UM2041 User manual

How to use the STEVAL-WESU1

Introduction

The STEVAL-WESU1 system reference design represents a highly efficient and effective solution for precise motion sensing in wearable applications.

The system embeds a low power ARM Cortex-M3 microcontroller unit (STM32L151VE), an iNEMO inertial module (LSM6DS3), a high performance magnetometer (LIS3MDL), a barometric pressure sensor (LPS25HB), a Bluetooth® low energy wireless network processor (BLUENRG-MS) and power management circuitry that allows fast charging and precise energy estimation (STNS01 and STC3115).

The connectivity, granted by the best in class BLUENRG-MS and supported by the integrated balun (BALF-NRG-01D3), combines maximum RF performance with low area occupancy and design effort. The system has passed the RF Test for FCC certification (FCC ID: S9NWESU1) and IC certification (IC ID: 8976C-WESU1).

STEVAL-WESU1 FW provides a complete framework to build wearable applications, using inertial and environmental sensor drivers, battery profile measurements, and Bluetooth low energy for data communication. It is built on the STM32Cube™ framework, which facilitates customization and the integration of further middleware algorithms.

An application layer based on the BlueST protocol (see *Section 5: "BlueST Protocol SDK"*) streams data from different devices (inertial and environmental sensors plus battery devices and RSSI) and algorithms, while a serial console over BLE allows control over the configuration parameters of the connected boards.

An ST-WESU™ app based on the the BlueST protocol logs all sensor data and provides demos for algorithms, battery detection and RSSI levels. It includes a command line interface through a debug console, allowing further control via internal permanent and session setting registers.

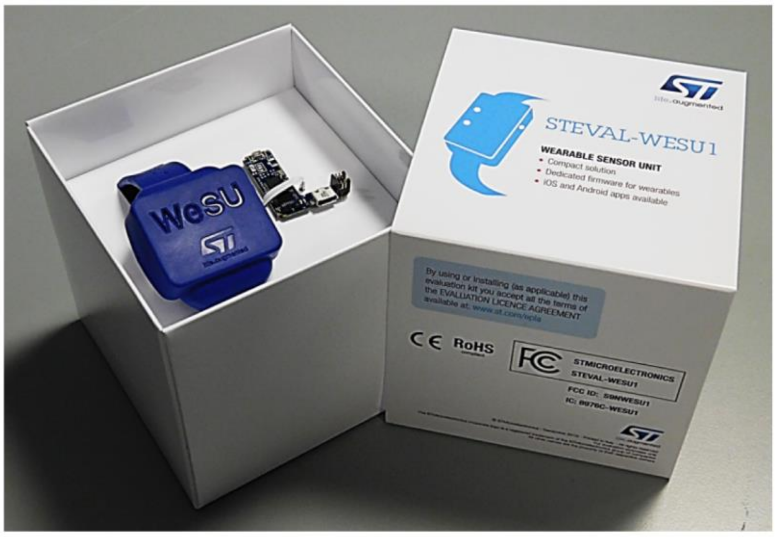
List of figures

1 Getting started

The STEVAL-WESU1 is a system reference design for users wanting to develop wearable applications, with every element of the system designed to accelerate the development process: from embedded end-customer devices to mobile software development.

Inside the STEVAL-WESU1 package, you will find all the main components that you need to experience the demo on our special platform firmware and dedicated mobile app.

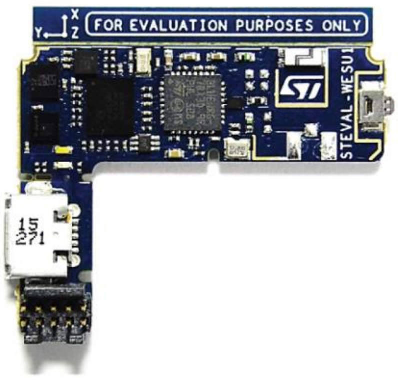
Figure 2: Inside the STEVAL-WESU1 package



The package includes:

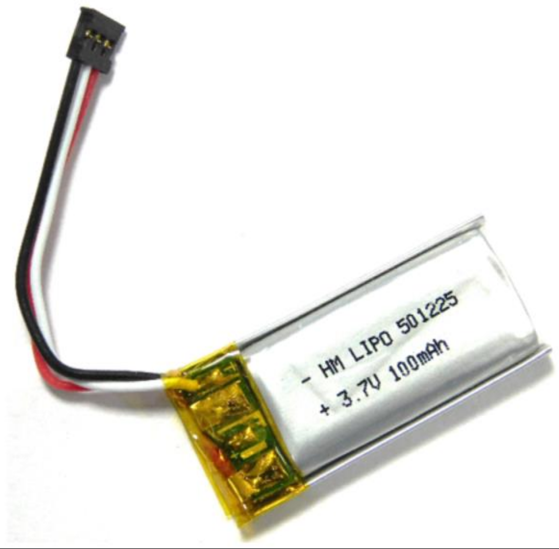
- One STEVAL-WESU1 reference design board (max. 35X30 mm size)

Figure 3: STEVAL-WESU1 board



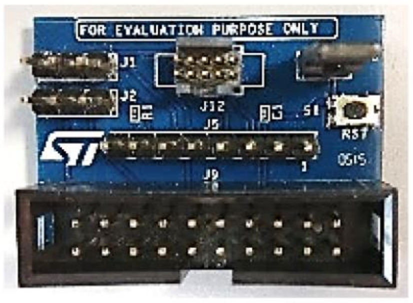
- One LiPo 100mAh battery (UN38.3 certified)

Figure 4: LiPO battery



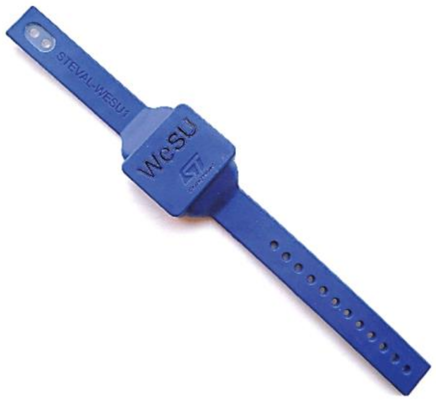
- ST-LINK adapter and cable

Figure 5: STEVAL-WESU1 SWD adapter



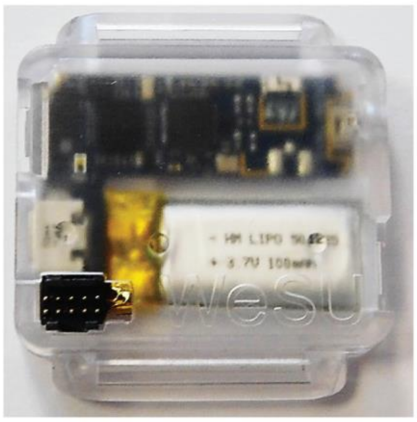
- Silicone wristband with fastening clip

Figure 6: STEVAL-WESU1 silicone wristband



- Moulded plastic board and battery case

Figure 7: Plastic case housing the STEVAL-WESU1 board



1.1 System setup guide

Follow these steps to assemble the kit:

1. Take the board and carefully remove the disclaimer tab (save it, as it contains the FCC and IC certification numbers).
2. Plug the battery to the connector on the back of the board.
3. Open the plastic case and carefully place the board with the battery inside it, taking care to align the user button with the external button hole. Put one of the two buttons on this hole and then snap the case shut.
4. Connect the USB cable to turn the board on for the first time, and verify that the red battery charging LED is lit.
5. Insert the plastic case inside the silicone wristband shroud and verify button operation by pressing it to shut the board down and once more to turn the board on again.
6. Fasten the wristband clip and enjoy the experience.

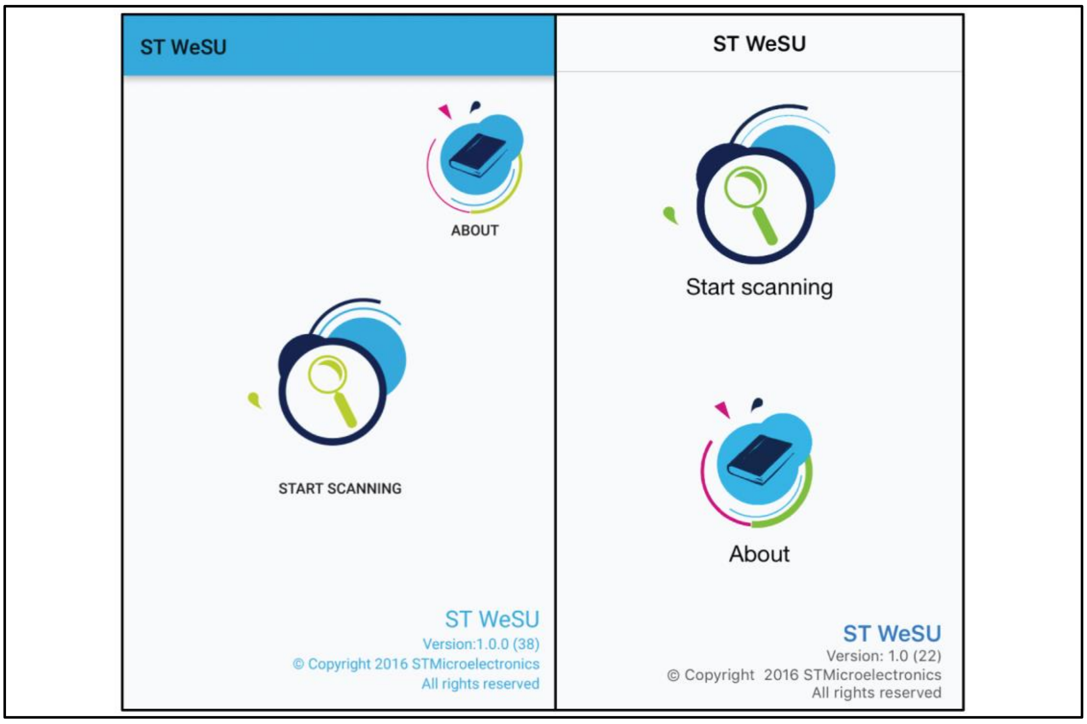
1.2 ST WeSU app setup

To visualize the information sent via Bluetooth low energy connectivity, install one of the following apps available for smartphones and tablets:

- ST WESU Android app available at Google Play™ store;
- ST WESU iOS app available at Apple Store™.

To install this app, you need a smartphone or tablet which supports BLE technology (4.0 or higher) (i.e., iPhone 4S/Android OS 4.3 and above).

Figure 8: ST WeSU Android iOS start page



Both versions of the app are based on a specific BlueST protocol SDK (see *Section 5: "BlueST Protocol SDK"*), which allows:

- Plotting and logging of the data from all of the sensors (supporting multiple connections)
- Sensor and algorithm demos (also with multiple connections)
- Battery/RSSI information
- Debug console for command line interface
- Configurable run time settings

1.3 System requirements

The STEVAL-WESU1 reference board requires:

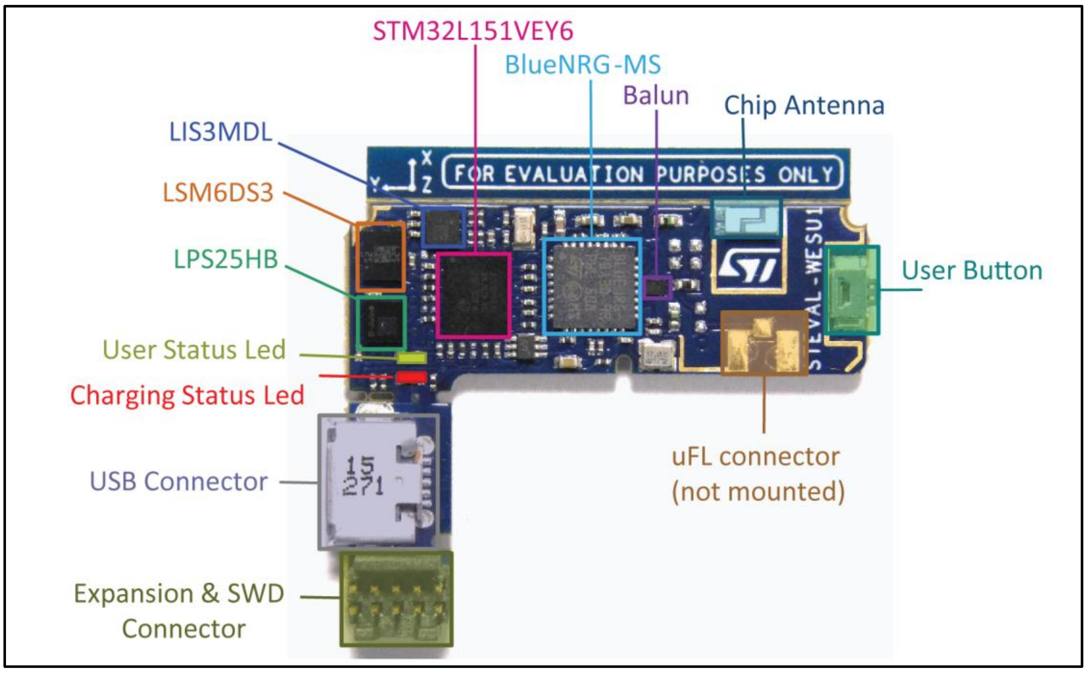
- A Windows™ (version 7, 8, 8.1 or 10) PC running an IAR, KEIL or System Workbench for STM32 firmware development environment
- One USB type A to micro B male cable to connect the STEVAL-WESU1 to the PC or wall adapter for power supply
- "ST-LINK/V2" (or equivalent) in-circuit debugger/programmer
- "ST-LINK utility" for binary firmware download (find the latest embedded software version on www.st.com).
- An Android (4.3 or higher) or iOS (8.0 or higher) smartphone or tablet with BLE technology (4.0 or higher).

2 STEVAL-WESU1 hardware description

The STEVAL-WESU1 has the following main components mounted on the top side:

- STM32L151VEY6, ultra-low-power ARM Cortex-M3 MCU with 512 Kbytes FLASH, 48kBytes of RAM in WLCSP100 package
- BLUENRG-MS, Bluetooth low energy (BLE) single-mode network processor, compliant with Bluetooth specification core 4.1
- BALF-NRG-01D3, 50 Ω balun for BLUENRG-MS transceiver with integrated harmonic filter
- LSM6DS3, iNEMO inertial module 3D accelerometer (±2/4/8/16g) + 3D gyroscope (±125/245/500/1000/2000dps)
- LIS3MDL, MEMS 3D magnetometer (±4/8/12/16 gauss)
- LPS25HB, MEMS pressure sensor, 260-1260 mBar absolute digital output barometer
- USBULC6-2M6 ultra large bandwidth ESD protection
- External oscillator LSE (32kHz) and HSE (24MHz) for the STM32L151VEY6
- User button, white user LED and red charging LED
- USB, SWD and uFL connector (not mounted)
- chip antenna

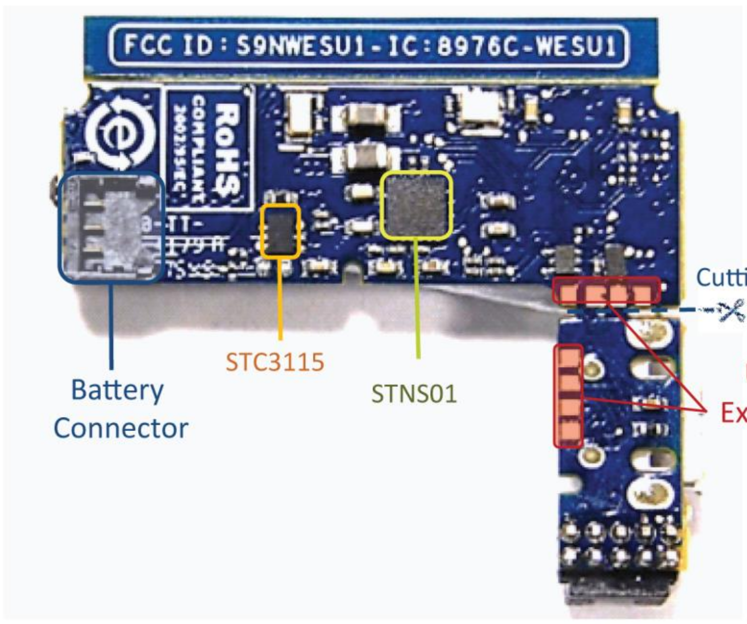
Figure 9: STEVAL-WESU1 top side components



On the bottom side, the following main components are mounted:

- STC3115, gas gauge IC with alarm output
- STNS01, Li-Ion linear battery charger
- Battery connector
- External oscillator low speed (32 kHz) and high speed (32 MHz) for BlueNRG-MS.

