the step-up circuit 2.

Power Pads			
Pin Name	I/O	Type	Descriptions
IOVCC	P	Power supply	- A supply voltage to the digital circuit. Connect to an external power supply of 1.65 ~ 3.6V.
VDD	O	Power	- Digital circuit power pad. Connect these pins with the 1uF capacitor.
N_VCORE	O	Power	- Digital circuit negative power pad. Connect these pins with the 1uF capacitor.
DGND	P	Power supply	- DGND for the digital side: DGND = 0V. In case of COG, connect to GND on the FPC to prevent noise.
AGND	P	Power supply	- AGND for the analog side: AGND = 0V. In case of COG, connect to GND on the FPC to prevent noise.
VPG	P	Power supply	- Power supply pin for the NV memory programming. Please provide 7 volt to this pin for NV memory programming.
MIPI_LDO	P	Stabilizing capacitor	Leave this pad as open.

Test Pads			
Pin Name	I/O	Type	Descriptions
DUMMY	-	-	-- Dummy pad. Leave the pin to be open when not in use.
TS[2:0]	I	IOGND	- Test pins These pins are internal pulled low. Please leave these pins as open or connected to GND.
TEST[5:0]	O	-	-TEST[5:0]: When set in test mode, the pin are test pins. Leave these pins to be open when not in use.
V1T V62T VWT	I	-	- Test pins. Leave these pins to be open when not in use.

Liquid crystal power supply specifications Table

No.	Item	Description
1	TFT Source Driver	960 pins (320 x RGB)
2	TFT Gate Driver	480 pins
3	TFT Display's Capacitor Structure	Cst structure only (Cs on Common)
4	Liquid Crystal Drive Output	S1 ~ S960 V0 ~ V63 grayscales
		G1 ~ G480 VGH – VGL
		VCOM 0~2.0V
5	Input Voltage	IOVCC 1.65 ~ 3.60V
		VCI 2.50 ~ 3.60V
6	Liquid Crystal Drive Voltages	DDVDH 4.5V ~ 6.5V
		DDVDL -6.5V ~ -4.5V
		VGH 10.0V ~ 20.0V
		VGL -5.0V ~ -15.0V
		VCL -1.9 ~ -3.0V
		VGH – VGL Max. 32.0V
7	Internal Step-up Circuits	DDVDH VCI1 X2
		DDVDL -(VCI1-VCL)
		VGH VCI1 x4, x5, x6
		VGL VCI1 x-3, x-4, x-5
		VCL VCI1 x-1

5. Pad Arrangement and Coordination

Chip Size: 22850um x 850um

Chip thickness : 250um (typ.)

Pad Location: Pad Center.

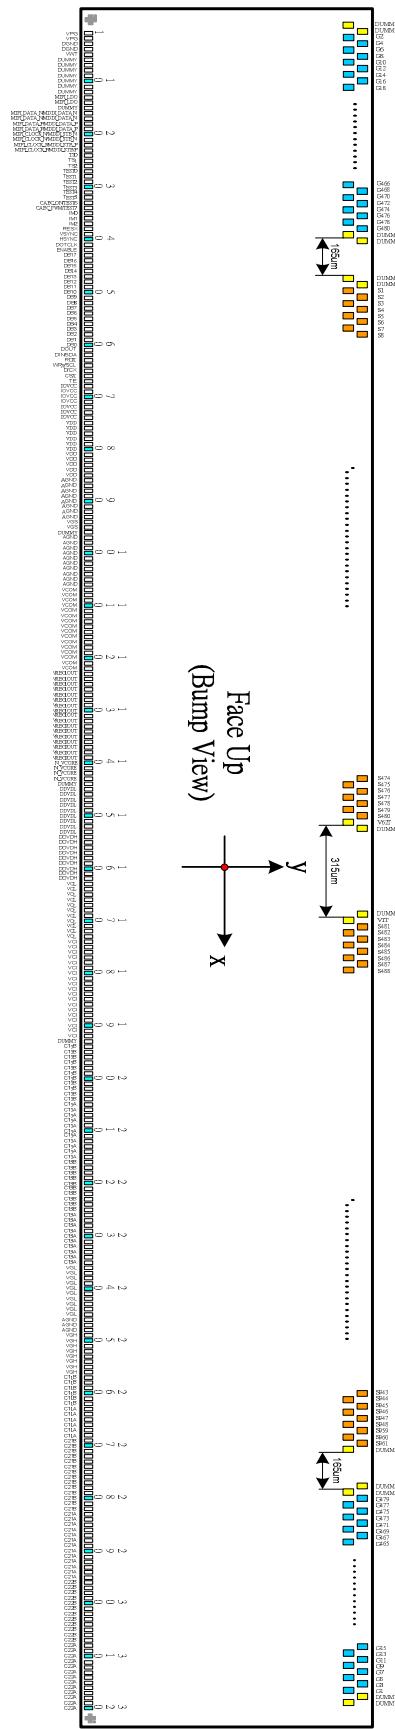

Coordinate Origin: Chip center

Au bump height: 15um (typ.)

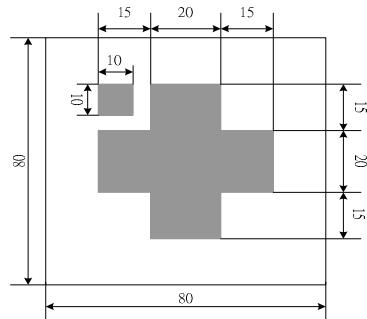

Au Bump Size:

1. 15um x 100um
Gate: G1 ~ G480
Source: S1 ~ S961

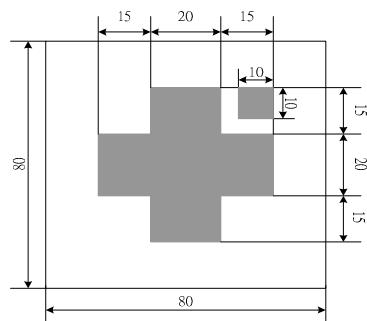

2. 50um x 80um
Input Pads
Pad 1 to 320.

6. Block Function Description

MCU System Interface

The ILI9486L supplies four kinds of MCU system interface with 8080-series parallel interface, 3-/4-line serial and RGB interface. The selection of the given interfaces are done by external IM [2:0] pins and shown as below:

IM2	IM1	IM0	Interface	Data Pin in Use
0	0	0	8080 18-bit bus interface	DB[17:0]
0	0	1	8080 9-bit bus interface	DB[8:0]
0	1	0	8080 16-bit bus interface	DB[15:0]
0	1	1	8080 8-bit bus interface	DB[7:0]
1	0	0	Prohibited	-
1	0	1	3-line SPI	SDA
1	1	0	Prohibited	
1	1	1	4-line SPI	SDA

ILI9486L has a 16-bit index register (IR), a 18-bit write-data register (WDR), and an 18-bit read-data register (RDR). The IR is the register to store index information from control registers and the internal GRAM. The WDR is the register to temporarily store data to be written to control registers and the internal GRAM. The RDR is the register to temporarily store data read from the GRAM. Data from the MPU to be written to the internal GRAM are first written to the WDR and then automatically written to the internal GRAM in internal operation. Data are read via the RDR from the internal GRAM. Therefore, invalid data are read out to the data bus when the ILI9486L read the first data from the internal GRAM. Valid data are read out after the ILI9486L performs the second read operation.

Registers are written consecutively as the register execution time except starting oscillator takes 0 clock cycle.

8080-Series			Operation
D/CX	RDX	WRX	
"L"	"H"	↓	Write command
"H"	↓	"H"	Read parameter
"H"	"H"	↓	Write parameter

Address Counter (AC)

The address counter (AC) gives an address to the internal GRAM. When the index of the register for setting a RAM address in the AC is written to the IR, the address information is sent from the IR to the AC. As writing data to the internal GRAM, the address in the AC is automatically updated plus or minus 1. The window address

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

function enables writing data only in the rectangular area arbitrarily set by users on the GRAM.

Graphic RAM (GRAM)

The GRAM is graphics RAM storing bit-pattern data of 345,600 bytes with 18 bits per pixel, enabling a maximum 320(RGB) x480 dot graphic display.

Grayscale Voltage Generating Circuit

Grayscale voltage generating circuit generates a liquid crystal drive voltage, which corresponds to grayscale level set in the Gamma correction register. The ILI9486L can display 262k colors at the maximum.

Power Supply Circuit

The LCD drive power supply circuit generates the voltage levels as VREG1OUT, VGH, VGL and VCOM for driving TFT LCD panel.

Timing Generating

The timing generator generates timing signals for internal circuits such as the internal GRAM. The timing for display operation such as RAM read operation and the timing for internal operation such as RAM access by MPU is outputted separately so that they do not interfere with each other.

Oscillator

The ILI9486L incorporates RC oscillator circuit. The frame frequency is changeable by command settings.

Panel Driver Circuit

The liquid crystal display driver circuit consists of a 960-output source drivers (S1~S960) and a 480-output gate driver (G1~G480).

7. Function Description

7.1. MCU interfaces

ILI9486L provides the 18-/16-/9-/8-bit parallel system interface for 8080 series, and 3-/4-line serial system interface for serial data input. The input system interface is selected by external pins as IM [2:0] and the bit formal per pixel color order is selected by DBI [2:0] bits.

7.1.1. MCU interface selection

The selection of a given interfaces are done by setting external pins IM [2:0] as show in the following table.

IM2	IM1	IM0	Interface	Data Pin in Use
0	0	0	8080 18-bit bus interface	DB[17:0]
0	0	1	8080 9-bit bus interface	DB[8:0]
0	1	0	8080 16-bit bus interface	DB[15:0]
0	1	1	8080 8-bit bus interface	DB[7:0]
1	0	0	Prohibited	-
1	0	1	3-line SPI	SDA
1	1	0	Prohibited	-
1	1	1	4-line SPI	SDA

7.1.2. 8080-Series Parallel Interface

ILI9486L can be accessed via 8-/9-/16-/18-bit MCU 8080-series parallel interface. The chip-select CSX (active low) is used to enable or disable ILI9486L chip. The RESX (active low) is an external reset signal. WRX is the parallel data write strobe, RDX is the parallel data read strobe and DB[17:0] is parallel data bus.

The MCU latches the input data at the rising edge of WRX signal. The D/CX is the signal of data/command selection. When D/CX='1', DB[17:0] bits are display RAM data or command parameters. When D/CX='0', D B[17:0] bits are commands.

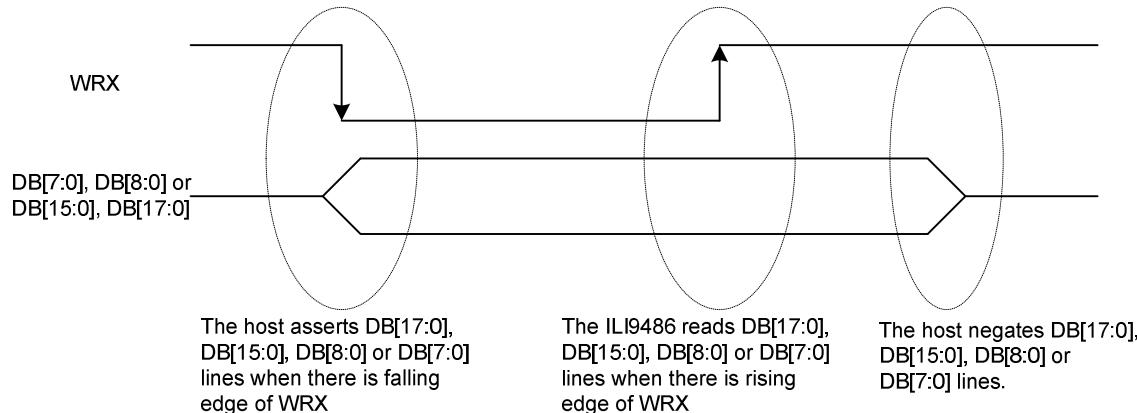

The 8080-series bi-directional interface can be used for communication between the MCU controller and LCD driver chip. The selection of 8080-series parallel interface is shown as the table in the following.

IM2	IM1	IMO	MPU-Interface Mode	WRX	RDX	D/CX	Function
0	0	0	8080 MCU 18-bit bus interface		"H"	"L"	Write command code.
					"H"	"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
					"H"	"H"	Reads parameter or display data.
0	0	1	8080 MCU 9-bit bus interface		"H"	"L"	Write command code.
					"H"	"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
					"H"	"H"	Reads parameter or display data.
0	1	0	8080 MCU 16-bit bus interface		"H"	"L"	Write command code.
					"H"	"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
					"H"	"H"	Reads parameter or display data.
0	1	1	8080 MCU 8-bit bus interface		"H"	"L"	Write command code.
					"H"	"H"	Read internal status.
					"H"	"H"	Write parameter or display data.
					"H"	"H"	Reads parameter or display data.

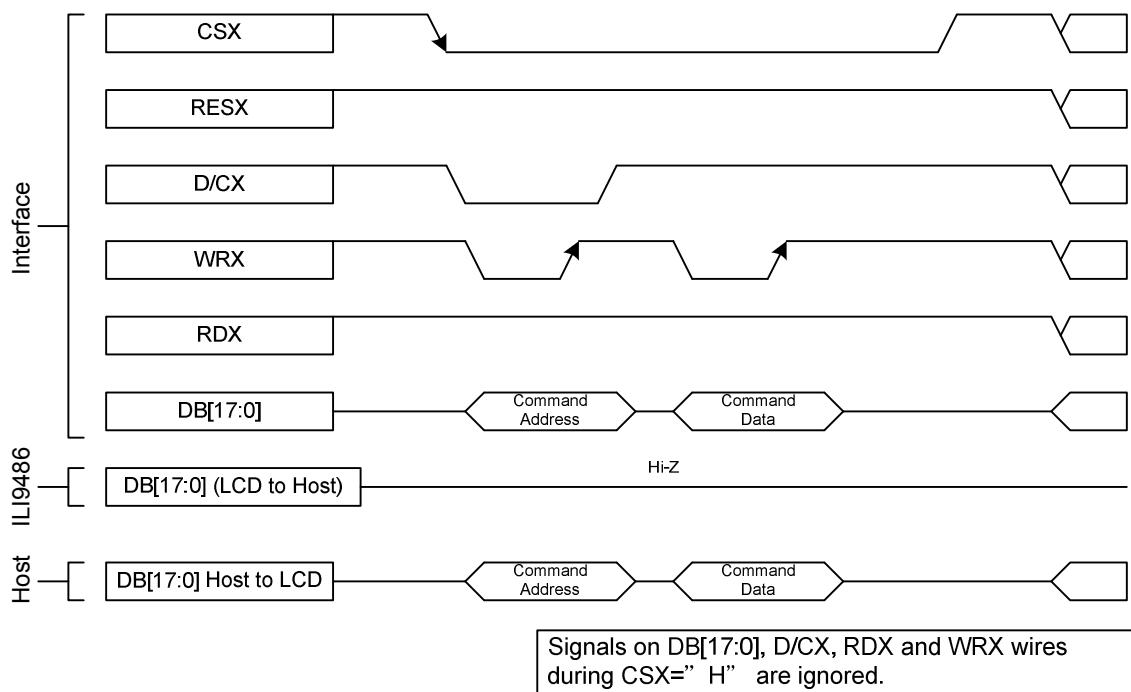

7.1.2.1. Write Cycle Sequence

The WRX signal is driven from high to low then pulled back to high during the write cycle. The host processor provides information during the write cycle when the display module captures the information from host processor on the rising edge of WRX. When the D/CX signal is driven to low level, then input data on the interface is interpreted as command information. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command parameter.

The following figure shows a write cycle for the 8080 MCU interface.

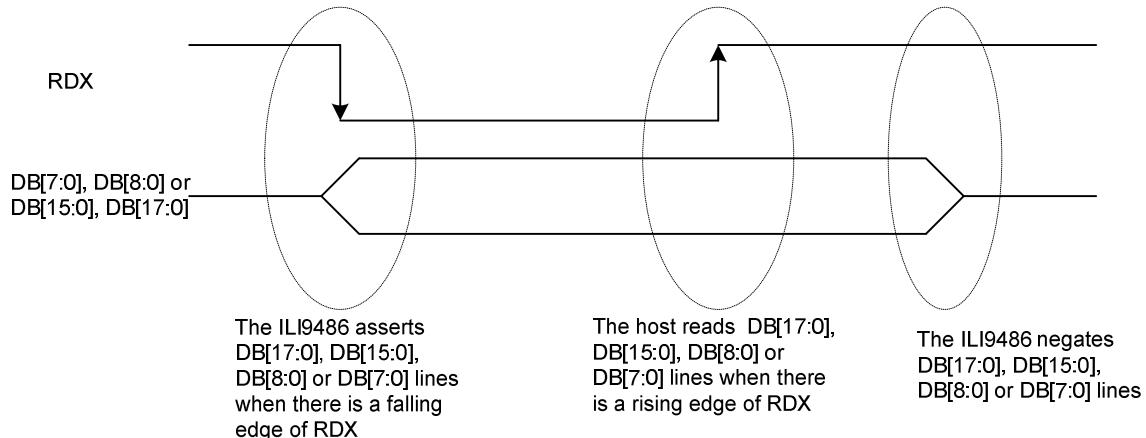

Note: WRX is an unsynchronized signal (It can be stopped)

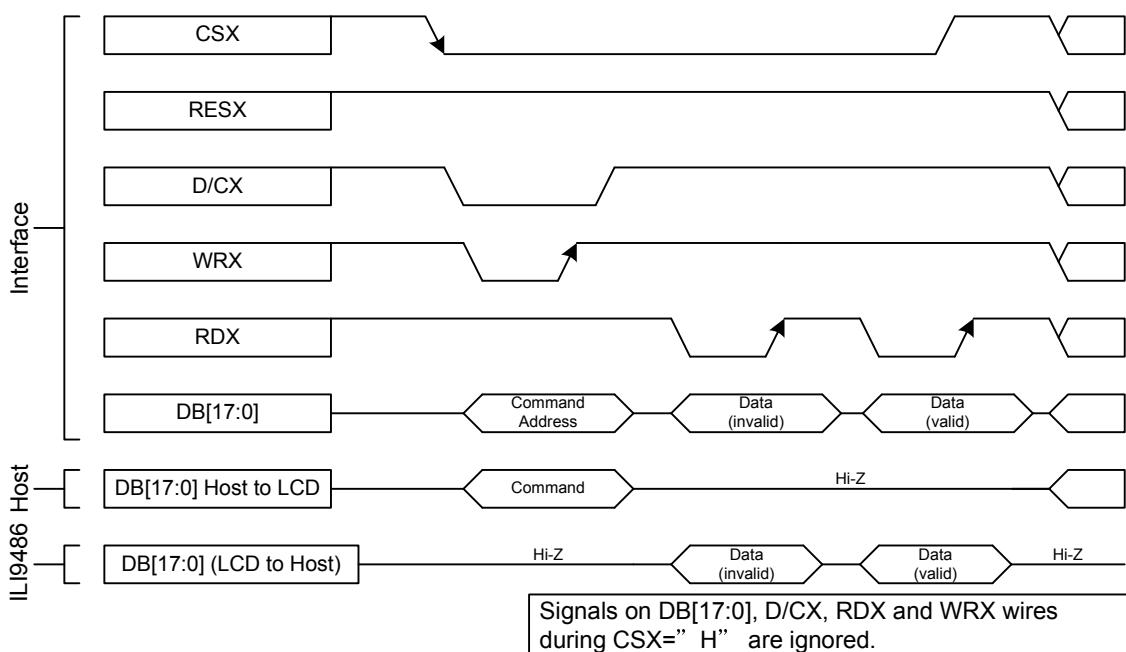

7.1.2.2. Read Cycle Sequence

The RDX signal is driven from high to low then allowed to be pulled back to high during the read cycle. The display module provides information to the host processor during the read cycle while the host processor reads the display module information on the rising edge of RDX signal. When the D/CX signal is driven to low level, then input data on the interface is interpreted as internal status or parameter. The D/CX signal also can be pulled high level when the data on the interface is RAM data or command parameter.

The following figure shows the read cycle for the 8080 MCU interface.

Note: RDX is an unsynchronized signal (It can be stopped).

Note: Read Data is only valid when the D/CX input is pulled high. If D/CX is driven low during read then the display information outputs will be High-Z.

7.1.3. Serial Interface

The selection of this interface is done by IM [2:0] bits. Please refer to the Table in the following.

IM2	IM1	IM0	MPU-Interface Mode	CSX	D/CX	SCL	Function
1	0	1	3-line serial interface	"L"	-	↓↑	Read/Write command, parameter or display data.
1	1	1	4-line serial interface	"L"	"L"/"H"	↓↑	Read/Write command, parameter or display data.

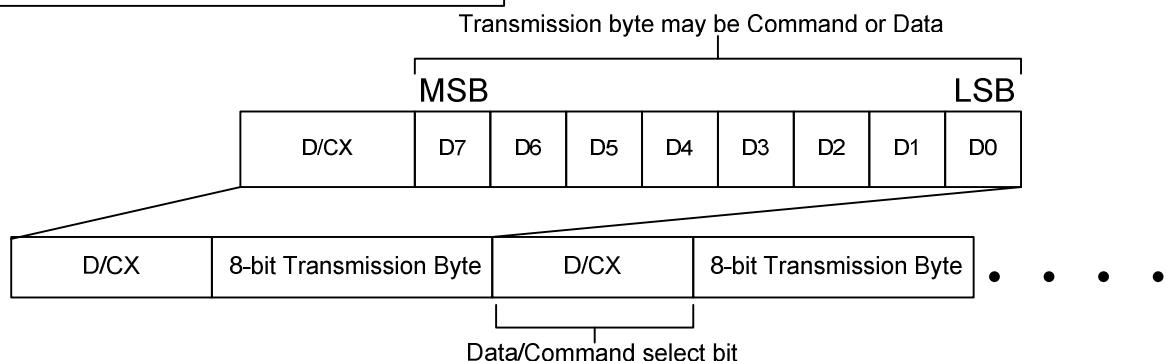

ILI9486L supplies 3-lines/ 9-bit and 4-line/8-bit bi-directional serial interfaces for communication between the host and ILI9486L. The 3-line serial mode consists of the chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA). The 4-line serial mode consists of the Data/Command selection input (D/CX), chip enable input (CSX), the serial clock input (SCL) and serial data Input/Output (SDA) for data transmission. The data bus (D [17:0]) which are not used, must be leave these unused pins to open. Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

7.1.3.1. Write Cycle Sequence

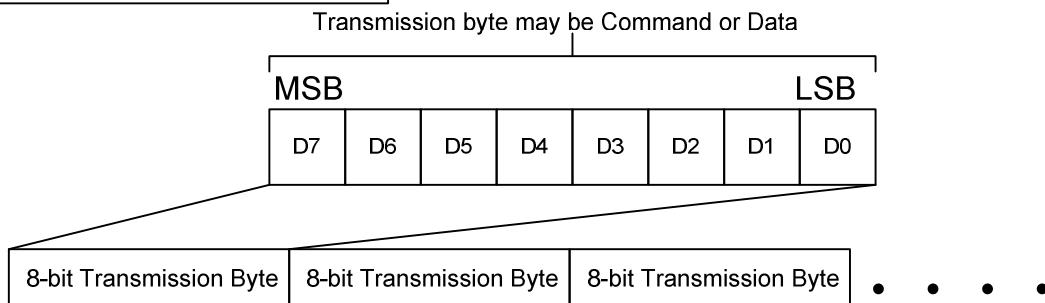

The write mode of the interface means the host writes commands and data to ILI9486L. The 3-lines serial data packet contains a data/command select bit (D/CX) and a transmission byte. If D/CX is "low", the transmission byte is interpreted as a command byte. If D/CX is "high", the transmission byte is stored in the display data RAM (Memory write command), or command register as parameter.

Any instruction can be sent in any order to the ILI9486L and the MSB is transmitted first. The serial interface is initialized when CSX is high status. In this state, SCL clock pulse and SDA data are no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission. See the detail of data format for 3-/4-line serial interface.

Data Format for 3-line Serial Interface

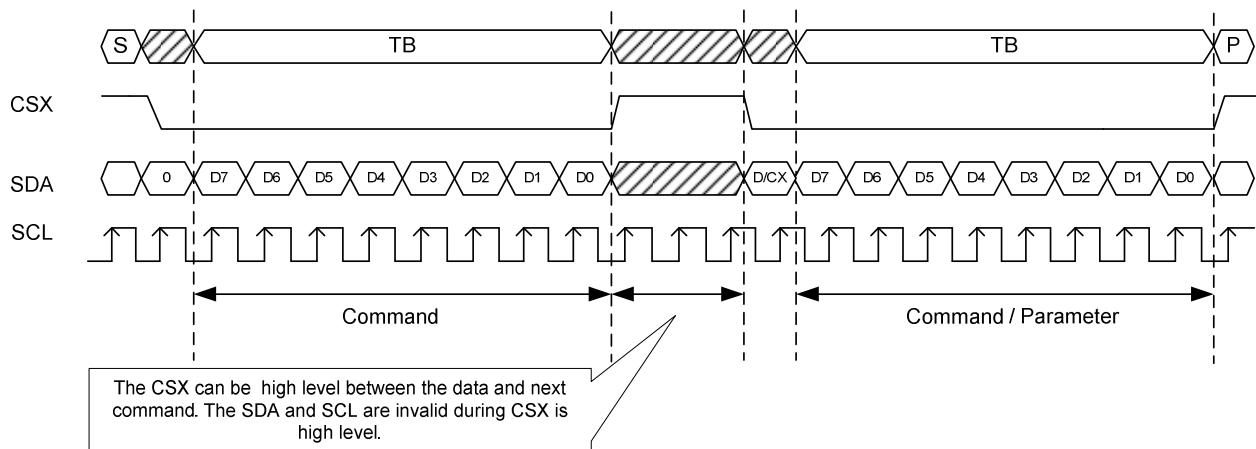

Data Format for 4-line Serial Interface

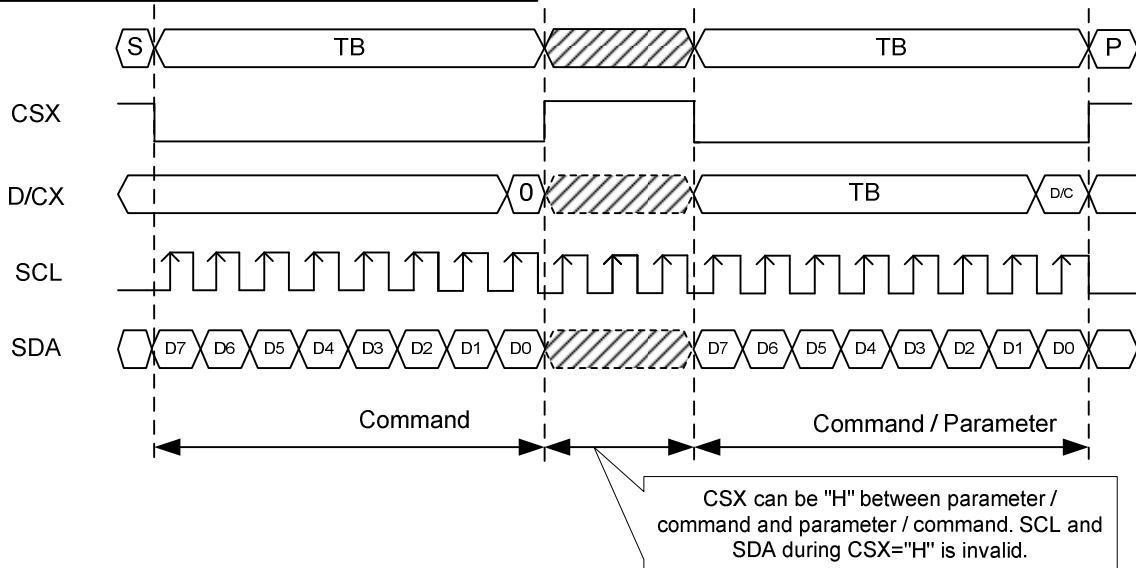

The host drives the CSX pin to low and starts by setting the D/CX bit on SDA. The bit is read by ILI9486L on the first rising edge of SCL signal. On the next falling edge of SCL, the MSB data bit (D7) is set on SDA by the host. On the next falling edge of SCL the next bit (D6) is set on SDA. If the optional D/CX signal is used, a byte is eight read cycle long. The 3/4-line serial interface writes sequence described in the Figure as below.

3-line Serial Interface Protocol

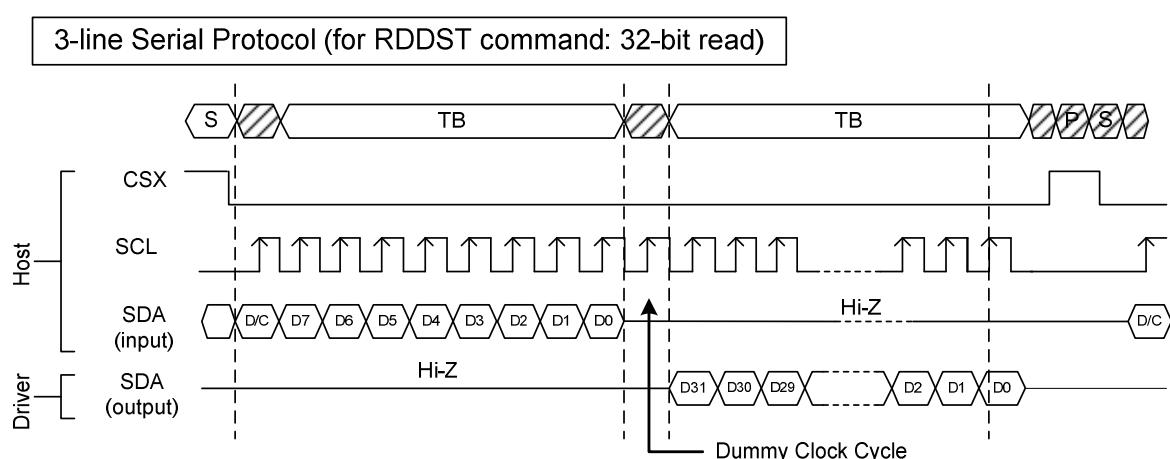

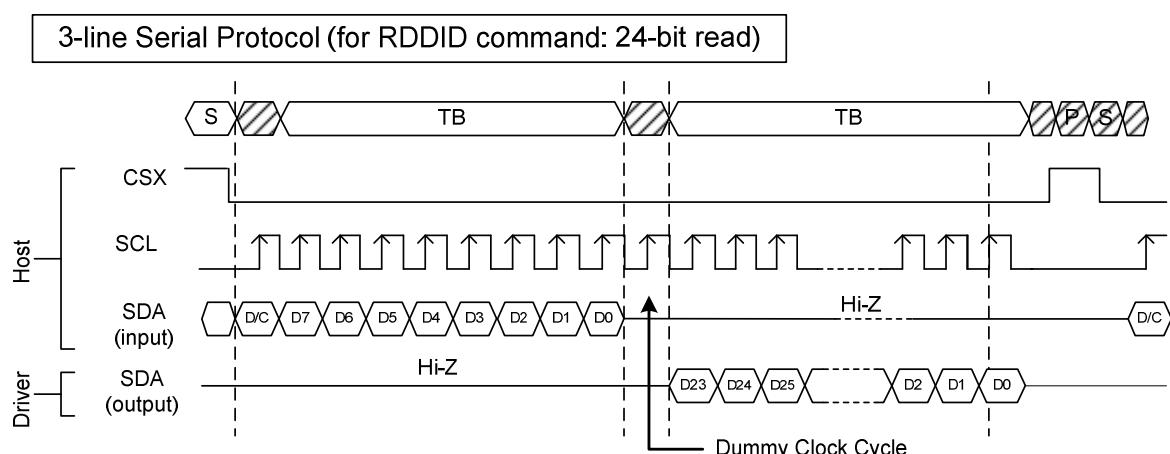

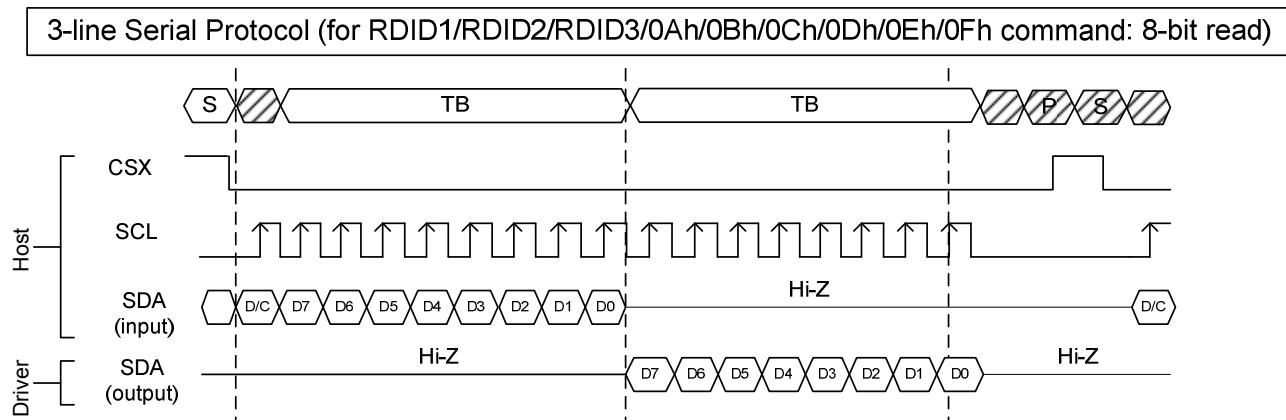

4-line Serial Interface Protocol

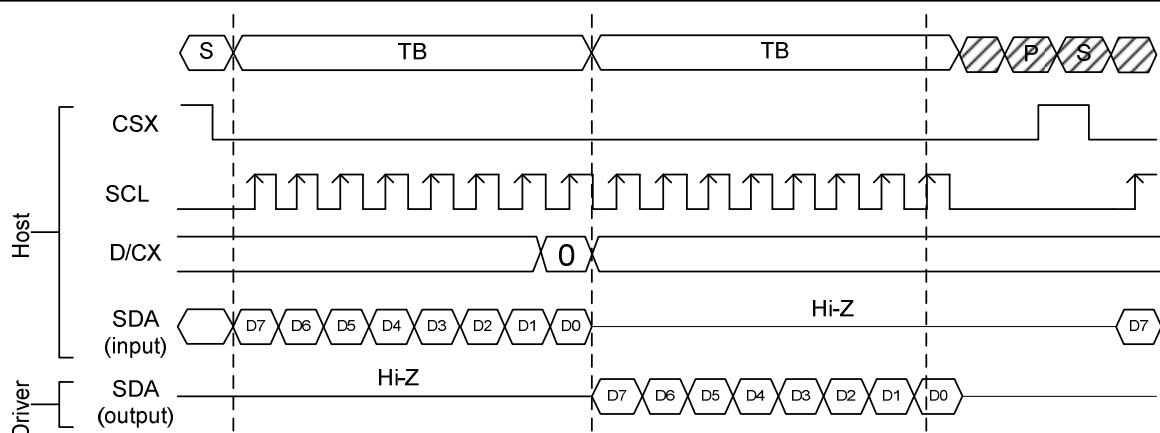

7.1.3.2. Read Cycle Sequence

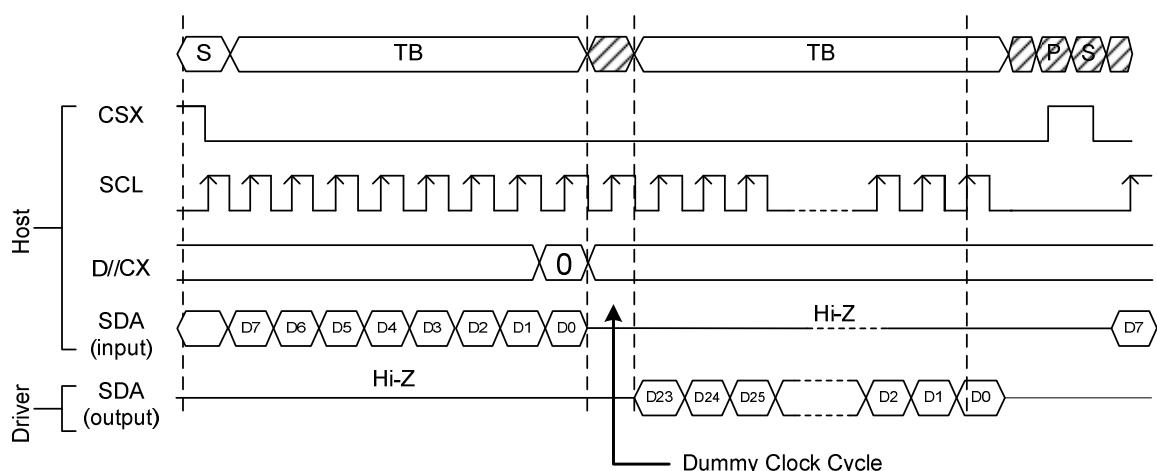

The read mode of the interface means that the host reads register value from ILI9486L. The host has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. The ILI9486L samples the SDA (input data) at the rising edges of SCL (serial clock), but shifts SDA (output data) at falling edges of SCL (serial clock). After the read status command has been sent, the SDA line must be set to tri-state no later than at the falling edge of SCL of the last bit. The read mode has three types of transmitted command data (8-/24-/32-bit) according command code.

