# Chapter 1 DE10-Nano Development Kit

The DE10-Nano Development Kit presents a robust hardware design platform built around the Intel System-on-Chip (SoC) FPGA, which combines the latest dual-core Cortex-A9 embedded cores with industry-leading programmable logic for ultimate design flexibility. Users can now leverage the power of tremendous re-configurability paired with a high-performance, low-power processor system. Intel's SoC integrates an ARM-based hard processor system (HPS) consisting of processor, peripherals and memory interfaces tied seamlessly with the FPGA fabric using a high-bandwidth interconnect backbone. The DE10-Nano development board is equipped with high-speed DDR3 memory, analog to digital capabilities, Ethernet networking, and much more that promise many exciting applications.

The DE10-Nano Development Kit contains all the tools needed to use the board in conjunction with a computer that runs the Microsoft Windows XP or later.

# **1.1 Package Contents**

Figure 1-1 shows a photograph of the DE10-Nano package.

Figure 1-1 The DE10-Nano package contents

The DE10-Nano package includes:

- The DE10-Nano development board
- DE10-Nano Quick Start Guide
- USB cable Type A to Mini-B for FPGA programming or UART control
- USB cable Type A to Micro-B for USB OTG connect to PC
- 5V DC power adapter
- microSD Card (Installed)
- Four Silicon Footstands

# 1.2 DE10-Nano System CD

The DE10-Nano System CD contains all the documents and supporting materials associated with DE10-Nano, including the user manual, system builder, reference designs, and device datasheets. Users can download this system CD from the link: <u>http://de10-nano.terasic.com/cd</u>.

# **1.3 Getting Help**

Here are the addresses where you can get help if you encounter any problems:

# Chapter 2 Introduction of the DE10-Nano Board

his chapter provides an introduction to the features and design characteristics of the board.

# **2.1 Layout and Components**

**Figure 2-1** and **Figure 2-2** shows a photograph of the board. It depicts the layout of the board and indicates the location of the connectors and key components.

Figure 2-1 DE10-Nano development board (top view)

Figure 2-2 DE10-Nano development board (bottom view)

The DE10-Nano board has many features that allow users to implement a wide range of designed circuits, from simple circuits to various multimedia projects.

The following hardware is provided on the board:

### FPGA

- Cyclone® V SE 5CSEBA6U23I7 device
- Serial configuration device EPCS128
- USB-Blaster II onboard for programming; JTAG Mode
- 2 push-buttons
- 4 slide switches
- 8 green user LEDs
- Three 50MHz clock sources from the clock generator
- Two 40-pin expansion header
- One Arduino expansion header (Uno R3 compatibility), can connect with Arduino shields.
- One 10-pin Analog input expansion header. (shared with Arduino Analog input)
- A/D converter, 4-wire SPI interface with FPGA
- HDMI TX, compatible with DVI v1.0 and HDCP v1.4

### HPS (Hard Processor System)

- 800MHz Dual-core ARM Cortex-A9 processor
- 1GB DDR3 SDRAM (32-bit data bus)
- 1 Gigabit Ethernet PHY with RJ45 connector
- port USB OTG, USB Micro-AB connector
- Micro SD card socket
- Accelerometer (I2C interface + interrupt)
- UART to USB, USB Mini-B connector
- Warm reset button and cold reset button
- One user button and one user LED
- LTC 2x7 expansion header

# **2.2 Block Diagram of the DE10-Nano Board**

**Figure 2-3** is the block diagram of the board. All the connections are established through the Cyclone V SoC FPGA device to provide maximum flexibility for users. Users can configure the FPGA to implement any system design.

Detailed information about Figure 2-3 are listed below.

