## SINGLE-ENDED ANALOG-INPUT 24-BIT, 96-kHz STEREO A/D CONVERTER

---

### FEATURES

- 24-Bit Delta-Sigma Stereo A/D Converter
- Single-Ended Voltage Input: 3 V p-p
- Antialiasing Filter Included
- Oversampling Decimation Filter
  - Oversampling Frequency:  $\times 64$ ,  $\times 128$
  - Pass-Band Ripple:  $\pm 0.05$  dB
  - Stop-Band Attenuation:  $-65$  dB
  - On-Chip High-Pass Filter (HPF): 0.84 Hz (44.1 kHz)
- High Performance
  - THD+N: 96 dB (Typical)
  - SNR: 105 dB (Typical)
  - Dynamic Range: 105 dB (Typical)
- PCM Audio Interface
  - Master/Slave Mode Selectable
  - Data Formats: 24-Bit Left-Justified; 24-Bit I<sup>2</sup>S; 20-, 24-Bit Right-Justified
- Sampling Rate: 16 kHz to 96 kHz
- System Clock: 256 f<sub>S</sub>, 384 f<sub>S</sub>, 512 f<sub>S</sub>, 768 f<sub>S</sub>
- Dual Power Supplies: 5 V for Analog, 3.3 V for Digital
- Package: 20-Pin SSOP

### APPLICATIONS

- AV Amplifier Receiver
- MD Player
- CD Recorder
- Multitrack Receiver
- Electric Musical Instrument

### DESCRIPTION

The PCM1802 is a high-performance, low-cost, single-chip stereo analog-to-digital converter with single-ended analog voltage input. The PCM1802 uses a delta-sigma modulator with 64- or 128-times oversampling, and includes a digital decimation filter and high-pass filter (HPF), which removes the dc component of the input signal. For various applications, the PCM1802 supports master and slave modes and four data formats in serial interface. The PCM1802 is suitable for a wide variety of cost-sensitive consumer applications where good performance, 5-V analog supply, and 3.3-V digital supply operation is required. The PCM1802 is fabricated using a highly advanced CMOS process and is available in the DB 20-pin SSOP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision.  
All other trademarks are the property of their respective owners.

This device contains circuits to protect its inputs and outputs against damage due to high static voltages or electrostatic fields. These circuits have been qualified to protect this device against electrostatic discharges (ESD) of up to 2 kV according to MIL-STD-883C, Method 3015; however, it is advised that precautions be taken to avoid application of any voltage higher than maximum-rated voltages to these high-impedance circuits. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to an appropriated logic voltage level, preferably either  $V_{CC}$  or ground. Specific guidelines for handling devices of this type are contained in the publication *Electrostatic Discharge (ESD)* (SSYA010) available from Texas Instruments.

### PIN ASSIGNMENTS

### BLOCK DIAGRAM

B0004-07

**Terminal Functions**

TERMINAL NAME PIN		I/O	DESCRIPTIONS
AGND	6	–	Analog GND
BCK	11	I/O	Bit clock input/output <sup>(1)</sup>
BYPAS	8	I	HPF bypass control. Low: normal mode (dc cut); High: bypass mode (through) <sup>(2)</sup>
DGND	13	–	Digital GND
DOUT	12	O	Audio data output
FMT0	17	I	Audio data format select 0. See <i>data format</i> <sup>(2)</sup>
FMT1	18	I	Audio data format select 1. See <i>data format</i> <sup>(2)</sup>
FSYNC	9	I/O	Frame synchronous clock input/output <sup>(1)</sup>
LRCK	10	I/O	Sampling clock input/output <sup>(1)</sup>
MODE0	19	I	Mode select 0. See <i>interface mode</i> <sup>(2)</sup>
MODE1	20	I	Mode select 1. See <i>interface mode</i> <sup>(2)</sup>
OSR	16	I	Oversampling ratio select. Low: $\times 64 f_S$ ; High: $\times 128 f_S$ <sup>(2)</sup>
$\overline{\text{PDWN}}$	7	I	Power-down control, active-low <sup>(2)</sup>
SCKI	15	I	System clock input; 256 $f_S$ , 384 $f_S$ , 512 $f_S$ , or 768 $f_S$ <sup>(3)</sup>
V <sub>CC</sub>	5	–	Analog power supply, 5 V
V <sub>DD</sub>	14	–	Digital power supply, 3.3 V
V <sub>INL</sub>	1	I	Analog input, L-channel
V <sub>INR</sub>	2	I	Analog input, R-channel
V <sub>REF1</sub>	3	–	Reference-1 decoupling capacitor
V <sub>REF2</sub>	4	–	Reference-2 voltage input, normally connected to V <sub>CC</sub>