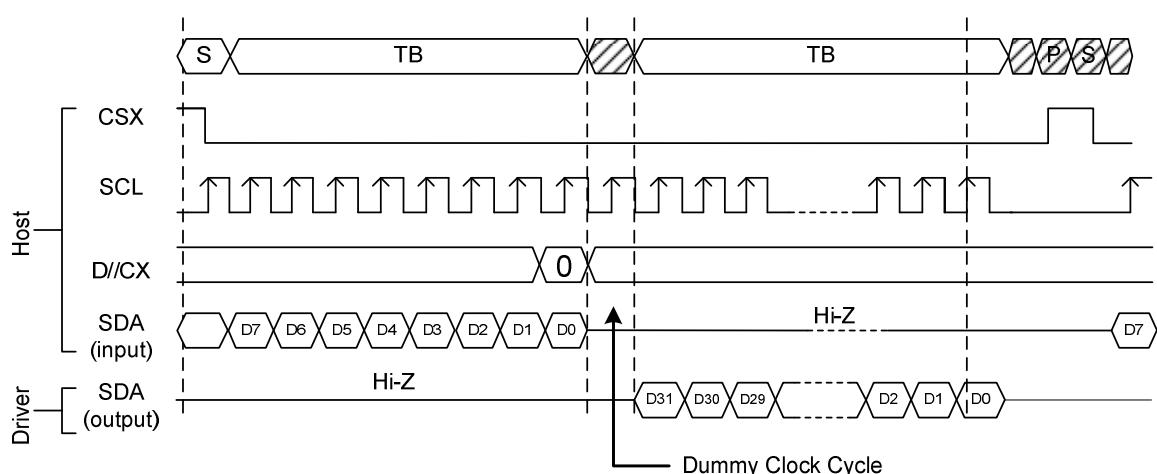

4-line Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command: 8-bit read)

4-line Serial Protocol (for RDDID command: 24-bit read)

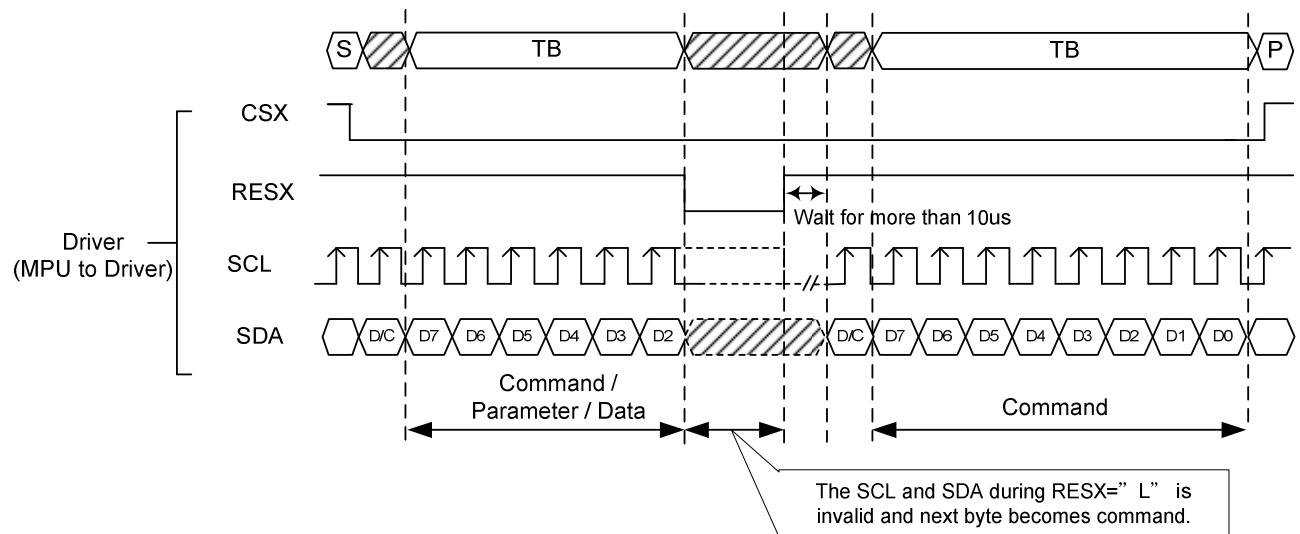

4-line Serial Protocol (for RDDST command: 32-bit read)

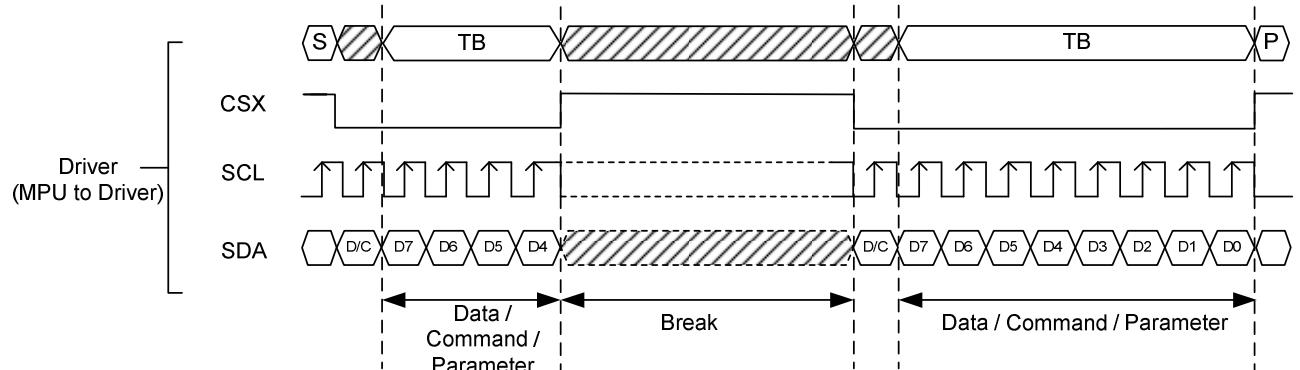

7.1.4. Data Transfer Break and Recovery

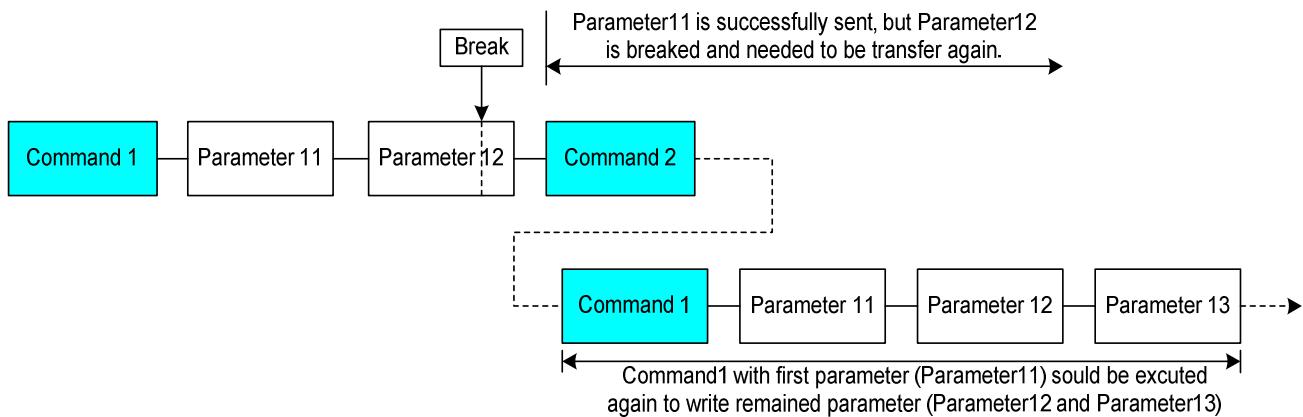

If there is a break in data transmission by RESX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select pin (CSX) is next activated after RESX have been High state.

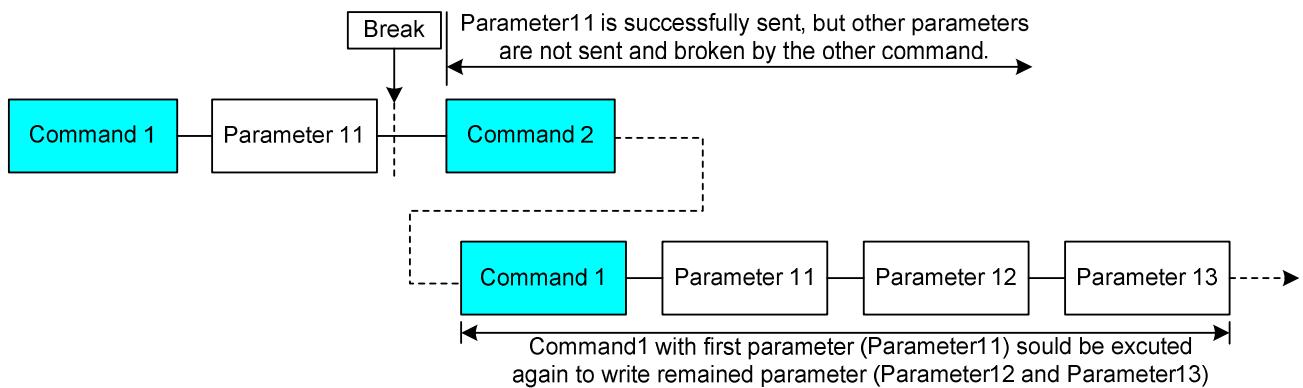

If there is a break in data transmission by CSX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then the driver will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select pin (CSX) is next activated.

If a two or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than continue to send the remained parameters that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

If a two or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

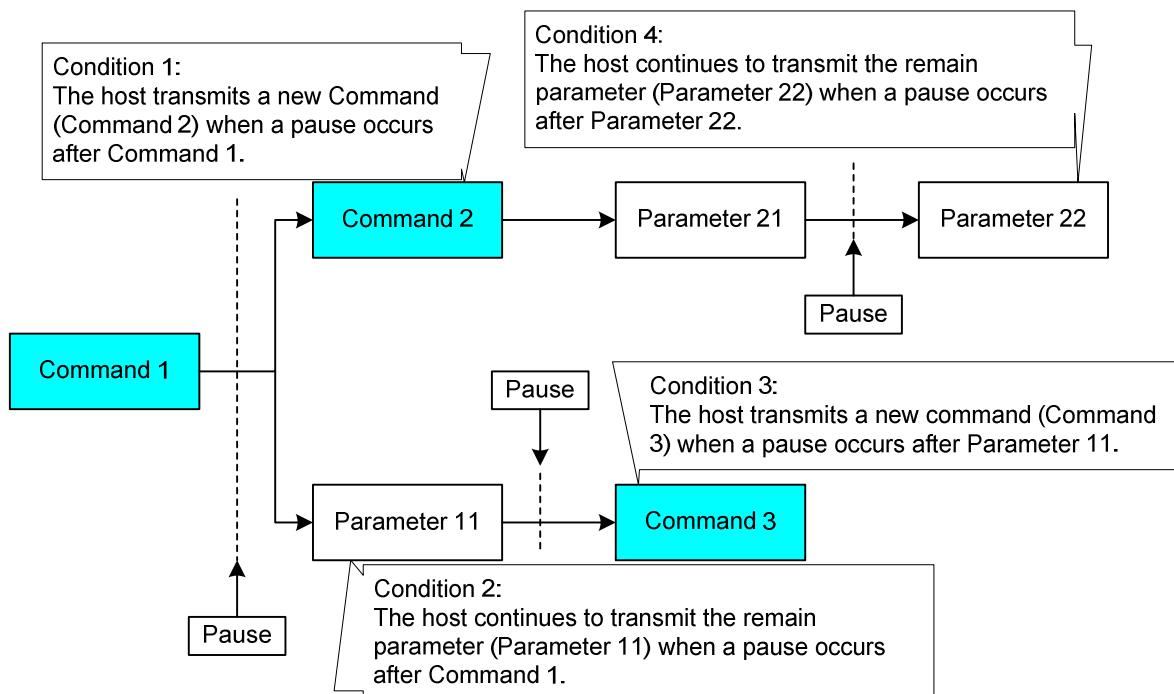

7.1.5. Data Transfer Pause

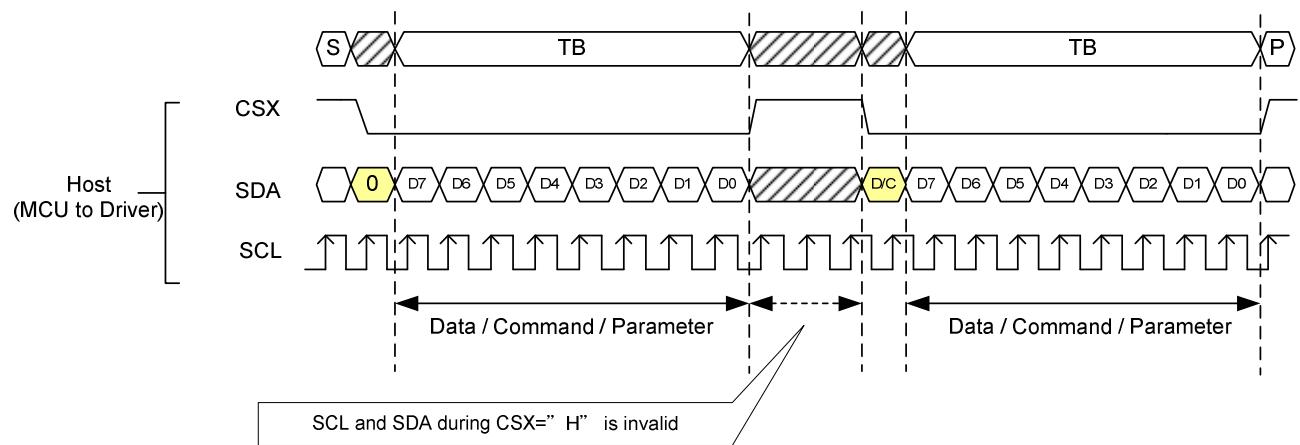

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select pin (CSX) is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then ILI9486L will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select pin is released after a whole byte of a command has been completed, then the display module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below.

This applies to the following 4 conditions:

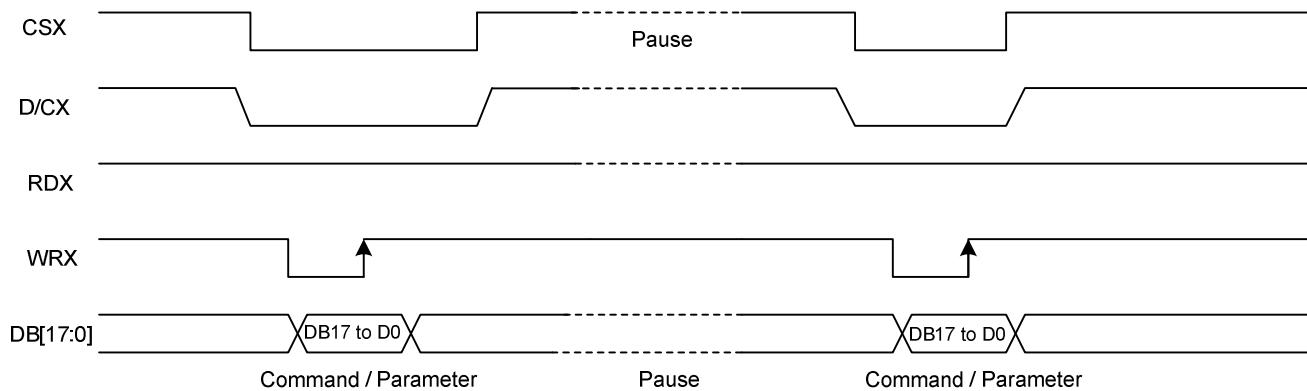

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

7.1.5.1. Serial Interface Pause

7.1.5.2. Parallel Interface Pause

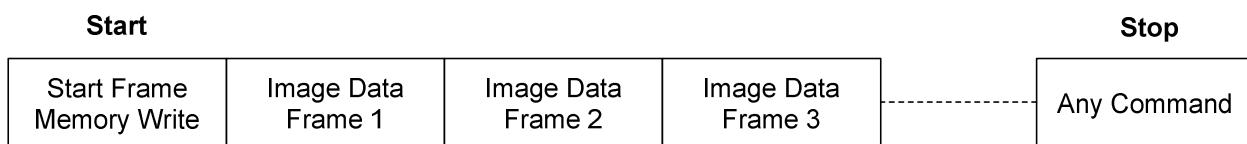

7.1.6. Data Transfer Mode

ILI9486L can provide four different kinds of color depth (8-bit/pixel, 9-bit/pixel, 16-bit/pixel and 18-bit/pixel) display data to the graphic RAM. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

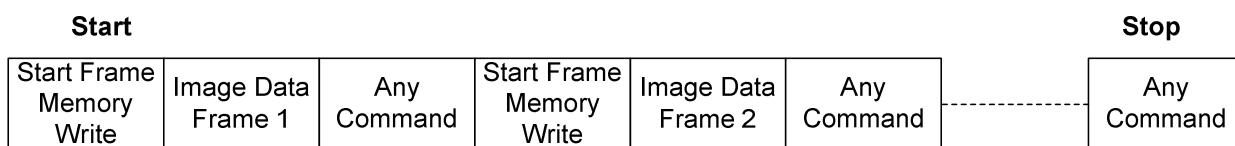

7.1.6.1. Method 1

The Image data is sent to the Frame Memory in the successive Frame writing, each time the Frame Memory is filled by image data, the Frame Memory pointer is reset to the start point and the next Frame is written.

7.1.6.2. Method 2

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Writing. Then Start Memory Write command is sent, and a new Frame is downloaded.

Note 1: These apply to all data transfer Color modes on both serial and parallel interfaces.

Note 2: The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

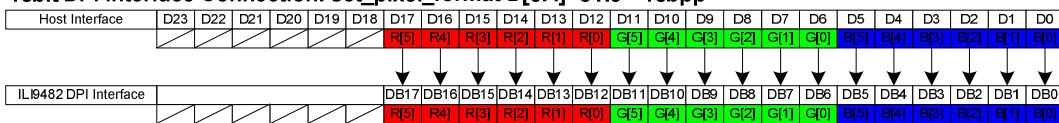

7.2. RGB Interface

7.2.1. RGB Interface Selection

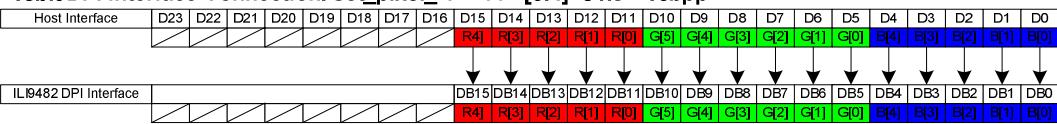

ILI9486L has the RGB interface and these interfaces can be selected by RCM bit. When RCM is set to “0”, the DE mode is selected which utilizes VSYNC, HSYNC, DOTCLK, DE, D [17:0] pins; when RCM is set to “1”, the SYNC mode is selected which utilizes which utilizes VSYNC, HSYNC, DOTCLK, D [17:0] pins. ILI9486 supports several pixel format that can be selected by DPI[3:0] bits in “Pixel Format Set (3Ah)” command. The selection of a given interfaces are done by DPI[3:0] as show in the following table.

RCM	DPI[2:0]					RGB Interface Mode	RGB Mode												Used Pins							
0	0	1	1	0	0	18-bit RGB interface (262K colors)	DE Mode Valid data is determined by the DE signal												VSYNC, HSYNC, DE, DOTCLK,D[17:0]							
0	0	1	0	1	1	16-bit RGB interface (65K colors)													VSYNC, HSYNC, DE, DOTCLK,D[15:0]							
1	0	1	1	0	0	18-bit RGB interface (262K colors)	SYNC Mode In SYNC mode, DE signal is ignored; blanking porch is determined by B5h command.												VSYNC, HSYNC, DOTCLK, D[17:0]							
1	0	1	0	1	1	16-bit RGB interface (65K colors)													VSYNC, HSYNC, DOTCLK, D[15:0]							

18bit DPI Interface Connection: set_pixel_format D[6:4]=3'h6 : 18bpp

16bit DPI Interface Connection: set_pixel_format D[6:4]=3'h5 : 16bpp

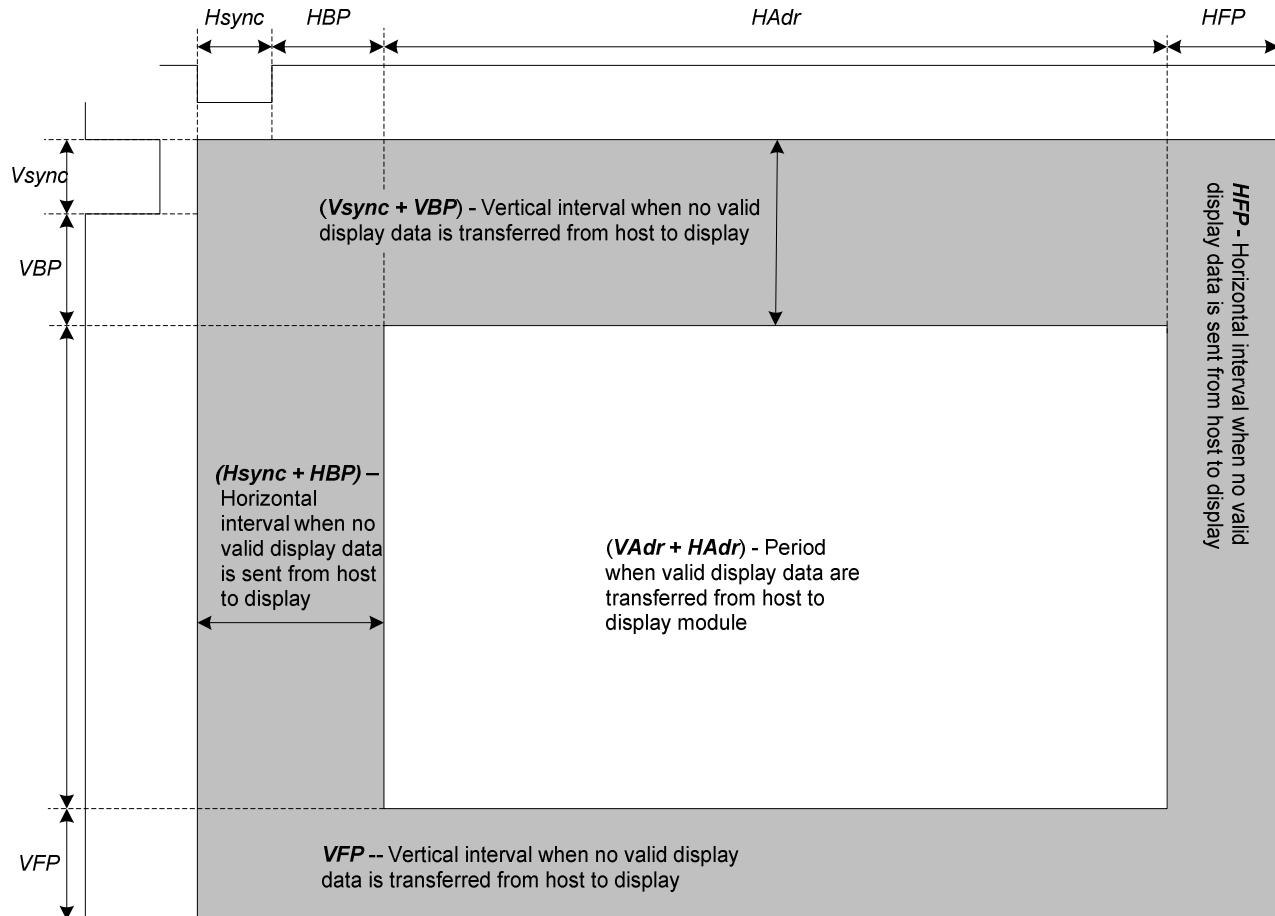

Pixel clock (DOTCLK) is running all the time without stopping and it is used to entering VSYNC, HSYNC, ENABLE and DB[17:0] states when there is a rising edge of the DOTCLK. The DOTCLK can not be used as continues internal clock for other functions of the display module.

Vertical synchronization (VSYNC) is used to tell when there is received a new frame of the display. This is low enable and its state is read to the display module by a rising edge of the DOTCLK signal.

Horizontal synchronization (HSYNC) is used to tell when there is received a new line of the frame. This is low enable and its state is read to the display module by a rising edge of the DOTCLK signal.

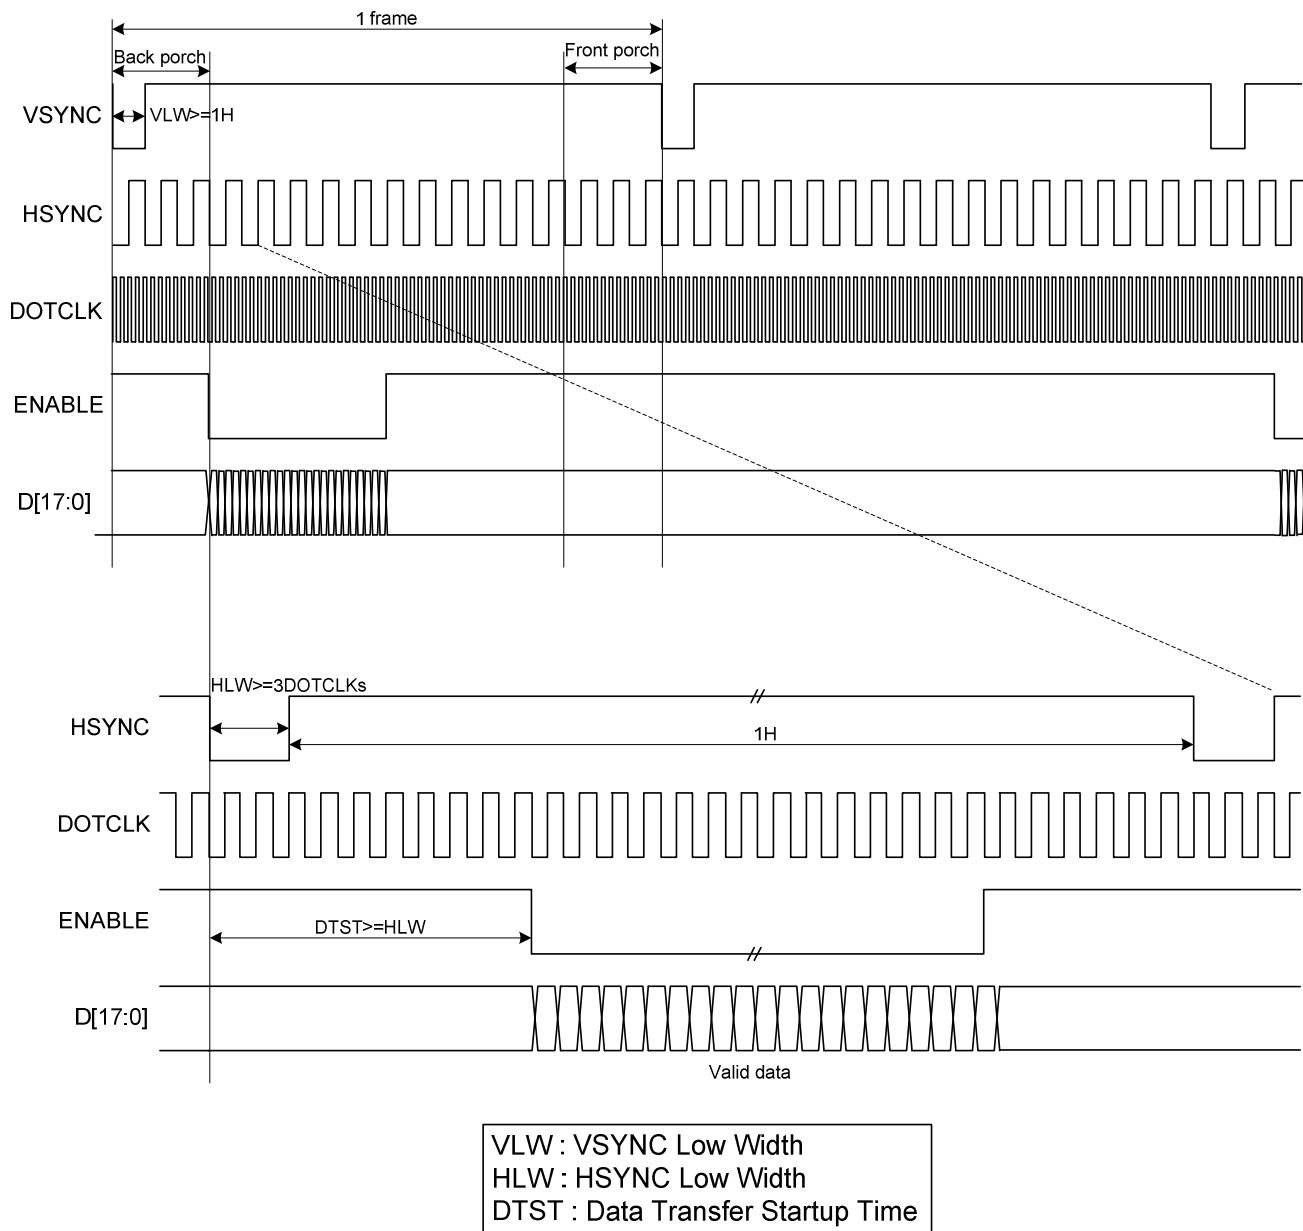

Data Enable (ENABLE) is used to tell when there is received RGB information that should be transferred on the display. This is a high enable and its state is read to the display module by a rising edge of the DOTCLK signal. DB[17:0] are used to tell what is the information of the image that is transferred on the display (When

ENABLE= '0' (low) and there is a rising edge of DOTCLK). DB[17:0] can be '0' (low) or '1' (high). These lines are read by a rising edge of the DOTCLK signal. In RGB interface modes, the input display data is written to GRAM first then outputs corresponding source voltage according the gray data from GRAM.