Figure 2-3 Block diagram of DE10-Nano

DE10-Nano User Manual

### **FPGA Device**

- Cyclone V SoC 5CSEBA6U23I7 Device
- Dual-core ARM Cortex-A9 (HPS)
- 110K programmable logic elements
- 5,570 Kbits embedded memory
- 6 fractional PLLs

## **Configuration and Debug**

- Serial configuration device EPCS128 on FPGA
- Onboard USB-Blaster II (Mini-B USB connector)

### **Memory Device**

- 1GB (2x256Mx16) DDR3 SDRAM on HPS
- Micro SD card socket on HPS

# Communication

- One USB 2.0 OTG (ULPI interface with USB Micro-AB connector)
- UART to USB (USB Mini-B connector)
- 10/100/1000 Ethernet

### Connectors

- Two 40-pin expansion headers
- Arduino expansion header
- One 10-pin ADC input header
- One LTC connector (one Serial Peripheral Interface (SPI) Master ,one I2C and one GPIO interface )

# Display

• HDMI TX, compatible with DVI v1.0 and HDCP v1.4

# ADC

- 12-Bit Resolution, 500Ksps Sampling Rate. SPI Interface.
- 8-Channel Analog Input. Input Range : 0V ~ 4.096V.

# Switches, Buttons, and Indicators

- 3 user Keys (FPGA x2, HPS x1)
- 4 user switches (FPGA x4)
- 9 user LEDs (FPGA x8, HPS x 1)
- 2 HPS reset buttons (HPS\_RESET\_n and HPS\_WARM\_RST\_n)

### Sensors

• G-Sensor on HPS

### Power

• 5V DC input

# Chapter 3 Using the DE10-Nano Board

his chapter provides an instruction to use the board and describes the peripherals.

# 3.1 Settings of FPGA Configuration Mode

When the DE10-Nano board is powered on, the FPGA can be configured from EPCS or HPS.

The MSEL[4:0] pins are used to select the configuration scheme. It is implemented as a 6-pin DIP switch **SW10** on the DE10-Nano board, as shown in **Figure 3-1**.

 Table 3-1 shows the relation between MSEL[4:0] and DIP switch (SW10).

Figure 3-1 DIP switch (SW10) setting of FPPx32 mode.

DE10-Nano User Manual

Board Reference	Signal Name	Description	Default	
SW10.1	MSEL0		ON ("0")	
SW10.2	MSEL1	OFF ("1")		
SW10.3	MSEL2	Use these pins to set the FPGA	ON ("0")	
SW10.4	MSEL3	Configuration scheme	OFF ("1")	
SW10.5	MSEL4		ON ("0")	
SW10.6	N/A	N/A	N/A	

### Table 3-1 FPGA Configuration Mode Switch (SW10)

**Table 3-2** shows MSEL[4:0] setting for FPGA configure, and default setting is FPPx32 Mode on DE10-Nano Board.

When the board is powered on and MSEL[4:0] set to "10010", the FPGA is configured from EPCS, which is pre-programmed with the default code. If developers using the "Linux LXDE Desktop" SD Card image, the MSEL[4:0] needs to be set to "01010" before the board is powered on.

Configuration	SW10.1 MSEL0	SW10.2 MSEL1	SW10.3 MSEL2	SW10.4 MSEL3	SW10.5 MSEL4	SW10.6	Description
AS	ON	OFF	ON	ON	OFF	N/A	FPGA configured from EPCS
FPPx32 / Compression Enabled / Fast POR (Default)	ON	OFF	ON	OFF	ON	N/A	FPGA configured from HPS software: U-Boot, with image stored on the SD card, like LXDE Desktop (default)
FPPx16 / Compression Disabled / Fast POR	ON	ON	ON	ON	ON	N/A	FPGA configured from HPS software: U-Boot, with image stored on the SD card

### Table 3-2 MSEL Pin Settings for FPGA Configure of DE10-Nano Board

# **3.2 Configuration of Cyclone V SoC FPGA on DE10-Nano**

There are two types of programming method supported by DE10-Nano:

1. JTAG programming: It is named after the IEEE standards Joint Test Action Group.

The configuration bit stream is downloaded directly into the Cyclone V SoC FPGA. The FPGA will retain its current status as long as the power keeps applying to the board; the configuration information will be lost when the power is off.

2. AS programming: The other programming method is Active Serial configuration.

The configuration bit stream is downloaded into the serial configuration device (EPCS128), which provides non-volatile storage for the bit stream. The information is retained within EPCS128 even if the DE10-Nano board is turned off. When the board is powered on, the configuration data in the EPCS128 device is automatically loaded into the Cyclone V SoC FPGA.

### ■ JTAG Chain on DE10-Nano Board

The FPGA device can be configured through JTAG interface on DE10-Nano board, but the JTAG chain must form a closed loop, which allows Quartus II programmer to the detect FPGA device. **Figure 3-2** illustrates the JTAG chain on DE10-Nano board.