Figure 10: STEVAL-WESU1 bottom side components



2.1 STEVAL-WESU1 board connections

The STEVAL-WESU1 includes several hardware connectors described below:

- micro-USB female plug, plus the same pins exposed in bottom pads.
- SWD connector (1.27 mm pitch)
- Battery connector

Figure 11: STEVAL-WESU1 top and bottom side board connections

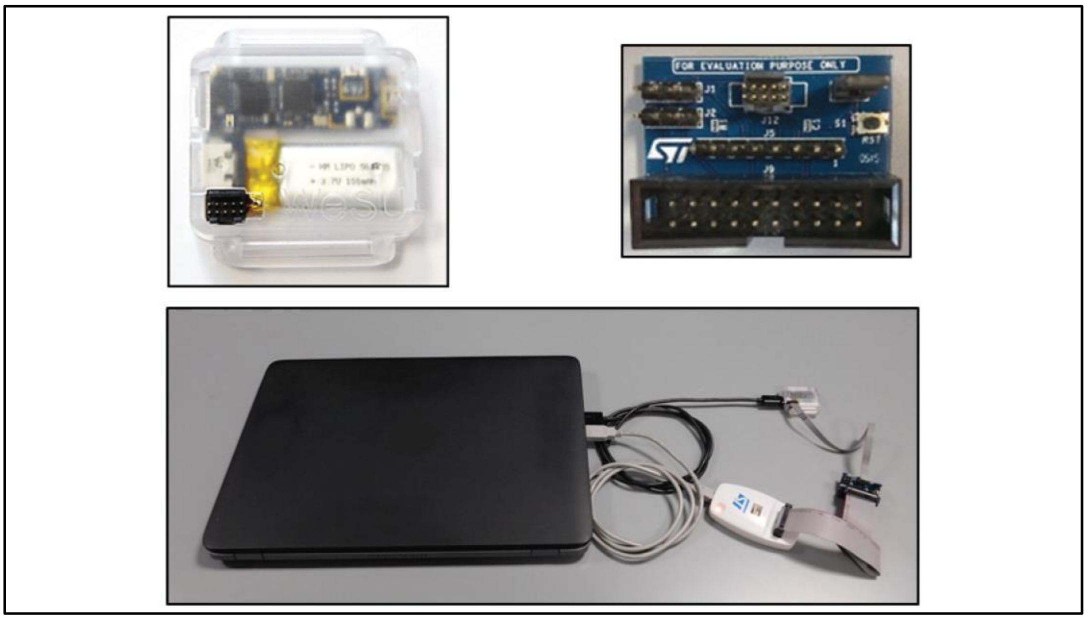
USB Exposed Pad

2.2 ST-LINK connections

The ST-LINK V2 programmer is required to update the firmware. Plug the cable (with adapter, bundled with the package) to the board and then connect the laptop as shown below.

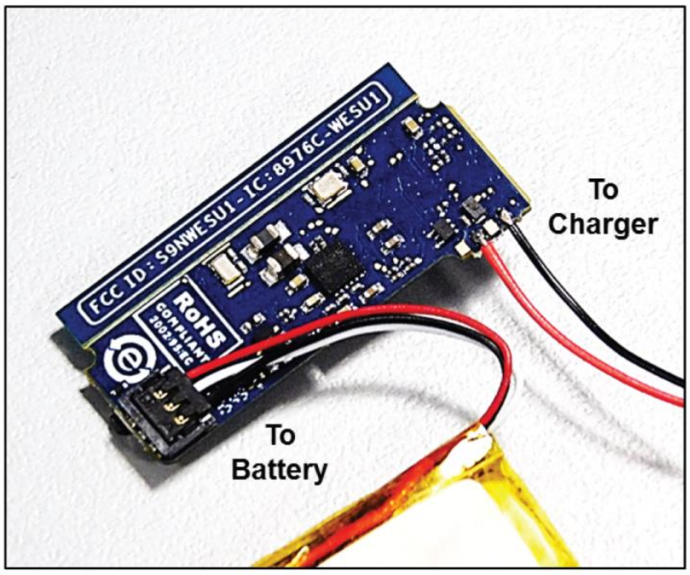
Figure 12: ST-Link connection using the adapter



2.3 Exposed pad connectors

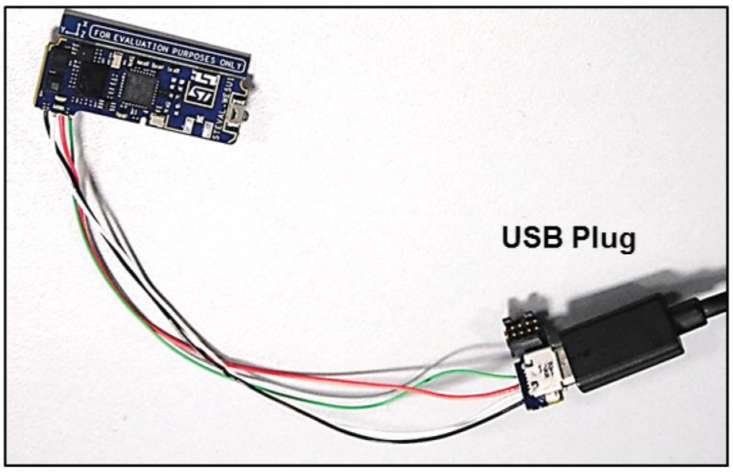
The STEVAL-WESU1 form factor can be reduced by cutting off the PCB tab hosting the USB and expansion connectors; the exposed pads on the bottom can be wired to the charger, as shown in the figure below:

Figure 13: STEVAL-WESU1 exposed pad connections for battery charging



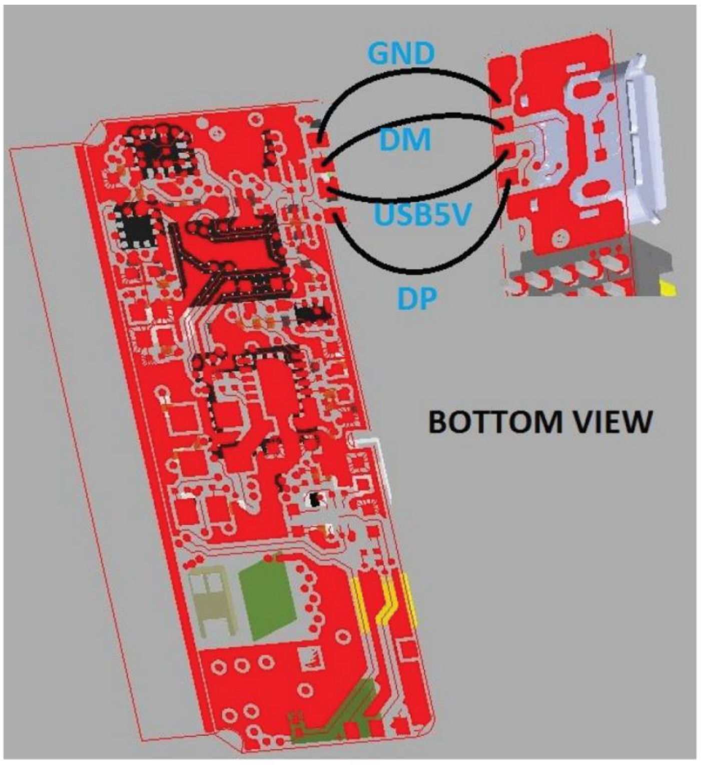
The exposed external pads can also be used to upgrade the firmware via USB using the DFU strategies with the simple four-wire connection shown below.

Figure 14: USB plug with external USB connector for DFU update



The USB feature is accessible via the exposed pads on the bottom of the PCB using the cable connection shown below:

Figure 15: USB connection with external plug after cutting



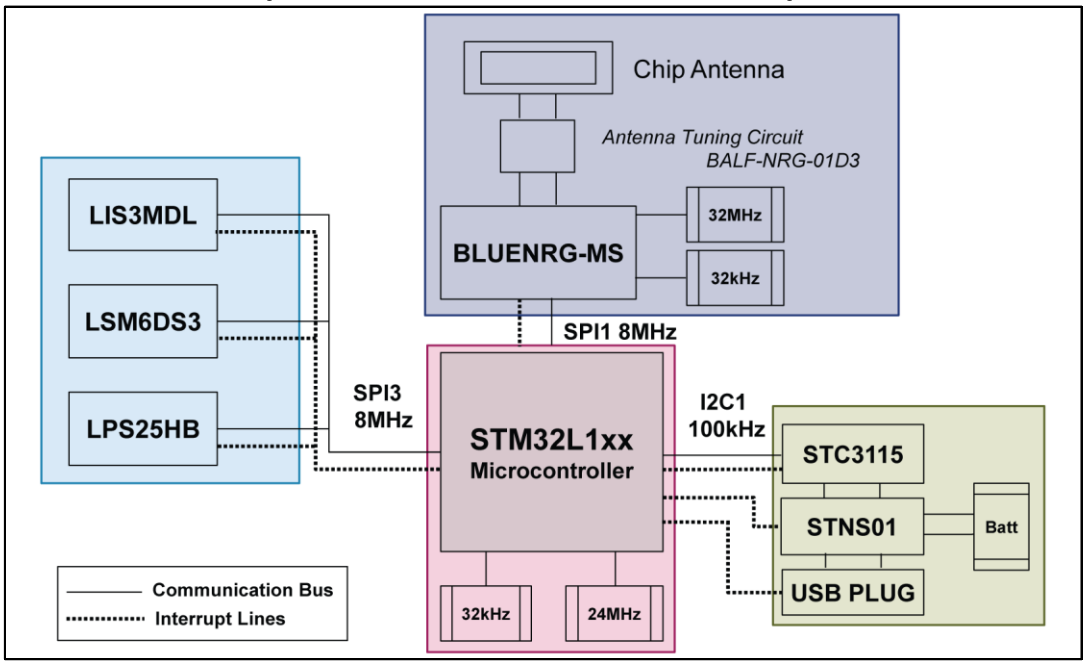
2.4 Hardware architecture

The whole system can be described in four separate functional subsystems:

- Microcontroller
- Sensors
- Connectivity
- Battery management

The sensors and the BLUENRG-MS devices are connected to the microcontroller through two separate SPI peripherals, while the power management is driven via an I²C peripheral and GPIOs.

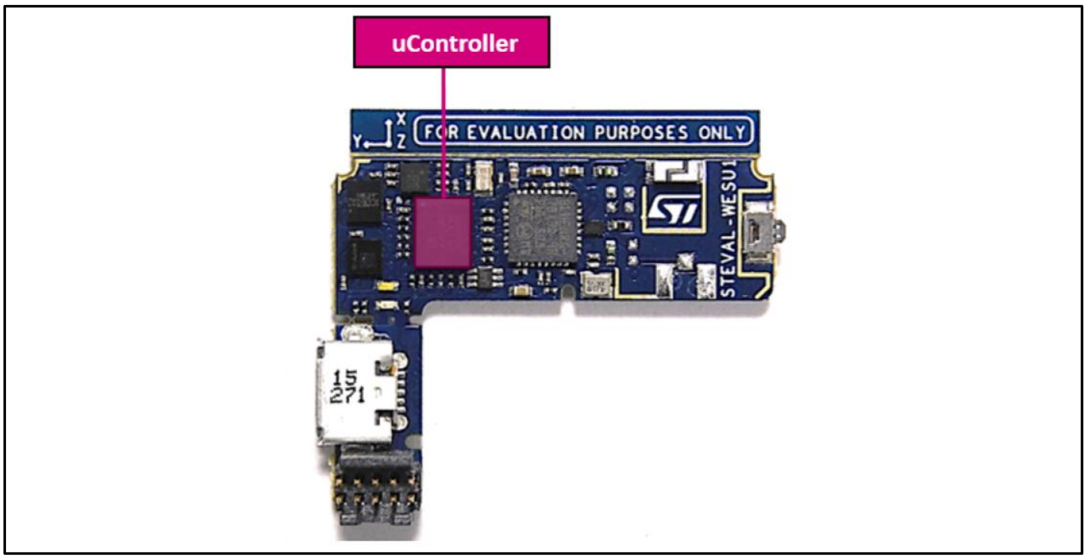
Figure 16: STEVAL-WESU1 functional block diagram



2.4.1 Microcontroller

STM32L151VEY6 is an ultra-low-power microcontroller unit based on the ARM® Cortex®-M3. It features a wide range of low power modes and voltage scaling for excellent power saving capabilities.

Figure 17: Microcontroller subsystem



2.4.1.1 SWD Connector and external peripheral connections

The STEVAL-WESU1 is equipped with a custom 10 pin connector (1.27 mm pitch), which can be used:

- To program the microcontroller via a dedicated adapter connected to the programming tool (like ST-Link)
- As an expansion connector to allow user access to other board features, as described in the following table