7.2.2. RGB Interface Timing

The timing chart of 18-/16-bit RGB interface mode is shown as below.

Note 1: The DE signal is not needed when RGB interface SYNC mode is selected.

Note 2: VSPL='0', HSPL='0', DPL='0' and EPL='0' of "Interface Mode Control (B0h)" command.

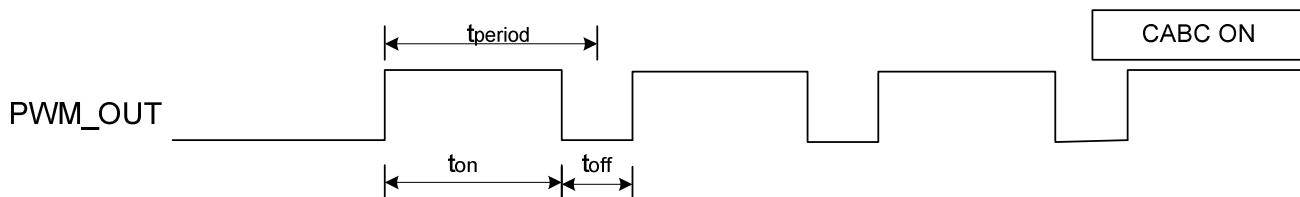

7.3. CABC (Content Adaptive Brightness Control)

ILI9486L provides a dynamic backlight control function as CABC (Content adaptive brightness control) to reduce the power consumption of the luminance source. ILI9486L will refer the gray scale content of display image to output a PWM waveform to LED driver for backlight brightness control. Content adaptation means that the content of gray sale can be increased while simultaneously lowering brightness of the backlight to achieve the same perceived brightness. The adjusted gray level scale and thus the power consumption reduction depend on the content of the image.

ILI9486L can calculate the backlight brightness level and send a PWM pulse to LED driver via PWM_OUT pin for backlight brightness control purpose. The PWM frequency can be adjusted by PWM_DIV parameters and the calculating equation as below:

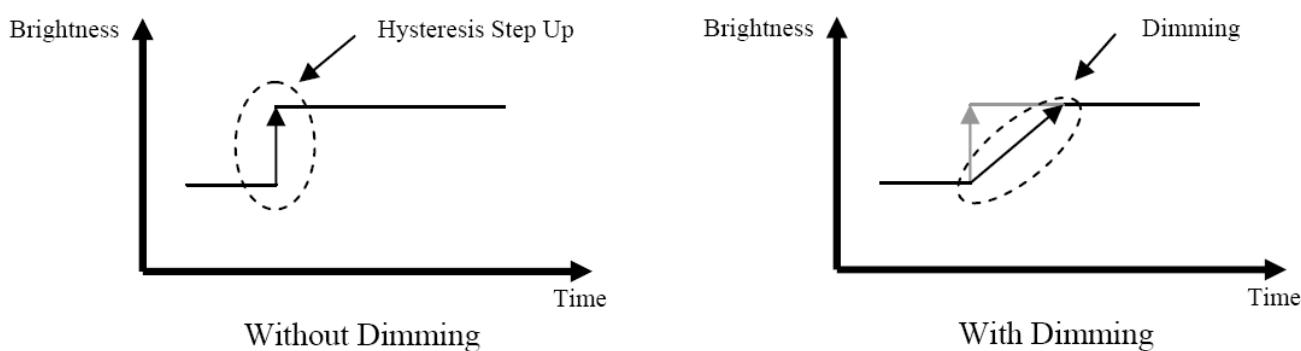

$$f_{\text{PWM_OUT}} = \frac{18\text{MHz}}{(\text{PWM_DIV}[7:0]+1) \times 255}$$

The figure in the following is the basic timing diagram which is applied ILI9486L to control LED driver.

Display Backlight Dimming Control

A dimming function (how fast to change the brightness from old to new level and what are brightness levels during the change) is used when changing from brightness level to another. This dimming function curve is the same in increment and decrement directions. The basic idea is described below.

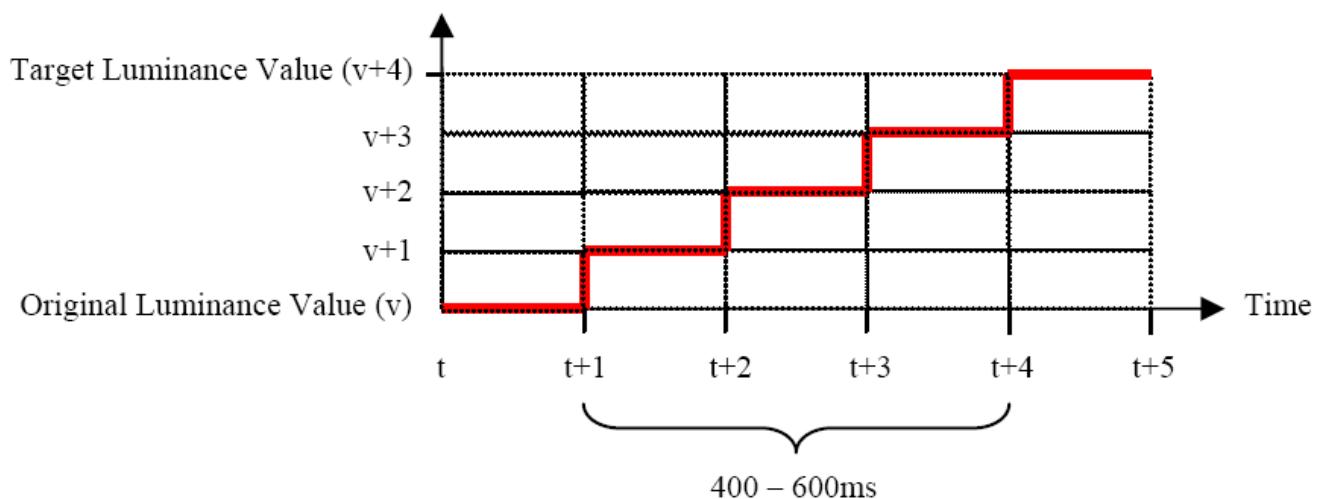

Dimming function can be enabled and disabled. See command “Write CTRL Display(53h), bit3(DD) for more information.

Dimming Requirement

Dimming function in the display module should be implemented so that 400 – 600ms is used for the transition between the original brightness value and the target brightness value. The transferring time steps between these two brightness values are equal making the transition linear.

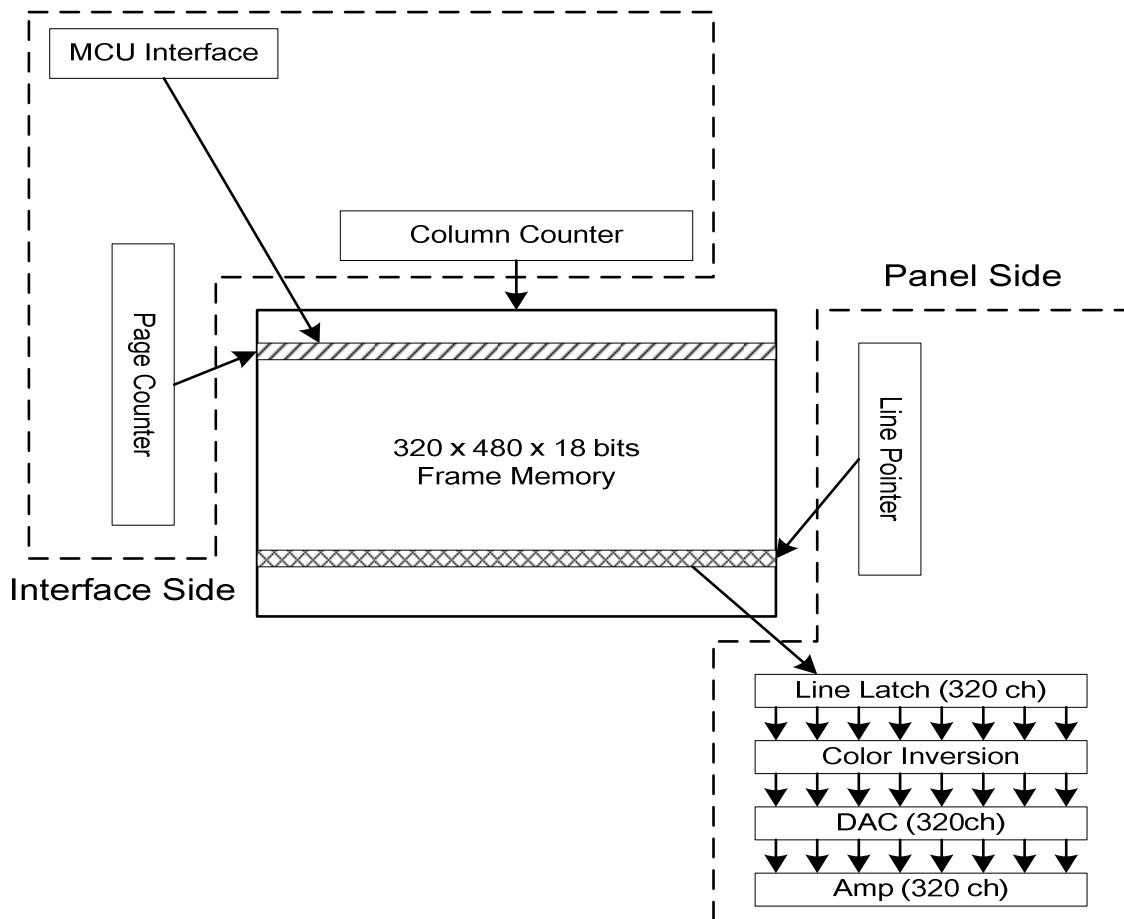

The dimming function is working similarly in both upward and downward directions.

An upward example is illustrated below.

7.4. Display Data RAM (DDRAM)

The ILI9486L has an integrated 320x480x18-bit graphic type static RAM. This 345,600-byte memory allows storing a 320xRGBx480 image with an 18-bit resolution (262K-color). There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

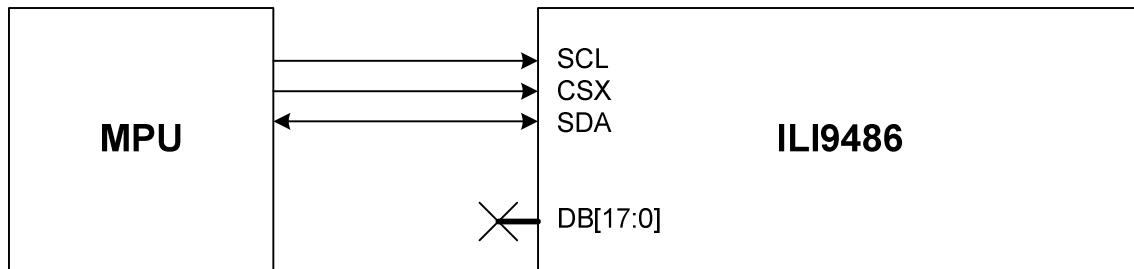

7.5. Display Data Format

ILI9486L supplies 18-/16-/9-/8-bit parallel MCU interface with 8080-series and 3-/4-line serial interface and 16-/18-bit parallel RGB interface. The parallel MCU interface and serial interface mode can be selected by external pins IM [2:0].

7.5.1. 3-line Serial Interface

The 3-line/9-bit serial bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "101". The figure in the following is the example of interface with 8080 microcomputer system interface.

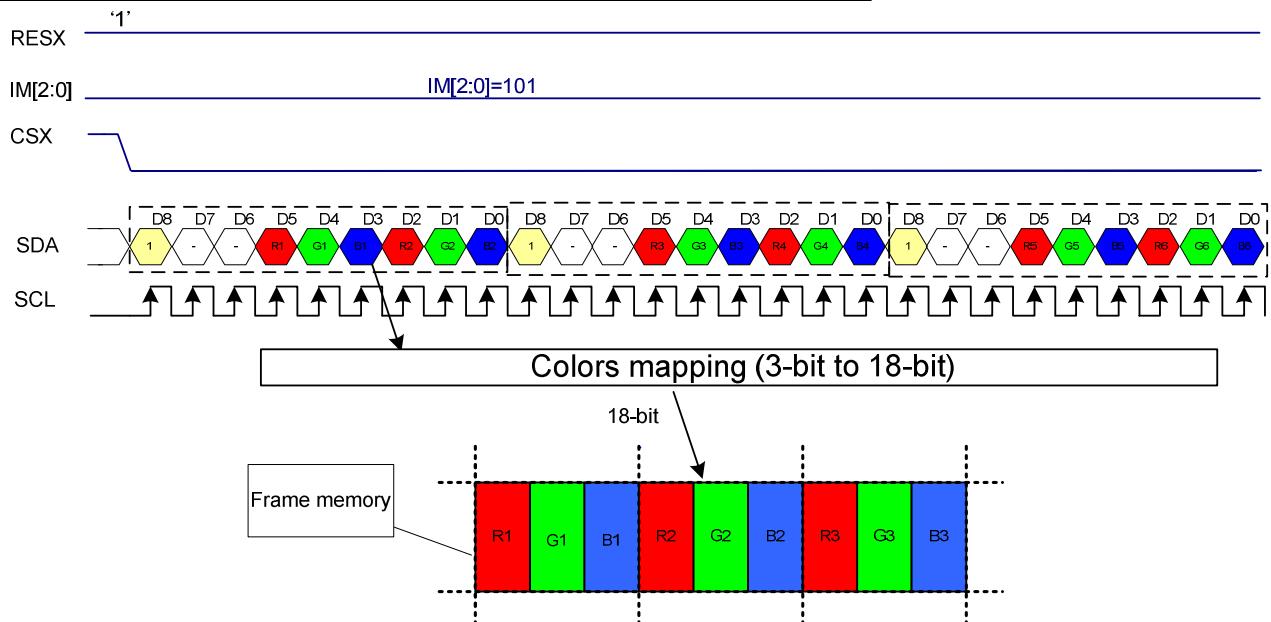

In 3-line serial interface, different display data formats are available for two color depths supported by the LCM listed below.

-8 colors, RGB 1, 1, 1 -bits input

-262k colors, RGB 6, 6, 6 -bits input.

3 bit/pixel color order (R:1-bit, G:1-bit, B:1-bit), 8 colors

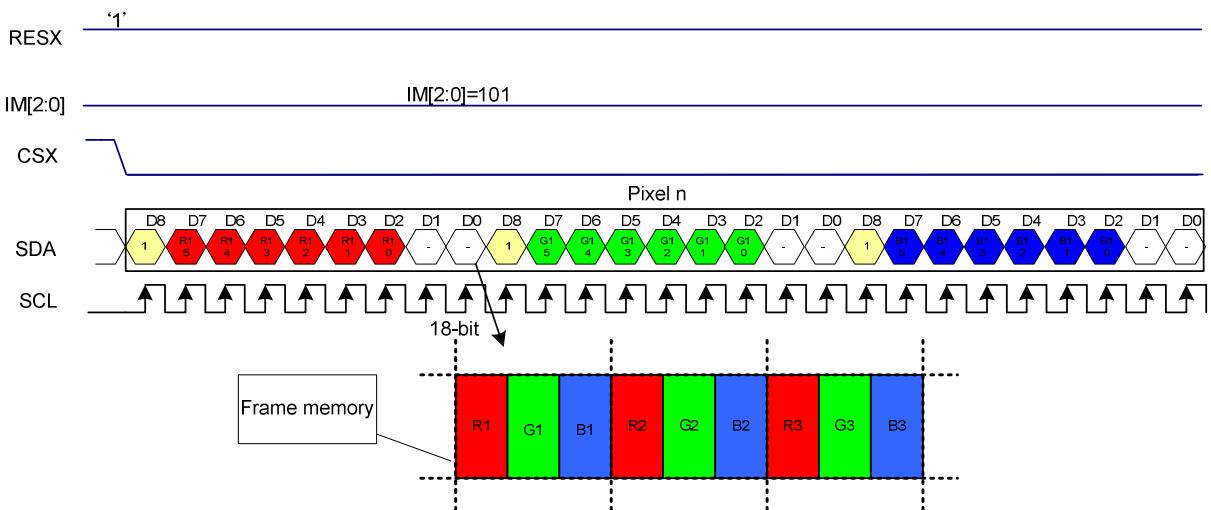

Note 1: The pixel data with 16-bit color depth information.

Note 2: The most significant bits are: Rx4, Gx5 and Bx4.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-' = Don't care – Leave these pins to Open.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

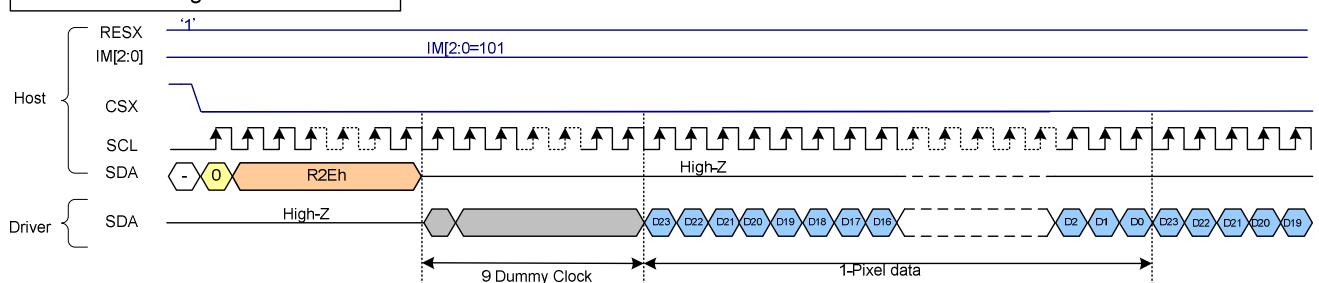

Note 1: The pixel data with 18-bit color depth information.

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are : Rx0, Gx0 and Bx0.

Note 4: '-'= Don't care - Leave these pins to Open.

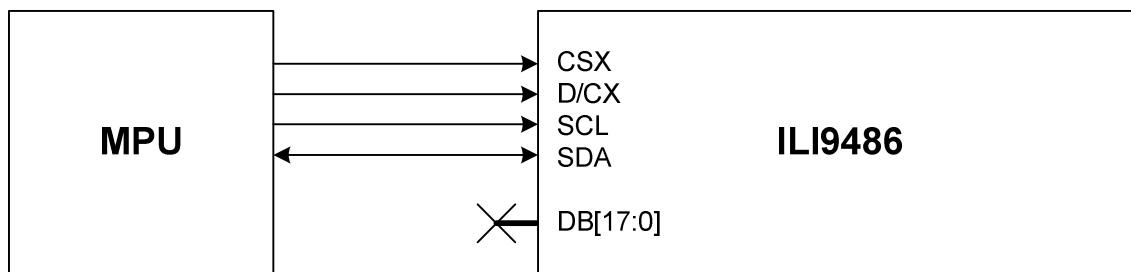

Read data through 3-line SPI mode

Note 1: '-'= Don't care – Leave these pins to Open.

7.5.2. 4-line Serial Interface

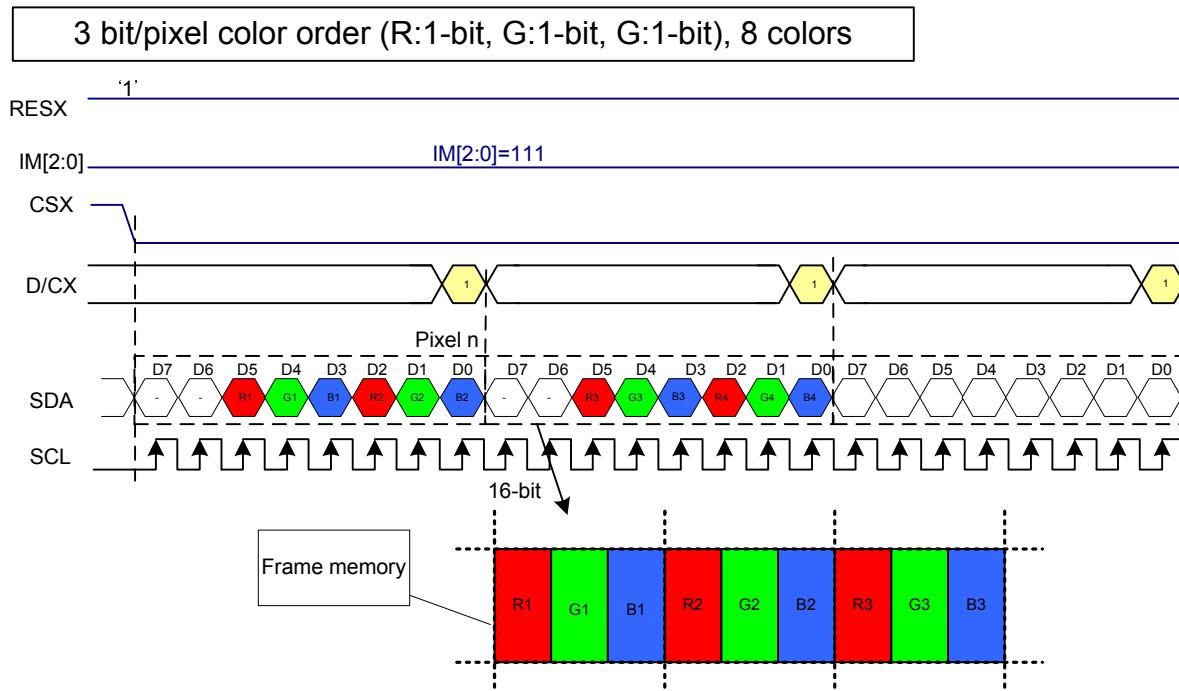

The 4-line/8-bit serial bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "111". The figure in the following is the example of interface with 8080 microcomputer system interface.

In 4-line serial interface, different display data formats are available for two color depths supported by the LCM listed below.

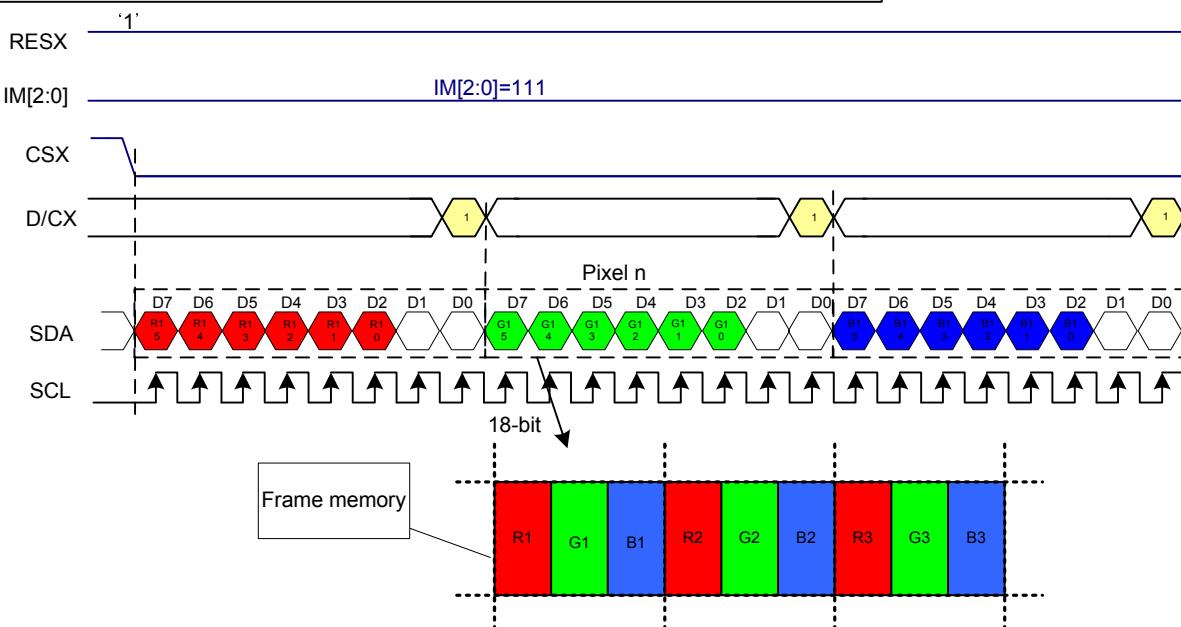

-8 colors, RGB 1, 1, 1 -bits input.

-262k colors, RGB 6, 6, 6 -bits input.

Note : '-' = Don't care – Leave these pins to Open.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit) , 262,144 colors

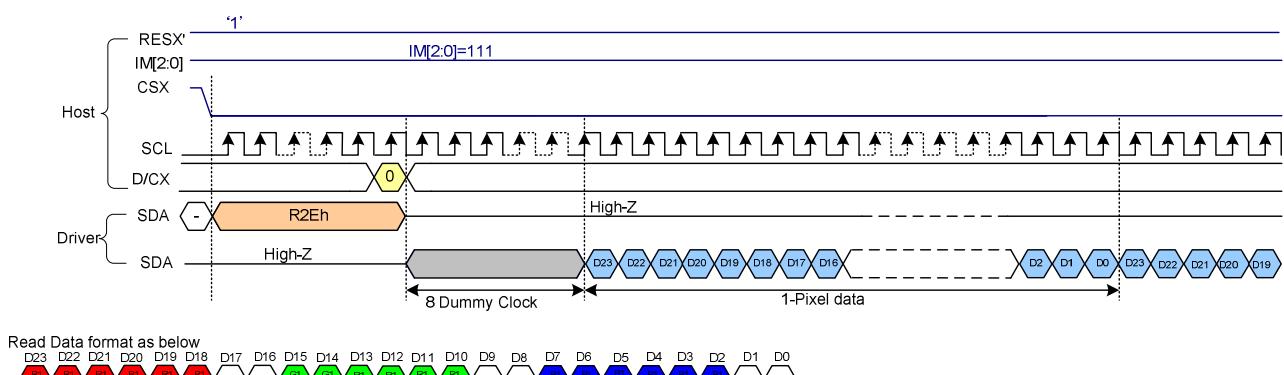

Note 1: The pixel data with 18-bit color depth information.

Note 2: The most significant bits are: Rx5, Gx5 and Bx5.

Note 3: The least significant bits are: Rx0, Gx0 and Bx0.

Note 4: '-' = Don't care – Leave these pins to Open.

Read data through 4-line SPI mode

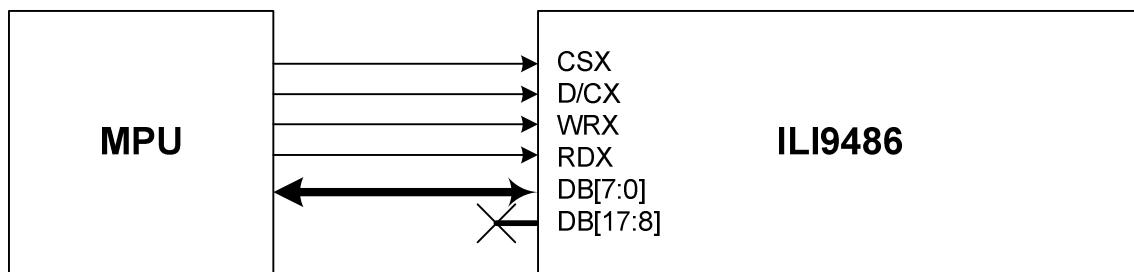

Note 1: '-' = Don't care – Leave these pins to Open.

7.5.3. 8-bit Parallel MCU Interface

The 8080-system 8-bit parallel bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "011".

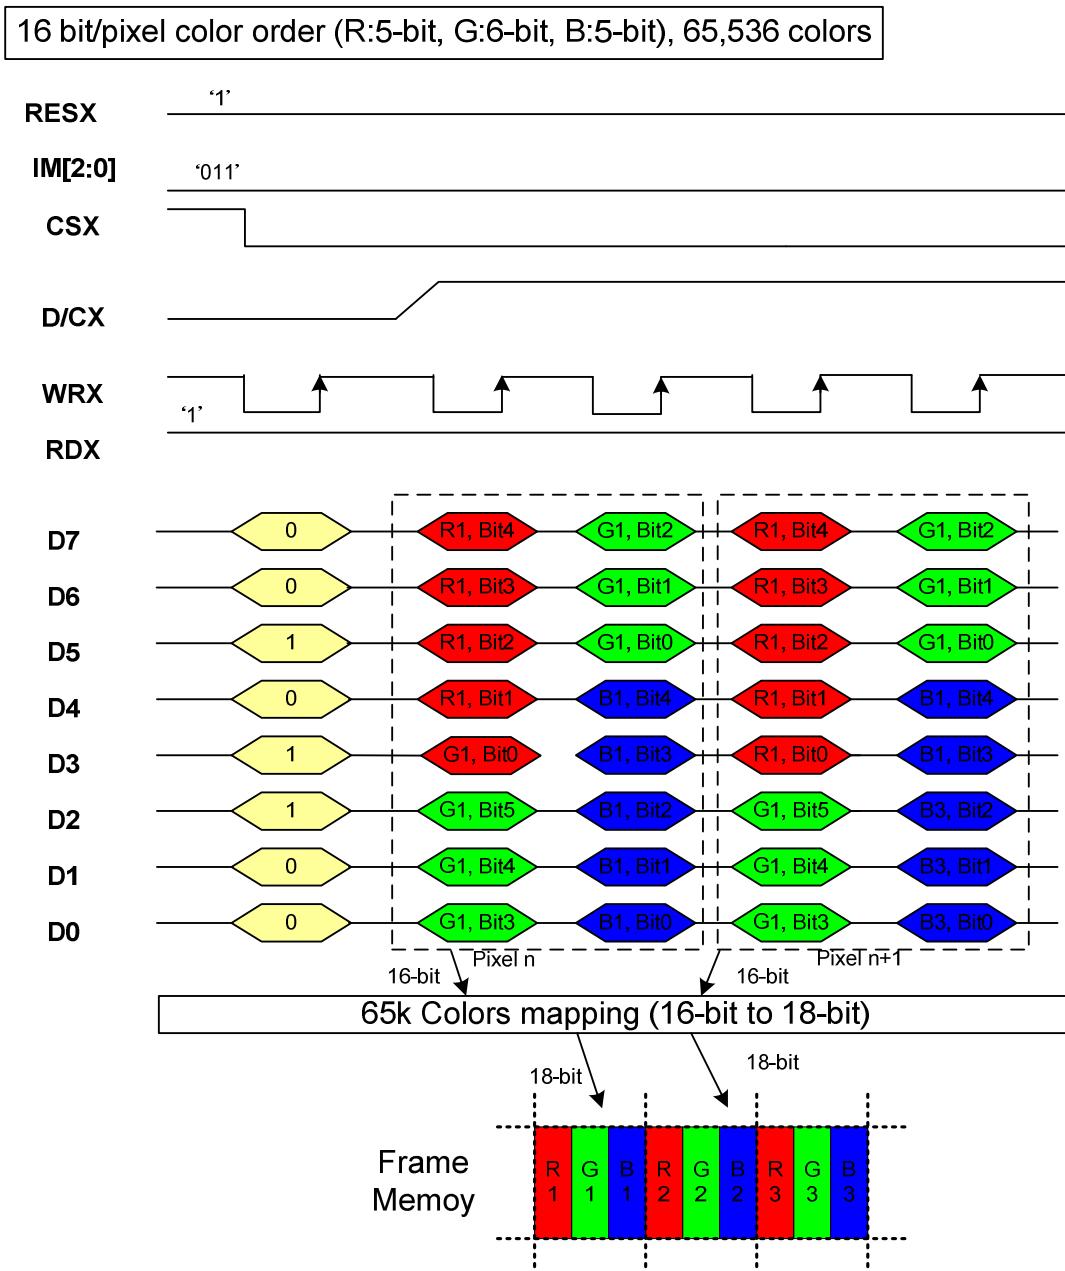

The figure in the following is the example of interface with 8080 microcomputer system interface.

Different display data formats are available for two color depths supported by listed below.

- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.5.3.1. 8-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color

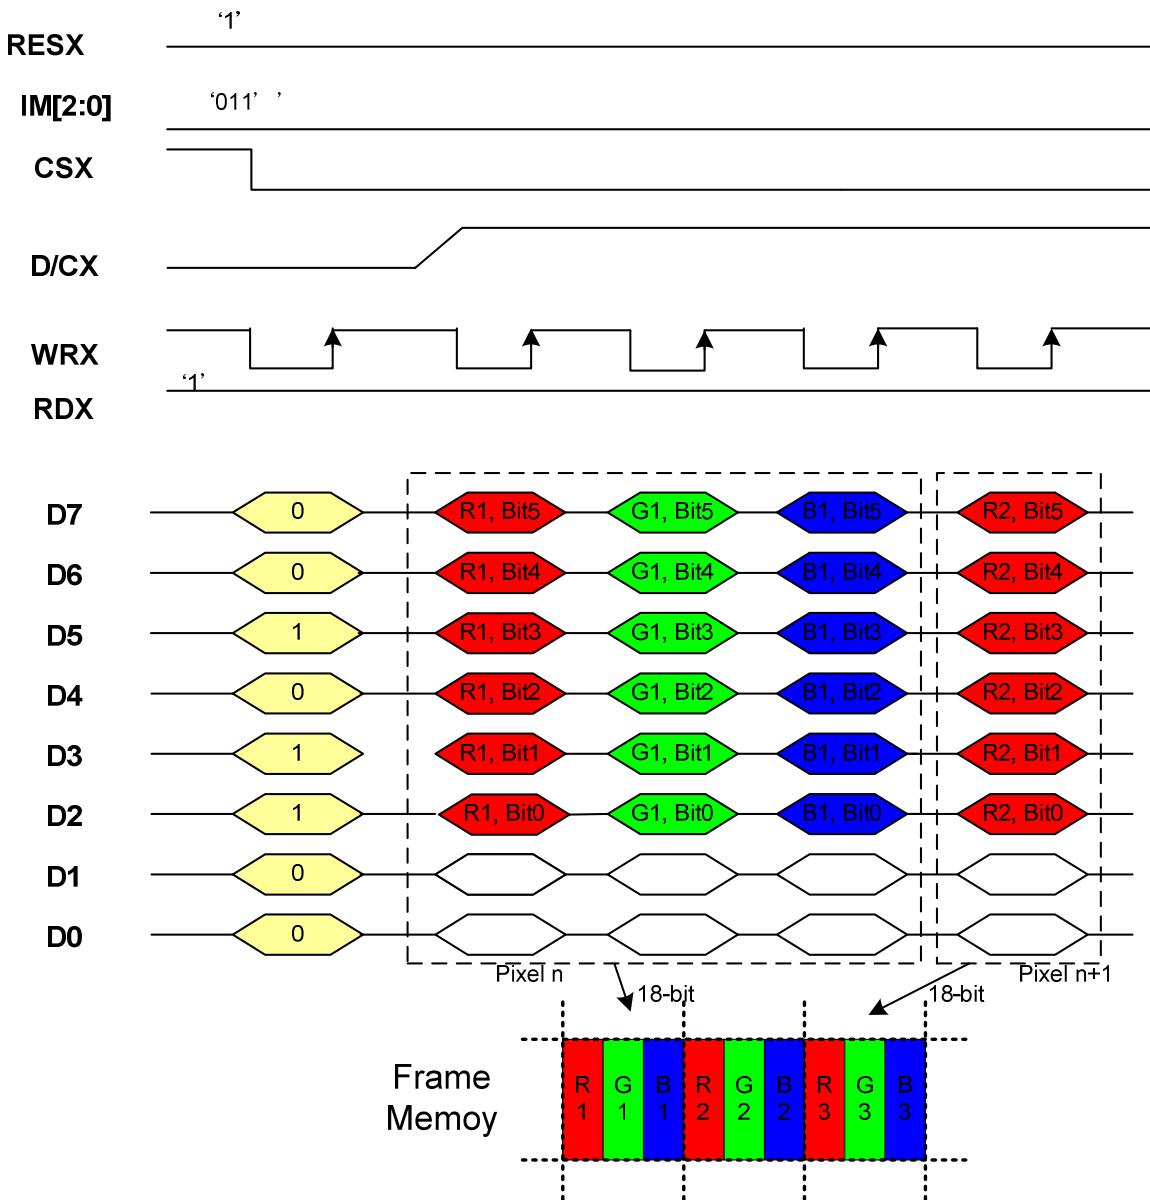

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green data and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2: 2-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-' = Don't care – Leave these pins to Open.

7.5.3.2. 8-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

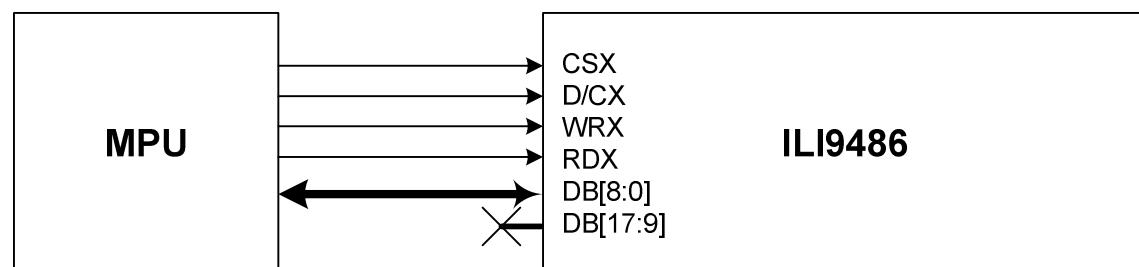

Note 2: 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-' = Don't care – Leave these pins to Open.

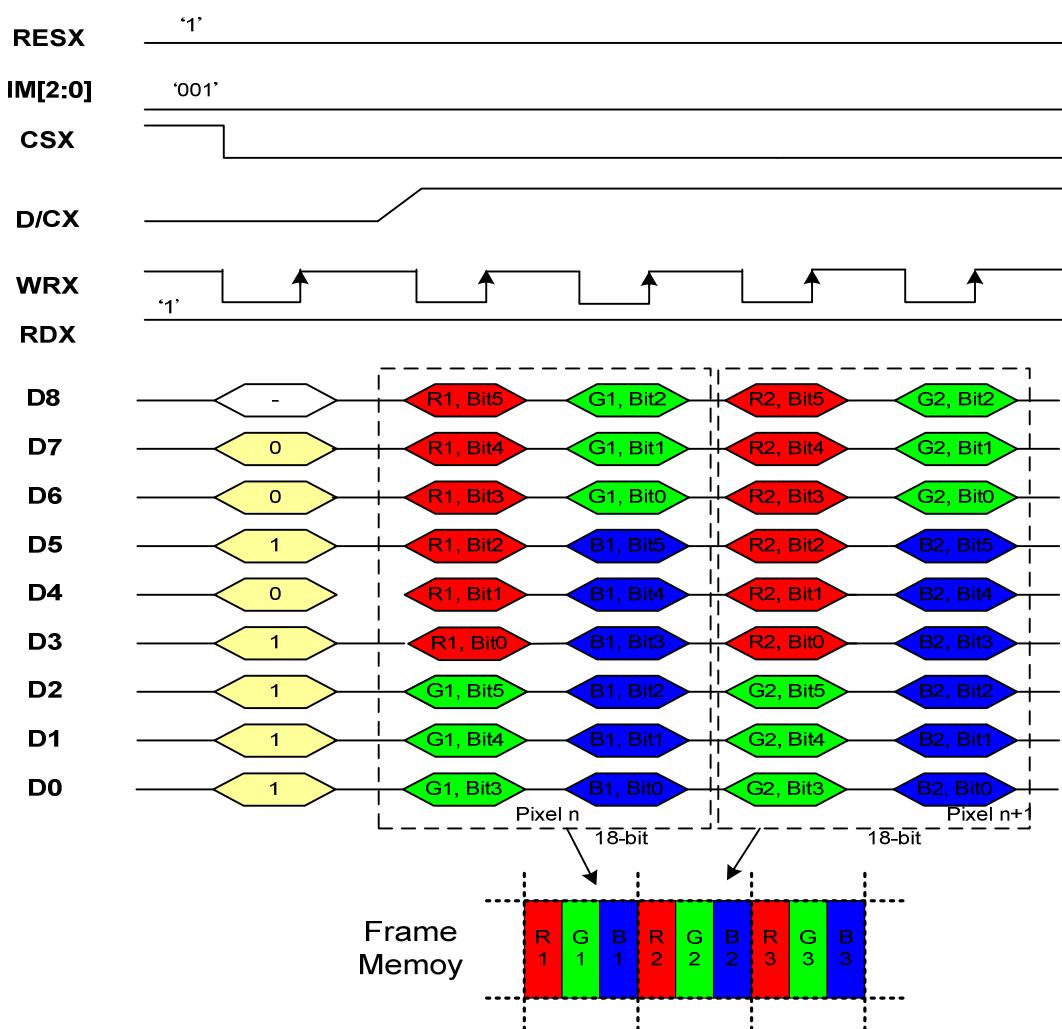

7.5.4. 9-bit Parallel MCU Interface

The 8080-system 9-bit parallel bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "001".

The figure in the following is the example of interface with 8080 microcomputer system interface.

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

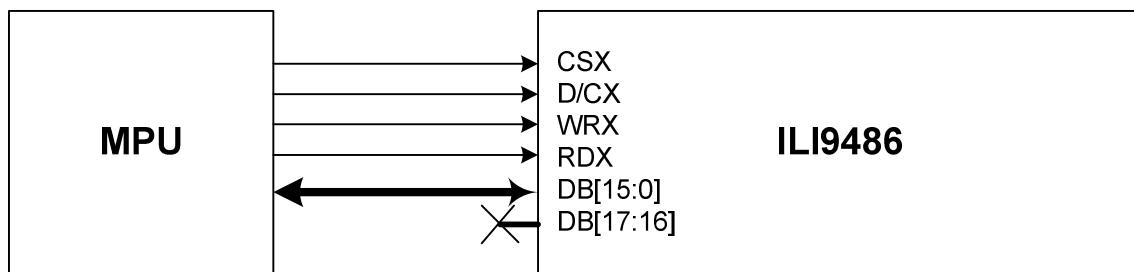

Note 2: 2-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

7.5.5. 16-bit Parallel MCU Interface

The 8080-system 16-bit parallel bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "010".

The figure in the following is the example of interface with 8080 microcomputer system interface.

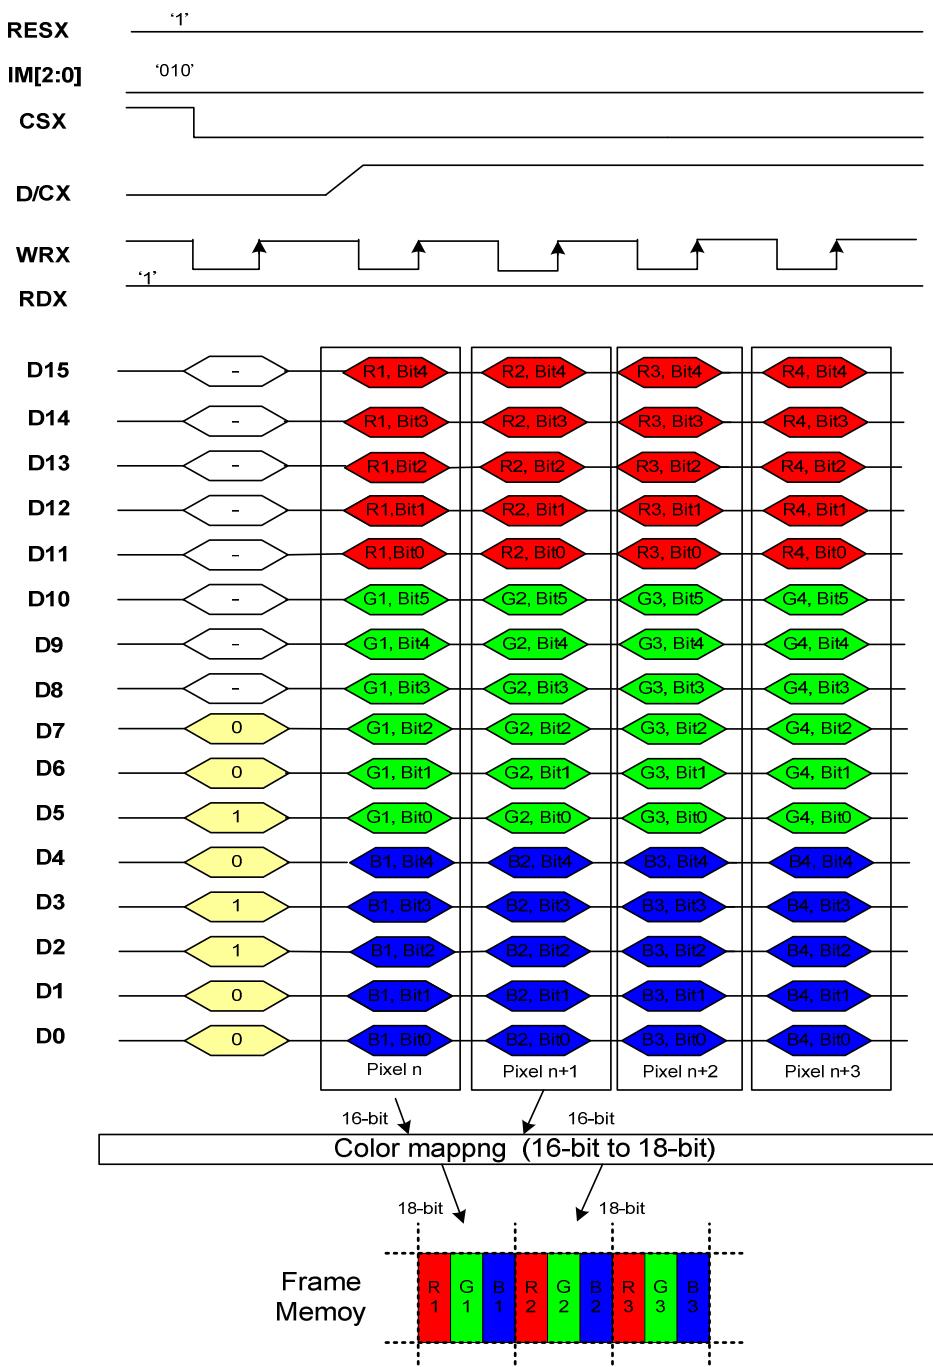

Different display data formats are available for two colors depth supported by listed below.

- 65K-Colors, RGB 5, 6, 5 -bits input data.
- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.5.5.1. 16-bit Data Bus for 16-bit/pixel (RGB 5-6-5 bits input), 65K-color

16 bit/pixel color order (R:5-bit, G:6-bit, B:5bit), 65,536 colors

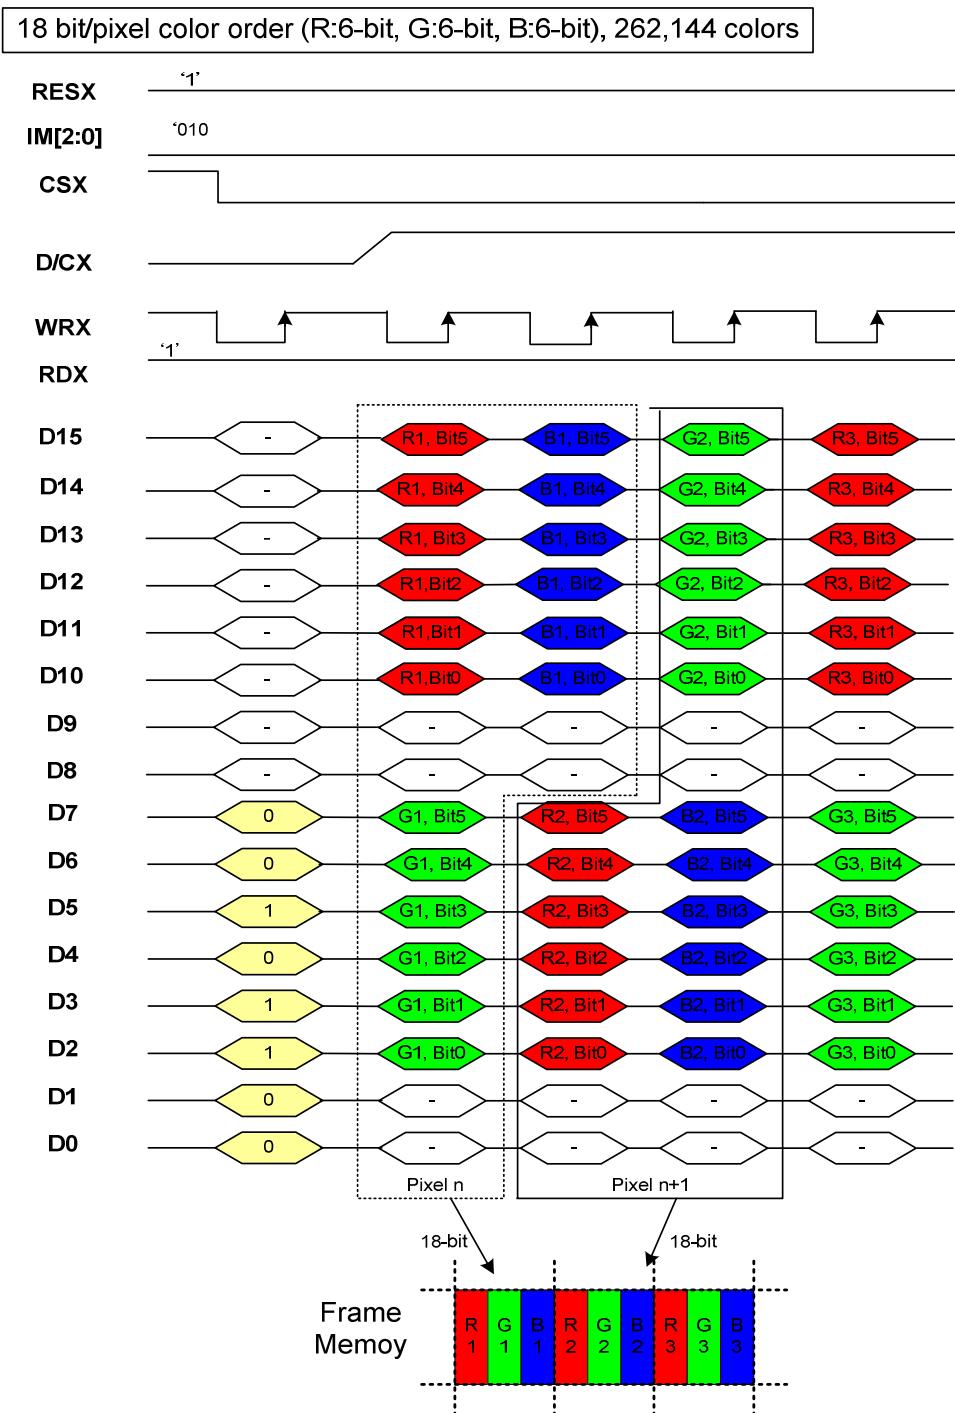

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green data and MSB=Bit 4, LSB=Bit0 for Red and Blue data.

Note 2: 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-' = Don't care – Leave these pins to Open.

7.5.5.2. 16-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

Note 1: The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, Red and Blue data.

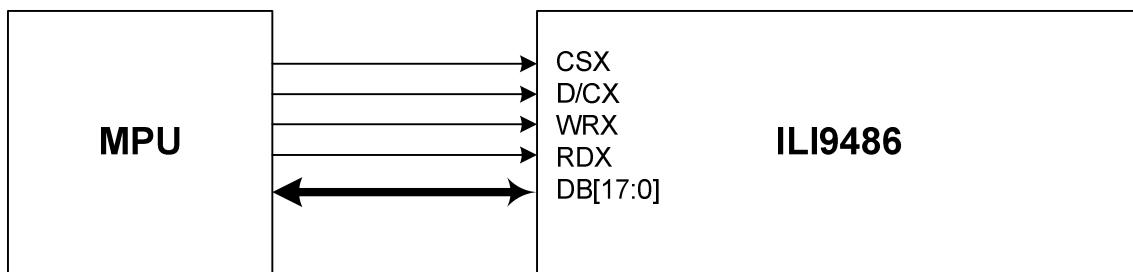

Note 2: 2-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3: '-' = Don't care – Leave these pins to Open.

7.5.6. 18-bit Parallel MCU Interface

The 8080-system 18-bit parallel bus interface of ILI9486L can be used by setting external pin as IM [2:0] to "000".

The figure in the following is the example of interface with 8080 microcomputer system interface.

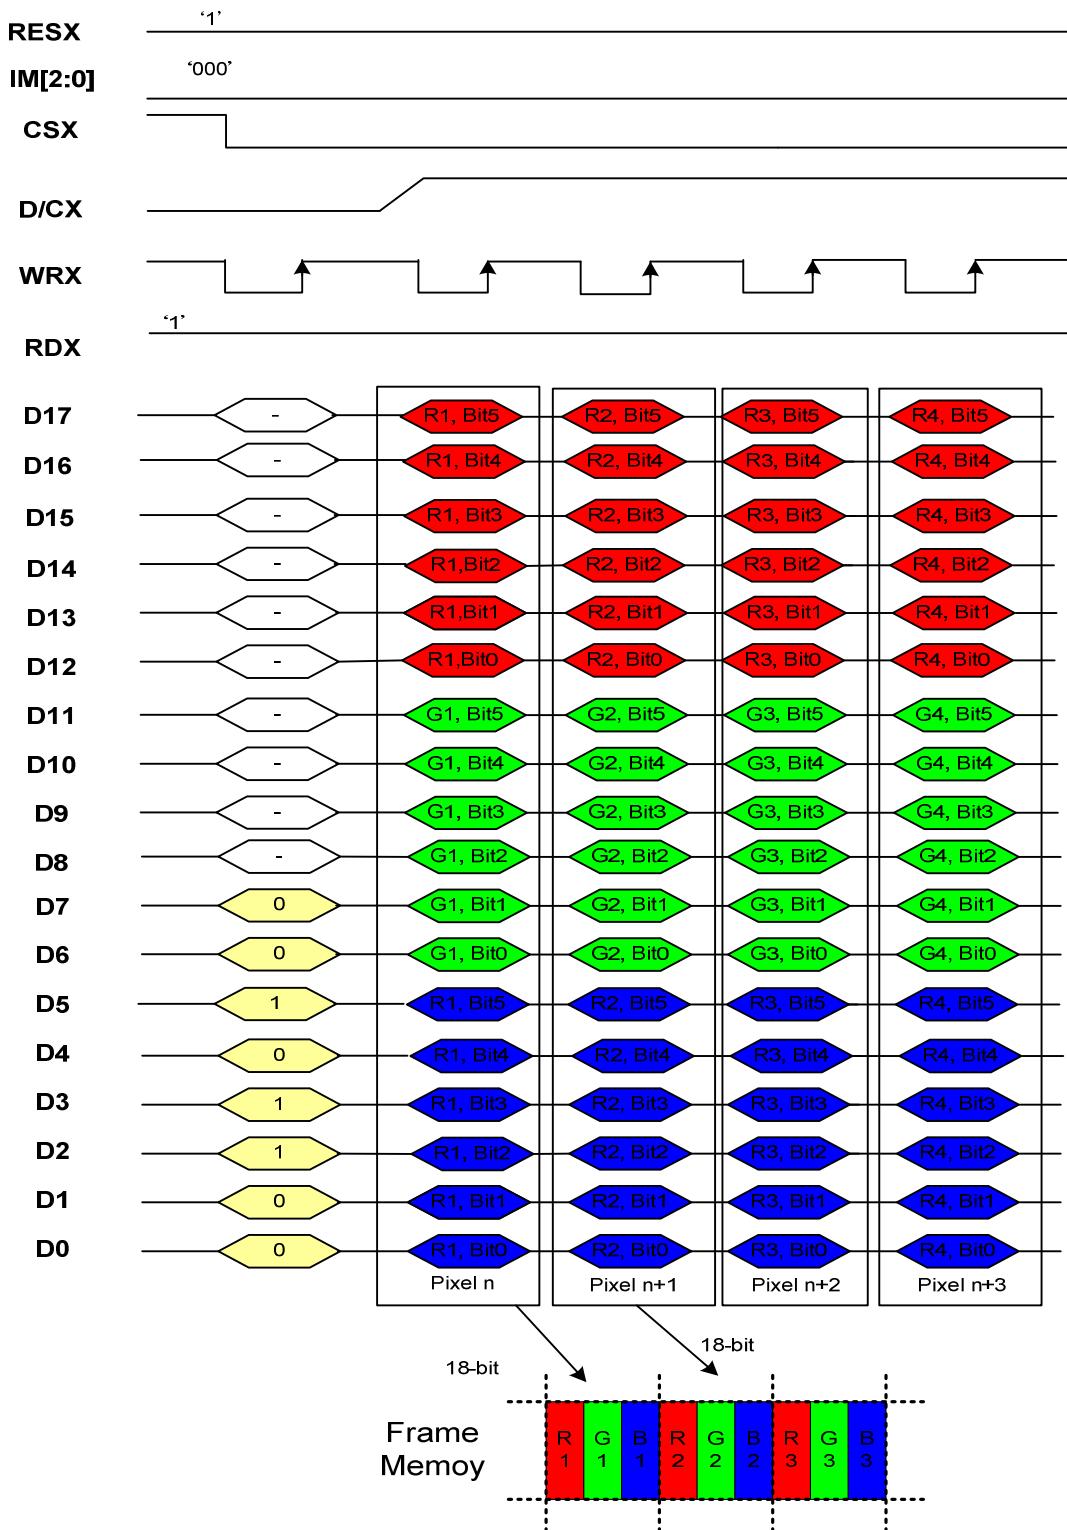

Different display data formats are available for one color depth only supported by listed below.

- 262K-Colors, RGB 6, 6, 6 -bits input data.

7.5.6.1. 18-bit Data Bus for 18-bit/pixel (RGB 6-6-6 bits input), 262K-color

18 bit/pixel color order (R:6-bit, G:6-bit, B:6-bit), 262,144 colors

Note 1: The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green and MSB=Bit4, LSB=Bit0 for Red and Blue data.

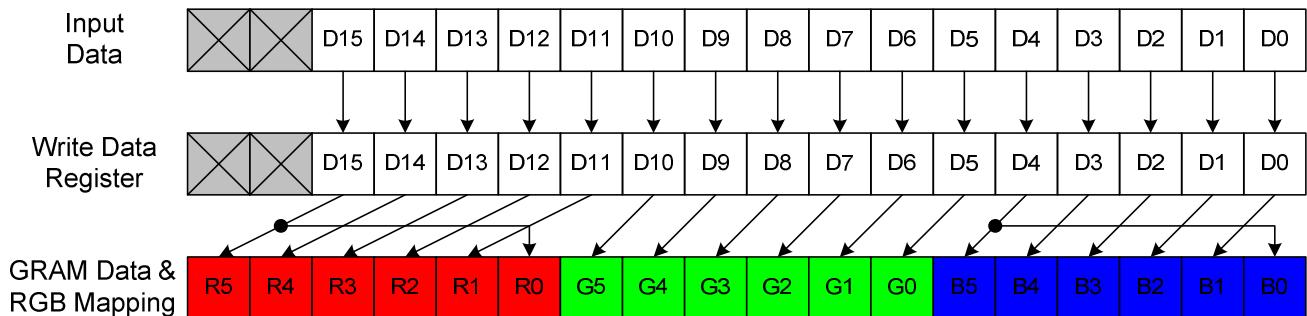

Note 2: 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3: '-'= Don't care – Leave these pins to Open.

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

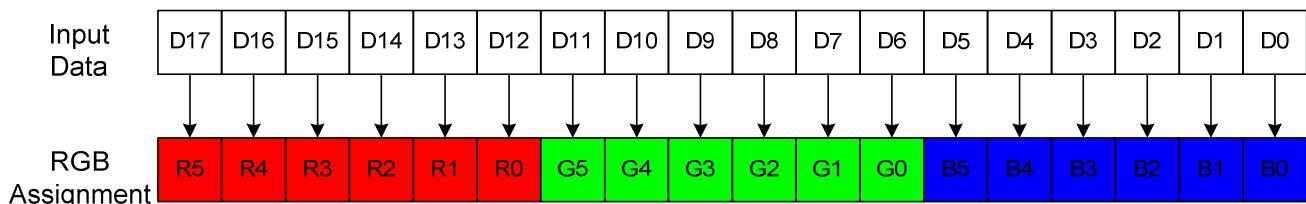

7.5.7. 16-bit Parallel RGB Interface

The 16-bit RGB interface is selected by setting the DPI[2:0] bits to “101”. The display operation is synchronized with VSYNC, HSYNC and DOTCLK signals. The display data are transferred to the internal GRAM in synchronization with the display operation via 16-bit RGB data bus (D[15:0]). Both D17 and D16 pins must be left to OPEN for ensure normally operation. Registers can be set by the system interface.

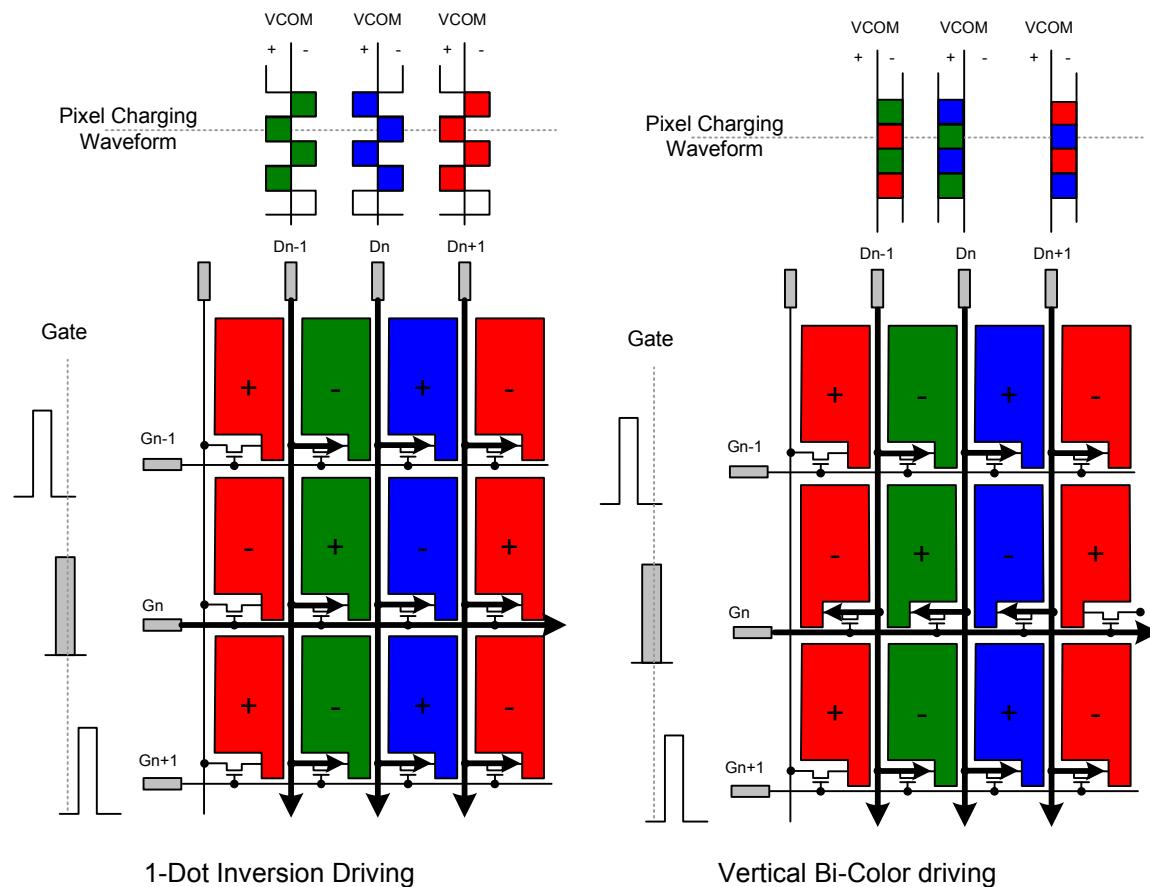

7.5.8. 18-bit Parallel RGB Interface

The 18-bit RGB interface is selected by setting the DPI[2:0] bits to “110”. The display operation is synchronized with VSYNC, HSYNC and DOTCLK signals. The display data are transferred to the internal GRAM in synchronization with the display operation via 18-bit RGB data bus (DB[17:0]) according to the data enable signal (ENABLE). Registers can be set by the system interface.