Figure 3-2 Path of the JTAG chain

### • Configure the FPGA in JTAG Mode

There are two devices (FPGA and HPS) on the JTAG chain. The following shows how the FPGA is programmed in JTAG mode step by step.

Open the Quartus II programmer, please Choose **Tools** > **Programmer**. The Programmer window opens. Please click "**Hardware Setup**", as circled in **Figure 3-3**.

Programmer - [Chain1.cdf]

Figure 3-9 Select the .sof file to be programmed into the FPGA device

Click "Program/Configure" check box and then click "Start" button to download the .sof file into the FPGA device, as shown in **Figure 3-10**.

Figure 3-10 Program.sof file into the FPGA device

### • Configure the FPGA in AS Mode

- The DE10-Nano board uses a serial configuration device (EPCS128) to store configuration data for the Cyclone V SoC FPGA. This configuration data is automatically loaded from the serial configuration device chip into the FPGA when the board is powered up.
- Users need to use Serial Flash Loader (SFL) to program the serial configuration device via JTAG interface. The FPGA-based SFL is a soft intellectual property (IP) core within the FPGA that bridge the JTAG and Flash interfaces. The SFL Megafunction is available in Quartus II. Figure 3-11 shows the programming method when adopting SFL solution.
- Please refer to Chapter 8: Steps of Programming the Serial Configuration Device for the basic programming instruction on the serial configuration device.

Figure 3-11 Programming a serial configuration device with SFL solution

# **3.3 Board Status Elements**

In addition to the 9 LEDs that FPGA/HPS device can control, there are 6 indicators which can indicate the board status (See Figure 3-12), please refer the details in Table 3-3

Table 3-3 LED Indicat
-----------------------

Board Reference	LED Name	Description
LED9	3.3-V Power	Illuminate when 3.3V power is active.
LED10	CONF_DONE	Illuminates when the FPGA is successfully configured.
LED11	JTAG_TX	Illuminate when data is transferred from JTAG to USB Host.
LED12	JTAG_RX	Illuminate when data is transferred from USB Host to JTAG.
TXD	UART TXD	Illuminate when data is transferred from FT232R to USB Host.
RXD	UART RXD	Illuminate when data is transferred from USB Host to FT232R.

# **3.4 Board Reset Elements**

There are two HPS reset buttons on DE10-Nano, HPS (cold) reset and HPS warm reset, as shown in **Figure 3-13**. **Table 3-4** describes the purpose of these two HPS reset buttons. **Figure 3-14** is the reset tree for DE10-Nano.

Figure 3-13 HPS cold reset and warm reset buttons on DE10-Nano

Board Reference	Signal Name	Description
KEY4	HPS RESET N	Cold reset to the HPS, Ethernet PHY and USB host device.
		Active low input which resets all HPS logics that can be reset.
КЕҮЗ	HDE WADM DET N	Warm reset to the HPS block. Active low input affects the system
	HPS_WARM_RST_N	reset domain for debug purpose.

Figure 3-14 HPS reset tree on DE10-Nano board

# **3.5 Clock Circuitry**

**Figure 3-15** shows the default frequency of all external clocks to the Cyclone V SoC FPGA. A clock generator is used to distribute clock signals with low jitter. The two 50MHz clock signals connected to the FPGA are used as clock sources for user logic. Three 25MHz clock signal are connected to two HPS clock inputs, and the other one is connected to the clock input of Gigabit Ethernet Transceiver. One 24MHz clock signal is connected to the USB controller for USB Blaster II circuit and FPGA. One 24MHz clock signals are connected to the clock inputs of USB OTG PHY. The associated pin assignment for clock inputs to FPGA I/O pins is listed in **Table 3-5**.

DE10-Nano User Manual

Figure 3-15 Block diagram of the clock distribution on DE10-Nano

### **Table 3-5 Pin Assignment of Clock Inputs**

### **3.6 Peripherals Connected to the FPGA**

This section describes the interfaces connected to the FPGA. Users can control or monitor different interfaces with user logic from the FPGA.

