### 3.3 Strapping Pins

**Note:**

The content below is excerpted from [ESP32-H2 Series Datasheet](#) > Section *Strapping Pins*. For the strapping pin mapping between the chip and modules, please refer to Chapter 6 *Module Schematics*.

At each startup or reset, a chip requires some initial configuration parameters, such as in which boot mode to load the chip, etc. These parameters are passed over via the strapping pins. After reset, the strapping pins work as normal function pins.

ESP32-H2 has the following parameters controlled by the given strapping pins at chip reset:

- **Chip boot mode** – GPIO8 and GPIO9
- **ROM message printing** – GPIO8

- **JTAG signal source** – GPIO25

GPIO9 is connected to the chip's internal weak pull-up resistor at chip reset. This resistor determines the default bit value of GPIO9. Also, the resistor determines the bit value if GPIO9 is connected to an external high-impedance circuit.

**Table 3: Default Configuration of Strapping Pins**

Strapping Pin	Default Config	Bit Value
GPIO8	Floating	–
GPIO9	Pull-up	1
GPIO25	Floating	–

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP32-H2 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IOs after reset.

### 3.3.1 Chip Boot Mode Control

After the reset is released, the combination of GPIO8 and GPIO9 controls the boot mode. See Table 4 [Boot Mode Control](#).

**Table 4: Boot Mode Control**

Boot Mode	GPIO8	GPIO9
Default Config	– (Floating)	1 (Pull-up)
<b>SPI Boot</b>	Any value	1
<b>Joint Download Boot<sup>1</sup></b>	1	0

<sup>1</sup> Joint Download Boot mode supports the following download methods:

- USB-Serial-JTAG Download Boot
- UART Download Boot

In SPI Boot mode, the ROM bootloader loads and executes the program from SPI flash to boot the system.

In Joint Download Boot mode, users can download binary files into flash using UART0 or USB interface. It is also possible to download binary files into SRAM and execute it from SRAM.

In addition to SPI Boot and Joint Download Boot modes, ESP32-H2 also supports SPI Download Boot mode. For details, please see [ESP32-H2 Technical Reference Manual](#) > Chapter *Chip Boot Control*.

### 3.3.2 ROM Messages Printing Control

During the ROM boot stage of SPI Boot mode, GPIO8, LP\_AON\_STORE4\_REG[0] and EFUSE\_UART\_PRINT\_CONTROL jointly control the printing of ROM messages.

**Table 5: ROM Message Printing Control**

Register <sup>1</sup>	eFuse <sup>2</sup>	GPIO8	ROM Message Printing
0	0 (0b00)	x <sup>3</sup>	ROM messages are always printed to UART0 during boot
	1 (0b01)	0	Print is enabled during boot
		1	Print is disabled during boot
	2 (0b10)	0	Print is disabled during boot
		1	Print is enabled during boot
3 (0b11)	x	Print is disabled during boot	
1	x	x	Print is disabled during boot

<sup>1</sup> Register: LP\_AON\_STORE4\_REG[0]

<sup>2</sup> eFuse: EFUSE\_UART\_PRINT\_CONTROL

<sup>3</sup> x: x indicates that the value has no effect on the result and can be ignored.

ROM message is printed to UART0 and USB Serial/JTAG Controller by default during power-on. Users can disable the printing to USB Serial/JTAG Controller by setting the eFuse bit EFUSE\_DIS\_USB\_SERIAL\_JTAG\_ROM\_PRINT.

Note that if EFUSE\_DIS\_USB\_SERIAL\_JTAG\_ROM\_PRINT is set to 0 to print to USB, but the USB Serial/JTAG Controller has been disabled, then ROM messages will not be printed to USB Serial/JTAG Controller.

Detailed description about the above-mentioned registers can be found in [ESP32-H2 Technical Reference Manual](#) > Chapter *eFuse Controller (EFUSE)*.

### 3.3.3 JTAG Signal Source Control

The strapping pin GPIO25 can be used to control the source of JTAG signals during the early boot process. This pin does not have any internal pull resistors and the strapping value must be controlled by the external circuit that cannot be in a high impedance state.

As Table 6 shows, GPIO25 is used in combination with EFUSE\_DIS\_PAD\_JTAG, EFUSE\_DIS\_USB\_JTAG, and EFUSE\_JTAG\_SEL\_ENABLE.

Table 6: JTAG Signal Source Control

eFuse 1 <sup>a</sup>	eFuse 2 <sup>b</sup>	eFuse 3 <sup>c</sup>	GPIO25	JTAG Signal Source
0	0	0	Ignored	USB Serial/JTAG Controller
		1	0	JTAG pins MTDI, MTCK, MTMS, and MTDO
			1	USB Serial/JTAG Controller
0	1	Ignored	Ignored	JTAG pins MTDI, MTCK, MTMS, and MTDO
1	0	Ignored	Ignored	USB Serial/JTAG Controller
1	1	Ignored	Ignored	JTAG is disabled

<sup>a</sup> eFuse 1: EFUSE\_DIS\_PAD\_JTAG

<sup>b</sup> eFuse 2: EFUSE\_DIS\_USB\_JTAG

<sup>c</sup> eFuse 3: EFUSE\_JTAG\_SEL\_ENABLE

Detailed description about the above-mentioned registers can be found in [ESP32-H2 Technical Reference Manual](#) > Chapter *eFuse Controller (EFUSE)*.

Figure 4 shows the setup and hold time for the strapping pin before and after the CHIP\_EN signal goes high. Details about the parameters are listed in Table 7.

## 5 RF Characteristics

This section contains tables with RF characteristics of the Espressif product.

The RF data is measured at the antenna port, where RF cable is connected, including the front-end loss. The external antennas used for the tests on the modules with external antenna connectors have an impedance of 50  $\Omega$ .

Devices should operate in the center frequency range allocated by regional regulatory authorities. The target center frequency range and the target transmit power are configurable by software. See [ESP RF Test Tool and Test Guide](#) for instructions.

Unless otherwise stated, the RF tests are conducted with a 3.3 V ( $\pm 5\%$ ) supply at 25 °C ambient temperature.

# 6 Module Schematics

This is the reference design of the module.

## 7 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

Figure 7: Peripheral Schematics

- Soldering the EPAD to the ground of the base board is not a must, however, it can optimize thermal performance. If you choose to solder it, please apply the correct amount of soldering paste. Too much soldering paste may increase the gap between the module and the baseboard. As a result, the adhesion between other pins and the baseboard may be poor.
- To ensure that the power supply to the ESP32-H2 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\text{ }\mu\text{F}$ . However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-H2's power-up and reset sequence timing diagram, please refer to [ESP32-H2 Series Datasheet](#) > Section *Power Supply*.

### 8.3 Dimensions of External Antenna Connector

ESP32-H2-MINI-1U uses the third generation external antenna connector as shown in Figure 12 *Dimensions of External Antenna Connector*. This connector is compatible with the following connectors:

- W.FL Series connector from Hirose
- MHF III connector from I-PEX
- AMMC connector from Amphenol

## 9 Product Handling

### 9.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and 60%RH. If the above conditions are not met, the module needs to be baked.

### 9.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 9.3 Soldering Profile

#### 9.3.1 Reflow Profile

Solder the module in a single reflow.

Figure 13: Reflow Profile

## 9.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