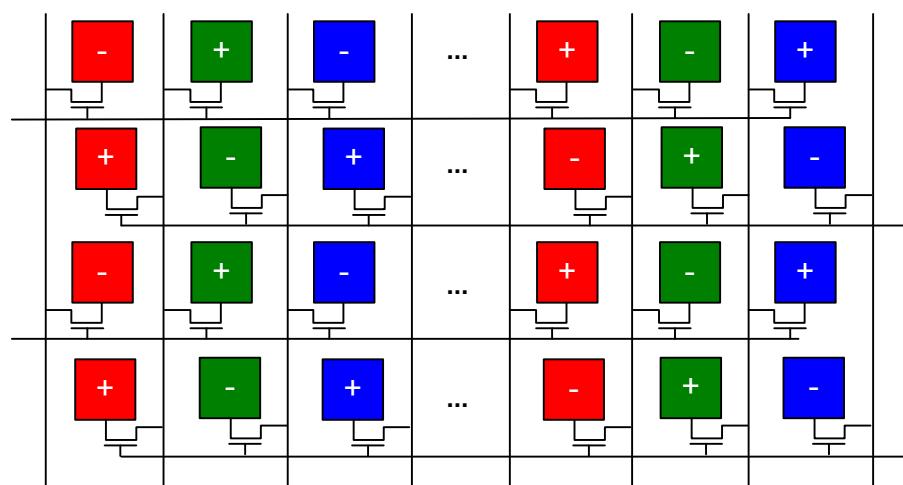

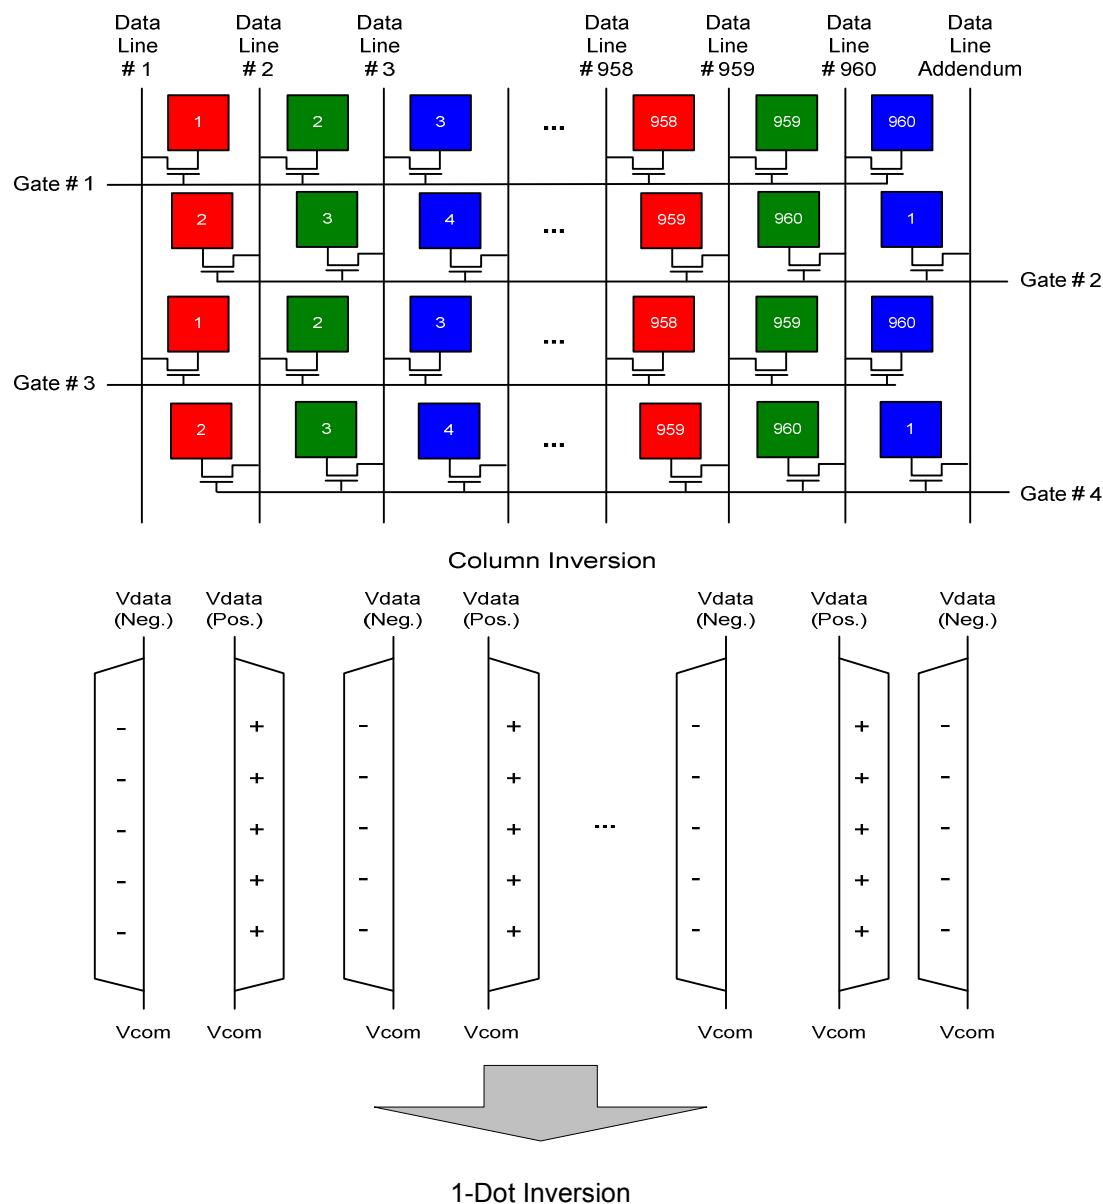

7.6. Z-inversion

The ILI9486L supports Z-inversion for reduce power consumption. The Zigzag can decrease the switching frequency, relative to the magnitude of the display power consumption, and the switching level. This method will have a addendum data line after the last data line.

7.8.1 Z-inversion concept

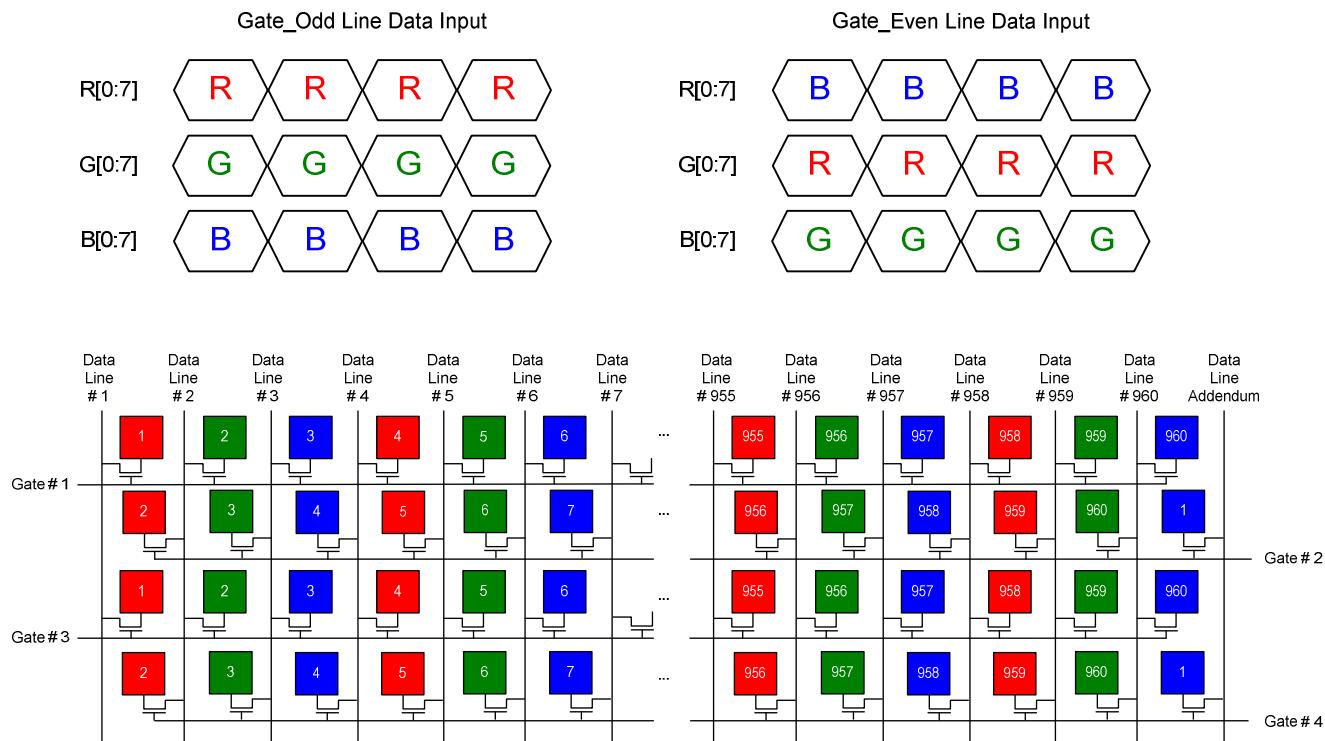

The Zigzag method uses the same polarity of data line of the column inversion to show out the 1-dot inversion.

7.8.2 Z-inversion Odd/Even Gate data input method

Gate_Odd line : using the normally data input mode and put on the R, G, B date to sub-pixel R, G, B respectively.

Gate_Even line : put on the G, B, R data to sub-pixel R, G, B respectively.

7.8.3 Z-inversion data input method

The driving panel display method is that added the one sub pixel at the Gate_Even shift the data output.

01h		SWRESET (Soft Reset)																							
	D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	XXXXXXXX	0	0	0	0	0	0	0	1	01h												
Parameter	No parameter																								
Description	<p>When the Software Reset command is written, it causes software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.)</p> <p>The display is blank immediately</p> <p>Note: The Frame Memory contents is kept or not by this command.</p> <p>X = Don't care</p>																								
Restriction	<p>It will be necessary to wait 5msec before sending new command following software reset. The display module loads all display supplier factory default values to the registers during this 5msec. If Software Reset is applied during Sleep Out mode, it will be necessary to wait 120msec before sending Sleep out command. Software Reset Command cannot be sent during Sleep Out sequence.</p>

8.2.4. Read Number of the Errors on DSI (05h)

05h		RDNUMED (Read Number of the Errors on DSI)																								
		D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command		0	1	↑	XXXXXXXX	0	0	0	0	0	1	0	1	05h												
1 st Parameter		1	↑	1	XXXXXXXX	X	X	X	X	X	X	X	X	XX												
2 nd Parameter		1	↑	1	XXXXXXXX	P[7:0]								XX												
Description	The second parameter is telling a number of the errors on DSI. The more detailed description of the bits is below. P [6..0] bits are telling a number of the errors. P [7] is set to '1' if there is overflow with P[6..0] bits. P [7...0] bits are set to '0's (as well as RDDSM(0Eh)'s D0 is set '0' at the same time) after there is sent the second parameter information (= The read function is completed). This function is always returning P [7...0] = 00h if the parallel MCU interface is selected. X = can be '0' or '1'																									
Restriction	ILI9486L is sending 2nd parameter value on the data lines if the MCU wants to read more than one parameter (= more than 2 RDX cycle) on parallel MCU interface. Only 2nd parameter is sent on DSI (The 1st parameter is not sent).																									
Register Availability	<table border="1"> <thead> <tr> <th>Status</th><th>Availability</th></tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td><td>Yes</td></tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td><td>Yes</td></tr> <tr> <td>Sleep In</td><td>Yes</td></tr> </tbody> </table>														Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

8.2.12. Sleep IN (10h)

SLPIN (Sleep IN)																									
10h	D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX												
Command	0	1	↑	XXXXXXXX	0	0	0	1	0	0	0	0	10h												
Parameter	No parameter																								
Description	<p>This command causes ILI9486L to enter the minimum power consumption mode.</p> <p>In this mode e.g. the DC/DC converter is stopped, Internal oscillator is stopped, and panel scanning is stopped.</p>  <p>MCU interface and memory are still working and the memory keeps its contents.</p> <p>Dimming function does not work when there is changing mode from Sleep OUT to Sleep IN.</p> <p>X = Don't care</p>																								
Restriction	<p>This command has no effect when module is already in sleep in mode. Sleep In Mode can only be left by the Sleep Out Command (11h). It will be necessary to wait 5msec before sending next command; this is to allow time for the supply voltages and clock circuits to stabilize. It will be necessary to wait 120msec after sending Sleep Out command (when in Sleep In Mode) before Sleep In command can be sent.</p>

:	1	1	↑							Dx[15:0]				XX												
N th Parameter	1	1	↑							Dn[15:0]				XX												
Description	This command transfers image data from the host processor to ILI9486L's frame memory starting at the pixel location specified by preceding Column Address Set (2Ah) and Page Address Set (2Bh) commands. If Memory Access Control (36h) B5 = 0: The column and page registers are reset to the Start Column (SC) and Start Page (SP), respectively. Pixel Data 1 is stored in frame memory at (SC, SP). The column register is then incremented and pixels are written to the frame memory until the column register equals the End Column (EC) value. The column register is then reset to SC and the page register is incremented. Pixels are written to the frame memory until the page register equals the End Page (EP) value or the host processor sends another command. If the number of pixels exceeds (EC – SC + 1) * (EP – SP + 1) the extra pixels are ignored. If Memory Access control (36h) B5 = 1: The column and page registers are reset to the Start Column (SC) and Start Page (SP), respectively. Pixel Data 1 is stored in frame memory at (SC, SP). The page register is then incremented and pixels are written to the frame memory until the page register equals the End Page (EP) value. The page register is then reset to SP and the column register is incremented. Pixels are written to the frame memory until the column register equals the End column (EC) value or the host processor sends another command. If the number of pixels exceeds (EC – SC + 1) * (EP – SP + 1) the extra pixels are ignored.																									
Restriction	There is no restriction on length of parameters.

:	1	1	↑						Dx[15:0]				XX												
(N+1) th Parameter	1	1	↑						Dn[15:0]				XX												
Description	This command transfers image data from ILI9486L's frame memory to the host processor starting at the pixel location specified by preceding set_column_address and set_page_address commands. If Memory Access control B5 = 0: The column and page registers are reset to the Start Column (SC) and Start Page (SP), respectively. Pixels are read from frame memory at (SC, SP). The column register is then incremented and pixels read from the frame memory until the column register equals the End Column (EC) value. The column register is then reset to SC and the page register is incremented. Pixels are read from the frame memory until the page register equals the End Page (EP) value or the host processor sends another command. If Memory Access Control B5 = 1: The column and page registers are reset to the Start Column (SC) and Start Page (SP), respectively. Pixels are read from frame memory at (SC, SP). The page register is then incremented and pixels read from the frame memory until the page register equals the End Page (EP) value. The page register is then reset to SP and the column register is incremented. Pixels are read from the frame memory until the column register equals the End Column (EC) value or the host processor sends another command.																								
Restriction	There is no restriction on length of parameters.

8.2.24. Partial Area (30h)

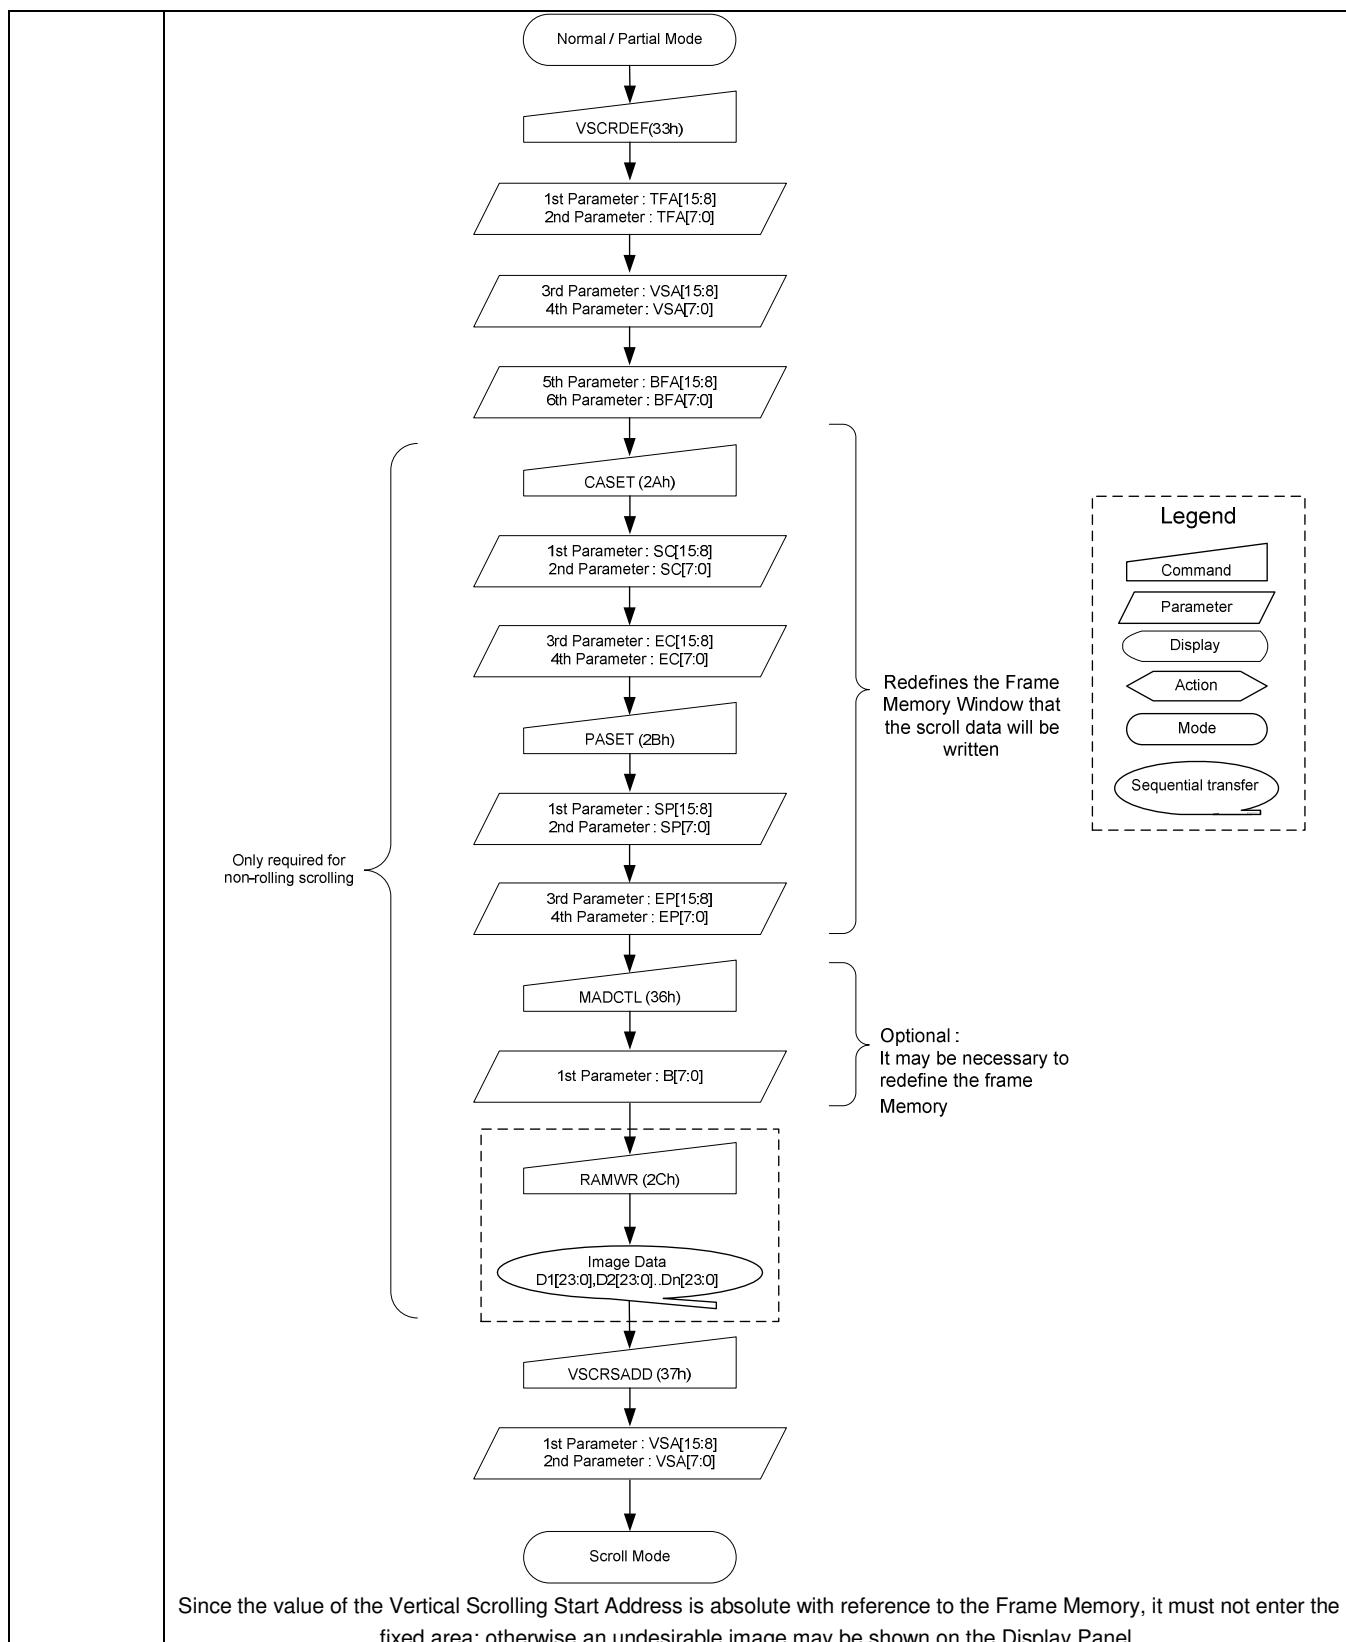

30h	PLTAR (Partial Area)												
	D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	0	1	↑	XXXXXXXX	0	0	1	1	0	0	0	0	30h
1 st Parameter	1	1	↑	XXXXXXXX					SR[15:8]				XX
2 nd Parameter	1	1	↑	XXXXXXXX					SR[7:0]				XX
3 rd Parameter	1	1	↑	XXXXXXXX					ER[15:8]				XX
4 th Parameter	1	1	↑	XXXXXXXX					ER[7:0]				XX
Description	This command defines the Partial Display mode's display area. There are two parameters associated with this command, the first defines the Start Row (SR) and the second the End Row (ER), as illustrated in the following figure. SR and ER refer to the Frame Memory If End Row>Start Row when MADCTL B4=0:-  If End Row>Start Row when MADCTL B4=1:-  If End Row<Start Row when MADCTL B4=0:-  If End Row = Start Row then the Partial Area will be one row deep. X = don't care.												
Restriction	SR[15:0] and ER[15:0] cannot be 0000h nor exceed the last vertical line number (01EFh).

5 th Parameter	1	1	↑	XXXXXXXX					BFA[15:8]				XX
6 th Parameter	1	1	↑	XXXXXXXX					BFA[7:0]				XX
Description	<p>This command defines the display vertical scrolling area.</p> <p>Memory Access Control (36h) B4 = 0: The 1st & 2nd parameter, TFA[8:0], describes the Top Fixed Area in number of lines from the top of the frame memory. The top of the frame memory and top of the display device are aligned. The 3rd & 4th parameter, VSA[8:0], describes the height of the Vertical Scrolling Area in number of lines of frame memory from the Vertical Scrolling Start Address. The first line of the Vertical Scrolling Area starts immediately after the bottom most line of the Top Fixed Area. The last line of the Vertical Scrolling Area ends immediately before the top most line of the Bottom Fixed Area.</p> <p>The 5th & 6th parameter, BFA[8:0], describes the Bottom Fixed Area in number of lines from the bottom of the frame memory. The bottom of the frame memory and bottom of the display device are aligned.</p> <p>TFA, VSA and BFA refer to the Frame Memory Line Pointer.</p> 												
	<p>Memory Access Control (36h) B4 = 1: The 1st & 2nd parameter, TFA[8:0], describes the Top Fixed Area in number of lines from the bottom of the frame memory. The bottom of the frame memory and bottom of the display device are aligned.</p> <p>The 3rd & 4th parameter, VSA[8:0], describes the height of the Vertical Scrolling Area in number of lines of frame memory from the Vertical Scrolling Start Address. The first line of the Vertical Scrolling Area starts immediately after the top most line of the Top Fixed Area. The last line of the Vertical Scrolling Area ends immediately before the bottom most line of the Bottom Fixed Area.</p> <p>The 5th & 6th parameter, BFA[8:0], describes the Bottom Fixed Area in number of lines from the top of the frame memory. The top of the frame memory and top of the display device are aligned.</p> <p>TFA, VSA and BFA refer to the Frame Memory Line Pointer.</p>												

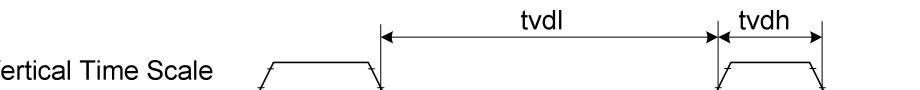

Restriction	The sum of TFA, VSA and BFA must equal the number of the display device's horizontal lines (pages), otherwise Scrolling mode is undefined. In Vertical Scroll Mode, set_address_mode B5 should be set to '0' – this only affects the Frame Memory Write.

8.2.29. Vertical Scrolling Start Address (37h)

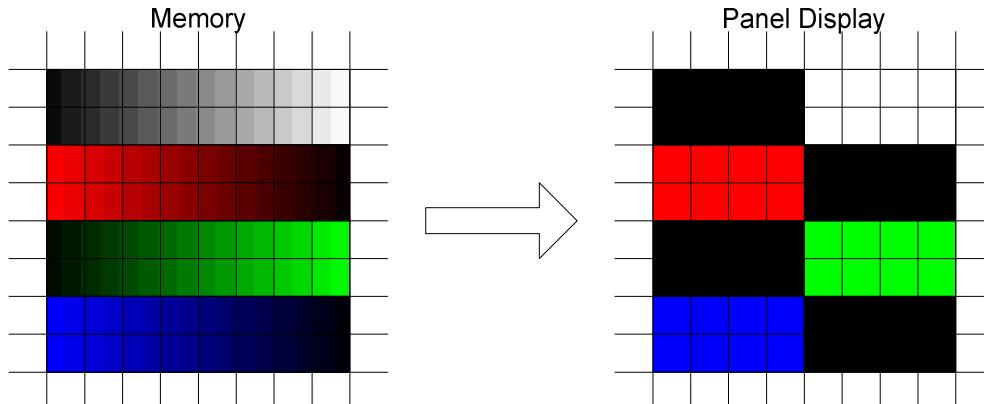

37h	VSCRSADD (Vertical Scrolling Start Address)												
	D/CX	RDX	WRX	D[15:8]	D7	D6	D5	D4	D3	D2	D1	D0	HEX
Command	0	1	↑	XXXXXXXXXX	0	0	1	1	0	1	1	1	37h
1 st Parameter	1	1	↑	XXXXXXXXXX					VSP[15:8]				XX
2 nd Parameter	1	1	↑	XXXXXXXXXX					VSP[7:0]				XX
Description	<p>This command is used together with Vertical Scrolling Definition (33h). These two commands describe the scrolling area and the scrolling mode. The Vertical Scrolling Start Address command has one parameter which describes the address of the line in the Frame Memory that will be written as the first line after the last line of the Top Fixed Area on the display as illustrated below:-</p> <p>When MADCTL B4=0</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 480 and VSP='3'.</p>												
	<p>When MADCTL B4=1</p> <p>Example:</p> <p>When Top Fixed Area = Bottom Fixed Area = 00, Vertical Scrolling Area = 480 and VSP='3'.</p>												
	<p>Notes: (1) When new Pointer position and Picture Data are sent, the result on the display will happen at the next Panel Scan to avoid tearing effect.</p> <p>VSP refers to the Frame Memory line Pointer.</p> <p>X = Don't care</p>												

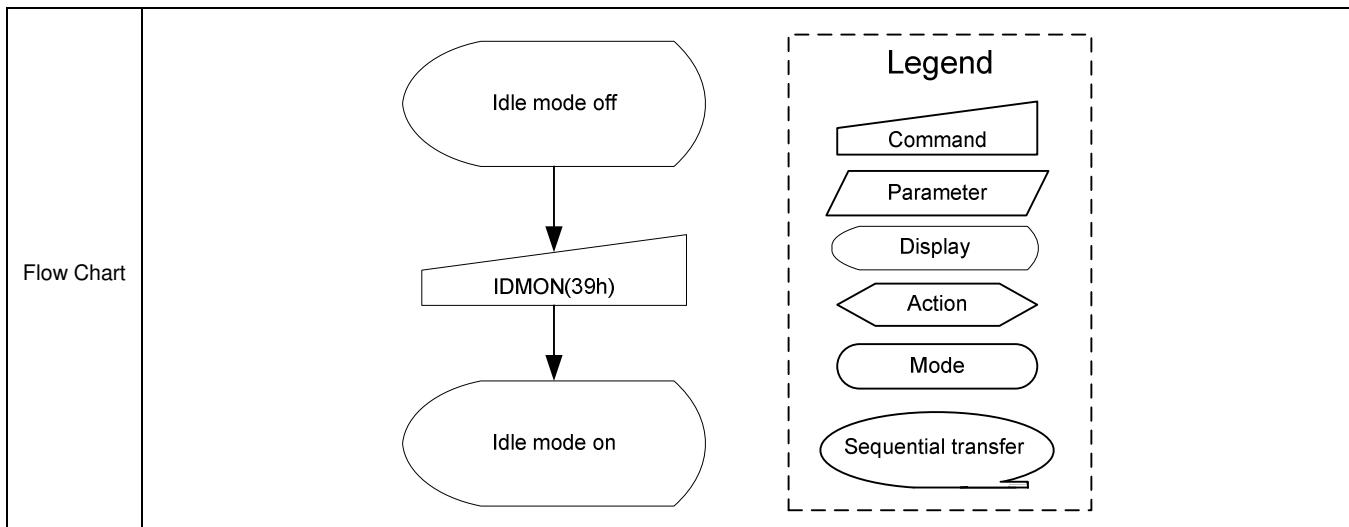

Restriction	Since the value of the Vertical Scrolling Start Address is absolute (with reference to the Frame Memory), it must not enter the fixed area (defined by Vertical Scrolling Definition (33h)) – otherwise undesirable image will be displayed on the Panel.

1 st Parameter	1	↑	1	XXXXXXXX	X	X	X	X	X	X	X	X	XX													
2 nd Parameter	1	↑	1	XXXXXXXX	DBV[7:0]								XX													
Description	This command is used to return the brightness value of the display. DBV[7:0] is reset when display is in sleep-in mode. DBV[7:0] is '0' when bit BCTRL of "Write CTRL Display (53h)" command is '0'. DBV[7:0] is manual set brightness specified with "Write CTRL Display (53h)" command when BCTRL bit is '1'. When bit BCTRL of "Write CTRL Display (53h)" command is '1' and C1/C0 bit of "Write Content Adaptive Brightness Control (55h)" command are '0', DBV[7:0] output is the brightness value specified with " Write Display Brightness (51h)" command.																									
Restriction	ILI9486L is sending 2nd parameter value on the data lines if the MCU wants to read more than one parameter (= more than 2 RDX cycle) on parallel MCU interface. Only 2nd parameter is sent on DSI (The 1st parameter is not sent).

SS: Select the shift direction of outputs from the source driver.

SS	Source Output Scan Direction
0	S1 → S960
1	S960 → S1

In addition to the shift direction, the settings for both SS and BGR bits are required to change the assignment of R, G, B dots to the source driver pins.

To assign R, G, B dots to the source driver pins from S1 to S960, set SS = 0.

To assign R, G, B dots to the source driver pins from S960 to S1, set SS = 1.

ISC[3:0]: Set the scan cycle when PTG selects interval scan in non-display area drive period. The scan cycle is defined by n frame periods, where n is an odd number from 3 to 31. The polarity of liquid crystal drive voltage from the gate driver is inverted in the same timing as the interval scan cycle.

ISC[3:0]	Scan cycle	(f _{FRAME})=60Hz
4'h0	Setting inhibited	—
4'h1	3 frames	50ms
4'h2	5 frames	84ms
4'h3	7 frames	117ms
4'h4	9 frames	150ms
4'h5	11 frames	184ms
4'h6	13 frames	217ms
4'h7	15 frames	251ms
4'h8	17 frames	284ms
4'h9	19 frames	317ms
4'hA	21 frames	351ms
4'hB	23 frames	384ms
4'hC	25 frames	418ms
4'hD	27 frames	451ms
4'hE	29 frames	484ms
4'hF	31 frames	518ms

GS: Sets the direction of scan by the gate driver.

GS	Gate Output Scan Direction
0	G1 → G480
1	G480 → G1

SM: Sets the gate driver pin arrangement in combination with the GS bit (R60h) to select the optimal scan mode for the module.

SM	GS	Scan Direction	Gate Output Sequence
0	0		G1, G2, G3, G4, ..., G476 G477, G478, G479, G480

THRES_STILL [3:0]: This parameter is used to set the ratio (percentage) of the maximum number of pixels that makes display image white (data="63) to the total of pixels by image process in STILL mode. After this parameter sets the number of pixels that makes display image white, threshold grayscale value (DTH) that makes display image white is set so that the number of the pixels set by this parameter does not change.

Description																																																				
	<i>Note1:</i> As above picture DIM1[2:0] mean DIM_MOV[2:0] or DIM_STILL[2:0] or DIM_UI[2:0] in different mode. <i>Note2:</i> As above picture DIM2[3:0] mean DIM_MIN[3:0] .																																																			
	DIM_MIN [3:0]: The parameter is used to set the imitation of minimum brightness change. If the parameter is large than the difference between target brightness and current brightness, then the brightness will not change.