### 3.6.1 User Push-buttons, Switches and LEDs

The board has two push-buttons connected to the FPGA, as shown in **Figure 3-16**. Schmitt trigger circuit is implemented and act as switch debounce in **Figure 3-17** for the push-buttons connected. The two push-buttons named KEY0 and KEY1 coming out of the Schmitt trigger device are connected directly to the Cyclone V SoC FPGA. The push-button generates a low logic level or high logic level when it is pressed or not, respectively. Since the push-buttons are debounced, they can be used as clock or reset inputs in a circuit.

Figure 3-16 Connections between the push-buttons and the Cyclone V SoC FPGA

Figure 3-17 Switch debouncing

There are four slide switches connected to the FPGA, as shown in **Figure 3-18**. These switches are not debounced and to be used as level-sensitive data inputs to a circuit. Each switch is connected directly and individually to the FPGA. When the switch is set to the DOWN position (towards the edge of the board), it generates a low logic level to the FPGA. When the switch is set to the UP position, a high logic level is generated to the FPGA.

Figure 3-18 Connections between the slide switches and the Cyclone V SoC FPGA

There are also eight user-controllable LEDs connected to the FPGA. Each LED is driven directly and individually by the Cyclone V SoC FPGA; driving its associated pin to a high logic level or low level to turn the LED on or off, respectively. **Figure 3-19** shows the connections between LEDs and Cyclone V SoC FPGA. **Table 3-6**, **Table 3-7** and **Table 3-8** list the pin assignment of user push-buttons, switches, and LEDs.

Figure 3-19 Connections between the LEDs and the Cyclone V SoC FPGA

Table 5-0 Fill Assignment of Side Switches

LED[5]	PIN_AE26	LED [5]	3.3V

### 3.6.2 2x20 GPIO Expansion Headers

The board has two 40-pin expansion headers. Each header has 36 user pins connected directly to the Cyclone V SoC FPGA. It also comes with DC +5V (VCC5), DC +3.3V (VCC3P3), and two GND pins. Figure 3-20 shows the I/O distribution of the GPIO connector. The maximum power consumption allowed for a daughter card connected to one or two GPIO ports is shown in Table 3-9 and Table 3-10 shows all the pin assignments of the GPIO connector.

		GF	PIO 0 (JP	P1)					GP	IO 1 (JP	7)

# **3.6.3 Arduino Uno R3 Expansion Header**

The board provides Arduino Uno revision 3 compatibility expansion header which comes with four independent headers. The expansion header has 17 user pins (16pins GPIO and 1pin Reset) connected directly to the Cyclone V SoC FPGA. 6-pins Analog input connects to ADC, and also provides DC +9V (VCC9), DC +5V (VCC5), DC +3.3V (VCC3P3 and IOREF), and three GND pins.

Please refer to Figure 3-21 for detailed pin-out information. The blue font represents the Arduino Uno R3 board pin-out definition.

Figure 3-21 lists the all the pin-out signal name of the Arduino Uno connector. The blue font represents the Arduino pin-out definition.

The 16 GPIO pins are provided to the Arduino Header for digital I/O. **Table 3-11** lists the all the pin assignments of the Arduino Uno connector (digital), signal names relative to the Cyclone V SoC FPGA.

DE10-Nano User Manual

Schematic Signal Name	FPGA Pin No.	Description	Specific features For Arduino	I/O Standard
Arduino_IO0	PIN_AG13	Arduino IO0	RXD	3.3-V
Arduino_IO1	PIN_AF13	Arduino IO1	TXD	3.3-V
Arduino_IO2	PIN_AG10	Arduino IO2		3.3-V
Arduino_IO3	PIN_AG9	Arduino IO3		3.3-V
Arduino_IO4	PIN_U14	Arduino IO4		3.3-V
Arduino_IO5	PIN_U13	Arduino IO5		3.3-V
Arduino_IO6	PIN_AG8	Arduino IO6		3.3-V
Arduino_IO7	PIN_AH8	Arduino IO7		3.3-V
Arduino_IO8	PIN_AF17	Arduino IO8		3.3-V
Arduino_IO9	PIN_AE15	Arduino IO9		3.3-V
Arduino_IO10	PIN_AF15	Arduino IO10	SS	3.3-V
Arduino_IO11	PIN_AG16	Arduino IO11	MOSI	3.3-V
Arduino_IO12	PIN_AH11	Arduino IO12	MISO	3.3-V
Arduino_IO13	PIN_AH12	Arduino IO13	SCK	3.3-V
Arduino_IO14	PIN_AH9	Arduino IO14	SDA	3.3-V
Arduino_IO15	PIN_AG11	Arduino IO15	SCL	3.3-V
Arduino_Reset_n	PIN_AH7	Reset signal, low active.		3.3-V