Figure 18: SWD connector and external peripheral connections

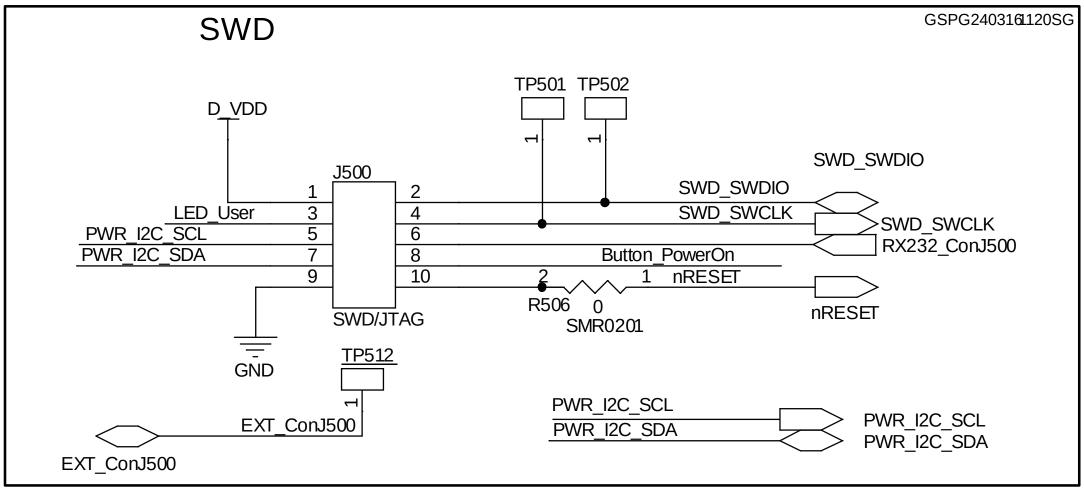


Table 1: Expansion connector GPIO description

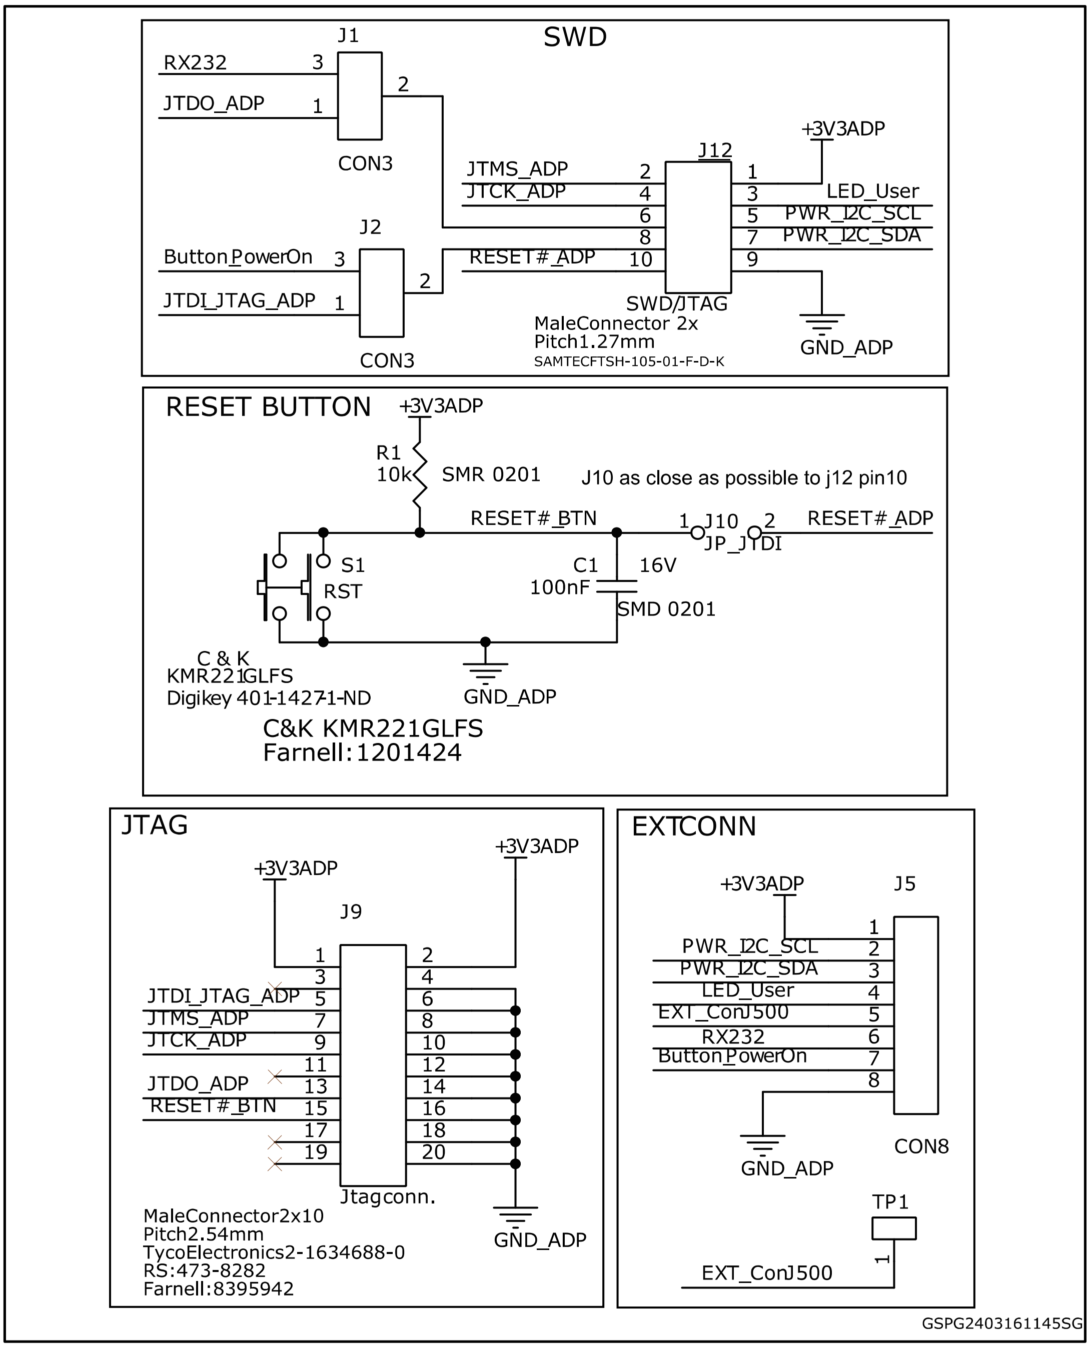
Exp. Pin J500	Port/Pin	Default Func.	I²C	USART	PWM	ADC
3	B0	User LED			TIM3CH3	ADC_CH8
5	B8	PWR_I2C_SCL	I2C1_SCL			
6	A3	-		USART2_RX	TIM2CH4	ADC_CH3
7	B9	PWR_I2C_SDA	I2C1_SDA			
8	A2	Push Button		USART2_TX	TIM2CH3	ADC_CH2

2.4.1.2 Programming adapter

Figure 19: Programming adapter description



The programming adapter can be used as an in-circuit debugger/programmer connection through J9 or as an expansion connector through J5.

It is equipped with the following jumpers:

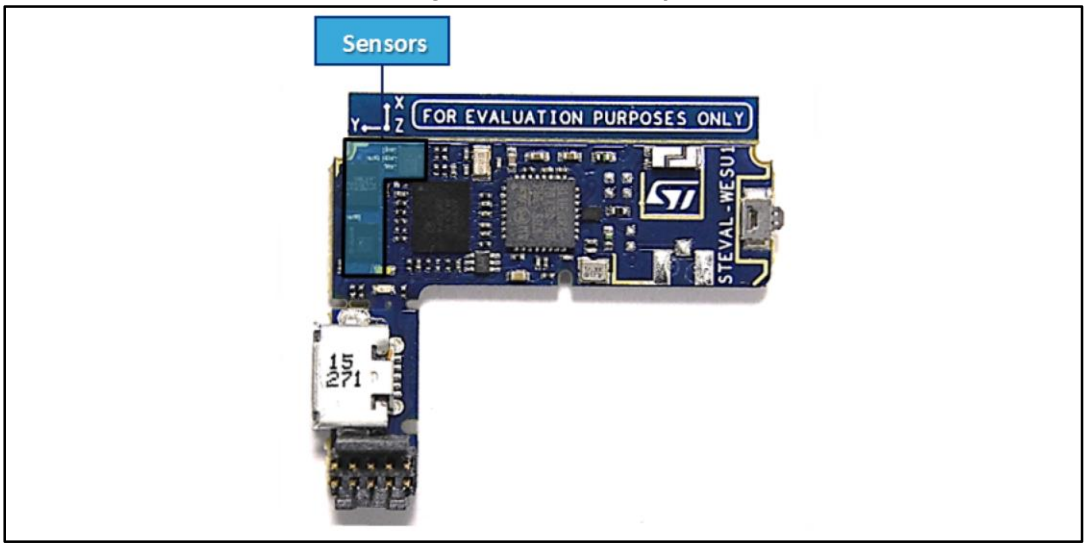
- **J1 and J2 for the UART**: J1 and J2 must be set to the 2-3 position in order to use the J5 connector for signal monitoring on an oscilloscope or external connections through J5. Position 1-2 is reserved.

- **J10 (single position) for reset pin connection**: J10 must be fitted to enable the programmer tool to reset the microcontroller; this also enables the S1 reset button.if you connect the adapter to WeSU board with J10 fitted, a reset command is issued.

2.4.2 Sensors

The integrated sensors are perfect for motion algorithms in wearable motion tracking, featuring extremely low power capabilities and advanced performance in terms of accuracy and embedded digital features.

Figure 20: Sensor array



2.4.2.1 LSM6DS3

The LSM6DS3 is a system-in-package featuring a 3D digital accelerometer and a 3D digital gyroscope performing at 1.25 mA (up to 1.6 kHz ODR) in high performance mode and enabling always-on low-power features for an optimal motion experience for the consumer. Up to 8 Kbyte of FIFO with dynamic allocation of significant data (i.e., external sensors, timestamp, etc.) allows overall system power saving.

ST’s family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes.

The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element. The LSM6DS3 has a full-scale acceleration range of ±2/±4/±8/±16 g and an angular rate range of ±125/±245/±500/±1000/±2000 dps.

High robustness to mechanical shock makes the LSM6DS3 the preferred choice of system designers for the creation and manufacturing of reliable products. The LSM6DS3 is available in a plastic land grid array (LGA) package.

2.4.2.2 LIS3MDL

The LIS3MDL is an ultra-low-power high performance three-axis magnetic sensor. The LIS3MDL has user-selectable full scales of ±4/ ±8/ ±12/±16 gauss.

The device may be configured to generate interrupt signals for magnetic field detection. The LIS3MDL includes an I²C serial bus interface that supports standard and fast mode (100 kHz and 400 kHz) and SPI serial standard interface.

The LIS3MDL is available in a small thin plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range of -40 °C to +85 °C.

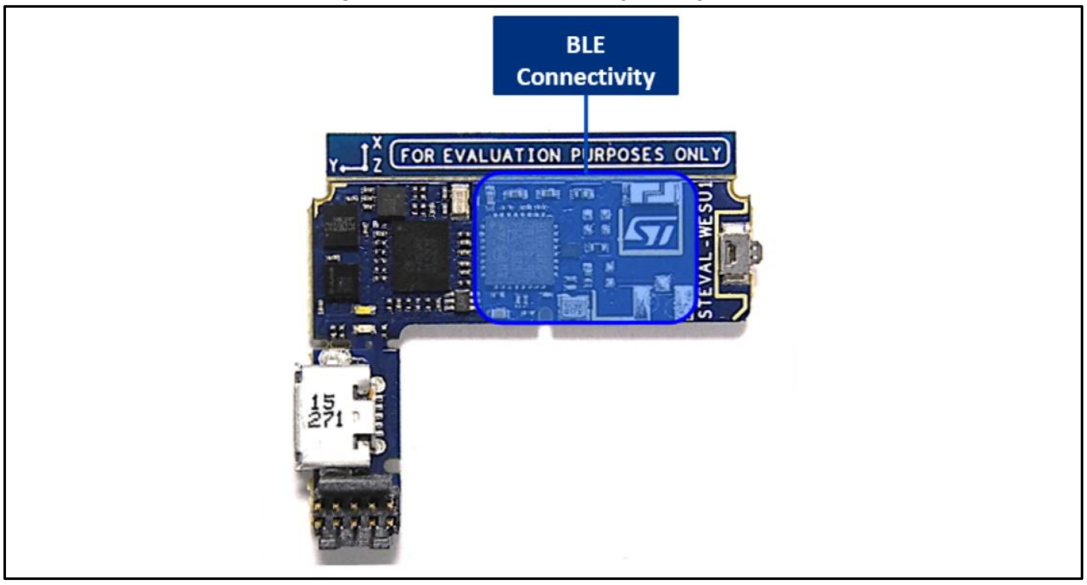
2.4.2.3 LPS25HB

The LPS25HB is an ultra-compact absolute piezo-resistive pressure sensor with an absolute range from 260 to 1260 hPa. It includes a monolithic sensing element and an IC interface able to take the information from the sensing element and to provide a digital signal to the external world.

Thanks to its high accuracy (1 Pa RMS, 24-bit ADC resolution), its bandwidth (1 – 25 Hz) and its very low power consumption (4 µA low power mode, 25 µA high performance mode), the integration of this sensor is suitable for height estimation (e.g., VRU vertical reference unit) and to enhance standard IMU performance with a high frequency altitude reference.

2.4.3 Bluetooth low energy connectivity

Figure 21: BLE connectivity subsystem



2.4.3.1 BLUENRG-MS and BALF-NRG-01D3

The BLUENRG-MS is a very low power Bluetooth low energy (BLE) single-mode network processor, compliant with Bluetooth specification v4.1. The BLUENRG-MS can act as master or slave. The entire Bluetooth low energy stack runs on the embedded Cortex M0 core. The non-volatile Flash memory allows on-field stack upgrading.

The BLUENRG-MS allows applications to meet the tight advisable peak current requirements imposed with the use of standard coin cell batteries. The maximum peak current is only 8.2 mA at 0 dBm of output power. Ultra low-power sleep modes and very short transition times between operating modes allow very low average current consumption, resulting in longer battery life. The BLUENRG-MS offers the option of interfacing with external microcontrollers using the SPI transport layer.

BALF-NRG-01D3 is a 50Ω conjugate match to BLUENRG-MS (QFN32 package) that integrates balun transformer and harmonics filtering. It features high RF performance with a very small footprint and RF BOM reduction. It has been chosen as the best trade-off between cost, size and high radio performance. The layout is optimized to suit a 4-layer design and a chip antenna.

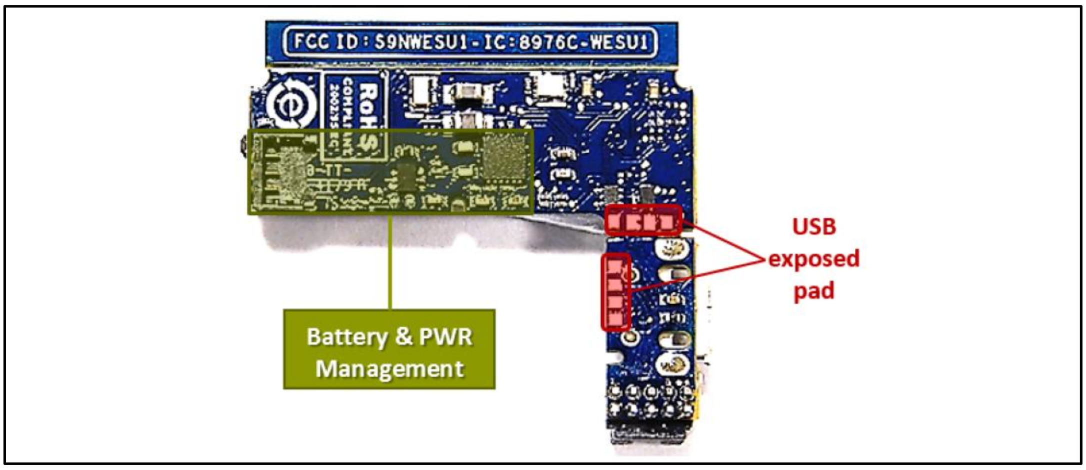
2.4.3.2 uFL connector

The uFL connector U201 (not mounted) is connected to the BLUENRG-MS RF path through C206 (not mounted). By soldering a 51 pF capacitor and desoldering L204, the uFL connector RF path can be activated; this is useful for debugging.

2.4.4 Battery and power management

The power management system allows USB battery charging with the STNS01 USB battery charger; battery level information is provided by the STC3115 device.

Figure 22: Battery and power management subsystem



2.4.4.1 STNS01

The STNS01 is a linear charger for single-cell Li-Ion batteries.

In the STEVAL-WESU1 system, it is configured as a battery charger and also functions as a power path switch between the USB power source and the battery power source.

The STNS01 battery charger is designed to charge single cell Li-Ion batteries up to 4.2 V using a CC-CV charging algorithm (see the STNS01 datasheet for more details). When a valid input voltage is detected, the STNS01 starts the charge cycle and the CHG pin switches from high impedance to low level. The CHG pin is connected to LED2 to monitor the charger.

The charging status LED (LED 2) can be:

- steady ON: the USB plug is correctly connected and the board is charging
- steady OFF: the board is not charging; reconnect the USB cable to force a re-start)
- flashing: charging failure (e.g., overtemperature, three-wire battery not connected), or battery not present.

The SYS pin is the voltage output of the STNS01 selected power path. This pin is connected to the linear voltage regulator providing VDD to all other devices.

The STM32L151VE is also connected to its SHDN pin to disconnect the power delivery to most of the devices and enable the shipment mode.

2.4.4.2 STC3115

The STC3115 includes the hardware functions required to implement a low-cost gas gauge for battery monitoring. The STC3115 uses current sensing, Coulomb counting and accurate measurements of the battery voltage to estimate the state-of-charge (SOC) of the battery. An internal temperature sensor simplifies implementation of temperature compensation.

An alarm output signals a low SOC condition and can also indicate low battery voltage. The alarm threshold levels are programmable.

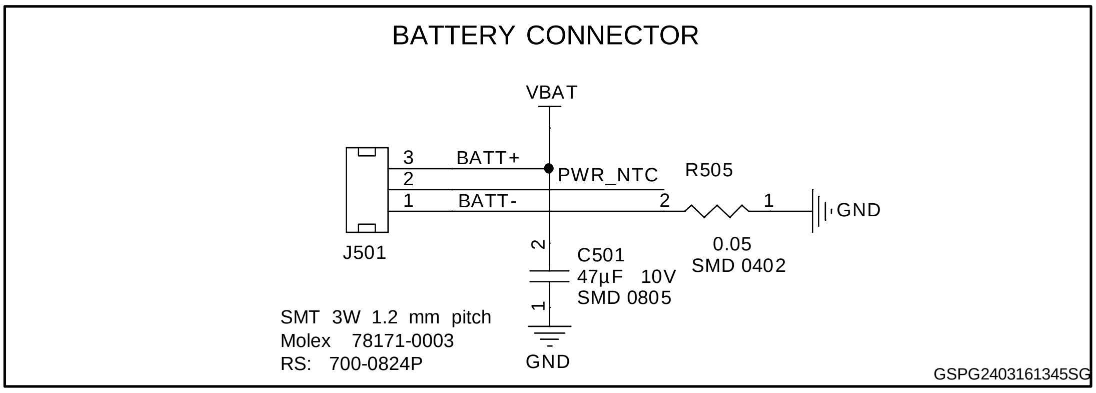
The STC3115 offers advanced features to ensure high performance gas gauging in all application conditions.

2.4.4.3 Battery connector

Battery connector is placed as shown in *Figure 11: "STEVAL-WESU1 top and bottom side board connections"*, and the hardware connection is as shown in the figure below.

Resistor R505 is placed as close as possible to this connector in order to sense the battery current more accurately, the value of which is then monitored by the STC3115 device.

Figure 23: Battery connector

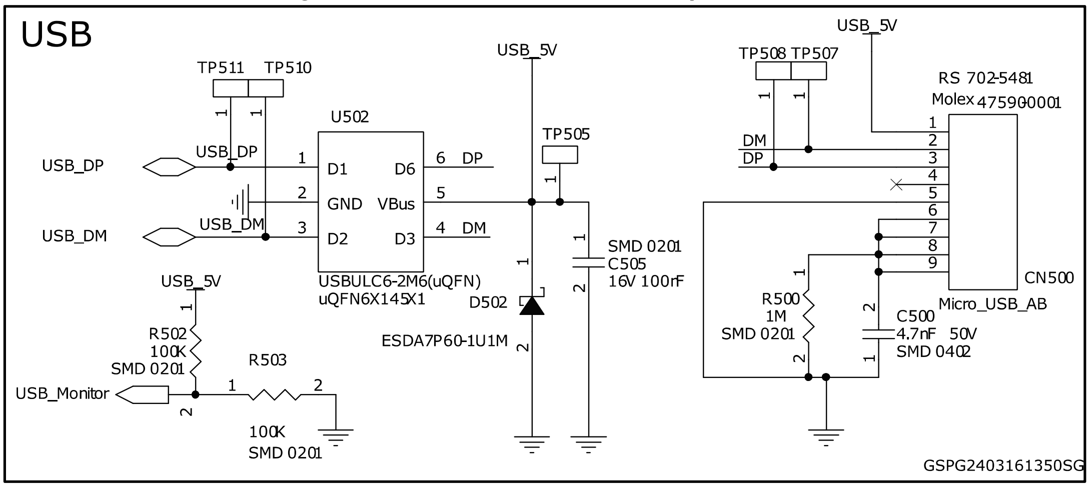


2.4.4.4 USB connector

The USB connector accepts a micro USB type B and it is used to charge the battery and to power the board even if battery is not present.