9. Display Data RAM

9.1. Configuration

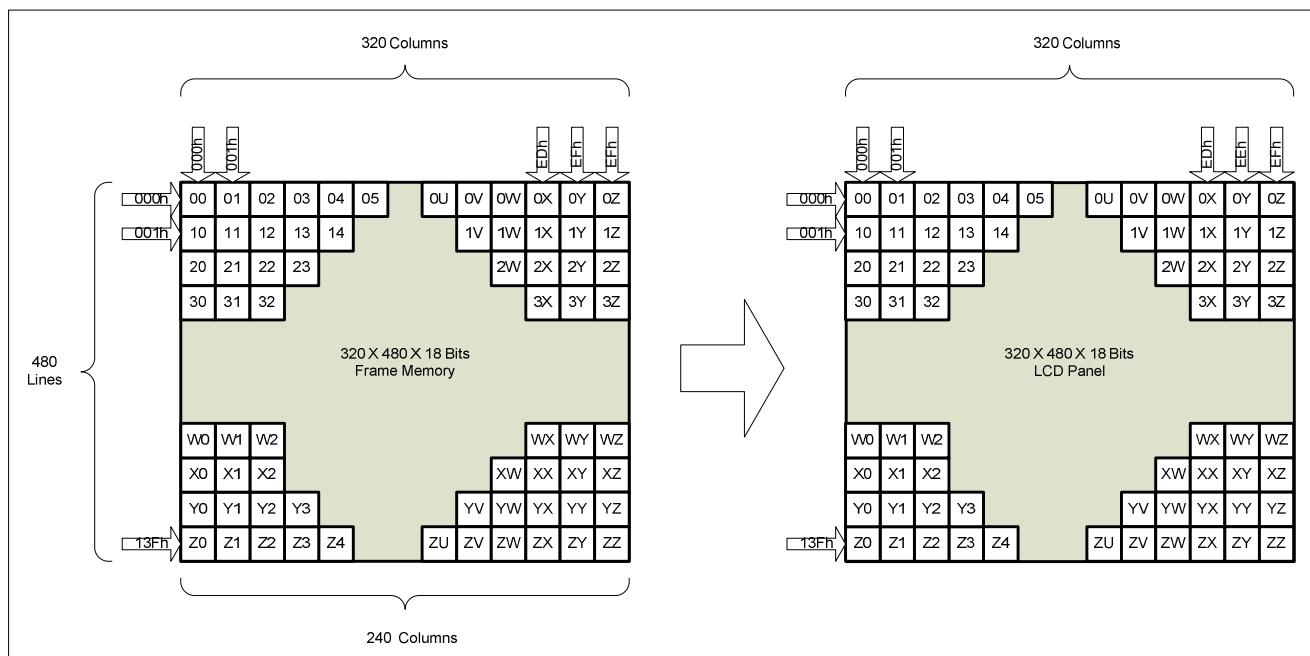

The display data RAM stores display dots and consists of 345,600 bits (320x480x18 bits). There is no restriction on access to the RAM even when the display data on the same address is loaded to DAC. There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

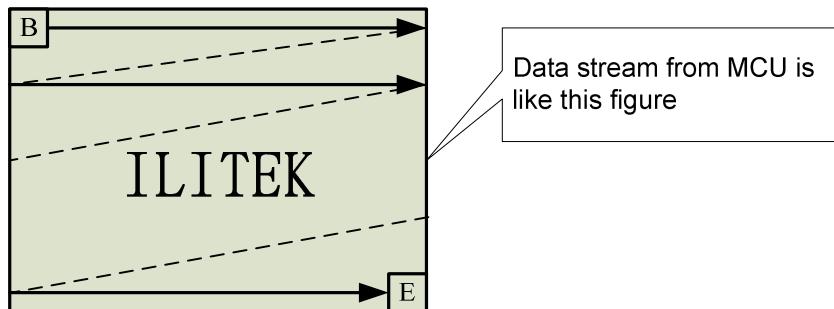

9.2. Memory to Display Address Mapping

In this mode, the content of the frame memory within an area where column pointer is 0000h to 013Fh and page pointer is 0000h to 01DFh is displayed.

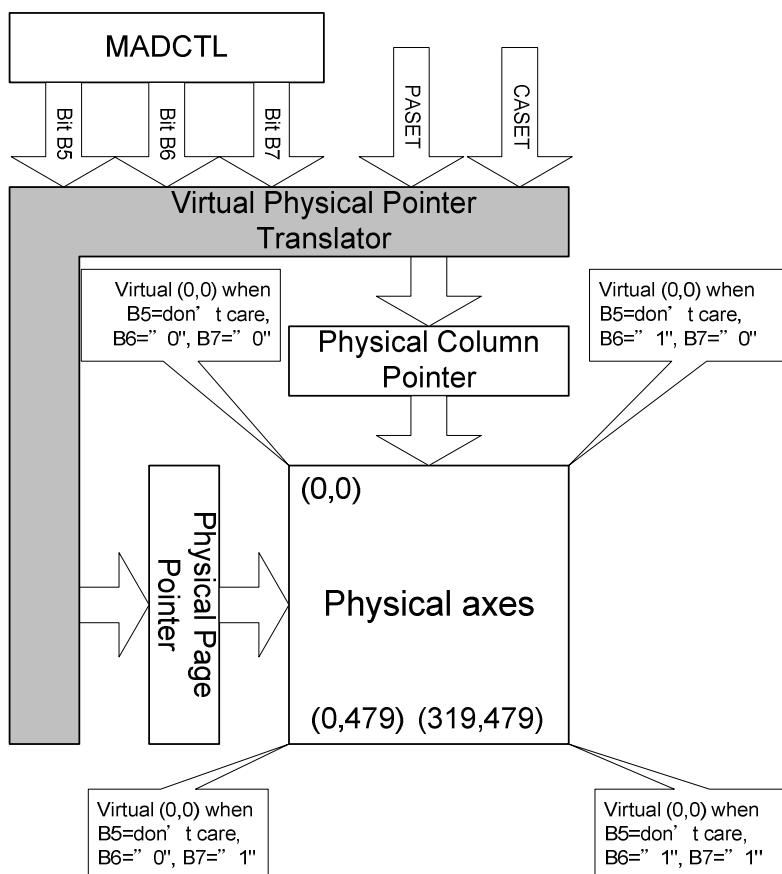

To display a dot on leftmost top corner, store the dot data at (column pointer, page pointer) = (0,0)

9.3. MCU to memory write/read direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by "Memory Data Access Control" Command, Bits B5, B6, and B7 as described below.

B5	B6	B7	CASET	PASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Page Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (479-Physical Page Pointer)
0	1	0	Direct to (319-Physical Column Pointer)	Direct to Physical Page Pointer
0	1	1	Direct to (319-Physical Column Pointer)	Direct to (479-Physical Page Pointer)
1	0	0	Direct to Physical Page Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (479-Physical Page Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Page Pointer	Direct to (319-Physical Column Pointer)
1	1	1	Direct to (479-Physical Page Pointer)	Direct to (319-Physical Column Pointer)

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

Condition	Column Counter	Page counter
When RAMWR/RAMRD command is accepted	Return to “Start column”	Return to “Start Page”
Complete Pixel Read/Write action	Increment by 1	No change
The Column values is large than “End Column”	Return to “Start column”	Increment by 1
The Page counter is large than “End Page”	Return to “Start column”	Return to “Start Page”

Note: Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7, B6 and B5.

The write order for each pixel unit is

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0

One pixel unit represents 1 column and 1 page counter value on the Frame Memory.

Display Data Direction	MADCTR Parameter			Image in the Memory (MPU)	Image in the Driver (Frame Memory)
	MV	MX	MY		
Normal	0	0	0		
Y-Mirror	0	0	1		
X-Mirror	0	1	0		
X-Mirror Y-Mirror	0	1	1		
X-Y Exchange	1	0	0		
X-Y Exchange Y-Mirror	1	0	1		
XY Exchange X-Mirror	1	1	0		
XY Exchange X-YMirror	1	1	1		

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

10. Tearing Effect Information

The Tearing Effect output supplies to the MCU a Panel synchronization information (= Tearing Effect Information) which is telling the position of the refreshing on the display panel, to the MCU which can decide when it can send image information to ILI9486L (Mainly used for a moving image e.g. video clips) that there can avoid the abnormal visual effect on the display panel of ILI9486L.

This information can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect Signal is defined by the parameter of the Tearing Effect Line Off & On commands.

This Tearing Effect information can be sent in two different ways:

- Separated Line, which is so-called Tearing Effect (TE) line.
- Bus, which is so-called Tearing Effect (TEE) Bus Trigger, when ILI9486L is sending a trigger to the MCU.

The TE line is used in MCU parallel interface. The TE line can also be used in DSI case if the tearing Effect (TEE) Bus Trigger is not possible to use. The Tearing Effect (TEE) Bus Trigger is only used in DSI case.

10.1. Tearing Effect Line

10.1.1. Tearing Effect Line Modes

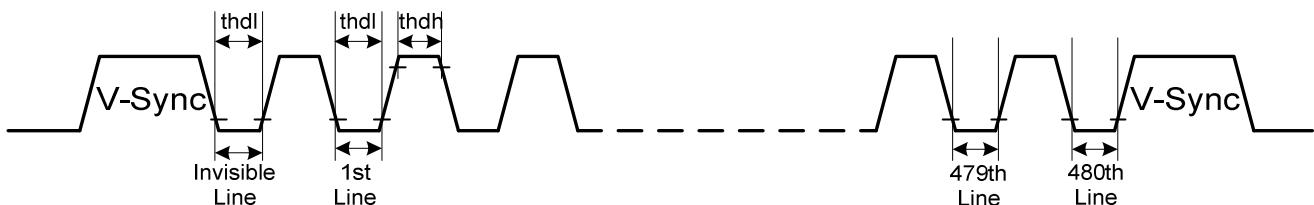

Mode 1, the Tearing Effect Output signal consists of V-Sync information only:

tvdh = The LCD display is not updated from the Frame Memory.

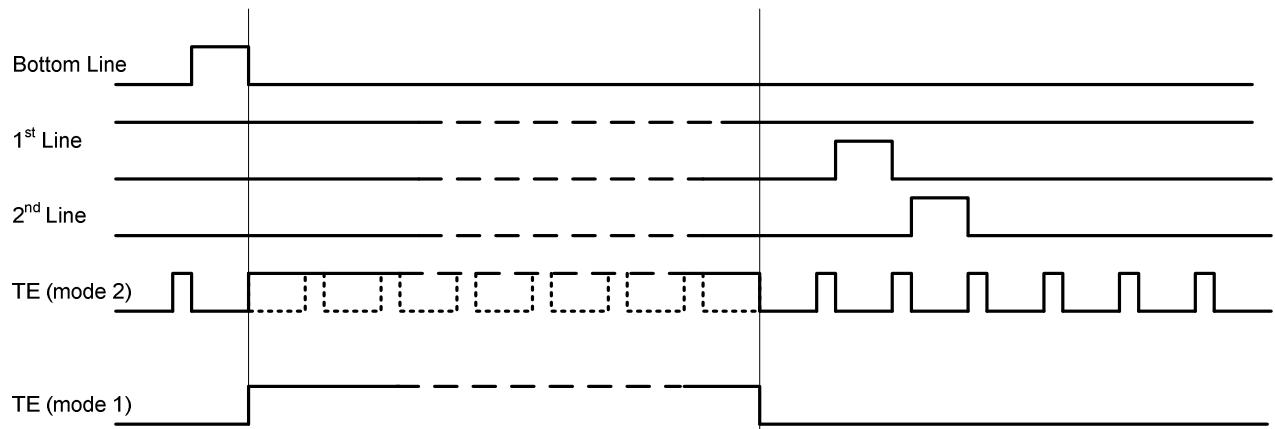

tvdl = The LCD display is updated from the Frame Memory (except Invisible Line – see below).

Mode 2, the tearing effect output signal consists of V-Sync and H-Sync information; there is one V-sync and 480 H-sync pulses per field:

thdh = The LCD display is not updated from the Frame Memory.

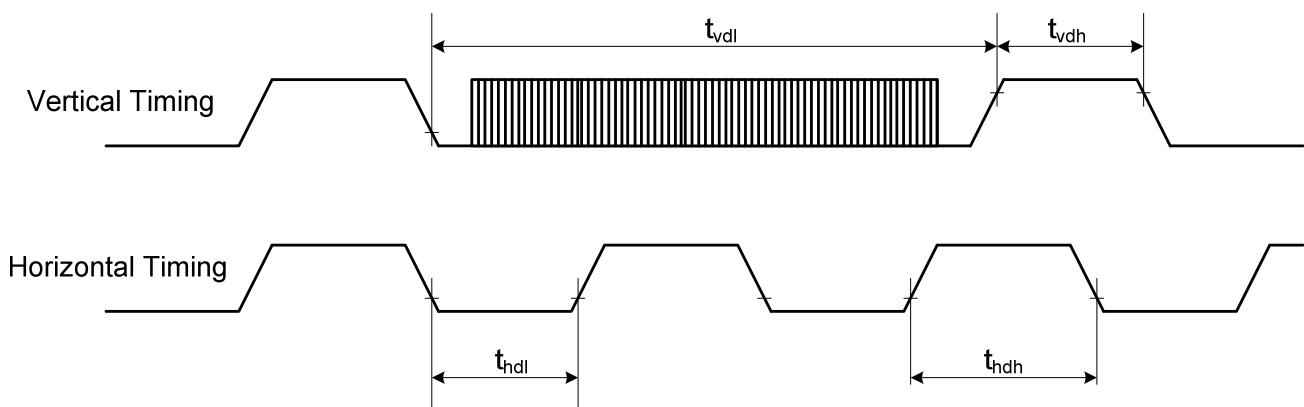

thdl = The LCD display is updated from the Frame Memory (except Invisible Line – see above).

Note: During Sleep In Mode, the Tearing Effect Output Pin is active Low.

10.1.2. Tearing Effect Line Timing

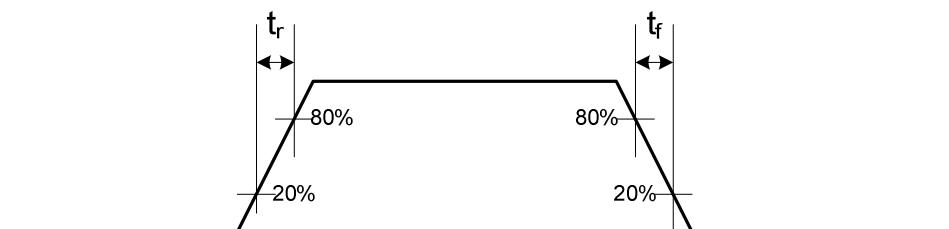

The tearing effect signal is described below:

AC characteristics of Tearing Effect Signal (Frame Rate = 60.5Hz)

Symbol	Parameter	Min.	Max.	Unit	Description
t_{vdl}	Vertical timing low duration	TBD	TBD	ms	
t_{vdh}	Vertical timing high duration	1000	TBD	us	
t_{hdl}	Horizontal timing low duration	TBD	TBD	us	
t_{hdh}	Horizontal timing high duration	TBD	500	us	

- Notes: 1. The timings in Table as above apply when MADCTL B4=0 and B4=1
 2. Minimum frequency of the TE-line can not be less than 25Hz when the TE-line is active on Mode 1.
 3. The signal's rise and fall times (t_f , t_r) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MCU and should be used to avoid Tearing Effect.

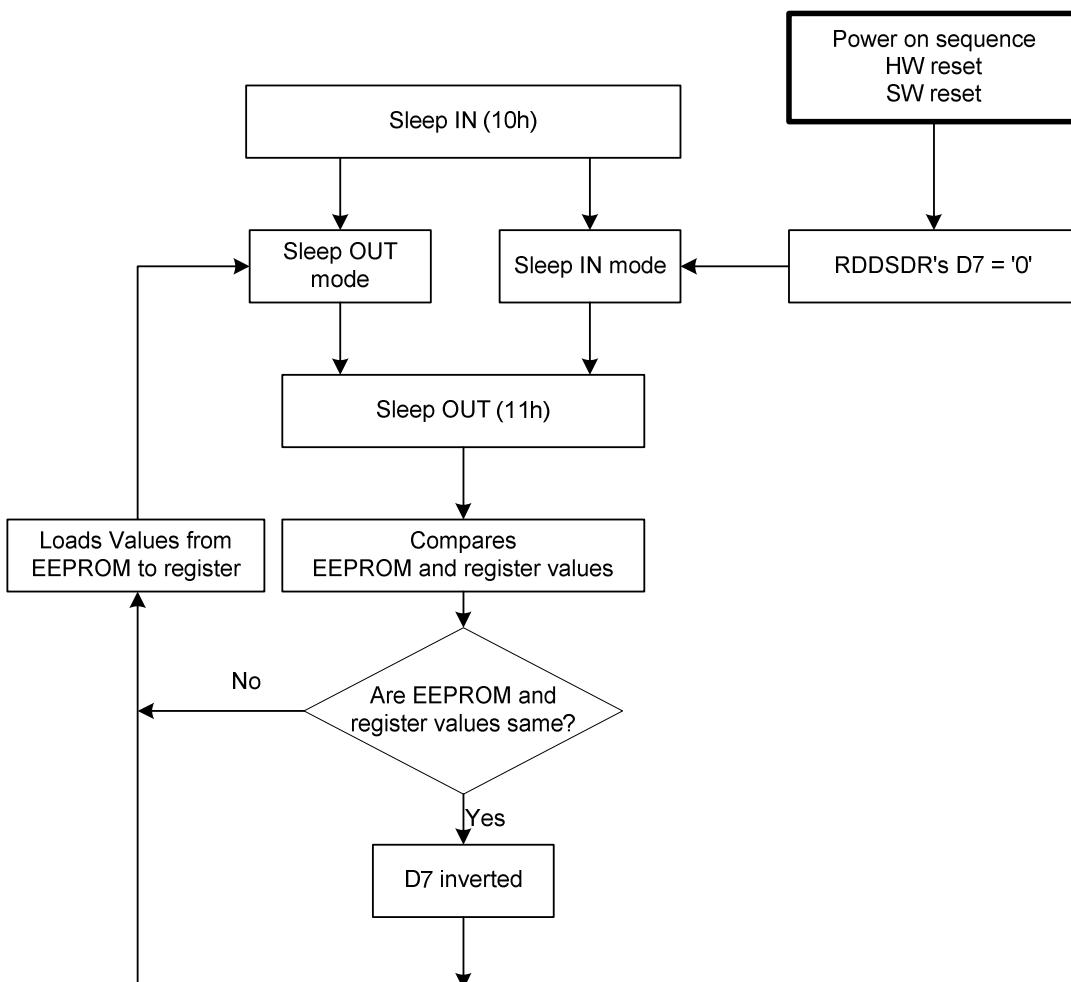

11. Sleep Out – Command and Self-Diagnostic Functions

11.1. Register loading Detection

Sleep Out-command (Command "Sleep Out (11h)") is a trigger for an internal function of ILI9486L, which indicates, if ILI9486L loading function of factory default values from EEPROM (or similar device) to registers of the display controller is working properly.

There are compared factory values of the EEPROM and register values of the display controller by the display controller (1st step: compares register and EEPROM values, 2nd step: loads EEPROM values to registers). If those both values (EEPROM and register values) are same, there is inverted (= increased by 1) a bit, which is defined in command "Read Display Self-Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= not increased by 1).

The flow chart for this internal function is following:

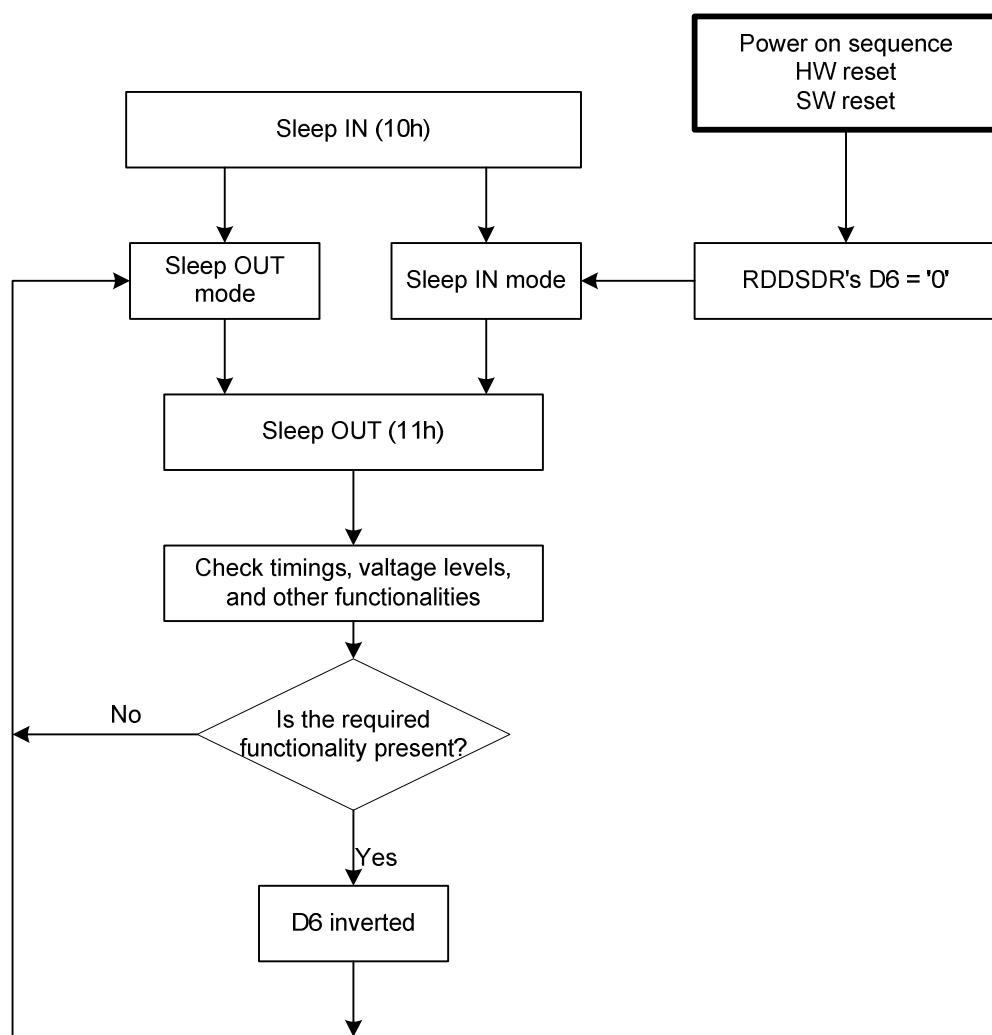

Note 1: There is not compared and loaded register values, which can be changed by User (User area commands: 00h to AFh and DAh to DDh), by ILI9486L.

11.2. Functionality Detection

Sleep Out-command (Command “Sleep Out (11h)”) is a trigger for an internal function of ILI9486L, which indicates, if ILI9486L is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if ILI9486L is still meeting functionality requirements (e.g. booster voltage levels, timings, etc.) If functionality requirement is met, there is an inverted (= increased by 1) bit, which defined in command “Read Display Self-Diagnostic Result (0Fh)” (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1). The flow chart for this internal function is shown as below.

The flow chart for this internal function is following:

Note 1: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In –mode to Sleep Out -mode, before there is possible to check if User's functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out –command is sent in Sleep Out -mode.

12. Power ON/OFF Sequence

IOVCC and VCI can be applied in any order. VCI and IOVCC can be powered down in any order. During power off, if LCD is in the Sleep Out mode, VCI and IOVCC must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, IOVCC or VCI can be powered down minimum 0msec after RESX has been released.

Note 1: There will be no damage to ILI9486L if the power sequences are not met.

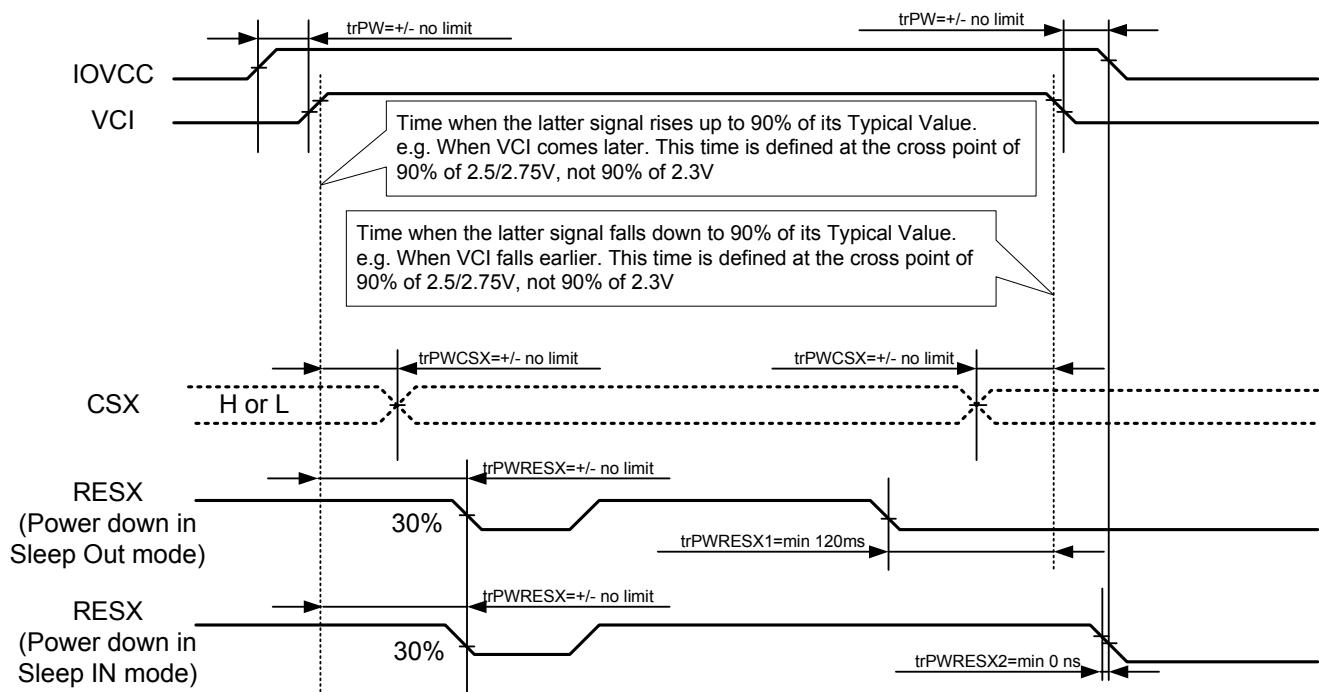

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

Note 4: If RESX line is not held stable by host during Power On Sequence as defined in Sections 12.1 and 12.2, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

12.1. Case 1 – RESX line is held High or Unstable by Host at Power ON

If RESX line is held High or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

trPWRESX1 is applied to RESX falling in the Sleep Out Mode
trPWRESX2 is applied to RESX falling in the Sleep In Mode

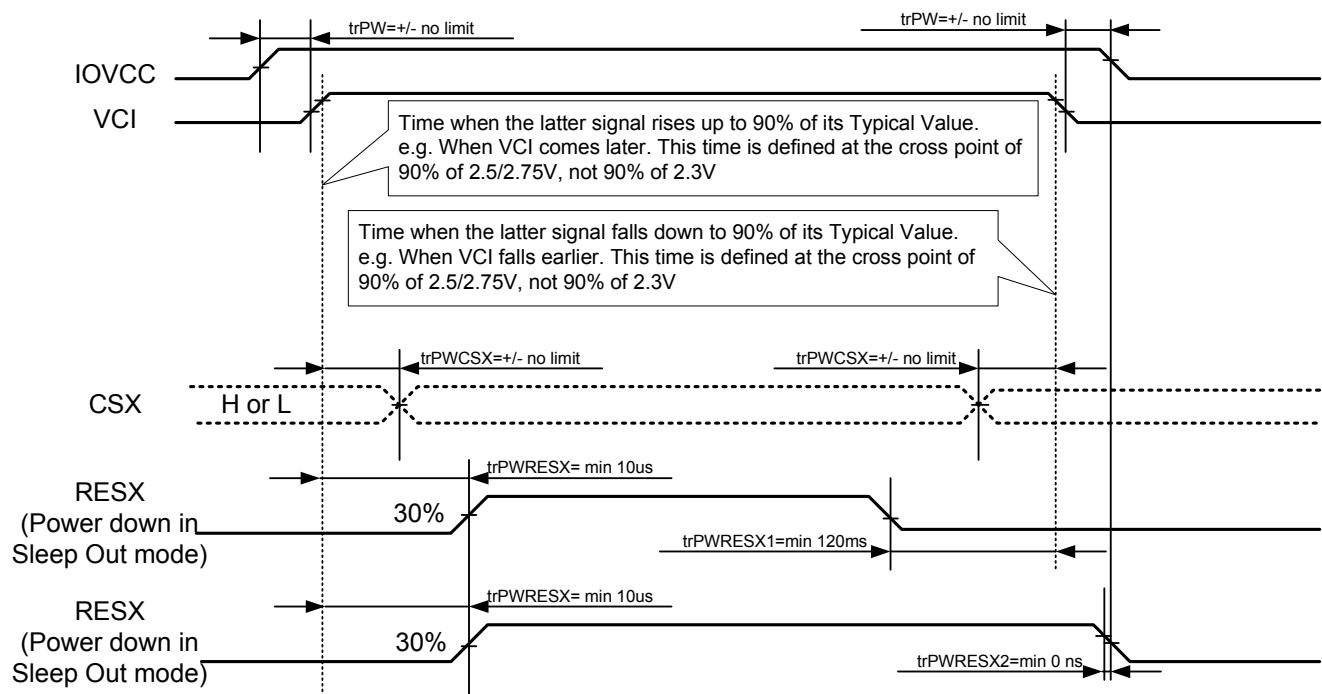

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal power level.

12.2. Case 2 – RESX line is held Low by Host at Power ON

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

10μsec after both VCI and IOVCC have been applied.

trPWRESX1 is applied to RESX falling in the Sleep Out Mode
trPWRESX2 is applied to RESX falling in the Sleep In Mode

Note 1: Unless otherwise specified, timings herein show cross point at 50% of signal power level.

12.3. Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for ILI9486L or ILI9486L will not cause any damages for the host or lines of the interface. At an uncontrolled power off event, ILI9486L will force the display to blank and will not be any abnormal visible effects within 1 second on the display and remains blank until "Power On Sequence" powers it up.

13. Power Level Definition

13.1. Power Levels

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode.

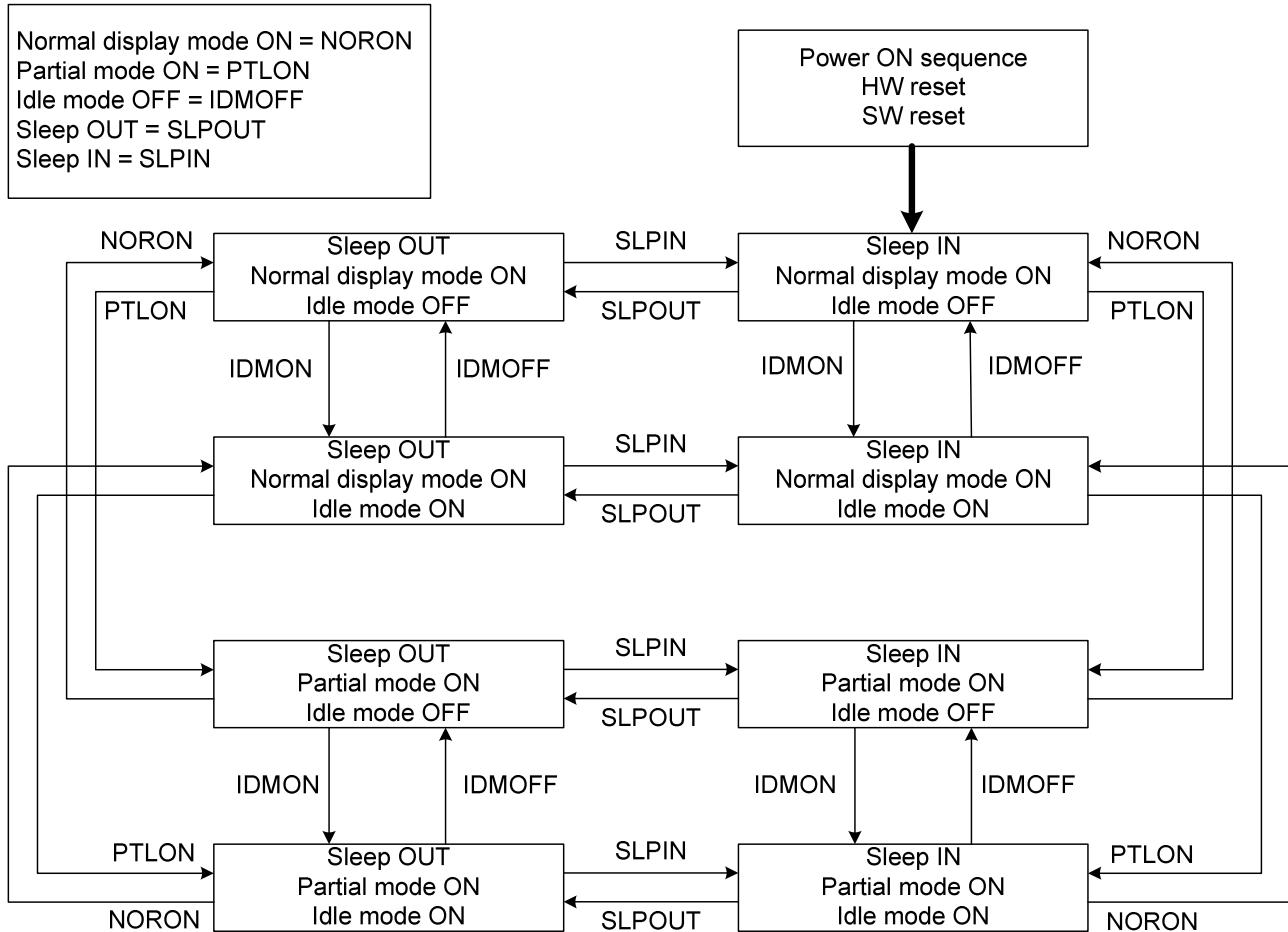

In this mode, the DC:DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with IOVCC power supply. Contents of the memory are safe.