- (1) Schmitt-trigger input  
 (2) Schmitt-trigger input with internal pulldown (50 k $\Omega$  typically), 5-V tolerant  
 (3) Schmitt-trigger input, 5-V tolerant

**ABSOLUTE MAXIMUM RATINGS**

 over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

Supply voltage	V <sub>CC</sub>	6.5 V
	V <sub>DD</sub>	4 V
Ground voltage differences	AGND, DGND	$\pm 0.1$ V
Supply voltage difference	V <sub>CC</sub> , V <sub>DD</sub>	V <sub>CC</sub> – V <sub>DD</sub> < 3.0 V
Digital input voltage	FSYNC, LRCK, BCK, DOUT	–0.3 V to (V <sub>DD</sub> + 0.3 V)
	$\overline{\text{PDWN}}$ , BYPAS, SCKI, OSR, FMT0, FMT1, MODE0, MODE1	–0.3 V to 6.5 V
Analog input voltage	V <sub>INL</sub> , V <sub>INR</sub> , V <sub>REF1</sub> , V <sub>REF2</sub>	–0.3 V to (V <sub>CC</sub> + 0.3 V)
Input current (any pins except supplies)		$\pm 10$ mA
Ambient temperature under bias		–40°C to 125°C
Storage temperature		–55°C to 150°C
Junction temperature		150°C
Lead temperature (soldering)		260°C, 5 s
Package temperature (IR reflow, peak)		260°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

**ELECTRICAL CHARACTERISTICS**

all specifications at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5\text{ V}$ ,  $V_{DD} = 3.3\text{ V}$ , master mode,  $f_S = 44.1\text{ kHz}$ , system clock =  $384 f_S$ , oversampling ratio =  $\times 128$ , 24-bit data (unless otherwise noted)