The USBULC6-2M6 ESD protection just after the USB connector, avoids any voltage spike damages, due to the plug operations, towards all the devices powered.

Figure 24: USB connector with ESD protection



3 STEVAL-WESU1 Firmware

3.1 Overview

This firmware package expands the functionality of the STM32Cube platform adding the following features to build a wearable application:

- Complete mid-level driver set necessary to build applications using pressure and temperature sensor (LPS25HB) and motion sensors (LIS3MDL and LSM6DS3)
- Data logger sample application about inertial and environmental sensors measurements, battery profile measurements, and algorithm demos. The data acquisition from different sensors is provided via SPI, and battery charging profile via I2C.
- Complete middleware to easily communicate with a BLE client application using a proprietary protocol (BlueST Protocol SDK).
- Low power setting configurable by app.
- Command line interface (CLI) using a debug console by app.
- Configuration interface: using EEPROM (permanent) and RAM (session) settings.
- OTA/USB-DFU: Firmware upgrade over the air through BLE connectivity (using BlueST APP) or USB IF.
- Node locked license terms for open.MEMS algorithms.

3.2 Architecture

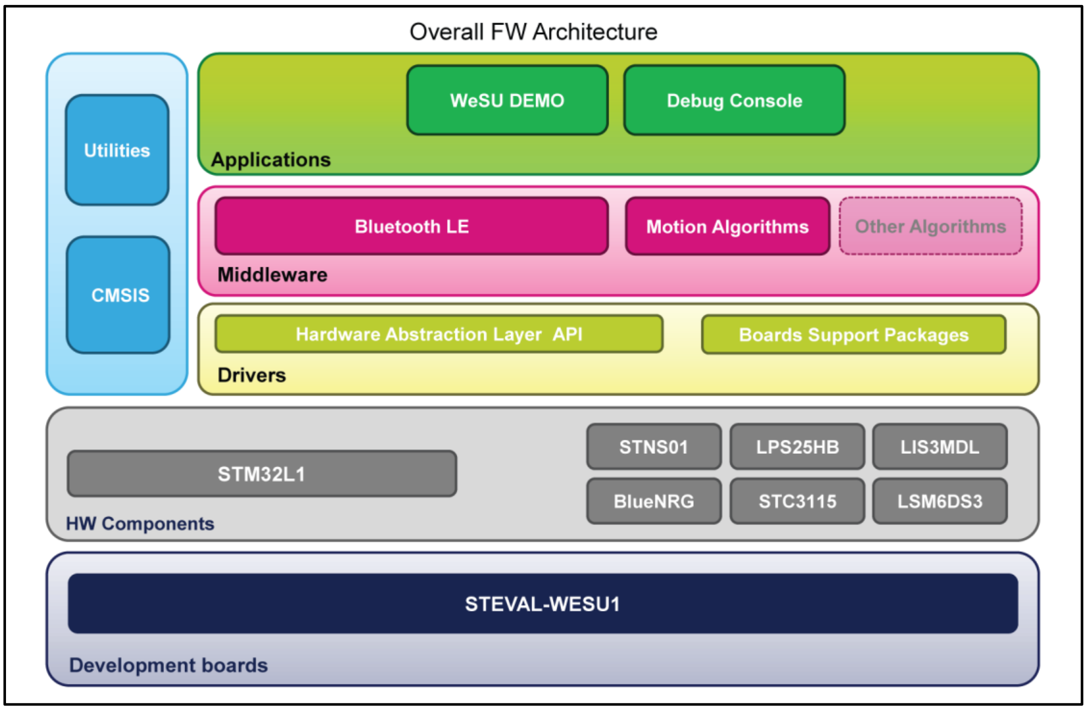
The firmware is based on the STM32Cube™ framework technology developed to build applications with the STM32 microcontroller.

The package provides a board support package (BSP) for the sensors and the middleware components for Bluetooth low energy communication with any external mobile device.

The firmware driver layers to access and use the hardware components are:

- **STM32Cube HAL layer**: simple, generic, multi-instance APIs (Application Programming Interfaces) which interact with the upper layer applications, libraries and stacks. These APIs are based on the common STM32Cube framework so other layers like the middleware layer can function without requiring specific hardware information for a given microcontroller unit (MCU). This structure improves library code reusability and guarantees easy portability across other devices.
- **Board support package (BSP) layer**: provides firmware support for the STM32 Nucleo board (excluding MCU) peripherals. These specific APIs provide a programming interface for certain board specific components like LEDs, user buttons, etc., but can also be used to fetch board serial and version information, and support initializing, configuring and reading data from sensors. The **BSP** provides the drivers for the STEVAL-WESU1 board peripherals, adding the connections to the microcontroller peripherals.

Figure 25: STEVAL-WESU1 firmware architecture



These specific APIs provide a programming interface for the on-board peripherals, but they can also be used to provide user support for initializing, configuring and reading data from communication buses, specific to STEVAL-WESU1.

This helps the user build the firmware using specific APIs for the following hardware subsystems:

- **BNRG**: to control connectivity
- **Platform**: to control and configure all the devices in the battery and power subsystem plus button, LEDs and GPIOs
- **Sensors**: to link, configure and control all the sensors

Embedded firmware library version information is included in “Release_Notes.html”.

3.3.1 Documentation

Contains a compiled HTML file generated from the source code and documentation that describes the firmware framework, drivers for the on-board components and APIs to manage all the different functions. See the “STEVAL-WESU1_FW.chm” manual for further details.

3.3.2 Drivers

All firmware packages adhering to the STM32CUBE framework contain the following main groups:

- **BSP**: the board specific drivers for whole the HW components
- **CMSIS**: vendor-independent hardware abstraction layer for ARM Cortex-M series.
- **STM32L1xx_HAL_Drivers**: microcontroller HAL libraries

Figure 27: firmware drivers folder

3.3.4 Projects folder

This directory contains a “Demonstrations” folder with a project that directly supports the ST WeSU app and an “Examples” folder with a project providing reference firmware.

With the ST WeSU app on an Android or iOS device, it is easy to display sensor and algorithm data in customized plots or demos.

The demonstration firmware aims to provide the functions available in the ST WeSU app, according to the BlueST protocol (see *Section 5: "BlueST Protocol SDK"*).

To set up a suitable development environment for creating applications for the STEVAL-WESU1, the projects are available for the following environments:

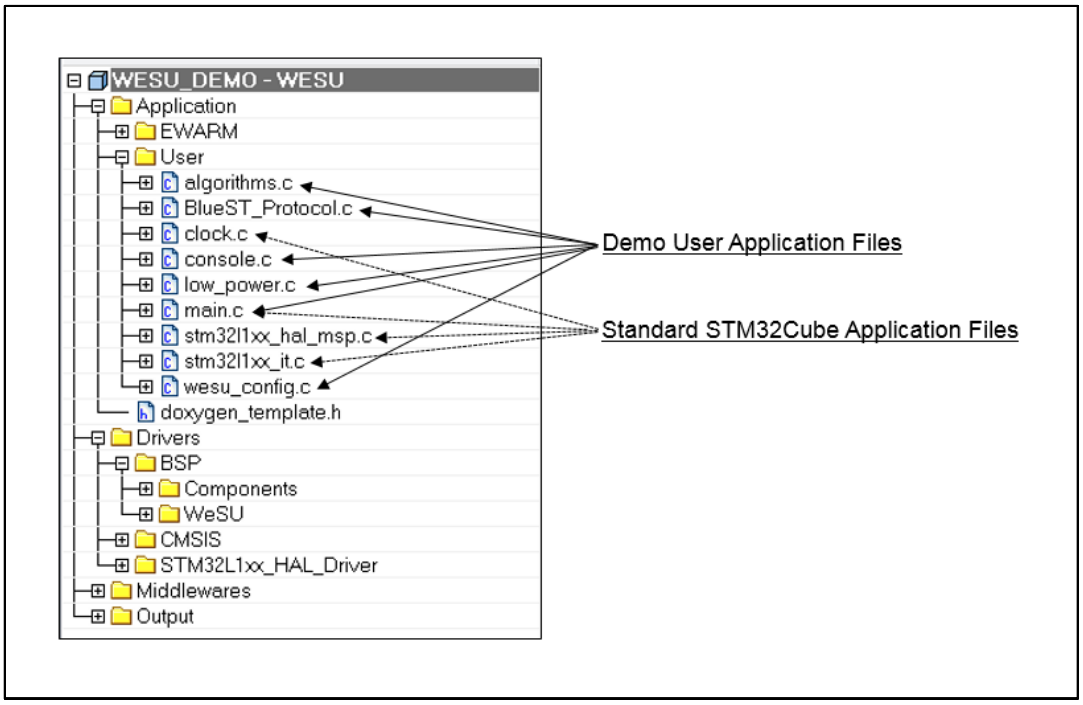
- **IAR** Embedded Workbench for ARM® (**EWARM**)
- **KEIL** RealView Microcontroller Development Kit (**MDK-ARM**)
- **System Workbench** for STM32 (**SW4STM32**)

3.3.5 Demonstration firmware overview

Typical demonstration firmware developed from the STM32Cube framework is found in an application folder containing the files groups described below:

- Demo user application files
- Standard STM32Cube application files

Figure 31: Demo application folder



The demo application files include all the functions to support the ST WeSU mobile app:

- **algorithms.c**: APIs to perform configuration, initialization, run, and processing for the algorithms included in the middleware.
- **BlueST_Protocol.c:** APIs to support the BlueST SDK protocol (see *Section 5: "BlueST Protocol SDK"*) in terms of service, characteristics, and data transmission/reception with BLE.
- **console.c**: APIs to provide the CLI commands for the debug console.
- **low_power.c:** APIs to configure the low power modes for the system
- **main.c**: The main demonstration routine including the top-level APIs
- **wesu_config.c:** APIs to configure, initialize, and check system-level functions and to control the permanent and session registers.

The standard STM32Cube application files have the same configuration as any standard example using the STM32 HAL libraries, with the simple addition of the peripherals used for the demo purposes in the following files:

- clock.c
- main.c
- stm32l1xx_hal_msp.c
- stm32l1xx_hal_it.c

3.3.5.1 Demo main

The main file includes the following functions:

- `HAL_Init`: configures the FLASH prefetch, time base source, NVIC and HAL low-level driver APIs
- `Error_Handler`: executed in case of error
- `HAL_Delay`: commonly used in any standard HAL example to provide an accurate delay (in milliseconds) based on the SysTick timer as time base source; in this case, it is a user file implementation using the _WFI instruction
- `RTC_Config`: configures RTC prescaler and data registers

- `RTC_TimeStampConfigDefault`: configures the default time and date
- `SystemClock_Config_APP_STARTUP`: configures the main system clock; suitable for application using one of the following clock configuration functions:
  - `SystemClock_Config_HSI_32MHz`
  - `SystemClock_Config_RTC_HSE32MHz`
  - `SystemClock_Config_HSI_12MHz`
  - `SystemClock_Config_HSE_18MHz`
  - `SystemClock_Config_MSI_2MHz`
- `DebugConfiguration`: configures debug facilities
- `User_Init`: initializes all the firmware sub-blocks used by the `User_Process` function; specifically, it:
  - Initializes register management
  - configures LED GPIO, button GPIO and EXTI Line
  - configures the RTC
  - initializes all the devices in the PWR Subsystem
  - initializes the BlueNRG subsystem management
  - initializes the sensor subsystem management
  - initializes all the algorithms
- `User_Process`: controls the process which is continuously executed in the main loop; specifically, it executes the following actions:
  - get data time to use RTC as calendar
  - backup and save the system parameters
  - switch the system in run mode
  - manage the LED in order to give different feedback for each step executed
  - get all the sensors data
  - execute the algorithms
  - control the BLE connection
  - manage the debug console
  - control the low power transitions using the user button or the app
- `Read_Sensors`: checks whether the sensor is enabled in the configuration registers. If enabled, get the data and save the value directly in the corresponding session registers
- `ManageBleConnection`
  - check BLE connection
  - update the connection parameters
  - update the sensors and other data to be sent through BLE, according to the corresponding configuration
- `HCI_Process`: BlueNRG HCI provides a standard interface for accessing the capabilities of the Bluetooth controller and BlueNRG LE stack.
- `Main`: uses the predefined APIs to execute the principal process and perform the demo application. This procedure allows the user to execute the most important `User_Process` function, the interval in ms is adjusted using the “nTimerFrequency” value. The functions executed include:
  - `HAL_Init()`;
  - `SystemClock_Config_APP_STARTUP()`;
  - `DebugConfiguration()`;
  - `User_Init()`;
  - `DBG_PRINTF(Firmware version)`;
  - `APP_BSP_LED_Off(LED)`;

– Infinite loop: `HCI_Process()`; check if the timestamp has increased by the value “nTimerPeriod”; `User_Process()`; `HAL_Delay` (1 ms)

3.3.5.2 BLE services

This firmware uses three Bluetooth services:

- `HW_Features_Service`: transmits hardware characteristics, including:
  – Temperature
  – Pressure
  – Battery voltage, battery current, battery SOC, battery status
  – 3D gyroscope, 3D magnetometer, 3D accelerometer
  – Sensor fusion data (AHRS values)
  – Algorithm1 data (activity recognition)
  – Algorithm2 data (carry position)
  – Algorithm3 data (Pedometer provided by HW using LSM6DS3)
  – Algorithm4 data (FreeFall provided by HW using LSM6DS3)
- `Configuration_Service`: for configuration management according to the BlueST protocol:
  – Register management characteristics
- `Console_Service`: to transmit two main characteristics:
  – Terminal
  – Stderr

This package is compatible with the ST WeSU Android/iOS application (Version 1.0 and above) available at Google Play/Apple Store, respectively.

This application can be used to display information sent with the BlueST SDK Protocol (*Section 5: "BlueST Protocol SDK"*).

3.3.5.3 Memory mapping

The demo application firmware is developed in order to provide all the functions necessary to support mobile app data streaming, remote configuration settings, and firmware upgrade using DFU or OTA.

To provide these features, specific firmware memory mapping has been implemented as in the following tables.

Table 2: Memory mapping

Memory type	Section	Start address	End address	Size (bytes)	Definition
INTERNAL FLASH (512K)	USB DFU[1]	0x08000000	0x08002FFF	12 K	DFU using USB connection
	Reset Manager	0x08003000	0x080037FF	2 K	Application OTA management
	Service manager[2]	0x08003800	0x08007FFF	18 K	OTA (over the air) firmware upgrade
	BlueNRG GUI	0x08008000	0x0801FFFF	96 K	BlueNRG GUI USB-BlueNRG bridge
	Application	0x08020000	0x0807FFFF	384K	Application Used for application firmware code: Demo application or Sensor example

Notes:

[1]Activation through the APP, using settings page or at startup/reboot, pressing the button for at least 3 seconds

[2]Activation through the APP, using settings page or at startup/reboot, without USB cable connection, pressing the button during the first led blink

Internal EEPROM and RAM are used for the application; specific areas are dedicated for register implementation. The following features are directly adjustable with the mobile app (marked with a double asterix (**) in the following tables):

- configure and control the on-board functions related to the microcontroller, sensors, connectivity and power management..
- store the data from the sensors, battery charging devices and other on-board devices, including system status information.
- allow remote control via the mobile app using settings menu or debug console in the ST WeSU app.

Some information (e. g., the accelerometer full scale or output data rate settings) is stored in the permanent registers only, while other data (e. g., sensor output data) is stored in the session registers; some information (e. g., the timer setting) is stored in both locations for temporary and permanent modifications.

A detailed description of permanent and session registers is available in the STEVAL-WESU1.chm.