### Table 3-11 Pin Assignments for Arduino Uno Expansion Header connector

Besides 16 pins for digital GPIO, there are also 6 analog inputs on the Arduino Uno R3 Expansion Header (ADC\_IN0 ~ ADC\_IN5). Consequently, we use ADC LTC2308 from Linear Technology on the board for possible future analog-to-digital applications. We will introduce in the next section.

# **3.6.4 A/D Converter and Analog Input**

The DE10-Nano has an analog-to-digital converter (LTC2308).

The LTC2308 is a low noise, 500ksps, 8-channel, 12-bit ADC with a SPI/MICROWIRE compatible serial interface. This ADC includes an internal reference and a fully differential sample-and-hold circuit to reduce common mode noise. The internal conversion clock allows the external serial output data clock (SCK) to operate at any frequency up to 40MHz.

It can be configured to accept eight input signals at inputs ADC\_IN0 through ADC\_IN7. These eight input signals are connected to a 2x5 header, as shown in Figure 3-22.

Figure 3-22 Signals of the 2x5 Header

These Analog inputs are shared with the Arduino's analog input pin (ADC\_IN0 ~ ADC\_IN5), **Figure 3-23** shows the connections between the FPGA, 2x5 header, Arduino Analog input, and the A/D converter.

More information about the A/D converter chip is available in its datasheet. It can be found on manufacturer's website or in the directory \Datasheet\ADC of DE10-Nano system CD.

### Figure 3-23 Connections between the FPGA, 2x5 header, and the A/D converter

Table 5-12 Fill Assignment of Abo					
Signal Name	FPGA Pin No.	Description	I/O Standard		
ADC_CONVST	PIN_U9	Conversion Start	3.3V		
ADC_SCK	PIN_V10	Serial Data Clock	3.3V		
ADC_SDI	PIN_AC4	Serial Data Input (FPGA to ADC)	3.3V		
ADC_SDO	PIN_AD4	Serial Data Out (ADC to FPGA)	3.3V		

### Table 3-12 Pin Assignment of ADC

# **3.6.5 HDMI TX Interface**

The development board provides High Performance HDMI Transmitter via the Analog Devices ADV7513 which incorporates HDMI v1.4 features, including 3D video support, and 165 MHz supports all video formats up to 1080p and UXGA. The ADV7513 is controlled via a serial I2C bus interface, which is connected to pins on the Cyclone V SoC FPGA. A schematic diagram of the audio circuitry is shown in **Figure 3-24**. Detailed information on using the ADV7513 HDMI TX is available on the manufacturer's website, or under the Datasheets\HDMI folder on the Kit System CD.

**Table 3-13** lists the HDMI Interface pin assignments and signal names relative to the Cyclone V SoC device.

### Table 3-13 HDMI Pin Assignments, Schematic Signal Names, and Functions

# **3.7 Peripherals Connected to Hard Processor System (HPS)**

This section introduces the interfaces connected to the HPS section of the Cyclone V SoC FPGA. Users can access these interfaces via the HPS processor.

### **3.7.1 User Push-buttons and LEDs**

Similar to the FPGA, the HPS also has its set of switches, buttons, LEDs, and other interfaces connected exclusively. Users can control these interfaces to monitor the status of HPS.

Table 3-14 gives the pin assignment of all the LEDs, switches, and push-buttons.

Signal Nam	FPGA Pin No	HPS GPIO	Register/bit	Function
HPS_KEY	PIN_J18	GPIO54	GPIO1[25]	I/O
HPS_LED	PIN_A20	GPIO53	GPIO1[24]	I/O

 Table 3-14 Pin Assignment of LEDs, Switches and Push-buttons

# 3.7.2 Gigabit Ethernet

The board supports Gigabit Ethernet transfer by an external Micrel KSZ9031RN PHY chip and HPS Ethernet MAC function. The KSZ9031RN chip with integrated 10/100/1000 Mbps Gigabit Ethernet transceiver also supports RGMII MAC interface. **Figure 3-23** shows the connections between the HPS, Gigabit Ethernet PHY, and RJ-45 connector.