**PRINCIPLES OF OPERATION**

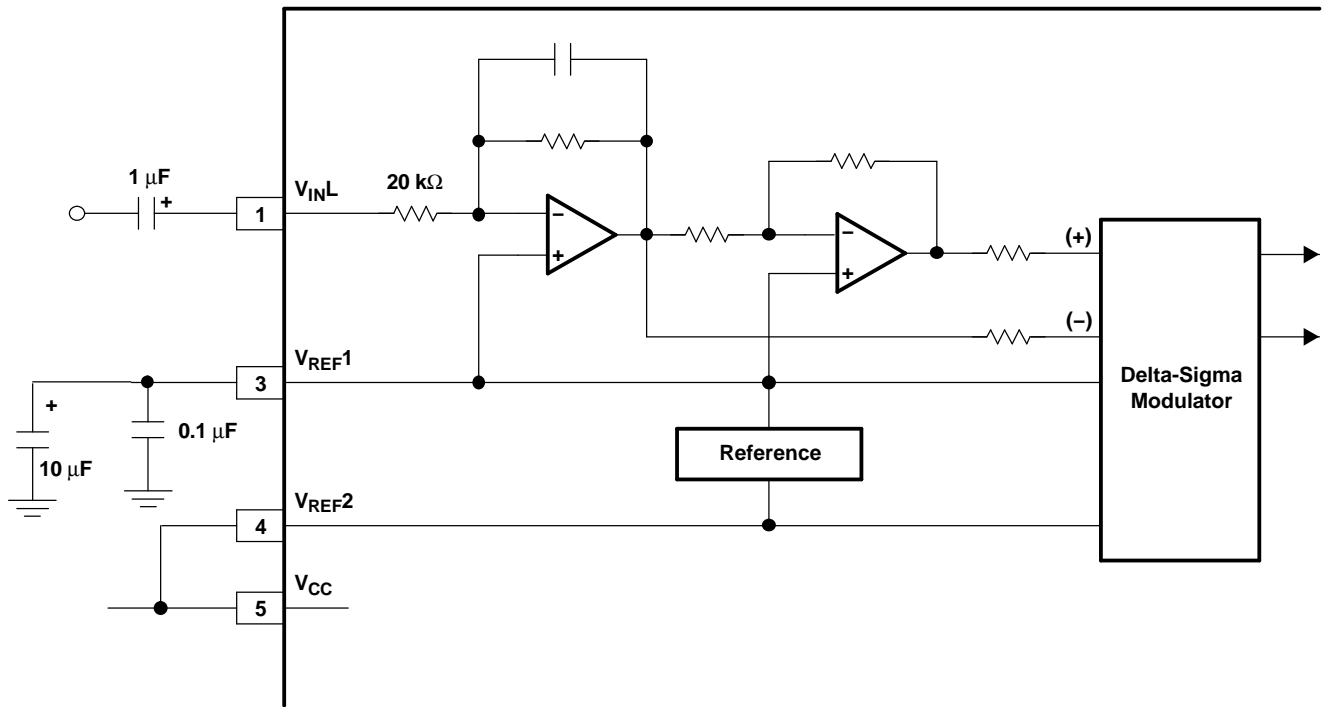

The PCM1802 consists of a reference circuit, two channels of single-ended-to-differential converter, a fifth-order delta-sigma modulator with full differential architecture, a decimation filter with high-pass filter, and a serial interface circuit. Figure 19 illustrates the total architecture of the PCM1802, Figure 20 illustrates the architecture of single-ended-to-differential converter and antialiasing filter, and Figure 21 is the block diagram of the fifth-order delta-sigma modulator and transfer function. An on-chip high-precision reference with one external capacitor provides all reference voltages that are needed in the PCM1802 and defines the full-scale voltage range for both channels. On-chip single-ended-to-differential signal converters save the design, space, and extra parts cost for external signal converters. Full-differential architecture provides a wide dynamic range and excellent power-supply rejection performance. The input signal is sampled at a  $\times 64$  or  $\times 128$  oversampling rate, thus eliminating an external sample-hold amplifier. A fifth-order delta-sigma noise shaper, which consists of five integrators using the switched capacitor technique and a comparator, shapes the quantization noise generated by the comparator and 1-bit DAC outside of the audio signal band. The high-order delta-sigma modulation randomizes the modulator outputs and reduces the idle tone level. The  $64\text{-}f_s$  or  $128\text{-}f_s$ , 1-bit stream from the delta-sigma modulator is converted to a  $1\text{-}f_s$ , 24-bit or 20-bit digital signal by removing high-frequency noise components with a decimation filter. The dc component of the signal is removed by the HPF, and the HPF output is converted to a time-multiplexed serial signal through the serial interface, which provides flexible serial formats.

## PRINCIPLES OF OPERATION (continued)

### System Clock

The PCM1802 supports  $256 f_s$ ,  $384 f_s$ ,  $512 f_s$ , and  $768 f_s$  as the system clock, where  $f_s$  is the audio sampling frequency. The system clock must be supplied on SCKI (pin 15).

The PCM1802 has a system clock detection circuit which automatically senses if the system clock is operating at  $256 f_s$ ,  $384 f_s$ ,  $512 f_s$ , or  $768 f_s$  in slave mode. In master mode, the system clock frequency must be selected by MODE0 (pin 19) and MODE1 (pin 20), and  $768 f_s$  is not available. For system clock inputs of  $384 f_s$ ,  $512 f_s$ , and  $768 f_s$ , the system clock is divided to  $256 f_s$  automatically, and the  $256 f_s$  clock is used to operate the delta-sigma modulator and the digital filter.

Table 1 shows the relationship of typical sampling frequencies and system clock frequencies, and Figure 22 shows system clock timing.