Table 3: Permanent register location

Memory type	Section	Start address	End address	Size (bytes)	Definition
INTERNAL EEPROM (16K)	USER EEPROM AREA	0x08080000	0x08080FEF	4080	
	NEW_APP_MEM_INFO	0x08080FF0	0x08080FF7	8	
	USB_DFU_MEM_INFO	0x08080FF8	0x08080FFF	8

	NOT USED	0x08083000	0x08083FFF	4K	reserved

Table 4: Session register location

Memory type	Section	Start address	End address	Size (bytes)	Definition
INTERNAL RAM (80K)	USER RAM	0x20000000	0x20012FFF	76K	
	**SESSION REGISTERS	0x20013000	0x200133FF	1K	SESSION REGS
	RFU (Reserved Future Use)	0x20013400	0x20013FFF	3K	

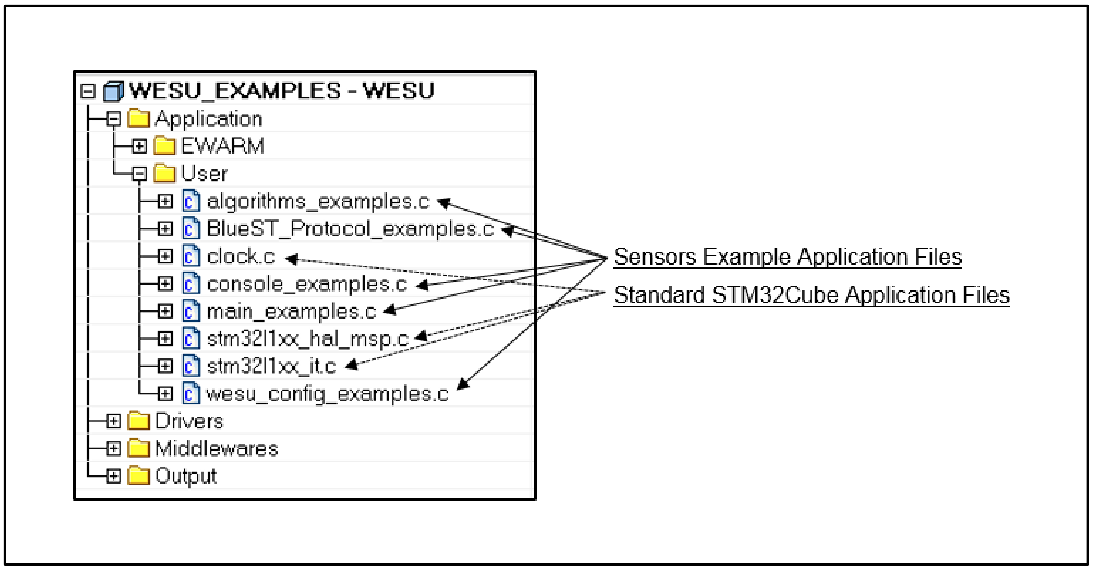
3.3.6 Example firmware overview

The sample sensor firmware gives insight into the development of simple applications involving data from a single sensor, use the BLE service and features, and other functions called by the ST WeSU app, in accordance with the BlueST protocol (*Section 5: "BlueST Protocol SDK"*).

Firmware examples developed using the STM32Cube framework require an “Application” folder with the files being either:

- Example application files
- Standard STM32Cube application files

Figure 33: Example application files package



The “Example” application files are the same as those for the “Demonstration” application, with some differences for certain files (identified with “filename_example.c”). You can use the ST WeSU mobile app to evaluate data streaming as shown in the demo.

3.4 Utilities

The firmware can be updated using the IDE toolchain projects available in the package; however, this procedure is only really useful to verify the code in debug mode. If this is not required, the user can just download the available binary files to the FLASH memory and proceed to test the application.

To use the binary firmware code, there are files dedicated to restoring functionality, including the default settings; however, to update it directly, you must:

- download and install "STM32 ST-LINK Utility" from *www.st.com* and run it
- click on “Target” -> “Settings” and select SWD Connection
- Click on “File” -> “Open” and select the binary file to be programmed
- Click on “Target” -> “Program and verify” and then “Start”
- Wait for the “Verification… OK” message in the log window and disconnect the programming cable

The binary files are available in the “Utilities” folder.

There are different batch files in the same folder that allow you to work with the ST-LINK programmer, without using the GUI.

The readme.txt file inside the folder will help you choose the appropriate batch file for the desired activity. The main ones are:

1. **STEVAL-WESU1_FACTORY.bat:** restore all the memory content to factory conditions.
2. **ProgApplication.bat:** update the DEMO application code only.
3. **ProgApplicationAndOTA.bat:** update the DEMO application code plus the OTA manager.
4. **ProgExamples.bat:** update the EXAMPLE application code only.

3.5 Device firmware upgrade

The STEVAL-WESU1 firmware can be updated via:

- a wired connection through the USB plug
- a wireless connection with BLE Over The Air (OTA)

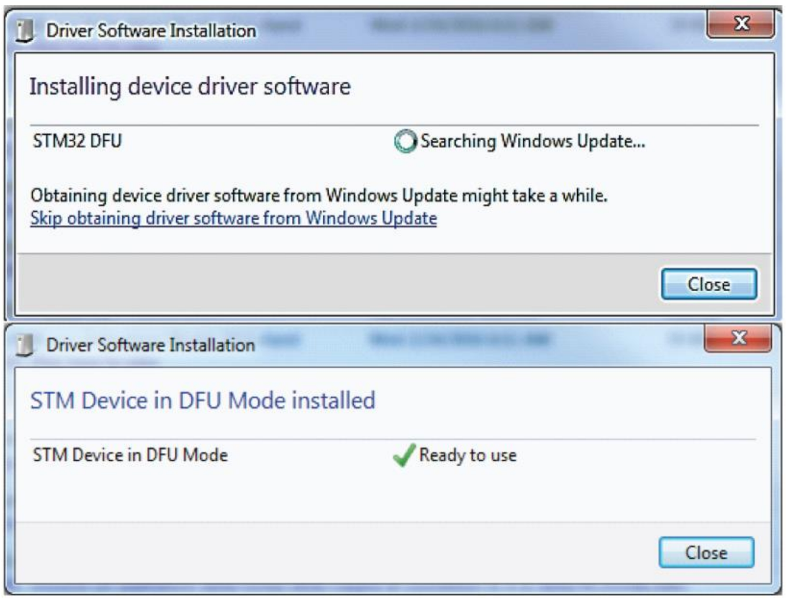
3.5.1 DFU using USB

Before connecting the USB cable, download and install the *DfuSe* demonstration software from *www.st.com*.

Following installation, set the board to DFU mode thus:

- Plug the USB cable, the board starts in normal mode running the demo application, and the LED should blink every two seconds (at 0.5Hz).
- Set the board to standby mode by pressing the user button. Wait until the LED goes off.
- With the USB cable still plugged, press and hold the user button for at least 3 seconds, until the LED turns on. The board then enters DFU Mode and the LED blinks at 2.5 Hz. You can also use the 'settings' menu in the ST WeSU app (Settings -> Node Configuration -> Device Firmware Upgrade -> USB DFU).
- With the USB connection still active, you will see the following message:

Figure 34: DFU driver installation



Installing device driver software

STM32 DFU — Searching Windows Update...

Obtaining device driver software from Windows Update might take a while.
Skip obtaining driver software from Windows Update

STM Device in DFU Mode installed

STM Device in DFU Mode — ✓ Ready to use

- Now run the "DfuSe Demonstration" software, see "STM Device in DFU Mode" in the "Available DFU Devices" drop down list.

Figure 35: DfuSe Demo

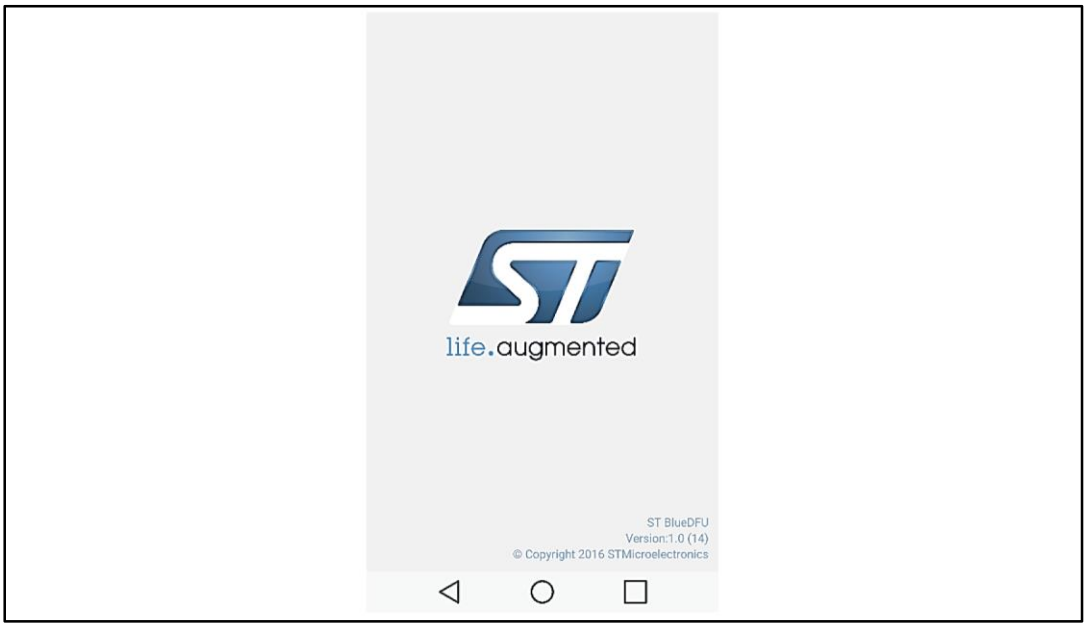
3.5.2 DFU using OTA

Before performing the OTA update, download and install the dedicated app on the mobile devices used: **ST BlueDFU**, available on Google Play, (soon to be available on Apple Store).

Figure 38: ST BlueDFU start page



Following installation, set the board in DFU mode thus:

- Push the user button to start the board in normal mode running the demo application; the LED blinks every two seconds (at 0.5 Hz).
- Set the board in standby mode by pressing the user button. Wait until the LED goes off.
- Without the USB cable plugged, press and hold the user button for at least for 3 seconds until the LED turns on. The board then enters OTA mode and the LED toggles at 1 Hz.

If you want to exit OTA mode without updating the firmware, press the user button three times (each time the LED performs a soft blink); the board will restart in normal mode running the demo application.

- When the board is in DFU OTA mode, run the **ST BlueDFU** application on your mobile device and check the device list.
- The board in OTA is recognizable by the name OTAWeSU.
- Select your board (the LED toggles faster at 4 Hz); the BLE connection is ready to download the firmware binary file. If there are different boards in OTA, you can check the address or simply ‘try’ the connection and verify which one accelerates the LED toggle frequency
- Select the *.bin file from a dedicated folder in the mobile device or use the default file already available in the folder with the star.
- Click the download icon, and double check the address values, filename and size of firmware code.

It is possible to upgrade more than one device simultaneously with the same binary firmware selected. Ensure you select the same device type (hardware configuration) and download the right firmware to avoid rendering the device unusable.

3.6 Toolchains

The STM32Cube expansion framework supports the following development tool-chain and compiler environments so you can build applications with the STEVAL-WESU1:

- IAR Embedded Workbench for ARM® (EWARM) toolchain + ST-LINK:
  – open IAR Embedded Workbench (V7.50 and above)
  – open the IAR project file EWARM\Project.eww
  – rebuild all files and load your image into target memory
  – run the application

- KEIL RealView Microcontroller Development Kit (MDK-ARM) toolchain + ST-LINK:
  - open µVision (V5.14 and above) toolchain
  - open the µVision project file MDK-ARM\Project.uvprojx
  - rebuild all files and load your image into target memory
  - run the application
- System Workbench for STM32 + ST-LINK:
  - open System Workbench for STM32 (1.8.0 and above)
  - set the default workspace proposed by the IDE (please be sure that there are not placed in the workspace path)
  - select "File" -> "Import" -> "Existing Projects into Workspace"; press "Browse" in "Select root directory" and choose the path where the System Workbench project is located
  - rebuild all files and load your image into target memory
  - run the application

When establishing your IDE workspace, ensure that the folder installation path is not too deep to avoid any eventual toolchain errors.

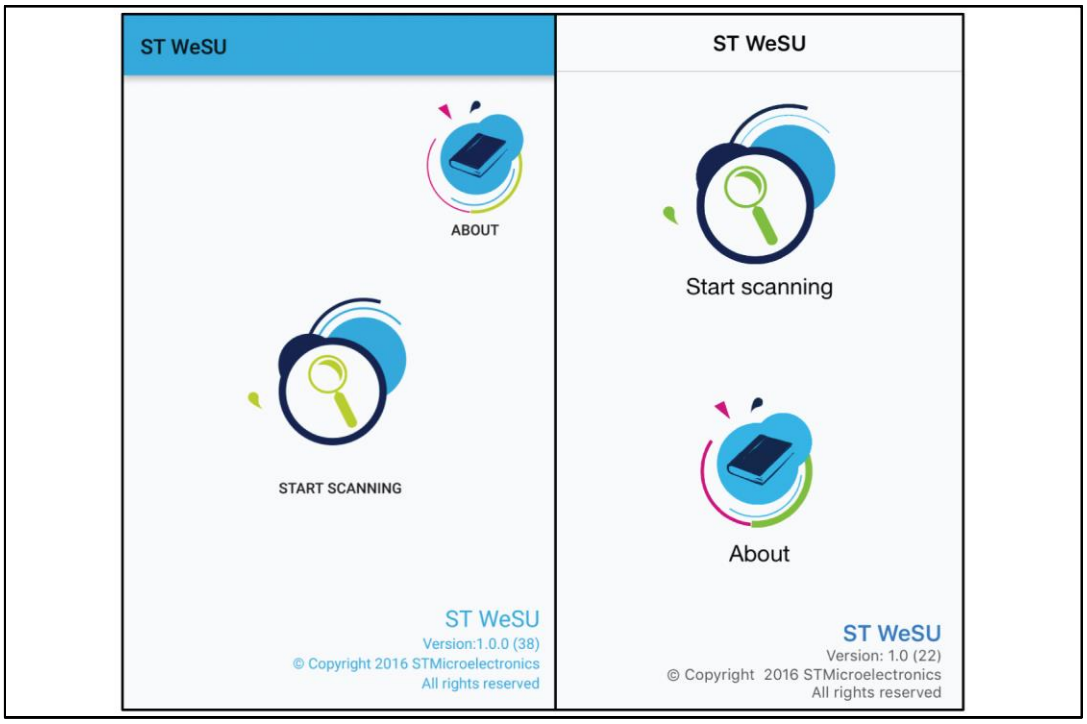
Any further firmware development can start using the reference projects included, and the SWD as the mandatory debug interface.

4 ST WeSU app

The STEVAL-WESU1 demo application firmware is designed to work with the ST WeSU App (Android ver. 4.4.0 / iOS Ver. 8.0, or above), available free of charge at Google Play and Apple Store.

The ST WeSU app opens with the start page below, from which you can command your mobile device to scan for nearby nodes.

Figure 41: ST WeSU app start page (Android and iOS)



You can then choose from one of the available boards to start all the demos and other supported functions.

Figure 42: ST WeSU app (Android and iOS) device list

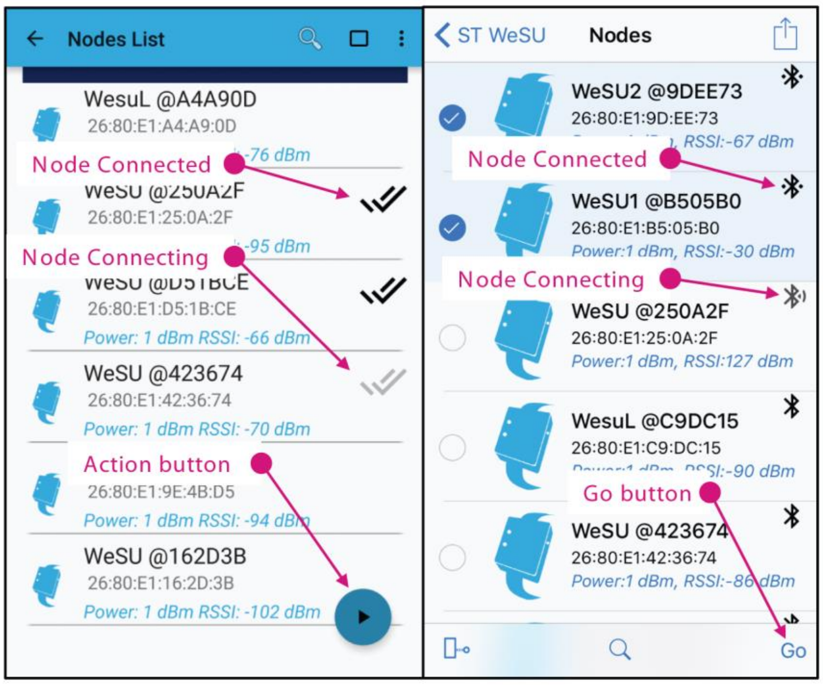
The double tick (✓) mark for multiple nodes on the Android page is black when a particular node is connected, and gray when the node is connecting; in iOS, the tick represents a connected node. To start the demos you need to press the Action/Go button shown below.