6. Power Off Mode.

In this mode, both VCI and IOVCC are removed.

Note1: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

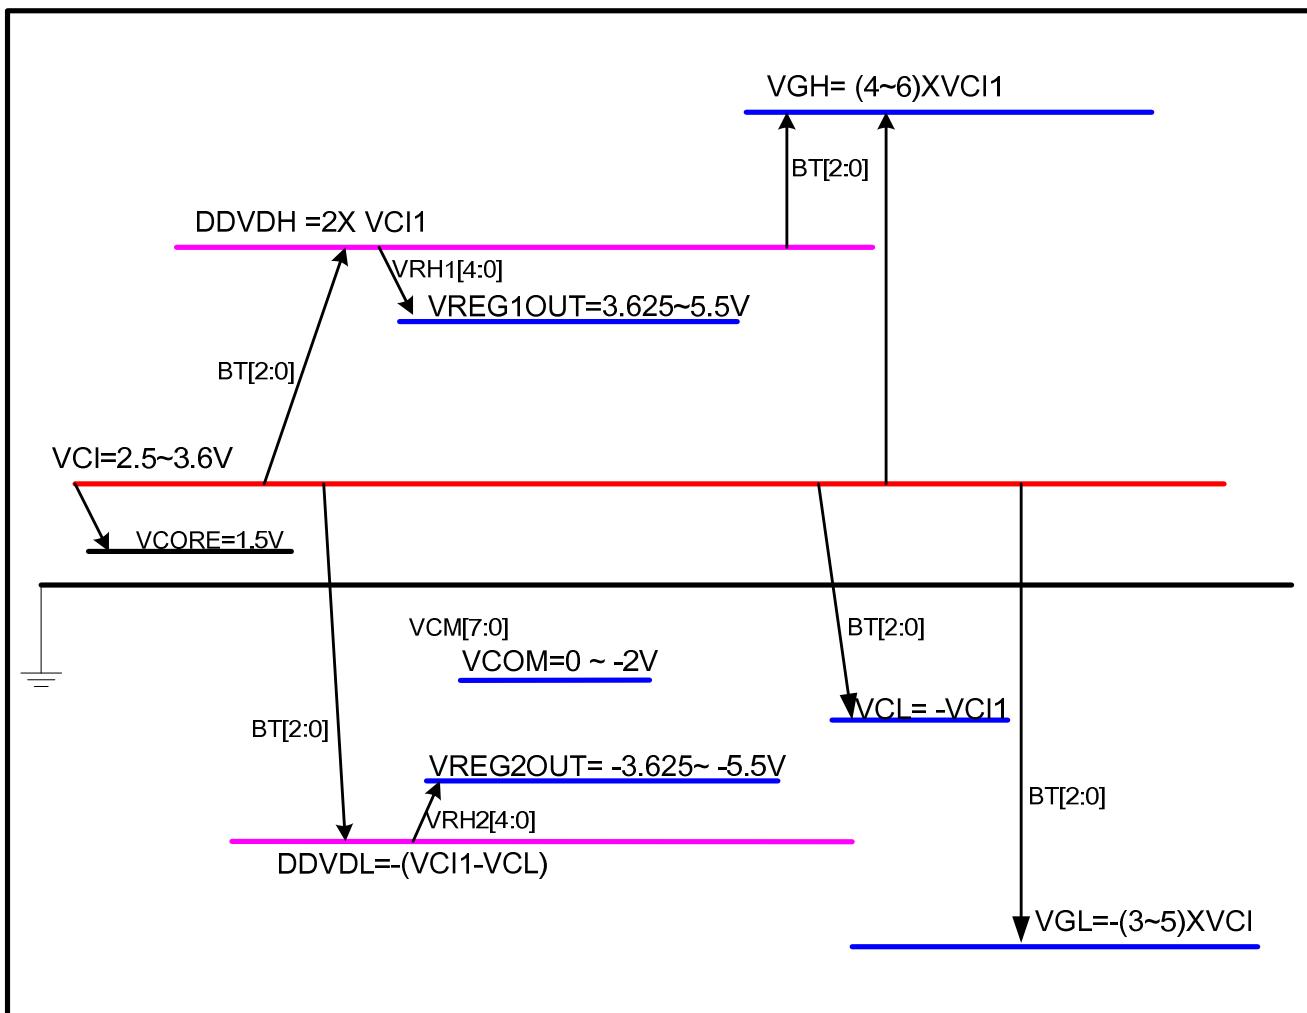

13.2. Power Flow Chart

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by User, when there is changing from one power mode to another power mode.

13.3. LCM Voltage Generation

14. Reset

14.1. Registers

The registers that are initialized are listed as below:

Register	After Powered ON	After Hardware Reset	After Software Reset
Frame Memory	Random	Random	Random
Sleep	In	In	In
Display Mode	Normal	Normal	Normal
Display Status	Display Off	Display Off	Display Off
Idle Mode	Off	Off	Off
Column Start Address	0000 h	0000 h	0000 h
Column End Address	013F h	013F h	013F h
Page Start Address	0000 h	0000 h	0000 h
Page End Address	01F h	013F h	013F h
Gamma Setting	GC0	GC0	GC0
Partial Area Start	0000 h	0000 h	0000 h
Partial Area End	01DF h	01DF h	01DF h
Memory Data Access Control	00 h	00 h	00h
RDNUMED	00 h	00 h	00h
RDDPM	08 h	08 h	08 h
RDDMADCTL	00 h	00 h	00 h
RDDCOLMOD	07 h	07 h	07 h
RDDIM	00 h	00 h	00 h
RDDSM	00 h	00 h	00 h
RDDSDR	00 h	00 h	00 h
RDDISBV	00 h	00 h	00 h
RDCTRLD	00 h	00 h	00 h
RDCABC	00 h	00 h	00 h
RDCABCMB	00 h	00 h	00 h
TE Output Line	Off	Off	Off
TE Line Mode	Mode 1 (Note 3)	Mode 1 (Note 3)	Mode 1 (Note 3)

Note 1: There will be no abnormal visible effects on the display when S/W or H/W Resets are applied.

Note 2: After Powered-On Reset finishes within 10μs after both VCI & IOVCC are applied.

Note 3: Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

14.2. Output Pins, I/O Pins

	After Power ON	After Hardware Reset	After Software Reset
TE line	Low	Low	Low
DB[17:0] (output driver), SDA	Hi-Z (Inactive)	Hi-Z (Inactive)	Hi-Z (Inactive)

Note 1: There will be no output from DB[17:0] during Power ON/OFF sequence, hardware reset and software reset.

14.3. Input Pins

	During Power ON Process	After Power ON	After Hardware Reset	After Software Reset	During Power OFF Process
RESX	See Chapter 12	Input valid	Input valid	Input valid	See Chapter 12
CSX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D/CX	Input invalid	Input valid	Input valid	Input valid	Input invalid
WRX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RDX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RWX	Input invalid	Input valid	Input valid	Input valid	Input invalid
SCL	Input invalid	Input valid	Input valid	Input valid	Input invalid
DB[17:0] (input driver), SDA	Input invalid	Input valid	Input valid	Input valid	Input invalid

14.4. Reset Timing

Signal	Symbol	Parameter	Min	Max	Unit
RESX	t_{RW}	Reset pulse duration	10		uS
	t_{RT}	Reset cancel		5 (note 1,5)	mS
				120 (note 1,6,7)	mS

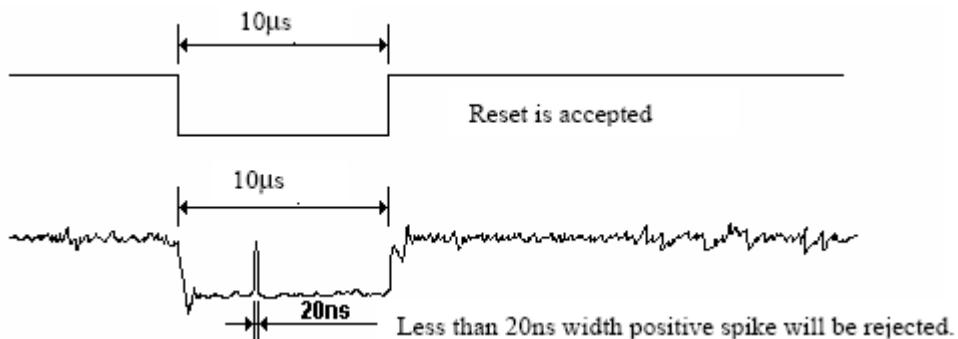

Note 1: The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from EEPROM to registers. This loading is done every time when there is HW reset cancel time (t_{RT}) within 5 ms after a rising edge of RESX.

Note 2: Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 9us	Reset
Between 5us and 9us	Reset starts

Note 3: During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out -mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.

Note 4: Spike Rejection also applies during a valid reset pulse as shown below:

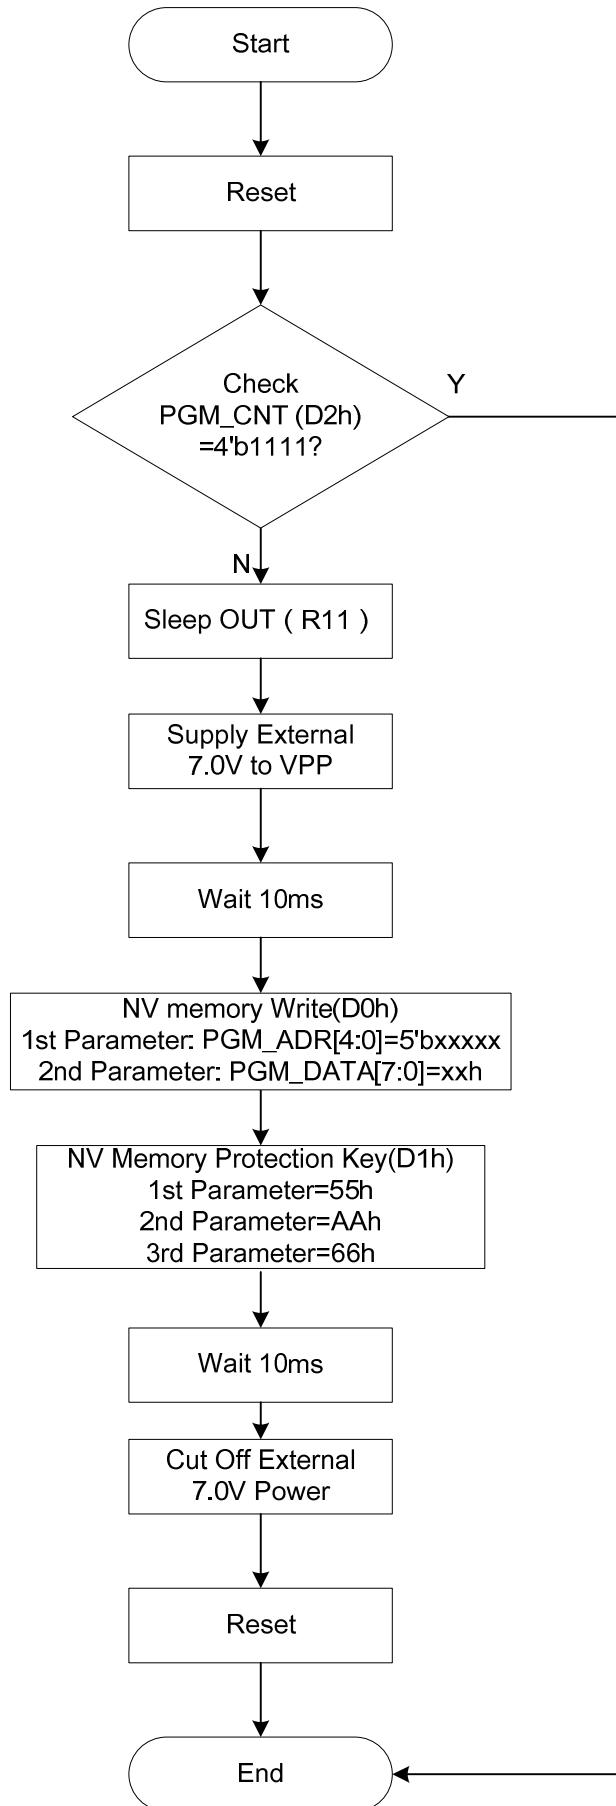

Note 5: When Reset applied during Sleep In Mode.

Note 6: When Reset applied during Sleep Out Mode.

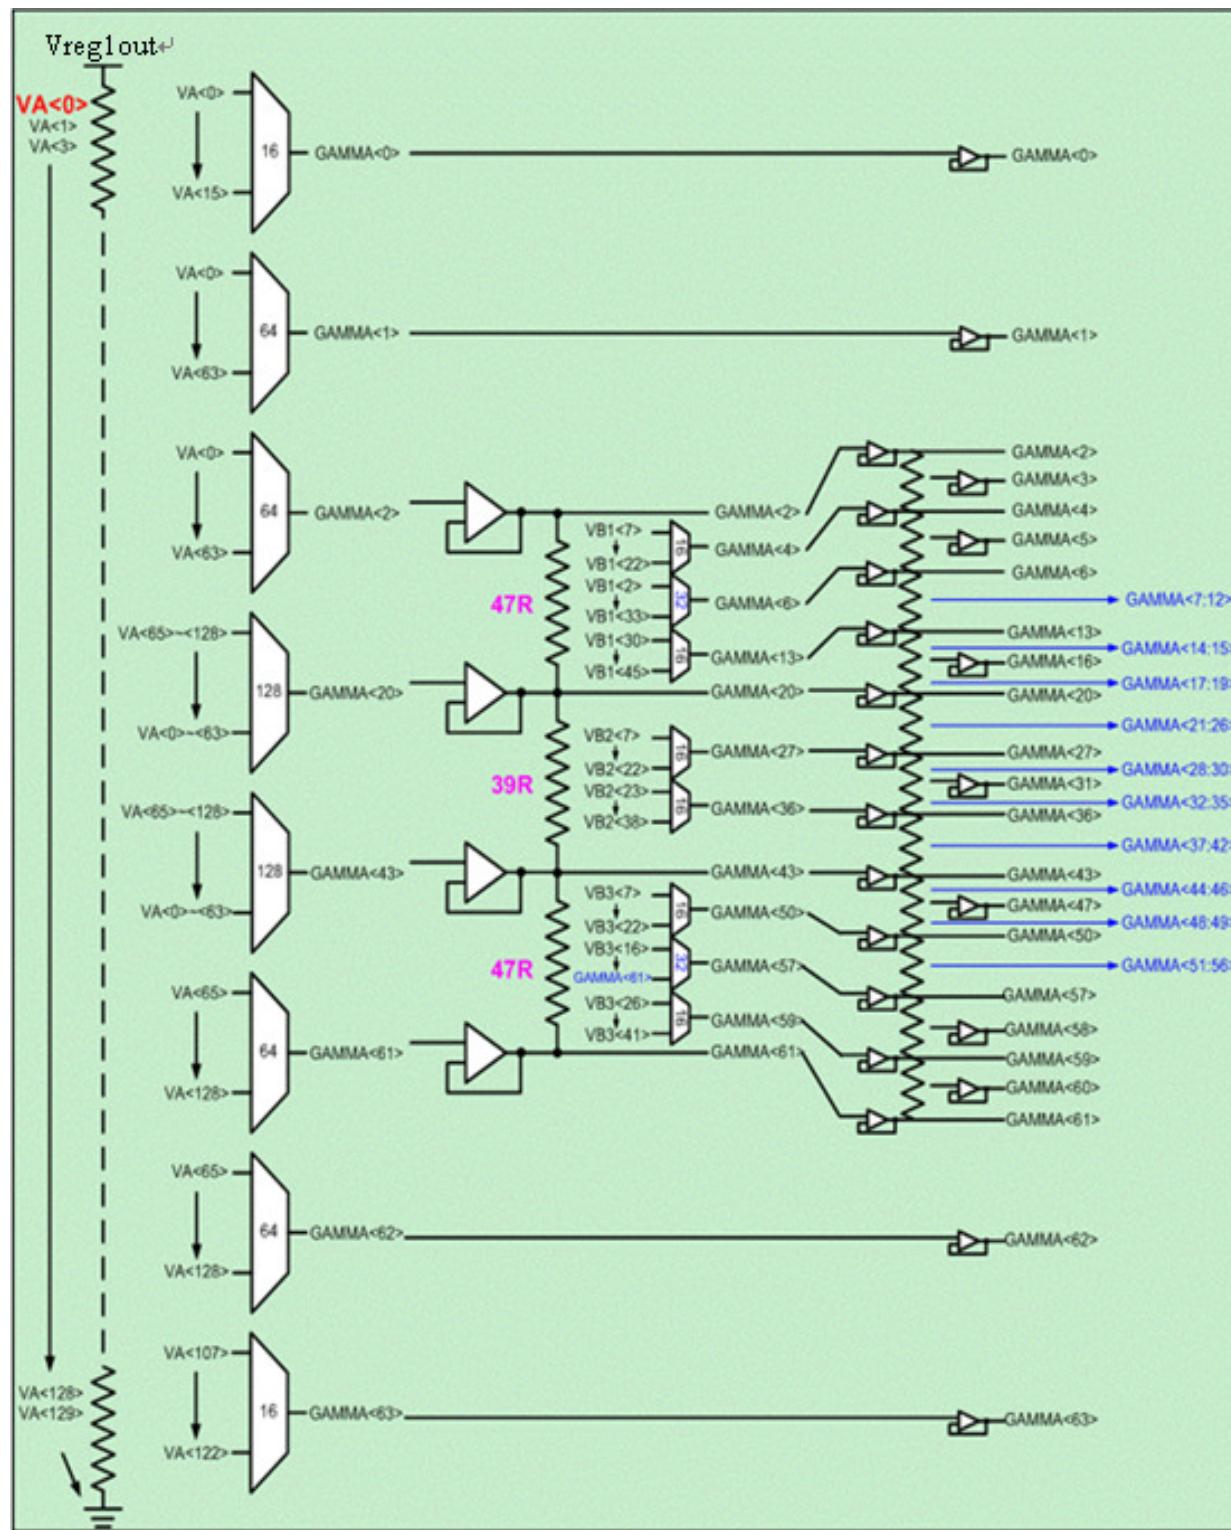

Note 7: It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

15. NV Memory Programming Flow

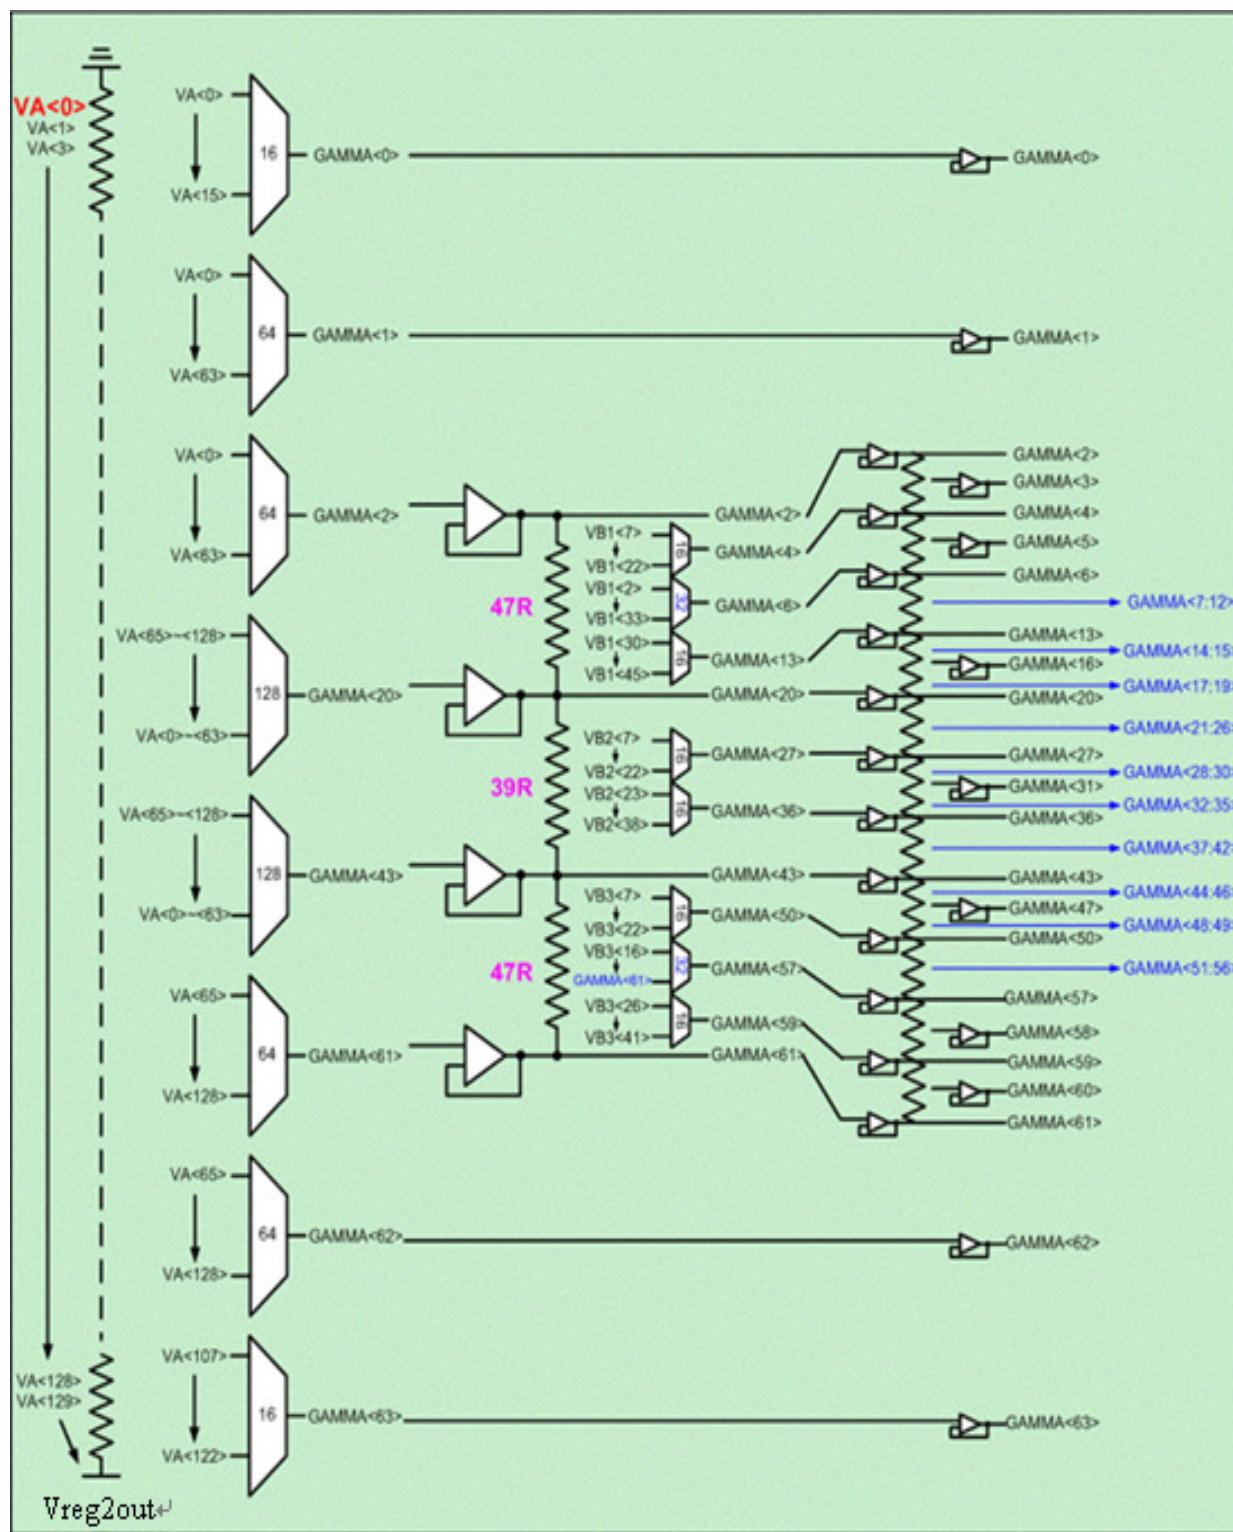

16. Gamma Correction

Positive Gamma Control (E0h)

Negative Gamma Control (E1h)

17. Electrical Characteristics

17.1. Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When ILI9486L is used out of the absolute maximum ratings, ILI9486L may be permanently damaged. To use ILI9486L within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, ILI9486 will malfunction and cause poor reliability.

Item	Symbol	Unit	Value
Supply voltage	VCI	V	-0.3 ~ +5.0
Supply voltage (Logic)	IOVCC	V	-0.3 ~ +4.6
Supply voltage (Digital)	VCORE	V	-0.3 ~ +2.4
Driver supply voltage	VGH-VGL	V	-0.3 ~ +33.0
Logic input voltage range	VIN	V	-0.3 ~ IOVCC + 0.3
Logic output voltage range	VOUT	V	-0.3 ~ IOVCC + 0.3
Operating temperature	Topr	°C	-40 ~ +85
Storage temperature	Tstg	°C	-55 ~ +110

Notes:If the absolute maximum rating of even is one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

17.2. DC Characteristics

DSI is using different state codes which are depending on DC voltage levels of the clock and data lanes. The meaning of the state codes is defined on the following table.

State Code	Line DC Voltage Levels	
	CLOCK_P or DATA_N	CLOCK_N or DATA_P
HS-0	Low (HS)	High (HS)
HS-1	High (HS)	Low (HS)
LP-00	Low (LP)	Low (LP)
LP-01	Low (LP)	High (LP)
LP-10	High (LP)	Low (LP)
LP-11	High (LP)	Low (LP)

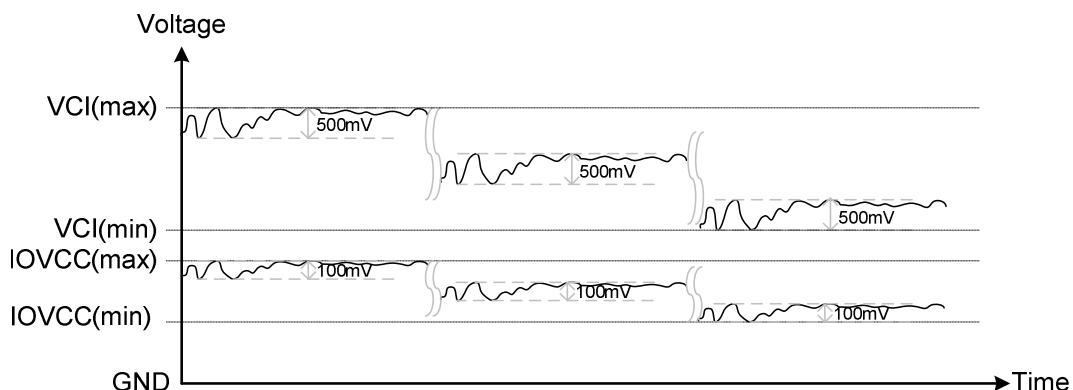

Note: $T_a = -30^\circ C$ to $70^\circ C$ (to $+85^\circ C$ no damage)

17.2.1. DC characteristics for Power Lines

Parameter	Symbol	Condition	Specification			Unit
			Min.	Typ.	Max.	
Analog power supply voltage	V_{CI}	Operating voltage	2.5	3.7	4.8	V
Digital power supply voltage	V_{IOVCC}	I/O supply voltage	1.65	1.8	1.95	V
Analog power supply voltage noise	V_{CI_NOISE}	Noise window, 0 to 100MHz	-	-	500	mV
Digital power supply voltage noise	V_{IOVCC_NOISE}	Noise window, 0 to 100MHz	-	-	500	mV

Note 1: $T_a = -30^\circ C$ to $70^\circ C$ (to $+85^\circ C$ no damage)

Note 2: These values are not symmetric amplitude, which centre points are IOVCC or VCI. See examples as reference purposes, when VCI_NOISE and $IOVCC_NOISE$ are maximums, below.

17.2.2. DC characteristics for DSI LP mode

DC levels of the LP-00, LP-01, LP-10 and LP-11 are defined on table below: DC Characteristics for DSI LP mode when LP-RX, LP-CD or LP-TX is mentioned on the condition column. Other logical levels of the table are for MCU interface.

Parameter	Symbol	Condition	Specification			Unit
Logic High level output voltage	V_{OH}	$I_{OUT}=-1mA$; Note 2	0.8 V_{IOVCC}	-	V_{IOVCC}	V
Logic Low level output voltage	V_{OL}	$I_{OUT}=-1mA$; Note 2	0.0	-	0.2 V_{IOVCC}	V
Logic High level input voltage	V_{IHLPCD}	LP-CD ; Note 3	450	-	1350	mV
Logic Low level input voltage	V_{ILLPCD}	LP-CD ; Note 3	0.0	-	200	mV
Logic High level input voltage	V_{IHLPRX}	LP-RX (CLOCK, DATA) ; Note 3	880	-	1350	mV
Logic Low level input voltage	V_{ILLPRX}	LP-RX (CLOCK, DATA) ; Note 3	0.0	-	550	mV
Logic Low level input voltage	$V_{ILLPRXULP}$	LP-RX (CLOCK ULP mode), Note 3	0.0	-	300	mV
Logic high level output voltage	V_{OHLPTX}	LP-TX (DATA), Note 3	1.1	-	1.3	V
Logic Low level output voltage	V_{OLLPTX}	LP-TX (DATA), Note 3	-50	-	50	mV
Logic High level input current	I_{IH}	LP-CD, LP-RX, Note 3	-	-	10	uA
Logic Low level input current	I_{IL}	LP-CD, LP-RX, Note 3	-10	-	-	uA

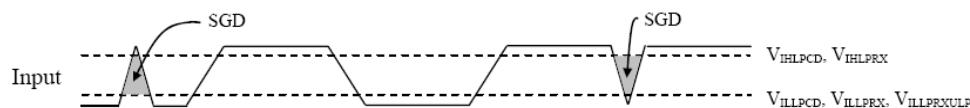

Note: (1) $T_a = -30^\circ C$ to $70^\circ C$ (to $+85^\circ C$ no damage)

(2) PWM_OUT, TE

(3) DSI High Speed mode is off

17.2.3. Spike / Glitch Rejection

Spike / Glitch Rejection – DSI						
Signal	Symbol	Parameter	Min	Max	Unit	
Input (DSI-CLOCK_P/N, DSI-CLOCK_P/N)	SGD	Input pulse rejection for DSI	--	300	Vps	

17.2.4. DC Characteristics for DSI HS mode

DC levels of the HS-0 and HS-1 are defined on table below: DC Characteristics for DSI HS mode.