**Table 1. Sampling Frequency and System Clock Frequency**

SAMPLING RATE FREQUENCY (kHz)	SYSTEM CLOCK FREQUENCY (MHz)			
	$256 f_s$	$384 f_s$	$512 f_s$	$768 f_s$

$t_{(SCKL)}$	System clock-pulse duration, low	7		ns

**Figure 22. System Clock Timing**

### Power-On Reset Sequence

The PCM1802 has an internal power-on reset circuit, and initialization (reset) is performed automatically when the power supply ( $V_{DD}$ ) exceeds 2.2 V (typical). While  $V_{DD} < 2.2$  V (typical), and for 1024 system-clock counts after  $V_{DD} > 2.2$  V (typical), the PCM1802 stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of  $4480/f_S$  has passed. Figure 23 illustrates the internal power-on reset timing and the digital output for power-on reset.

T0014-05

Figure 23. Internal Power-On Reset Timing

### Serial Audio Data Interface

The PCM1802 interfaces with the audio system through BCK (pin 11), LRCK (pin 10), FSYNC (pin 9), and DOUT (pin 12).

## Interface Mode

The PCM1802 supports master mode and slave mode as interface modes, and they are selected by MODE1 (pin 20) and MODE0 (pin 19) as shown in Table 2.

In master mode, the PCM1802 provides the timing for serial audio data communications between the PCM1802 and the digital audio processor or external circuit. In slave mode, the PCM1802 receives the timing for data transfer from an external controller.

**Table 2. Interface Mode**

MODE1	MODE0	INTERFACE MODE
0	0	Slave mode (256 f <sub>S</sub> , 384 f <sub>S</sub> , 512 f <sub>S</sub> , 768 f <sub>S</sub> )
0	1	Master mode (512 f <sub>S</sub> )
1	0	Master mode (384 f <sub>S</sub> )
1	1	Master mode (256 f <sub>S</sub> )

### Master mode

In master mode, BCK, LRCK, and FSYNC work as output pins, and these pins are controlled by timing which is generated in the clock circuit of the PCM1802. FSYNC is used to designate the valid data from the PCM1802. The rising edge of FSYNC indicates the starting point of the converted audio data and the falling edge of this signal indicates the ending point of the data. The frequency of this signal is fixed at  $2 \times \text{LRCK}$ . The duty cycle ratio depends on data bit length. The frequency of BCK is fixed at  $64 \times \text{LRCK}$ . The 768 f<sub>S</sub> system clock is not available in master mode.

### Slave mode

In slave mode, BCK, LRCK, and FSYNC work as input pins. FSYNC is used to enable the BCK signal, and the PCM1802 can shift out the converted data while FSYNC is HIGH. The PCM1802 accepts either the 64 BCK/LRCK or the 48 BCK/LRCK format. The delay of FSYNC from the LRCK transition must be within 16 BCKs for the 64 BCK/LRCK format and within 12 BCKs for the 48 BCK/LRCK format.

### Data Format

The PCM1802 supports four audio data formats in both master and slave modes, and they are selected by FMT1 (pin 18) and FMT0 (pin 17) as shown in Table 3. Figure 24 and Figure 26 illustrate the data formats in slave mode and master mode, respectively.

**Table 3. Data Format**

$t_{(FSYP)}$	FSYNC period	5	$1/(2 f_s)$	40	$\mu s$
$t_{(CKDO)}$	Delay time, BCK falling edge to DOUT valid	-10		20	ns
$t_{(LRDO)}$	Delay time, LRCK edge to DOUT valid	-10		20	ns
$t_r$	Rise time of all signals			10	ns
$t_f$	Fall time of all signals			10	ns

NOTE: Timing measurement reference level is  $(V_{IH} + V_{IL}) / 2$ . Rise and fall times are measured from 10% to 90% of IN/OUT signal swing. Load capacitance of all signals is 20 pF.

Figure 27. Audio Data Interface Timing (Master Mode: FSYNC, LRCK, and BCK Work as Outputs)

## Synchronization With Digital Audio System

In slave mode, the PCM1802 operates under LRCK, synchronized with system clock SCKI. The PCM1802 does not need a specific phase relationship between LRCK and SCKI, but does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than  $\pm 6$  BCKs for 64 BCK/frame ( $\pm 5$  BCKs for 48 BCK/frame) during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within  $1/f_s$  and digital output is forced into BPZ code until resynchronization between LRCK and SCKI is completed.