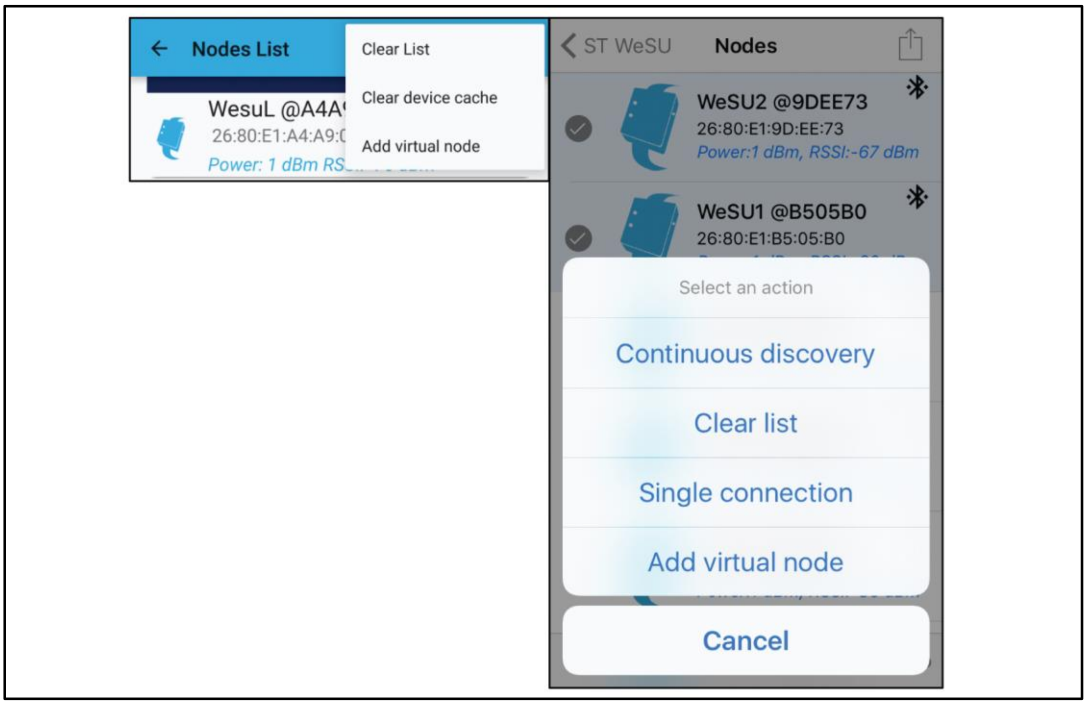
Figure 44: Node status (Android and iOS) indication



From the node list view, you can:

- restart scanning for nearby nodes from the search button or by swiping down the node list;
- switch from single multiple connection
- clear list to remove unconnected devices
- clear device cache (only Android) to clear Bluetooth device memory on specific node data saved at first-time node connection; this command forces the closure of all existing connections
- add virtual node is primarily for debugging purposes; it adds a virtual node and generates random data

Figure 45: Nodes list (Android and iOS) menu



In single node connection mode, the AHRS motion demo showing a simple spinning cubes starts as soon upon board selection, providing immediate STEVAL-WESU1 motion information.

Other demos are accessible via the demo selector button indicated below, or by scrolling the active page from right to left. The “Action” selector gives access to all available board actions and application settings.

Figure 46: Demo index and Action menu (Android)

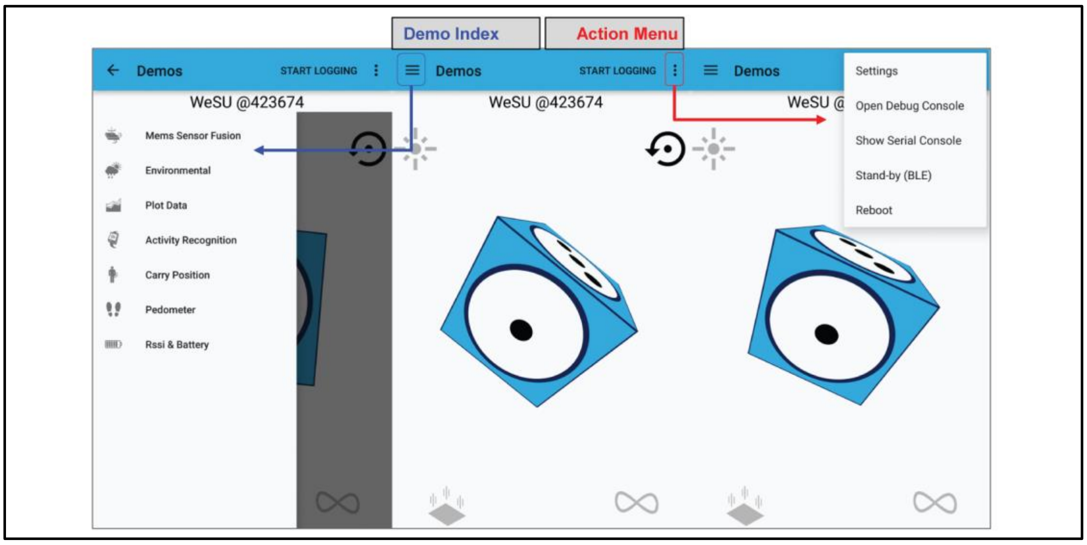


Figure 47: Demo index and Action menu (iOS)

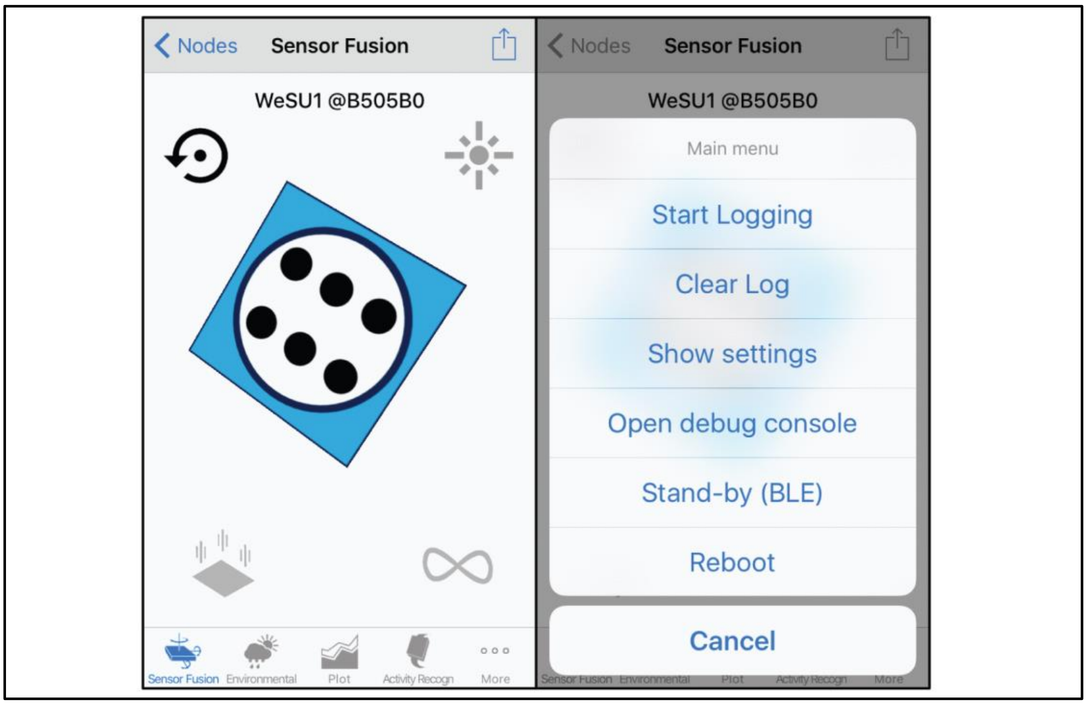


4.1 Demo overview

From the first page, you can access the following:

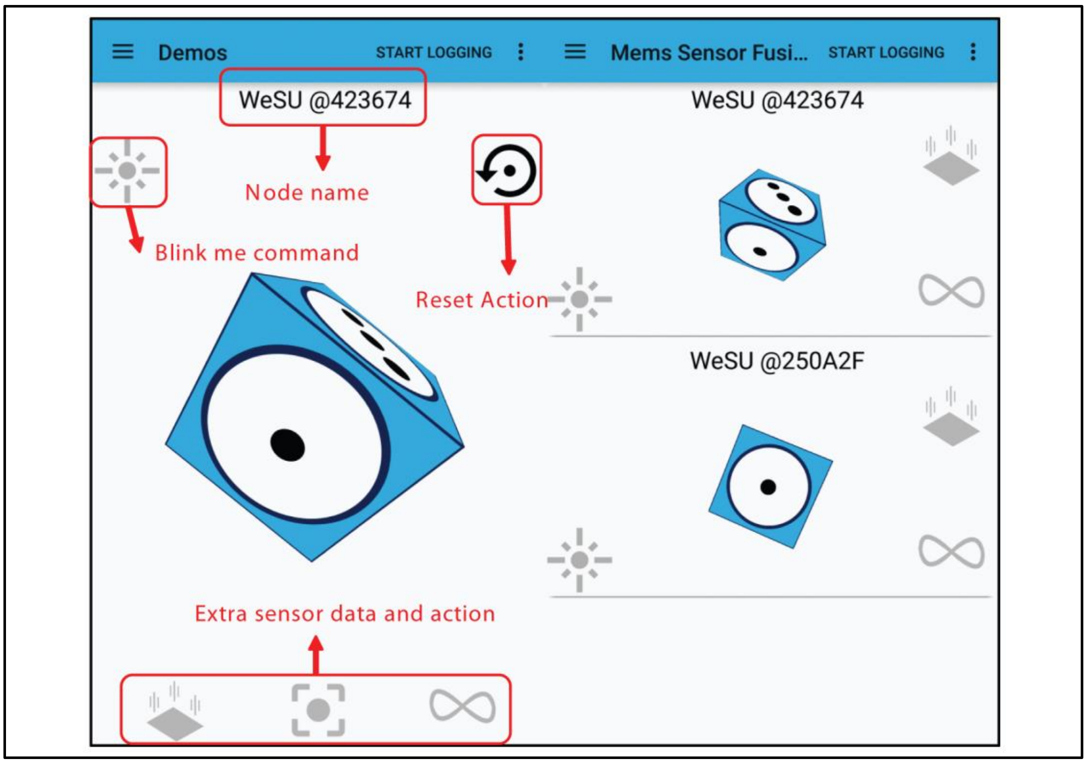
- **Sensor fusion demo**
- **Environmental demo**
- **Plot data demo:** to set plot length (time scale), and start/stop logging data
- **Algorithms demos**:
  - Activity Recognition
  - Carry Position
  - Pedometer
- **RSSI and battery charging**:
  - RSSI value
  - TxPower
  - SOC battery in percentage
  - Battery status, voltage and current

The following sections relate to both Android and iOS versions, even if only Android screenshots are actually shown.

4.1.1 Mems sensor fusion demo

The Mems sensor fusion demo is automatically launched after board selection.

Figure 48: ST WeSU app (Android version) motion sensor fusion demo



It directly feeds all the available information associated with the board motion features and actions.

Node name indicates which node is running, the start/stop logging command is discussed below, and the reset command aligns the cube position

The extra sensor data and action area shows the extra available features and commands:

- Freefall (if available) shows the freefall status:
  - no freefall
  - currently in freefall
  - Saved freefalls – if shown, it displays the list of the last 10 freefalls when clicked; from here you can choose to either continue adding freefall events or clearing the list entirely.

Figure 49: Freefall icons

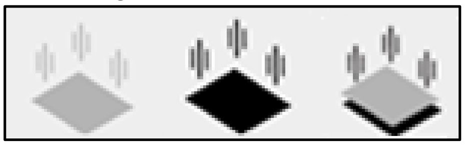


Figure 50: Freefall events list

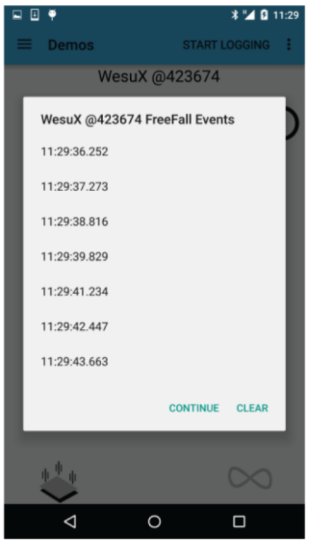


WesuX @423674 FreeFall Events

11:29:36.252

11:29:37.273

11:29:38.816

11:29:39.829

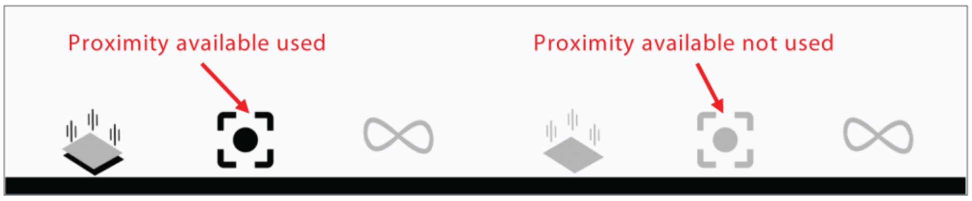
11:29:41.234

11:29:42.447

11:29:43.663

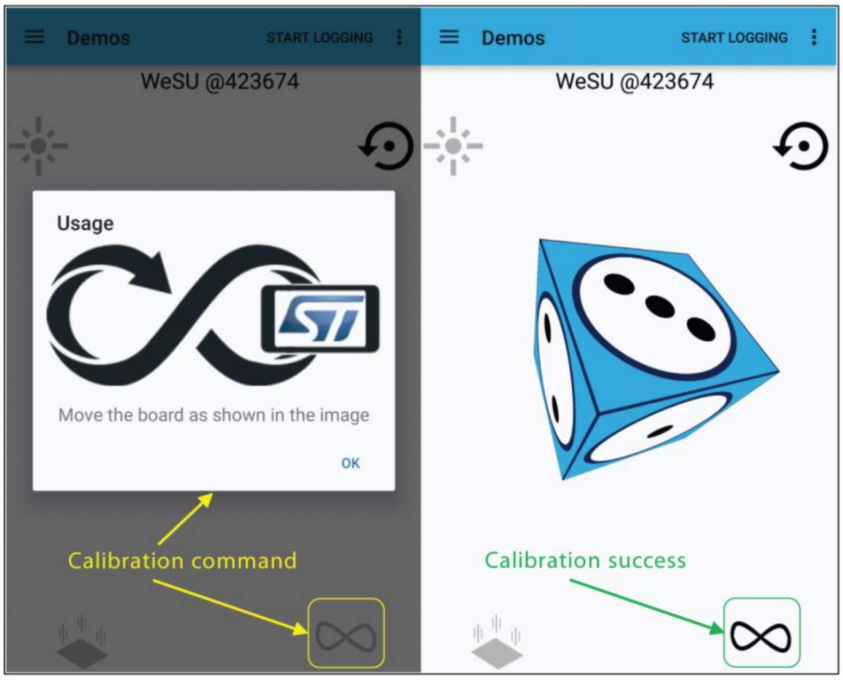
- Proximity sensor (if available) pressing it changes the status
  - proximity available not applied
  - proximity available and applied (the cube size changes with proximity)

Figure 51: Proximity sensor status (only if available)



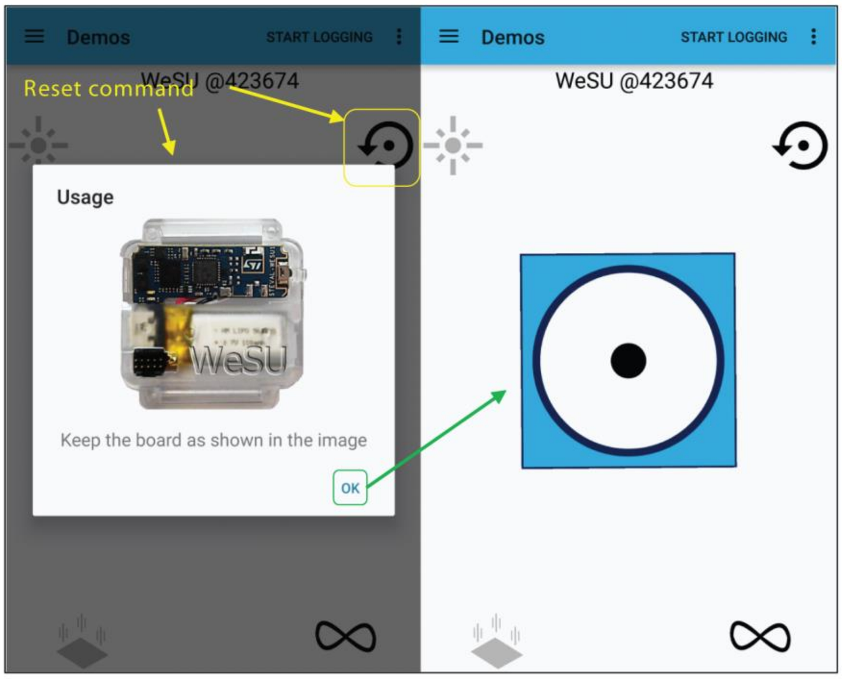
- MEMS sensor fusion calibration (if available). The calibration status of the sensor fusion library is normally gray before calibration. When pushed, a popup window instructs you how to move the board to facilitate calibration; the symbol turns black when calibration has been completed successfully.
  - calibration available (calibration status unknown)
  - node sensor fusion calibrated

Figure 52: ST WeSU (Android) calibration



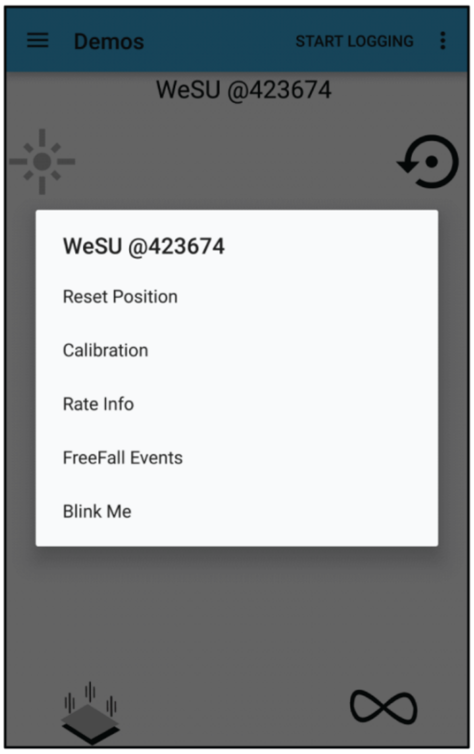
- The reset action button allows resetting the cube position; when pushed, a popup window explains how to physically move the board to the default position. Reset is useful after calibration.