The pin assignment associated to Gigabit Ethernet interface is listed in **Table 3-15**. More information about the KSZ9031RN PHY chip and its datasheet, as well as the application notes, which are available on the manufacturer's website.

Table 3-15 Pin	Assignment	of Gigabit	<b>Ethernet PHY</b>
Table 3-15 FIII	Assignment	UI GIYADIL	

There are two LEDs, green LED (LEDG) and yellow LED (LEDY), which represent the status of Ethernet PHY (KSZ9031RN). The LED control signals are connected to the LEDs on the RJ45 connector. The state and definition of LEDG and LEDY are listed in **Table 3-16**. For instance, the connection from board to Gigabit Ethernet is established once the LEDG lights on.

LED (State)		LED (Definition)			
LEDG	LEDY	LEDG	LEDY	Link /Activity	
Н	Н	OFF	OFF	Link off	
L	Н	ON	OFF	1000 Link / No Activity	
Toggle	Н	Blinking	OFF	1000 Link / Activity (RX, TX)	
Н	L	OFF	ON	100 Link / No Activity	
Н	Toggle	OFF	Blinking	100 Link / Activity (RX, TX)	
L	L	ON	ON	10 Link/ No Activity	
Toggle	Toggle	Blinking	Blinking	Link / Activity (RX, TX)	

#### Table 3-16 State and Definition of LED Mode Pins

# 3.7.3 UART

The board has one UART interface connected for communication with the HPS. This interface doesn't support HW flow control signals. The physical interface is implemented by UART-USB onboard bridge from a FT232R chip to the host with an USB Mini-B connector. More information about the chip is available on the manufacturer's website, or in the directory \Datasheets\UART\_TO\_USB of DE10-Nano system CD. Figure 3-25 shows the connections between the HPS, FT232R chip, and the USB Mini-B connector. Table 3-17 lists the pin assignment of UART interface connected to the HPS.

Figure 3-25 Connections between the HPS and FT232R Chip	)
Table 3-17 Pin Assignment of UART Interface	

Signal Name	FPGA Pin No.	Description	I/O Standard
HPS_UART_RX	PIN_A22	HPS UART Receiver	3.3V
HPS_UART_TX	PIN_B21	HPS UART Transmitter	3.3V
HPS_CONV_USB_N	PIN_C6	Reserve	3.3V

# 3.7.4 DDR3 Memory

The board supports 1GB of DDR3 SDRAM comprising of two x16 bit DDR3 devices on HPS side. The signals are connected to the dedicated Hard Memory Controller for HPS I/O banks and the target speed is 400 MHz. Figure 3-26 shows the connections between the DDR3 and Cyclone V SoC FPGA. Table 3-18 lists the pin assignment of DDR3 and its description with I/O standard.

Figure 3-26 Connections between FPGA and DDR3

# 3.7.5 Micro SD Card Socket

The board supports Micro SD card interface with x4 data lines. It serves not only an external storage for the HPS, but also an alternative boot option for DE10-Nano board. **Figure 3-27** shows signals connected between the HPS and Micro SD card socket.

 Table 3-19 lists the pin assignment of Micro SD card socket to the HPS.

Figure 3-27 Connections between the FPGA and SD card socket

Signal Name	FPGA Pin No	Description	I/O Standard

	/	•••				÷

# 3.7.6 USB 2.0 OTG PHY

The board provides USB interfaces using the SMSC USB3300 controller. A SMSC USB3300 device in a 32-pin QFN package device is used to interface to a single Type AB Micro-USB connector. This device supports UTMI+ Low Pin Interface (ULPI) to communicate to USB 2.0 controller in HPS. As defined by OTG mode, the PHY can operate in Host or Device modes. When operating in Host mode, the interface will supply the power to the device through the Micro-USB interface. **Figure 3-28** shows the connections of USB PTG PHY to the HPS. **Table 3-20** lists the pin assignment of USB OTG PHY to the HPS.