In the case of changes less than  $\pm 5$  BCKs for 64 BCK/frame ( $\pm 4$  BCKs for 48 BCK/frame), resynchronization does not occur.

Figure 28 illustrates the digital output response for loss of synchronization and resynchronization. During undefined data, some noise might be generated in the audio signal. Also, the transition of normal to undefined data and undefined or zero data to normal creates a data discontinuity in the digital output, which can generate some noise in the audio signal.

It is recommended to set  $\overline{\text{PDWN}}$  low to get stable analog performance when the sampling rate, interface mode, data format, or oversampling control is changed.

Figure 28. ADC Digital Output for Loss of Synchronization and Resynchronization

### Power Down, HPF Bypass, Oversampling Control

$\overline{\text{PDWN}}$  (pin 7) controls the entire ADC operation. During power-down mode, both the supply current for the analog portion and the clock signal for the digital portion are shut down, and power dissipation is minimized. Also, DOUT (pin 12) is disabled and no system clock is accepted during power-down mode.

#### Power-Down Control

PDWN	MODE
LOW	Power-down mode
HIGH	Normal operation mode

The built-in function for dc component rejection can be bypassed using the BYPAS (pin 8) control. In bypass mode, the dc components of the analog input signal, internal dc offset, etc., are also converted and included in the digital output data.

#### HPF Bypass Control

BYPAS	HPF (HIGH-PASS FILTER) MODE
LOW	Normal (no dc component on DOUT) mode
HIGH	Bypass (dc component on DOUT) mode

OSR (pin 16) controls the oversampling ratio of the delta-sigma modulator,  $\times 64$  or  $\times 128$ . The  $\times 128$  mode is available for  $f_s < 50$  kHz, and must be used carefully as performance is affected by the duty cycle of the  $384 f_s$  system clock.

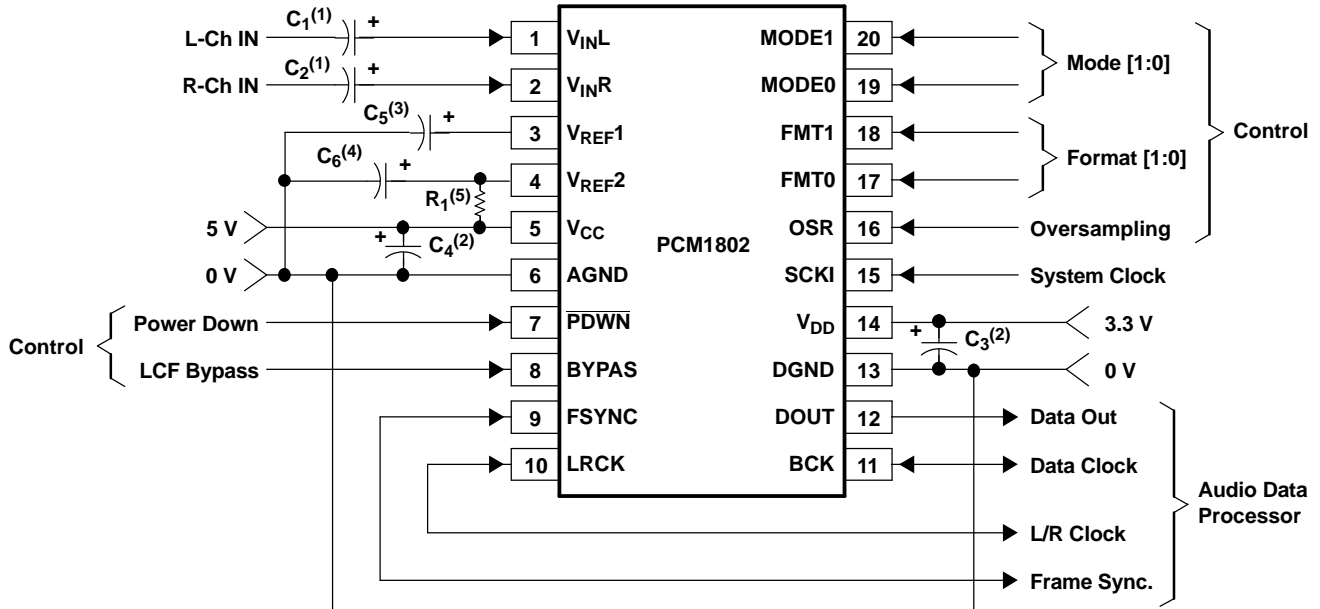

#### Oversampling Control

OSR	OVERSAMPLING RATIO
LOW	$\times 64$
HIGH	$\times 128$ ( $f_s < 50$ kHz)

## APPLICATION INFORMATION

### Typical Circuit Connection Diagram

Figure 29 illustrates a typical circuit connection diagram in which the cutoff frequency of the input HPF is about 8 Hz.