Figure 53: ST WeSU (Android) reset position



All demo commands are also available by tapping the demo area with a context menu, as shown below.

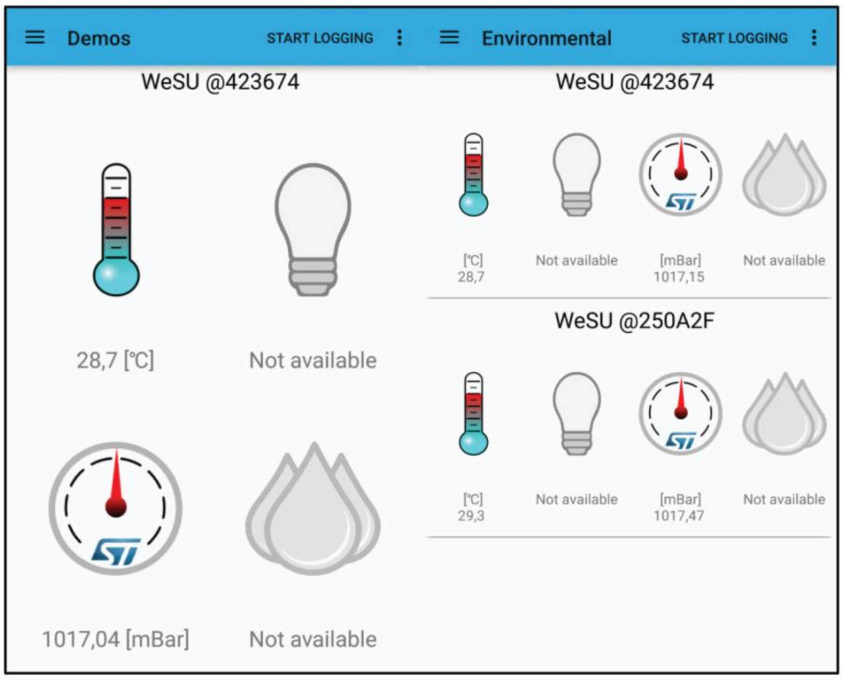
Figure 54: Commands context menu



4.1.2 Environmental demo

On the next page (scrolling display right to left or use the demo selector button), you can run the environmental demo, with pressure and temperature feeds.

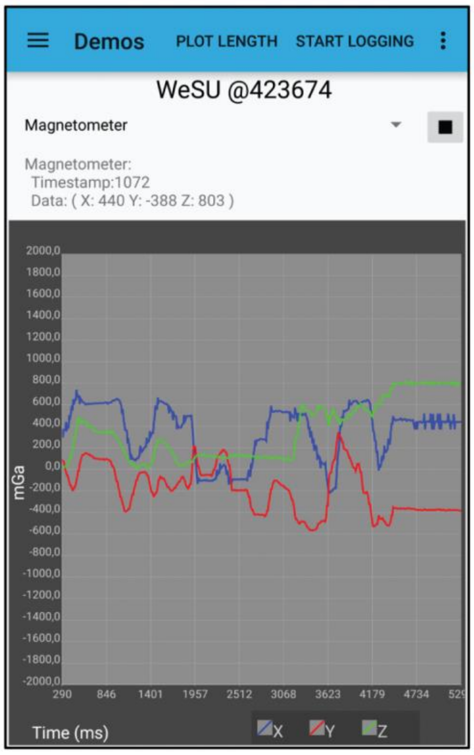
Figure 55: ST WeSU app (Android version) environmental demo



4.1.3 Plot data demo

This demo includes the data plot from direct on-board sensor values, or values returned by algorithms run by the firmware.

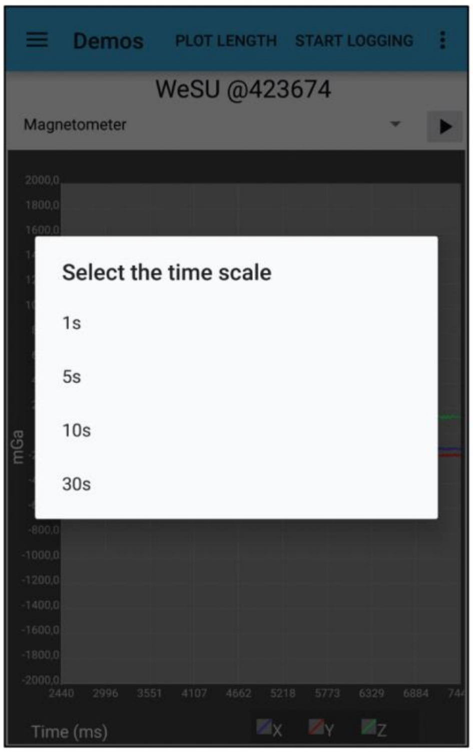
Figure 56: ST WeSU app (Android version) example plot (magnetometer values)



Magnetometer:
Timestamp:1072
Data: (X: 440 Y: -388 Z: 803)

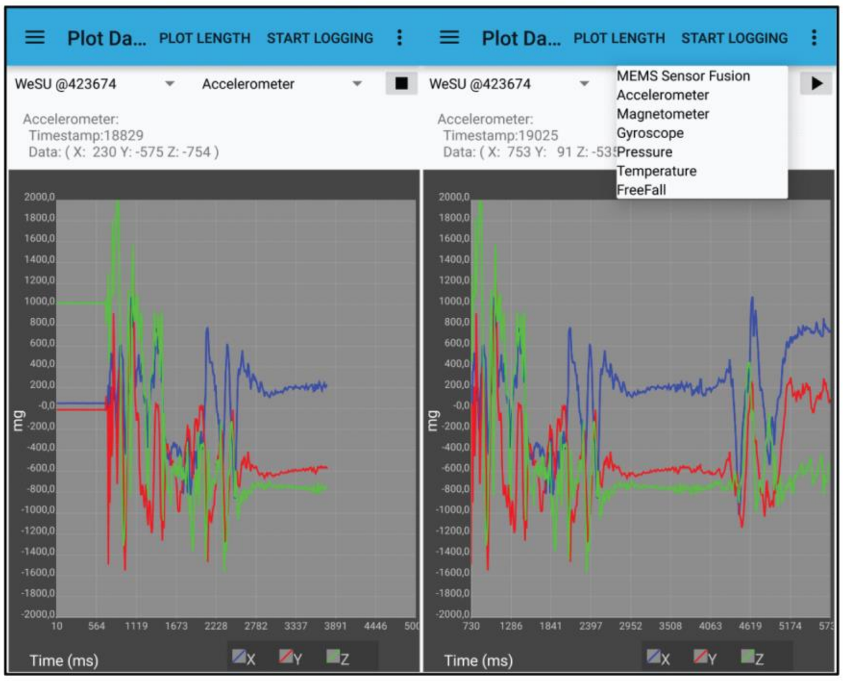
You can change the plot settings from the combo selection. From the Plot length menu, you can select the time frame from 1 s to 30 s, as shown below.

Figure 57: Plot length time scale selection



When multiple nodes are connected, it is also possible to select the device and feature to plot.

Figure 58: Features data plot selection



Accelerometer:
Timestamp:18829
Data: (X: 230 Y: -575 Z: -754)

Accelerometer:
Timestamp:19025
Data: (X: 753 Y: 91 Z: -53

4.1.4 Algorithm demos

Apart from the sensor fusion demo already discussed, the following motion-related demos are also available.

4.1.4.1 The osxMotionAR suite

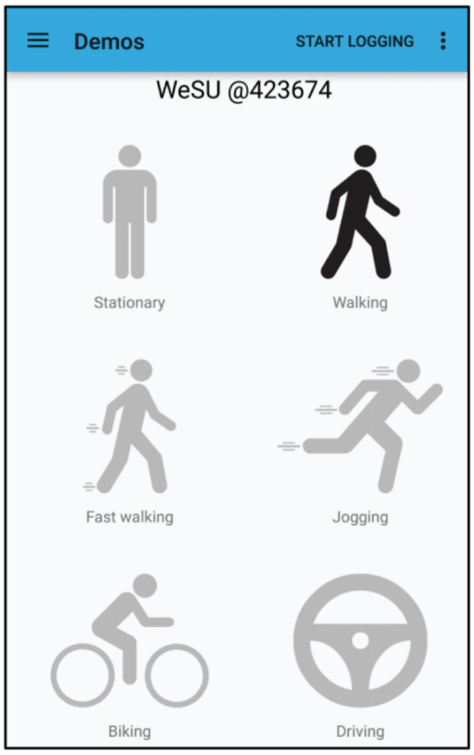
The osxMotionAR suite features predictive software which recognizes common activities and states, like:

- stationary
- walking
- fast walking
- jogging
- biking
- driving

Real-time activity recognition can significantly improve the user experience in advanced motion-based applications for consumer, computer, industrial and medical purposes.

The algorithm exclusively manages the data acquired from the accelerometer at a low sampling frequency (16 Hz) to minimize power consumption.

Figure 59: Activity recognition demo



The osxMotionAR engine is provided as a node-locked library which allows derivative firmware images to run on a specific STM32-based board only.

Licensing activation code requests must be forwarded to ST and these codes must then be included in the project prior to usage - failure to do so will prevent proper API execution.

The resulting firmware binary image will therefore be node-locked.

4.1.4.2 The OSX MotionCP suite

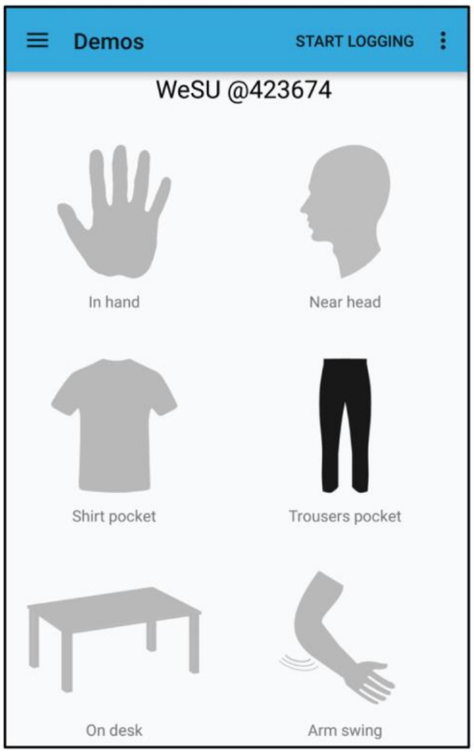
This predictive software recognizes the carry position of the board using exclusively the data acquired from the accelerometer; carry positions include:

- on desk
- in hand
- near head
- shirt pocket
- trouser pocket
- arm swinging

The real-time carry position algorithm can significantly improve motion-based applications in the consumer, computer, industrial and medical fields.

The algorithm exclusively manages the data acquired from the accelerometer at a low sampling frequency (50 Hz) to minimize power consumption.

Figure 60: Carry position demo



The osxMotionCP engine is provided as a node-locked library which allows derivative firmware images to run on a specific STM32-based board only.

Licensing activation codes must be requested from ST and included in the project prior to attempting its usage - failure to do so will prevent proper API execution.

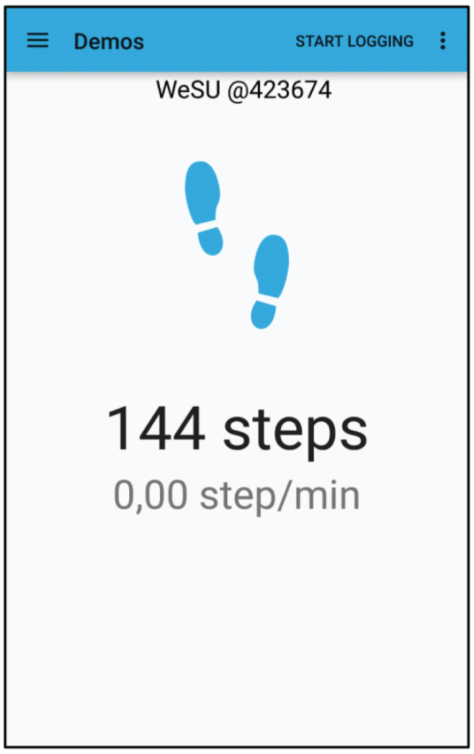
The resulting firmware binary image will therefore be node-locked.

4.1.4.3 The pedometer suite

This is a simple demo to show the available data directly from the hardware, thanks to an algorithm in the LSM6DS3 device which feeds accelerometer data at a very low sampling frequency (1 Hz).

The Demo is already implemented to also support the Step/min measurement, available in the osxMotionPM embedded software.

Figure 61: Pedometer demo



WeSU @423674

144 steps

0,00 step/min

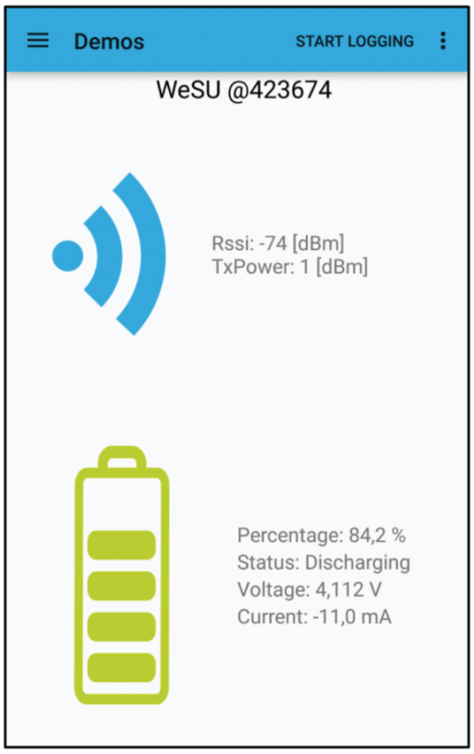
4.1.4.4 RSSI and battery

This simple demo shows the data directly from the on-board power management subsystem hardware. For the battery charging profile values, all the data comes directly from the STC3115 and STNS01 devices placed in the battery circuit path.

The values shown are:

- status of charge (SOC) in percentage
- battery status
- voltage
- current

Figure 62: RSSI and battery charging demo



WeSU @423674

Rssi: -74 [dBm]
TxPower: 1 [dBm]

Percentage: 84,2 %
Status: Discharging
Voltage: 4,112 V
Current: -11,0 mA

4.2 Action list overview

From the action selector button at the top right of the screen, you can access:

- Start/stop logging
- Settings
- Debug console
- Serial console
- BLE standby functions
- Reboot functions

4.2.1 Start/stop logging

All the demos views have the start/stop logging command, which saves raw demo data in the .csv format. Data is stored for each connected device in files that contain logs for each feature. For example, logging environmental data results in yyyymmdd_HHmm_Temperature.csv and yyyymmdd_HHmm_Pressure.csv files, where the prefix represents the date and time when the log starts.

