## 3. How to Control via External MCU

### 3.1. How to Send AT Commands

- **When BT is NOT connected, for ALL commands**

1. Output low to [UART PD](#) pin to enable UART interface. Please keep it low during the whole time when sending AT commands.
2. Send any AT commands you want. *Please wait for at least 250 ms between sending each command.*

We recommend sending corresponding “Read” command ([section 2.2.2](#)) right after the delay to know whether the writing is successful before moving on to step 3 to save your settings.

*Please prolong the delay (over 250 ms) when writing or/and reading is not successful.*

3. Send command “ **AT+RESET** ” (**not HW reset**) to save all your settings.
4. Output high or NC to [UART PD](#) pin to turn off UART interface.

- **When BT is connected for following commands ONLY**

**Write: AT+DISCONNECT, AT+SLEEP**

**Read: AT?ADCVALUE**

1. Output low to [UART PD](#) pin to enable UART interface. Please keep it low during the whole time when sending AT commands.
2. Output low to [flash default](#) pin to enable receiving AT commands when BT is connected. Please keep it low during the whole time when sending AT commands.
3. Send “AT?ADCVALUE” or “AT+DISCONNECT” or “AT+SLEEP”
4. Output high or NC to [UART PD](#) pin to turn off UART interface.
5. Output high or NC to [flash default](#) pin to disable the module to receive AT commands when BT is connected.

## 3.2. How to Transmit Data

**\* Only when BT is connected \***

1. Output low to **UART PD** pin to enable UART interface. Please keep it low during the whole time when transmitting data.
2. Output high or NC to **UART PD** pin to turn off UART interface.

## 3.3. How to Return to the Setting of Default Flash

**\* Only when BT is NOT connected \***

**\* Note that default baud rate is “9600bps,n,8,1”. For other default, please check [“2.3 Default Info”](#)**

### ● Use Hardware Method

1. Read **indicator** pin first to check if BT is *NOT* in connection.
2. Output a low pulse to **flash default** pin, then system will return to default setting.

### ● Use Software method

1. Output low to **UART PD** pin to enable UART interface. Please keep it low during the whole time when sending AT commands.
2. Send command “AT+DEFAULT”, then system will return to default setting.

## 4. Test Report

All testing is done under **PHY mode at 1M bps.**

## 12. Notes and Cautions

Module is not designed to last for a lifetime. Like general products, it is expected to be worn out after continuous usage through the years. To assure that product will perform better and last longer, please make sure you:

- Follow the guidelines of this document while designing circuit/end-product. Any discrepancy of core Bluetooth technology and technical specification of IC should refer to definition of Bluetooth Organization and Nordic Semiconductor as final reference.
- Do not supply voltage that is not within range of specification.
- Eliminate static electricity at any cost when working with the module as it may cause damage. It is highly recommended adding anti-ESD components to circuit design to prevent damage from real-life ESD events. Anti-ESD methods can be also applied in mechanical design.
- Do not expose modules under direct sunlight for long duration. Modules should be kept away from humid and salty air conditions, and any corrosive gasses or substances. Store it within  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  before and after installation.
- Avoid any physical shock, intense stress to the module or its surface.
- Do not wash the module. No-Clean Paste is used in production. Washing it will oxidize the metal shield and have chemistry reaction with No-Clean Paste. Functions of the module are not guaranteed if it has been washed.

The module is not suitable for life support device or system and not allowed to be used in destructive device or systems in any direct or indirect ways. The customer agrees to indemnify Raytac for any losses when applying modules in applications such as the ones described above.