S0026-02

- (1)  $C_1, C_2$ : A 1- $\mu\text{F}$  capacitor gives 8-Hz ( $\tau = 1 \mu\text{F} \times 20 \text{ k}\Omega$ ) cutoff frequency for input HPF in normal operation and requires a power-on settling time with a 20-ms time constant during the power-on initialization period.
- (2)  $C_3, C_4$ : Bypass capacitors, 0.1- $\mu\text{F}$  ceramic and 10- $\mu\text{F}$  tantalum, depending on layout and power supply
- (3)  $C_5$ : 0.1- $\mu\text{F}$  ceramic and 10- $\mu\text{F}$  tantalum capacitors are recommended.
- (4)  $C_6$ : 0.1- $\mu\text{F}$  ceramic and 10- $\mu\text{F}$  tantalum capacitors are recommended when using a noisy analog power supply. These capacitor are not required for a clean analog supply.
- (5)  $R_1$ : A 1-k $\Omega$  resistor is recommended when using a noisy analog power supply. This resistor is shorted for a clean analog supply.

**Figure 29. Typical Circuit Connection**

**APPLICATION INFORMATION (continued)****Board Design and Layout Considerations****V<sub>CC</sub>, V<sub>DD</sub> Pins**

The digital and analog power supply lines to the PCM1802 should be bypassed to the corresponding ground pins with 0.1- $\mu$ F ceramic and 10- $\mu$ F tantalum capacitors as close to the pins as possible to maximize the dynamic performance of the ADC.

**AGND, DGND Pins**

To maximize the dynamic performance of the PCM1802, the analog and digital grounds are not connected internally. These grounds should have low impedance to avoid digital noise feeding back into the analog ground. They should be connected directly to each other under the parts to reduce the potential noise problem.

**V<sub>IN</sub> Pins**

A 1- $\mu$ F capacitor is recommended as an ac-coupling capacitor, which gives an 8-Hz cutoff frequency. If a higher full-scale input voltage is required, it can be accommodated by adding only one series resistor to each V<sub>IN</sub> pin.

**V<sub>REF1</sub> Pin**

A ceramic capacitor of 0.1  $\mu$ F and an electrolytic capacitor of 10  $\mu$ F are recommended between V<sub>REF1</sub> and AGND to ensure low source impedance for the ADC references. These capacitors should be located as close as possible to the V<sub>REF1</sub> pin to reduce dynamic errors on the ADC references.

**V<sub>REF2</sub> Pin**

The differential voltage between V<sub>REF2</sub> and AGND sets the analog input full-scale range. A ceramic capacitor of 0.1  $\mu$ F and an electrolytic capacitor of 10  $\mu$ F are recommended between V<sub>REF2</sub> and AGND with the insertion of a 1-k $\Omega$  resistor between V<sub>CC</sub> and V<sub>REF2</sub> when using a noisy analog power supply. These capacitors and resistor are not required for a clean analog supply. These capacitors should be located as close as possible to the V<sub>REF2</sub> pin to reduce dynamic errors on the ADC references. Full-scale input level is affected by this 1-k $\Omega$  resistor, decreasing by 3%.

**DOUT Pin**

The DOUT pin has enough load drive capability, but locating a buffer near the PCM1802 and minimizing load capacitance is recommended if the DOUT line is long, in order to minimize the digital-analog crosstalk and maximize the dynamic performance of the ADC.

**System Clock**

The quality of the system clock can influence dynamic performance, as the PCM1802 operates based on the system clock. In slave mode, it may be necessary to consider the system-clock duty cycle, jitter, and the time difference between the system clock transition and the BCK or LRCK transition.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
