HOW THE KIT WORKS

DESIGN AN EDGE LIT DISPLAY PIECE WITH THIS

5V LED Strip Kit

Build Instructions

Before you start, take a look at the Printed Circuit Board (PCB). The components go in the side with the writing on and the solder goes on the side with the tracks and silver pads.

1

PLACE THE SWITCH

Place the switch into the three holes at the end. Make sure the switch actuator sticks out from the end of the PCB.

Solder the switch and trim the legs.

2

PLACE THE LEDs

Place the 4 LEDs.

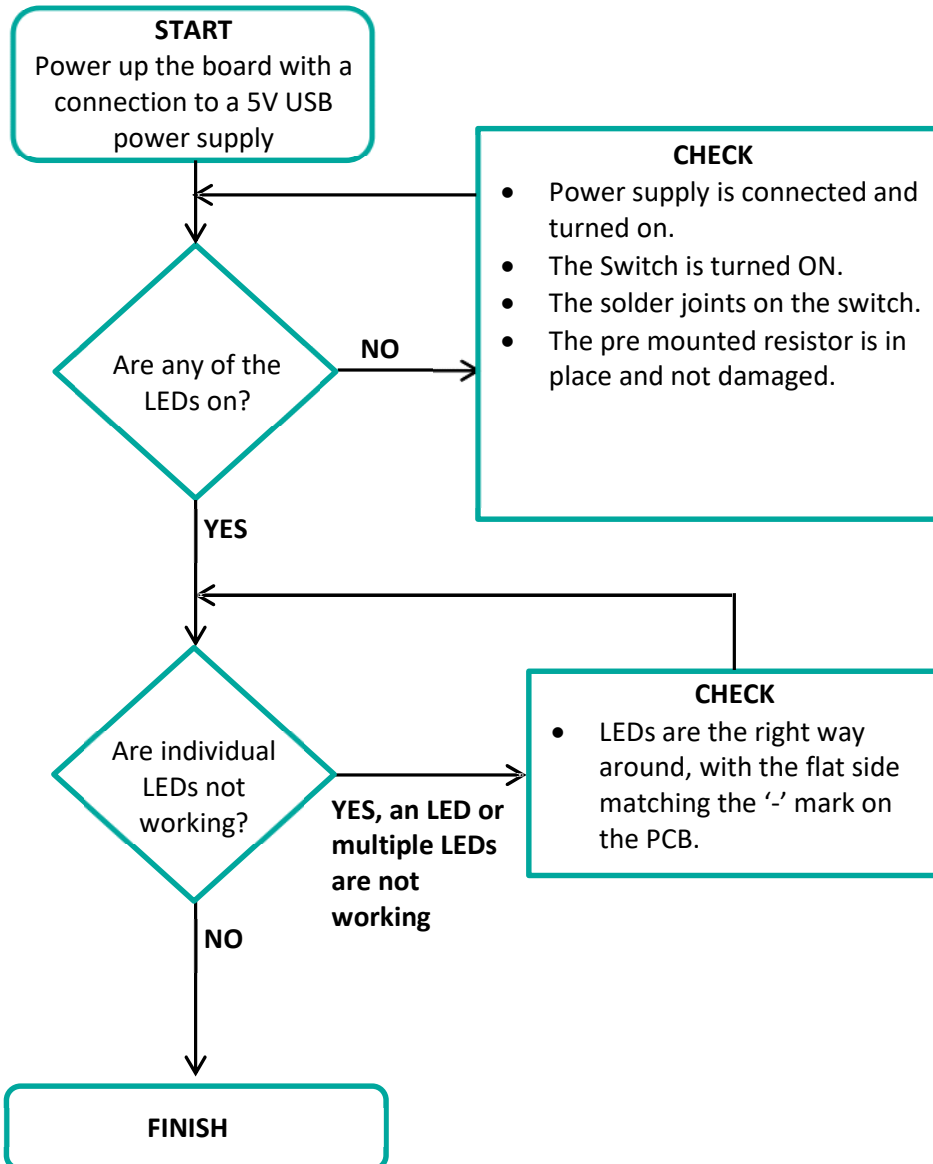

Make sure they are the correct way round. The PCB silk screen indicates the shape – line up the flat side as shown. Additionally, the longer leg goes in the hole marked with the +.

Solder the LEDs and trim the legs.

Checking Your 5V LED Strip PCB

- Have you soldered all the components in? There should be no unused component holes. Only the mounting holes should be empty.
- Is the LED orientation correct? (Does the outline of the LED match the markings on the PCB?)

Designing the Enclosure

When you design the enclosure, you will need to consider:

- The size of the PCB (below).
- Where the power cable comes out.
- Where the power switch is.
- There is a single 3.2mm hole in the PCB to secure the PCB in the enclosure.

This technical drawing of the built 5V LED Desk Lamp PCB should help you to design your enclosure. The total height of the assembled unit is approximately 9mm.

(Dimensions in mm)

	<p>Mounting the PCB to the enclosure</p> <p>The drawing to the left shows how a hex spacer can be used with two bolts to fix the PCB to the enclosure.</p> <p><i>Your PCB has one mounting hole designed to take M3 bolts.</i></p>
--	---

How the 5V LED Strip Works

The circuit diagram for the 5V LED Desk Lamp is shown above. It is a very simple circuit. The board contains a switch, four LEDs all sharing a current limit resistor.

Power is supplied from the USB connector (or alternatively by the power pads on the PCB). The switch then controls the flow of power to the LEDs.

LEDs can be damaged if too much current goes through them, so a 22 Ohm resistor is used to protect them. This allows around 21mA of current to flow through each LED, or 84mA overall. To save space on the PCB the kit comes with a surface mount resistor already soldered in place.

Online Information

Two sets of information can be downloaded from the product page where the kit can also be reordered from. The 'Essential Information' contains all of the information that you need to get started with the kit and the 'Teaching Resources' contains more information on soldering, components used in the kit, educational schemes of work and so on and also includes the essentials.