The file includes:

- header information with date time of log start, devices connected, the logged feature, data header and units
- the raw data with the logged host date time stamp (relative to start time), node name and feature timestamp.

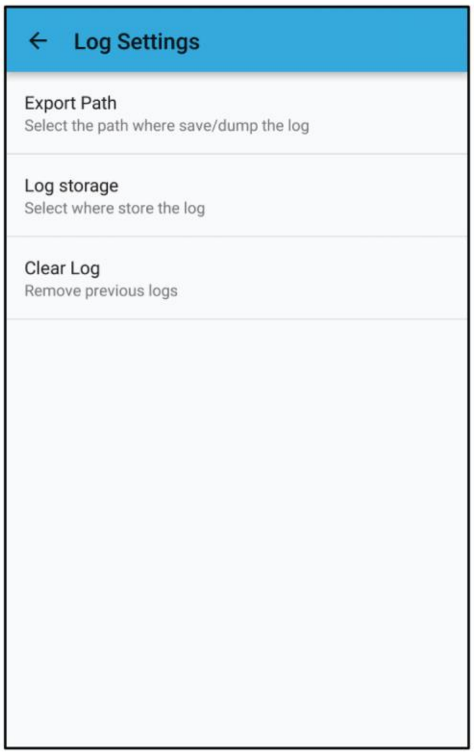
Stopping the log triggers the prompt to send all available logged data by mail.

4.2.2 Settings

This menu provides the following settings groups:

- **General Settings:** to enable free fall signalling
- **Log Settings:** to set your export path and determine how logged data is treated:
  - saved directly in .csv files
  - saved in an sql db and exported to .csv once logging has finished in order to send the data by mail
  - not saved, but sent to the logCat (Android Studio debug view)
  - clear log removes all .csv files logged from your export path

Figure 63: Log settings



Log Settings

Export Path
Select the path where save/dump the log

Log storage
Select where store the log

Clear Log
Remove previous logs

- **Device Configuration:** is divided into the following subgroups:
  a. Device general settings control connection parameters
  b. Session settings configure the firmware session registers to control high level sensor and algorithm features, and low power mode.
  c. Persistent settings configure the firmware persistent registers to control the same features as the session settings, but with default values. it also contains others low level sensor parameters like full scale (FS), output data rate (ODR) and BLE output power.
  d. System settings include RTC configuration, device firmware upgrade (DFU) selector and five different Power-OFF modes.

4.2.3 Debug console

The Debug console can be opened from the actions menu to allow management of several board features and command functions (sensor selection, read frequency, BlueNRG communication subsampling) through a command line interface, and also to read register values.

Figure 64: Debug console command list

When the Debug console is open, all the functions implemented in the firmware can be manipulated through a simple command line interface:

- To get information, status and internal register in reading: `?command_name`
- To set a value, an internal register or other in writing mode: `!command_name`

An important role implemented in the Debug console is the window to set the License for all the algorithms. In the text entry window, simply paste the contents of the email received as a result of the request processed with the license wizard.

Figure 65: Debug set node license dialog

Copy and Paste received license in the below text area.

4.2.4 Serial console

This is a terminal window for debugging, where you can read messages from the firmware and control critical conditions.

4.2.5 BLE standby

This is a command to force the Bluetooth standby condition, causing demo interruption and forcing the entire STEVAL-WESU1 system into STOP mode.

4.2.6 Reboot

Force a system reboot to guarantee control in case of problems with communications or sensor data, or low power modes.

5 BlueST Protocol SDK

The Bluetooth low energy interface protocol is used by the BlueST app (iOS and Android) with the STEVAL-WESU1 reference design. The sensor board exposes its functions and communicates with the host through structured services and characteristics.

Each data characteristic can be signaled with different timings (setting the respective register and therefore subsampling the application timer) and can be read asynchronously.

5.1 Advertising format

According to the Bluetooth 4.0 core specification Vol.3 part C, the 0xFF identifies vendor-specific information.

5.1.1 Bluetooth low energy AD structure (max. 31 bytes)

Table 6: BLE advertising structure

AD Field Name	ADType	AD Length	Record size
TX_POWER_LEVEL	0x0A	2	3
COMPLETE_NAME	0x09	Max. 10/16 (*)	11/17 (*)
MANUF_SPECIFIC	0xFF	13/7 (*)	14/8 (*)
FLAGS	0x01	2	3

(*) If the public device address is not set in the MANUF_SPECIFIC field, then the COMPLETE_NAME can be maximum 16 bytes

5.1.2 AD structures

5.1.2.1 TX_POWER_LEVEL advertising item

Table 7: BLE TX power level advertising field

Octets LSB	0	1	2
Name	Len	Type	-100 a + 20 dBm
Value	0x02	0x0A	0xXX

5.1.2.2 MANUF_SPECIFIC advertising item

Table 8: BLE advertising manuf.-specific advertising field

Octets LSB	0	1	2	3	4	5	6	7	8	9	10	11	12	13
Name	Len	Type	Ver	Dev ID	Group A Features		Group B Features		Company assigned			Company id (proposal)		
Value	0x0D	0xFF	0x01	0xXX	0xXXXX		0xXXXX		0xXXXXXX			0x2680E1		
									Public device address (48 bits) (optional)					

Table 9: Group A features map

N	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit	RFU	RFU	RFU	RFU	RFU	RFU	RFU	RFU	ACC	GYRO	MAG	PRESS	RFU	TEMP	BATT	RFU

Table 10: Group B features map

N	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit	RFU	RFU	RFU	RFU	RFU	RFU	Free Fall	RFU	Sensor Fusion	RFU	RFU	Activity Recognition	Carry Position	RFU	RFU	Pedometer

5.1.2.3 Device ID enum

Table 11: Device ID enumeration

ID	HW
0x00	Generic
0x01	WeSU
0x02 – 0x7F	RFU
0x80 – 0xFF	Nucleo Map

If GPA or GPB bits are set, then the general purpose characteristics have to be defined

The msb in the Device ID enum is used to indicate a Nucleo-based system

5.2 Services/characteristics

Table 12: Services/characteristics allocation map

Groups	Service	Char	Max Size	Mode	UUID	Note
Data	Features				0x0000 0000 0001	
		Group A 16 single features	n/a	r/n	0xXXXX 0000 0001	TS + Value, 0xXXXX only one bit, (e.g. Accelerometer bit 7 => 0x00800001-)

Groups	Service	Char	Max Size	Mode	UUID	Note
		Group B 16 single features	n/a	r/n	0x0000 XXXX 0001	TS + Value, Only one bit
	General Purpose				0x0000 0000 0003	must use the characteristic descriptor to configure the data Unit, Name, Type (Size), Format (Precision)
		GP XXXX XXXX	n/a	r/n	0xXXXX XXXX 0003	TS + Value[s]
Debug	Debug				0x0000 0000 000E	
		Term	n/a	r/w/n	0x0000 0001 000E	This characteristic is used for debug purpose as a hyper-terminal like connection (Stdio)
		StdErr	n/a	r/n	0x0000 0002 000E	This characteristic is used for debug purpose as an output only terminal in order for the BLE device to send textual info on errors (StdErr)
Config	Control		64		0x0000 0000 000F	
		Registers access			0x0000 0001 000F	
		Feature Command	64	w/n	0x0000 0002 000F	

Note:

1. BLUETOOTH SPECIFICATION Version 4.2 [Vol 3, Part B] 2.5.1 UUID
2. Service UUID -11e1-9ab4-0002a5d5c51b
3. Char UUID -11e1-ac36-0002a5d5c51b
4. All data char contains TS [2 bytes] (first field)
5. TS is timestamp (uint16) relative to the board and valid for all features

5.2.1 HW single feature packet

All packets start with a uint16 timestamp (TS)

5.2.1.1 Generic packet format

Table 13: Generic packet format

Octets LSB	0	1	2	3	…	N
Name	TS		Payload: Value[s]			
Value	0xXXXX		0xXXXXXXXX			

5.2.1.2 Motion sensors packet format

Accelerometer payload: mg, signed int16

Gyroscope payload: dps, signed int16

Magnetometer payload: mGa, signed int16

Table 14: Motion sensors packet format

Octets LSB	**0**	**1**	**2**	**3**	**4**	**5**
Name	X		Y		Z	
Value	0xXXXX		0xXXXX		0xXXXX	

5.2.1.3 Battery packet format

Battery payload:

- **Battery level**: 0.1%, signed int16 (multiply by 10)
- **Battery Voltage**: mV, signed int16
- **Average current**: mA, signed int16
- **Power mgmt. Status**: enum, unsigned int8

Table 15: Battery packet format

Octets LSB	**0**	**1**	**2**	**3**	**4**	**5**	**6**
Name	Battery level		Battery Voltage		Average current		Power Mng Status
Value	0xXXXX		0xXXXX		0xXXXX		0xXX

Table 16: Pressure packet format

Octets LSB	**0**	**1**	**2**	**3**
Name	Pressure Value			
Value	0xXXXXXXXX			

Pressure payload: mbar, signed int32, multiply by 100

5.2.1.4 Temperature packet format

Temperature payload: Celsius, multiply by 10

Table 17: Temperature packet format

Octets LSB	**0**	**1**
Name	Value	
Value	0xXXXX	

5.2.2 Aggregate feature packet

To optimize the data throughput, you can aggregate multiple features in a single characteristic. The resulting UUID is the OR of the UUID of the single features.

The features data must follow the feature mask order.

Example: Motion packet (0x00700000) = Accelerometer (0x00400000) + Gyroscope (0x00200000) + Magnetometer (0x00100000)

Table 18: Motion packet format

Octets LSB	**0**	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**	**18**	**19**
Name	TS		Accelerometer						Gyroscope						Magnetometer					
			X		X		X		X		X		X		X		X		X	
Value	0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX		0xXXXX	

Accelerometer payload: mg, signed int16

Gyroscope payload: tenth of dps, signed int16

Magnetometer payload: mGa, signed int16

5.2.3 SW single feature packet 1/2

All packets start with a uint16 timestamp (TS)

5.2.3.1 Generic packet format

Table 19: Generic packet format

Octets LSB	**0**	**1**	**2**	**3**	**…**	**N**
Name	TS		Payload:Value[s]			
Value	0xXXXX		0xXXXXXXXX			

5.2.3.2 Sensor fusion payload: 4x float (IEEE 754 single)

Table 20: Sensor fusion packet format

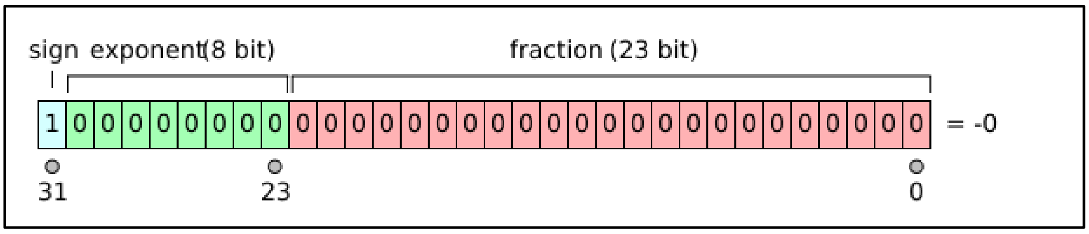
Octets LSB	**0**	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**
Name	TS		qi				qj				qk				qs			
Value	0xXXXX		0xXXXXXXXX				0xXXXXXXXX				0xXXXXXXXX				0xXXXXXXXX			
			Vector coefficients												Scalar coefficient (optional)			

If it only has 3 fields (qi,qj,qk), the vector coefficients are normalized

IEEE 754 single (Reference: AN4044 on *www.st.com*).

(Using floating-point unit (FPU) with STM32F405/07xx and STM32F415/417xx microcontrollers)

Figure 66: IEEE 754 single reference



5.2.3.3 Free fall payload

Free fall payload: 1 byte is needed if used in an aggregated fashion

- 1 = free fall event
- 0 = no free fall event

Table 21: Free fall packet format

Octets LSB	**0**
Name	Value
Value	0 or 1

5.2.3.4 Activity recognition payload

Activity recognition payload: 1 byte

Table 22: Activity recognition packet format

Octets LSB	**0**
Name	Value
Value	0 …. 6

Table 23: Valid activity types

Activity type	
0x00	No activity (no enough data for decide)
0x01	Stationary
0x02	Walking
0x03	Fast walking
0x04	jogging
0x05	Biking
0x06	driving

5.2.3.5 Carry position payload

Carry position payload: 1 byte

Table 24: Carry position packet format

Octets LSB	**0**
Name	Value
Value	0 …. 6

Table 25: Carry position type

Carry position type	
0x00	Unknown
0x01	On Desk
0x02	In Hand

Carry position type	
0x03	Near Head
0x04	Shirt Pocket
0x05	Trouser Pocket
0x06	Arm Swing

5.2.4 Configuration settings

5.2.4.1 Register access

Table 26: Register access packet format

Octets LSB	**0**	**1**	**2**	**3**	**4**	**5**	**…**	**64**
Name	CTRL	ADDR	ERR	LEN	Payload			

- CTRL field

Table 27: Control field

N	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Mode	Pending	Mode	Type	Error	Ack	RFU	RFU	RFU
1	Exec op	Persistent	Write	Error	Ack required	-	-	-
0	No op	Session	Read	No error	No ack	-	-	-

- ADDR: register address (0x00 – 0xFF)
- ERR: error code (0x00, no ERROR – 0x01-0xFF specific error code)
- LEN: register number (len * 2 = payload size in byte)

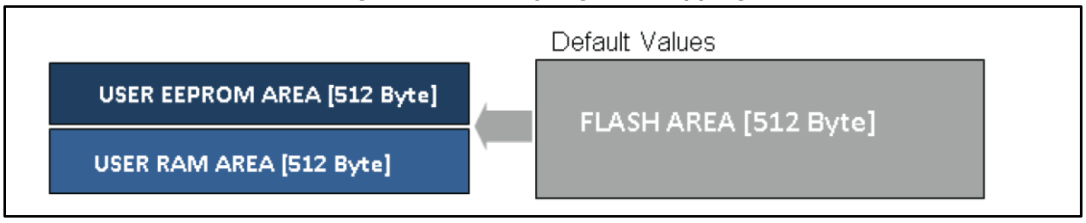
5.2.5 Debug

- The package doesn’t contain a timestap
- If the package doesn’t end in ‘\0’, the message finishes in the next package
- Max package size is 20 bytes

5.3 Registers

The control registers (16 bit) are for hardware configuration and runtime operation. The default configuration is stored in FLASH memory and loaded into RAM and EEPROM during runtime.

Figure 67: Memory register mapping



Access at this memory area is regulated through write and read operations in the Memory Access characteristic and through notification events.

5.3.1 Register types

Persistent registers are stored in EEPROM, data is preserved in case of power loss (battery discharge or failure).

Session registers are stored in RAM, data is preserved as long as the system is supplied (battery or external power).

5.3.2 Errors

Table 28: Error code mapping

Name	Error code	Session
NO_ERROR_CODE	0x00	No error
ERROR_LENGHT	0x01	Max payload length is 16 (TBC)
ERROR_WRONG_FORMAT	0x02	Incorrect payload data format
ERROR_NOT_IMPLEMENTED	0x03	Register not implemented (optional)
ERROR_ACTION_NOT_ALLOWED	0x04	Action not allowed
ERROR_REG_IS_READ_ONLY	0x05	Read only register
ERROR_NOT_ALLOWED	0x06	Ctrl field mask is not allowed

7 Formal notices required by the U.S. Federal Communications Commission ("FCC")

Model: STEVAL-WESU1

FCC ID: S9NWESU1

Any changes or modifications to this equipment not expressly approved by STMicroelectronics may cause harmful interference and void the user’s authority to operate this equipment.

This device complies with part 15 of the FCC rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference, and
2. This device must accept any interference received, including interference that may cause undesired operation.

For Class A Digital Devices

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

For Class B Digital Devices

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference's by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

8 Formal notices required by the Industry Canada ("IC")

Model: STEVAL-WESU1

IC: 8976C-WESU1

English:

This Class A or B digital apparatus complies with Canadian CS-03.

Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

French:

Cet appareil numérique de la classe A ou B est conforme à la norme CS-03 du Canada.

Les changements ou les modifications pas expressément approuvés par la partie responsable de la conformité ont pu vider l’autorité de l'utilisateur pour actionner l'équipement.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. 'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

9 Acronyms and abbreviations

Table 30: List of acronyms

Acronym	Description
AHRS	Attitude heading reference system
API	Application programming interface
BLE	Bluetooth low energy
BSP	Board support package
CLI	Command line interface
DFU	Device firmware upgrade
FS	Full scale (MEMS sensor setting)
HAL	Hardware abstraction level
HCI	Host command interface
IDE	Integrated development environment
ODR	Output data rate (MEMS sensor setting)
OTA	Over the air
SOC	Status of charge