Parameter	Symbol	Condition	Specification			Unit
Input Common Mode Voltage for Clock	V_{CMCLK}	DSI-CLOCK_P/N ; Note 2,3	70	-	330	mV
Input Common Mode Voltage for Data	V_{CMDATA}	DSI-DATA_P/N ; Note 2,3	70	-	330	mV
Common Mode Ripple for Clock Equal or Less than 450MHz	$V_{CMRCLKL450}$	DSI-CLOCK_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Data Equal or Less than 450MHz	$V_{CMRDATL450}$	DSI-DATA_P/N ; Note 4	-50	-	50	mV
Common Mode Ripple for Clock More than 450MHz (peak sine wave)	$V_{CMRCLKM450}$	DSI-CLOCK_P/N	-	-	100	mV
Common Mode Ripple for Data More than 450MHz (peak sine wave)	$V_{CMRDATM450}$	DSI-DATA_P/N	-	-	100	mV
Differential Input Low Level Threshold Voltage for Clock	V_{THCLK-}	DSI-CLOCK_P/N	-70	-	-	mV
Differential Input Low Level Threshold Voltage for Data	$V_{THDATA-}$	DSI-DATA_P/N	-70	-	-	mV
Differential Input High Level Threshold Voltage for Clock	$V_{THHCLK+}$	DSI-CLOCK_P/N	-	-	70	mV
Differential Input High Level Threshold Voltage for Data	$V_{THHDATA+}$	DSI-DATA_P/N	-	-	70	mV
Single-ended Input Low Voltage	V_{ILHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-40	-	-	mV
Single-ended Input High Voltage	V_{IHHS}	DSI-CLOCK_P/N, DSI-DATA_P/N ; Note 3	-	-	460	mV
Differential Termination Resistor	R_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	80	100	125	Ω
Single-ended Threshold Voltage for Termination Enable	$V_{TERM-EN}$	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	450	mV
Termination Capacitor	C_{TERM}	DSI-CLOCK_P/N, DSI-DATA_P/N	-	-	14	pF

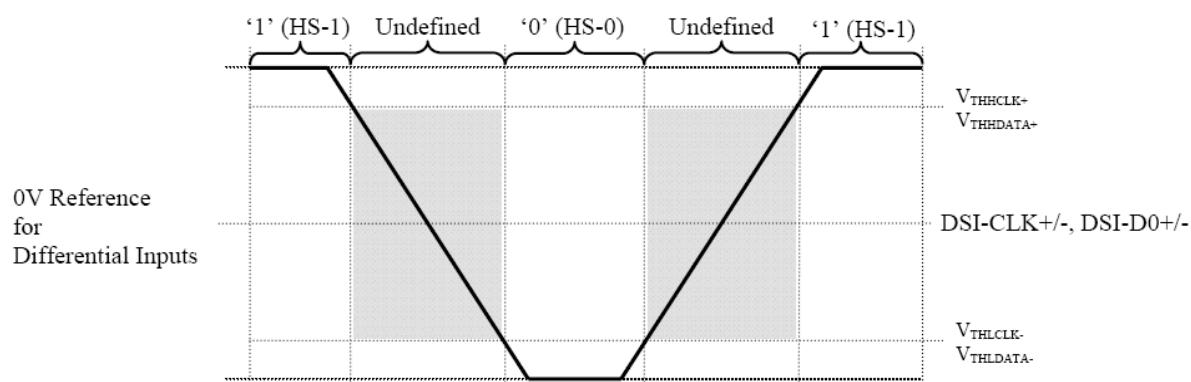

Note: (1) $T_a = -30$ to 70 °C (to $+85$ °C no damage), $IOVCC = 1.65$ to $1.95V$, $GND = 0V$

(2) Includes 50mV (-50mV to 50mV) ground difference

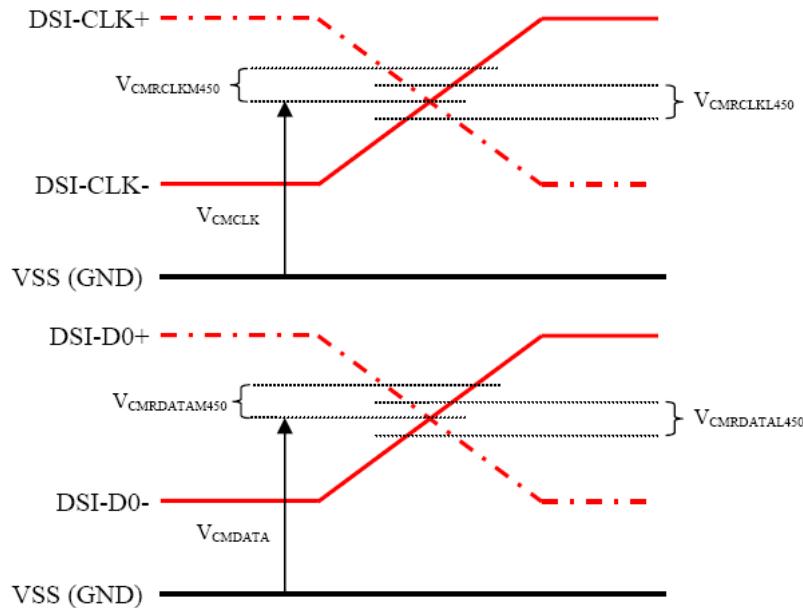

(3) Without $VCMRCLKM450/VCMRDATM450$

(4) Without 50mV (-50mV to 50mV) ground difference

The DSI receiver (HS mode) is understanding that there is logical '1' (HS-1) when a differential voltage is more than $VTHH$ (CLK+/DATA+) and the DSI receiver (HS mode) is understanding that there is logical '0' (HS-0) when a differential voltage is more than $VTHL$ (CLK-/DATA-). There is undefined state if the differential voltage is less than $VTHH$ (CLK+/DATA+) and less than $VTHL$ (CLK-/DATA-). A reference figure is below.

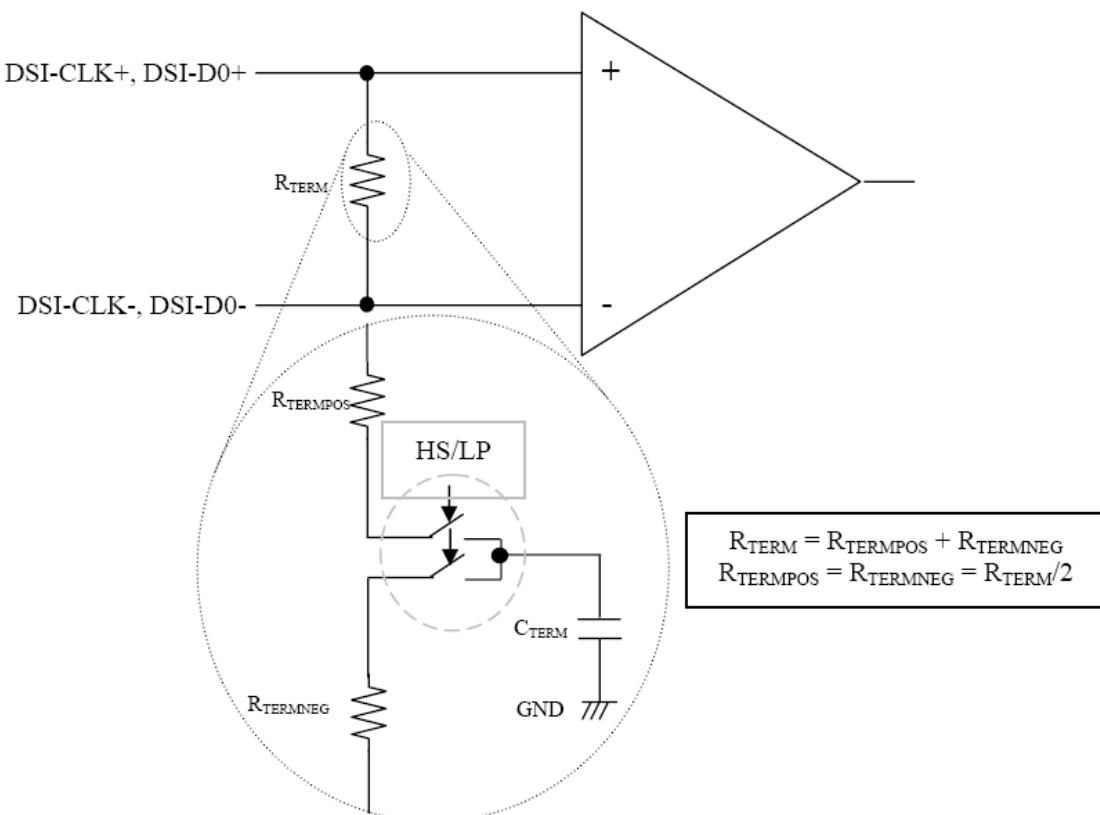

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

The termination resistor (RTERM) of the differential DSI receiver can be driven two different states by the receiver:

- Low Power (LP) mode when the termination resistor is not connected between differential inputs
 $DSI-CLK+ <=> DSI-CLK-$ or $DSI-D0+ <=> DSI-D0-$)
- High Speed (HS) mode when the termination resistor is connected between differential inputs
 $(DSI-CLK+ <=> DSI-CLK-$ or $DSI-D0+ <=> DSI-D0-$)

The termination switch (HS/LP), when the termination resistor is not connected, is illustrated below.

17.2.5. DC Characteristics for Panel Driving

Item	Symbol	Condition	Min.	Typ.	Max.	Unit	Note
Power & Operation Voltage							
Analog operating voltage	VCI	-	2.5	2.8	3.6	V	
Logic operating voltage	IOVCC	-	1.65	2.8	3.6	V	
Digital operating voltage	VCORE	Digital block power supply	-	1.5	-	V	Note2
Gate Driver High Voltage	VGH	-	10.0	-	16.0	V	Note3
Gate Driver Low Voltage	VGL	-	-16.0	-	-9.0	V	Note3
Driver Supply Voltage	-	VGH-VGL	19	-	32	V	Note3
VCOM Operation							
VCOM Amplitude Voltage	VCOM	-	0	-	-2.0	V	Note3
Source Driver							
Source Output Range	Vsout	-	0.1	-	VREG1OUT-0.1	V	Note4
Positive Gamma Reference Voltage	VREG1OUT	-	3.6	-	5.5	V	Note3
Negative Gamma Reference Voltage	VREG2OUT		-5.5		-3.6	V	Note3
Source Output Setting Time	Tr	Below with 99% precision	-	15	20	uS	Note4,5
Output Deviation Voltage (Source Output channel)	Vdev	Sout>=4.2V	-	-	20	mV	Note4
		Sout<=0.8V	-	-	15	mV	-
Output Offset Voltage	VOFSET	-	-	-	35	mV	Note6
Booster Operation							
1 st Booster (VCI1x2) Voltage	DDVDH	-	4.5	-	6.0	V	Note3
1 st Booster (VCI1x2) Voltage	DDVDL	-	-6.0	-	-4.5	V	Note3
1 st Booster (VCI1x2 Drop Voltage	VCI1x2 drop	loading=1mA	-	-	5	%	Note3
Liner Range	Vliner	-	0.2	-	DDVDH-0.2	V	

Note 1: IOVCC=1.65 to 3.6V, VCI=2.5 to 3.6V, AGND=DGND=0V, Ta=-30 to 70 (to +85 no damage) °C.

Note2: Please supply digital IOVCC voltage equal or less than analog VCI voltage.

Note2, 3, 4: When the measurements are performed with LCD module. Measurement Points are like below.

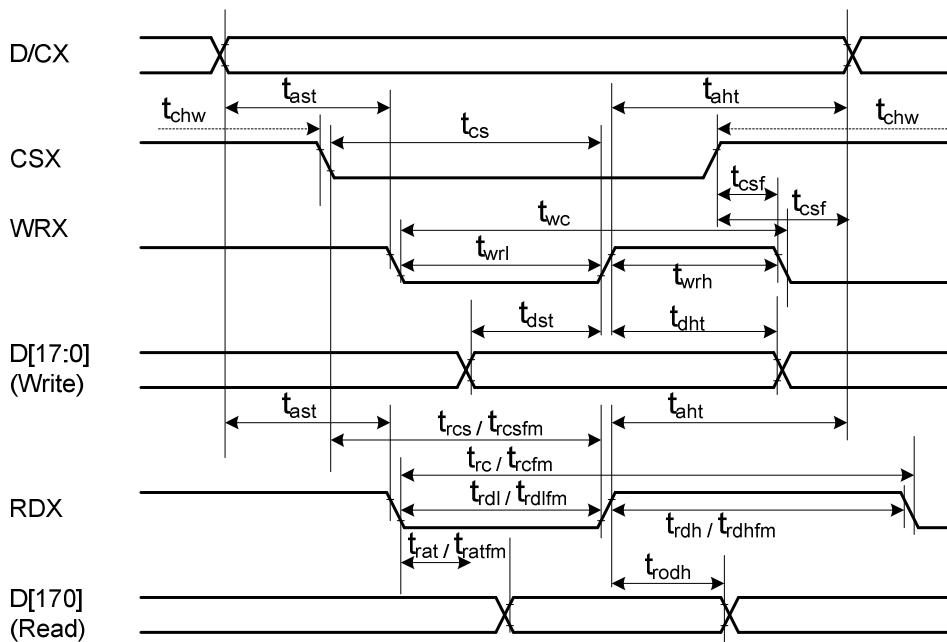

Note3: CSX, RDX, WRX, DB[17:0], D/CX, RESX, TE, SDA, SCL, IM2, IM1, IM0, and Test pins.

Note5: Source channel loading = 10pF/channel, Gate channel loading = 50pF/channel

Note6: The Max. Value is between with Note 4 measure point and Gamma setting value

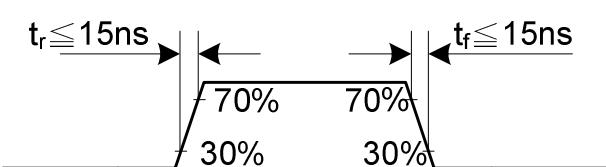

17.3. AC Characteristics

17.3.1. Display Parallel 18/16/9/8-bit Interface Timing Characteristics (8080-series)

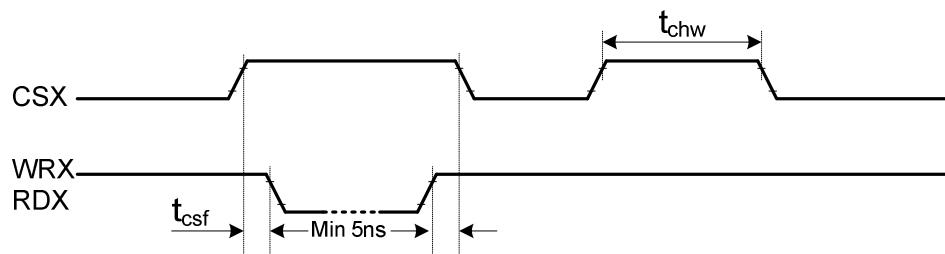

Signal	Symbol	Parameter	min	max	Unit	Description
DCX	t _{ast}	Address setup time	0	-	ns	-
	t _{ah}	Address hold time (Write/Read)	0	-	ns	-
CSX	t _{ch}	CSX "H" pulse width	0	-	ns	-
	t _{cs}	Chip Select setup time (Write)	15	-	ns	-
	t _{rcts}	Chip Select setup time (Read ID)	45	-	ns	-
	t _{rcsfm}	Chip Select setup time (Read FM)	355	-	ns	-
	t _{csf}	Chip Select Wait time (Write/Read)	0	-	ns	-
WRX	t _{wc}	Write cycle	50	-	ns	-
	t _{twrh}	Write Control pulse H duration	15	-	ns	-
	t _{twrl}	Write Control pulse L duration	15	-	ns	-
RDX (FM)	t _{rcfm}	Read Cycle (FM)	450	-	ns	When read from Frame Memory
	t _{trdhfm}	Read Control H duration (FM)	90	-	ns	
	t _{trdlfm}	Read Control L duration (FM)	355	-	ns	
RDX (ID)	t _{rc}	Read cycle (ID)	160	-	ns	When read ID data
	t _{trdh}	Read Control pulse H duration	90	-	ns	
	t _{trdl}	Read Control pulse L duration	45	-	ns	
DB[17:0], DB[15:0], DB[8:0], DB[7:0]	t _{dst}	Write data setup time	10	-	ns	For maximum CL=30pF For minimum CL=8pF
	t _{dh}	Write data hold time	10	-	ns	
	t _{rat}	Read access time	-	40	ns	
	t _{ratfm}	Read access time	-	340	ns	
	t _{rodh}	Read output disable time	20	80	ns	

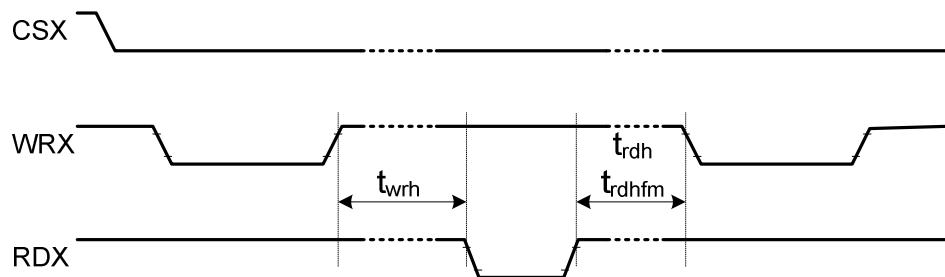

Note: (1) $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.6V$, $AGND=DGND=0V$

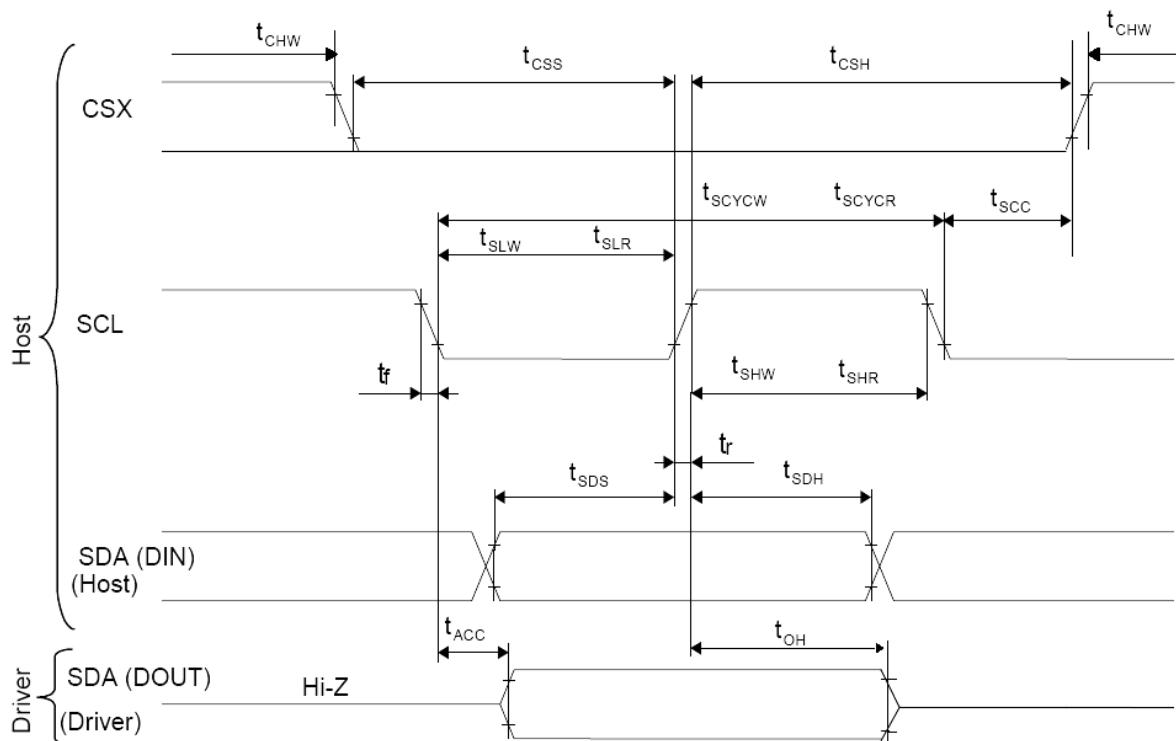

(2) Logic high and low levels are specified as 30% and 70% of IOVCC for input signals.

(3) Logic high and low levels are specified as 30% and 70% of IOVCC for input signals.

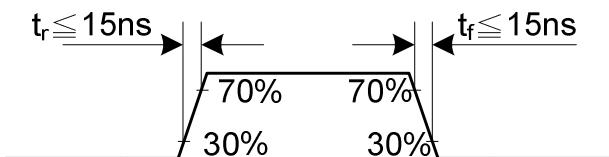

17.3.2. Display Serial Interface Timing Characteristics (3-line SPI system)

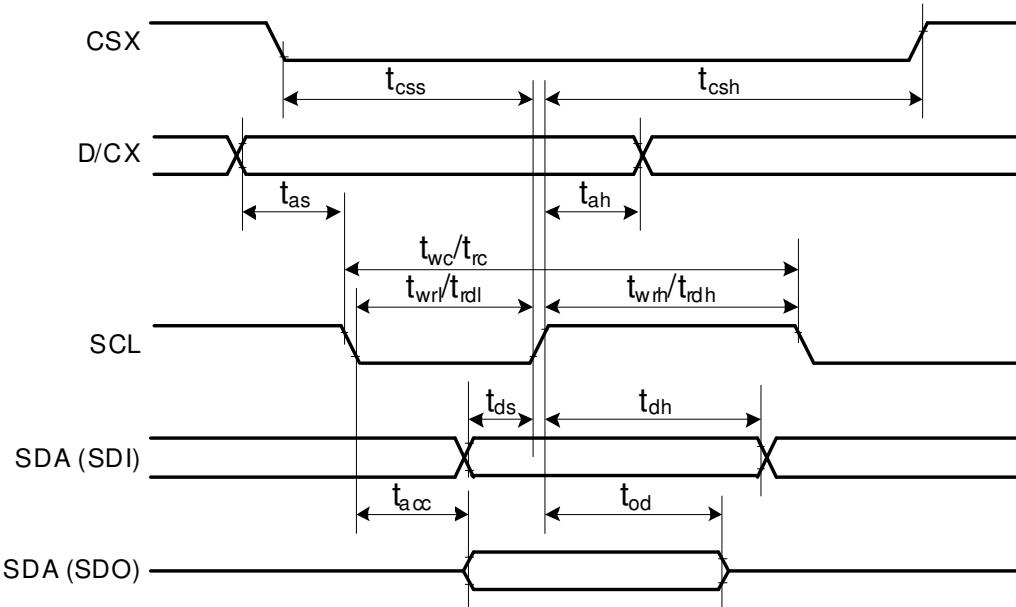

Signal	Symbol	Parameter	min	max	Unit	Description
SCL	tscycw	Serial Clock Cycle (Write)	66	-	ns	
	tshw	SCL "H" Pulse Width (Write)	15	-	ns	
	tslw	SCL "L" Pulse Width (Write)	15	-	ns	
	tscycr	Serial Clock Cycle (Read)	150	-	ns	
	tshr	SCL "H" Pulse Width (Read)	60	-	ns	
	tslr	SCL "L" Pulse Width (Read)	60	-	ns	
SDA / SDI (Input)	tsds	Data setup time (Write)	10	-	ns	
	tsdh	Data hold time (Write)	10	-	ns	
SDA / SDO (Output)	tacc	Access time (Read)	10	50	ns	
	toh	Output disable time (Read)	15	50	ns	
CSX	tscc	SCL-CSX	15	-	ns	
	tchw	CSX "H" Pulse Width	40	-	ns	
	tcss	CSX-SCL Time	60	-	ns	
	tcsh		65	-	ns	

Note: $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.6V$, $AGND=DGND=0V$, $T=10\pm0.5ns$

17.3.3. Display Serial Interface Timing Characteristics (4-line SPI system)

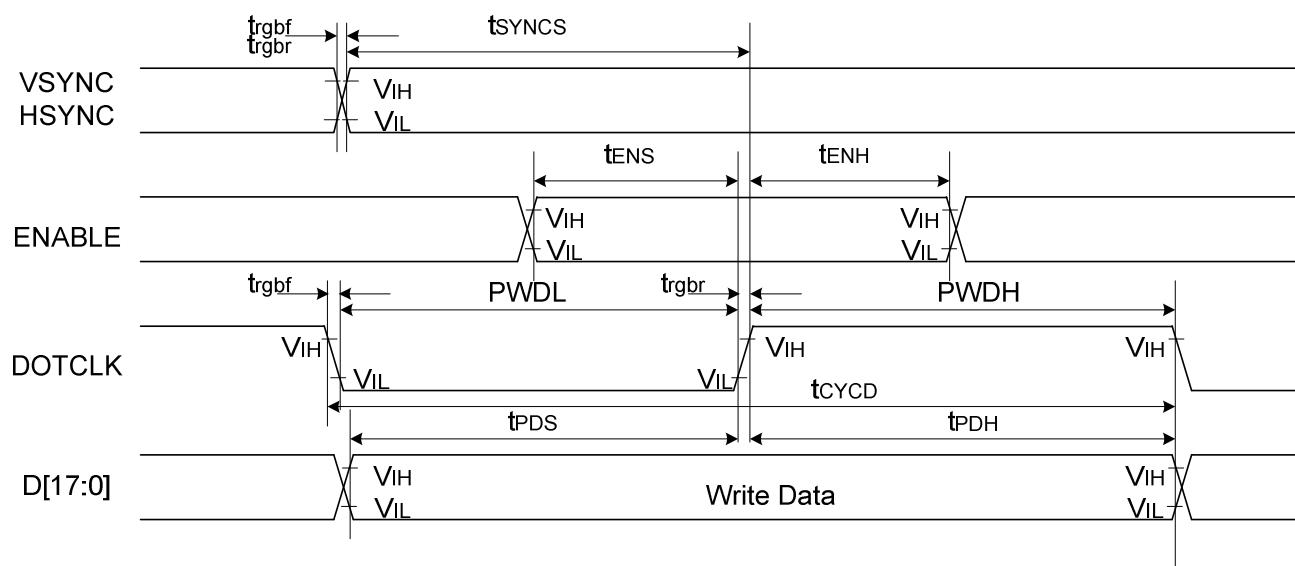

Signal	Symbol	Parameter	min	max	Unit	Description
CSX	tcss	Chip select time (Write)	15	-	ns	
	tcsh	Chip select hold time (Read)	60	-	ns	
SCL	t _{wc}	Serial clock cycle (Write)	66	-	ns	
	t _{wrh}	SCL "H" pulse width (Write)	15	-	ns	
	t _{wrl}	SCL "L" pulse width (Write)	15	-	ns	
	t _{rc}	Serial clock cycle (Read)	150	-	ns	
	t _{rdh}	SCL "H" pulse width (Read)	60	-	ns	
	t _{rdl}	SCL "L" pulse width (Read)	60	-	ns	
D/CX	t _{as}	D/CX setup time	10	-	ns	
	t _{ah}	D/CX hold time (Write / Read)	10	-	ns	
SDA / SDI (Input)	t _{ds}	Data setup time (Write)	10	-	ns	
	t _{dh}	Data hold time (Write)	10	-	ns	
SDA / SDO (Output)	t _{acc}	Access time (Read)	10	50	ns	For maximum CL=30pF For minimum CL=8pF
	t _{od}	Output disable time (Read)	15	50	ns	

Note: (1) $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.6V$, $AGND=DGND=0V$, $T=10+/-0.5ns$.

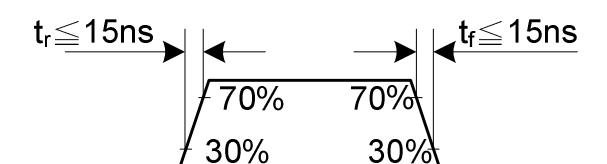

(2) Does not include signal rise and fall times.

17.3.4. Parallel 18/16-bit RGB Interface Timing Characteristics

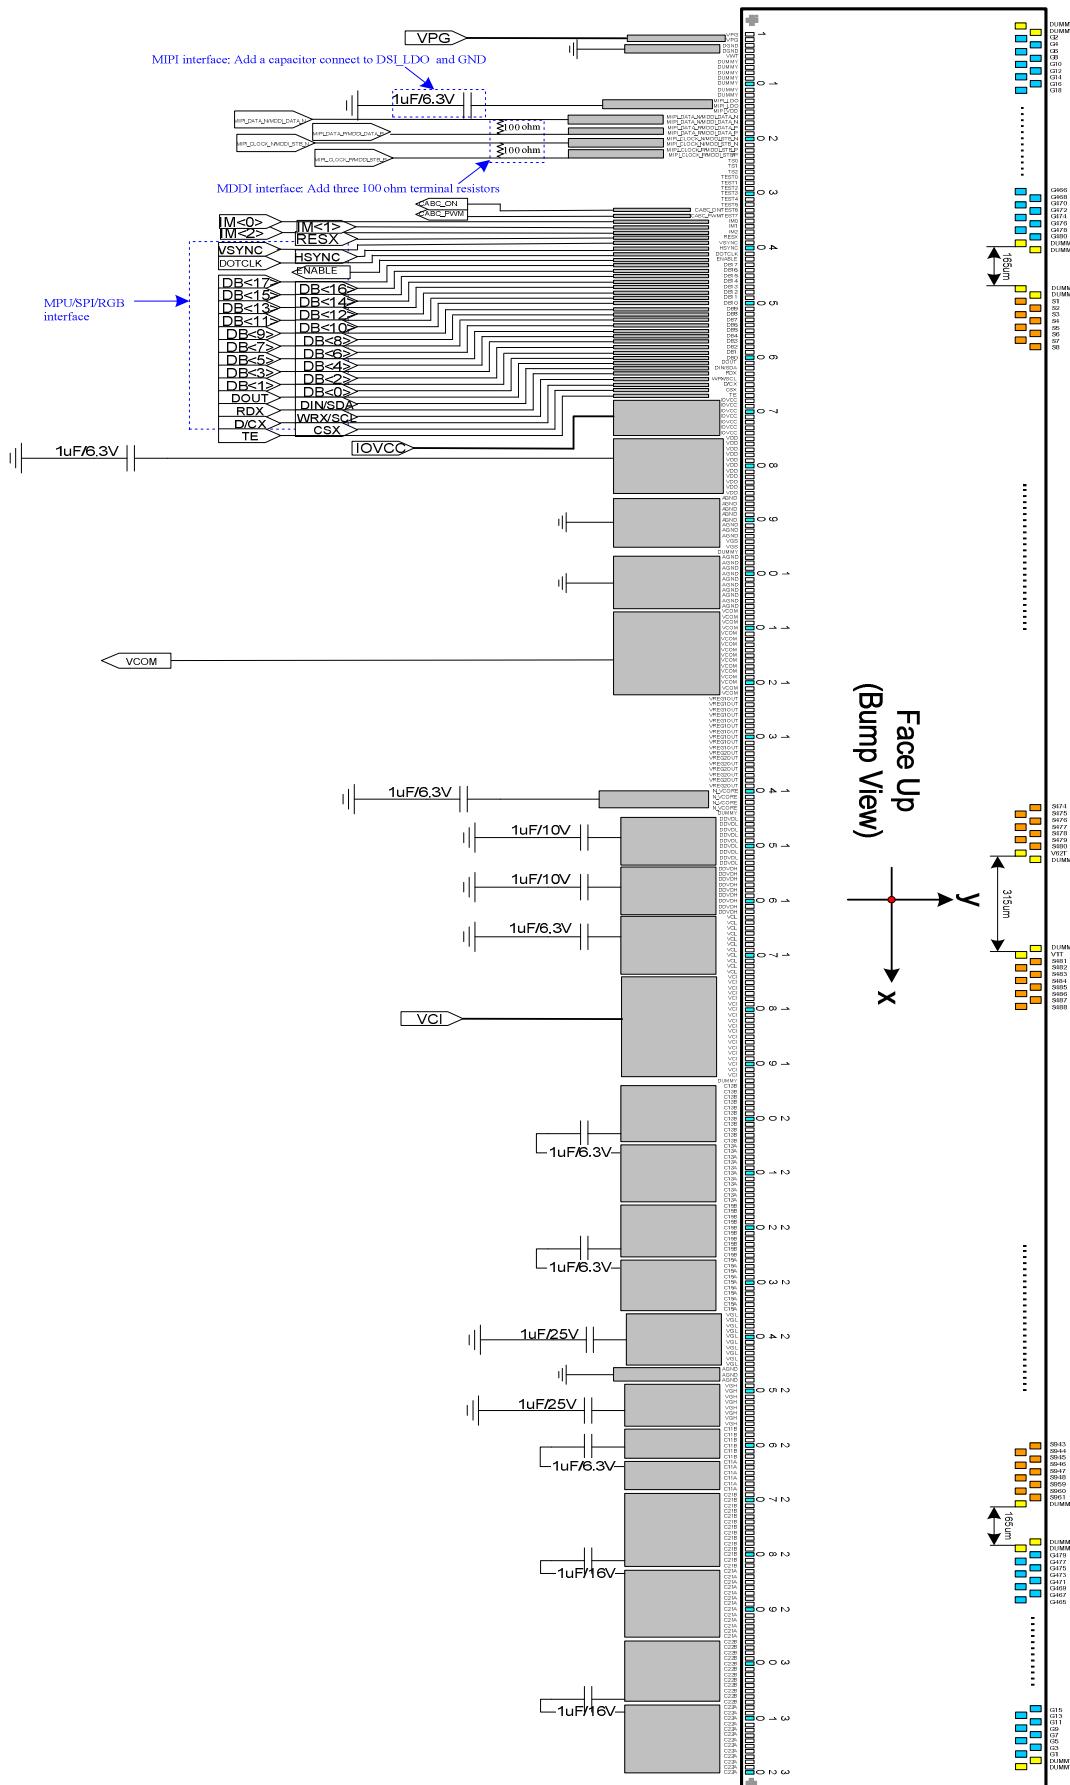

Signal	Symbol	Parameter	min	max	Unit	Description
VSYNC / HSYNC	t_{SYNCS}	VSYNC/HSYNC setup time	15	-	ns	18/16-bit bus RGB interface mode
	t_{SYNCH}	VSYNC/HSYNC hold time	15	-	ns	
ENABLE	t_{ENS}	ENABLE setup time	15	-	ns	18/16-bit bus RGB interface mode
	t_{ENH}	ENABLE hold time	15	-	ns	
DB[17:0]	t_{PDS}	Data setup time	15	-	ns	18/16-bit bus RGB interface mode
	t_{PDH}	Data hold time	15	-	ns	
DOTCLK	t_{PWDH}	DOTCLK high-level period	15	-	ns	18/16-bit bus RGB interface mode
	t_{PWDL}	DOTCLK low-level period	15	-	ns	
	t_{CYCD}	DOTCLK cycle time	66	-	ns	
	t_{rgbr}, t_{rgbf}	DOTCLK,HSYNC,VSYNC rise/fall time	-	15	ns	

Note: $T_a = -30$ to 70 °C, $IOVCC=1.65V$ to $3.6V$, $VCI=2.5V$ to $3.3V$, $AGND=DGND=0V$

18. Application Circuit

The information contained herein is the exclusive property of ILI Technology Corp. and shall not be distributed, reproduced, or disclosed in whole or in part without prior written permission of ILI Technology Corp.

The following table shows specifications of external elements connected to ILI9486L's power supply circuit.

Items	Recommended Specification	Pin connection
Capacity 1 μF (B characteristics)	6.3V	C11A/B, C13A/B, C15A/B, VCL, VDD, N_VCORE(back up)
	10V	DDVDH, DDVDL
	16V	C21 A/B, C22A/B(for +6,-3 backup)
	25V	VGH, VGL