Figure 3-28 Connections between the HPS and USB OTG PHY

#### Table 3-20 Pin Assignment of USB OTG PHY

# 3.7.7 G-sensor

The board comes with a digital accelerometer sensor module (ADXL345), commonly known as G-sensor. This G-sensor is a small, thin, ultralow power assumption 3-axis accelerometer with high-resolution measurement. Digitalized output is formatted as 16-bit in two's complement and can be accessed through I2C interface. The I2C address of G-sensor is 0xA6/0xA7. More information about this chip can be found in its datasheet, which is available on manufacturer's website or in the directory \Datasheet\G-Sensor folder of DE10-Nano system CD. **Figure 3-29** shows the connections between the HPS and G-sensor. **Table 3-21** lists the pin assignment of G-senor to the HPS.

Figure 3-29 Connections between Cyclone V SoC FPGA and G-Sensor

Signal Name	FPGA Pin No.	Description	I/O Standard
HPS_GSENSOR_INT	PIN_A17	HPS GSENSOR Interrupt Output	3.3V
HPS_I2C0_SCLK	PIN_C18	HPS I2C0 Clock	3.3V
HPS_I2C0_SDAT	PIN_A19	HPS I2C0 Data	3.3V

Table 3-21 Pin	Assignment	of G-senor

# 3.7.8 LTC Connector

The board has a 14-pin header, which is originally used to communicate with various daughter cards from Linear Technology. It is connected to the SPI Master and I2C ports of HPS. The communication with these two protocols is bi-directional. The 14-pin header can also be used for GPIO, SPI, or I2C based communication with the HPS. Connections between the HPS and LTC connector are shown in **Figure 3-30**, and the pin assignment of LTC connector is listed in **Table 3-22**.

Figure 3-30 Connections between the HPS and LTC connector

Table 3-22 Pin Assignment of LTC Connector
--

Signal Name	FPGA Pin No.	Description	I/O Standard
HPS_LTC_GPIO	PIN_H13	HPS LTC GPIO	3.3V

# Chapter 4 DE10-Nano System Builder

his chapter describes how users can create a custom design project with the tool named DE10-Nano System Builder.

# **4.1 Introduction**

The DE10-Nano System Builder is a Windows-based utility. It is designed to help users create a Quartus II project for DE10-Nano within minutes. The generated Quartus II project files include:

- Quartus II project file (.qpf)
- Quartus II setting file (.qsf)
- Top-level design file (.v)
- Synopsis design constraints file (.sdc)
- Pin assignment document (.htm)

The above files generated by the DE10-Nano System Builder can also prevent occurrence of situations that are prone to compilation error when users manually edit the top-level design file or place pin assignment. The common mistakes that users encounter are:

- Board is damaged due to incorrect bank voltage setting or pin assignment.
- Board is malfunctioned because of wrong device chosen, declaration of pin location or direction is incorrect or forgotten.
- Performance degradation due to improper pin assignment.

# 4.2 Design Flow

This section provides an introduction to the design flow of building a Quartus II project for DE10-Nano under the DE10-Nano System Builder. The design flow is illustrated in **Figure 4-1**.

The DE10-Nano System Builder will generate two major files, a top-level design file (.v) and a Quartus II setting file (.qsf) after users launch the DE10-Nano System Builder and create a new project according to their design requirements.

The top-level design file contains a top-level Verilog HDL wrapper for users to add their own design/logic. The Quartus II setting file contains information such as FPGA device type, top-level pin assignment, and the I/O standard for each user-defined I/O pin.

Finally, the Quartus II programmer is used to download .sof file to the development board via JTAG interface.

Figure 4-1 Design flow of building a project from the beginning to the end

# 4.3 Using DE10-Nano System Builder

This section provides the procedures in details on how to use the DE10-Nano System Builder.

### Install and Launch the DE10-Nano System Builder

The DE10-Nano System Builder is located in the directory:

"Tools\SystemBuilder" of the DE10-Nano System CD. Users can copy the entire folder to a host computer without installing the utility. A window will pop up, as shown in **Figure 4-2**, after executing the DE10-Nano SystemBuilder.exe on the host computer.

# System Configuration

Users are given the flexibility in the System Configuration to include their choice of components in the project, as shown in **Figure 4-4**. Each component onboard is listed and users can enable or disable one or more components at will. If a component is enabled, the DE10-Nano System Builder will automatically generate its associated pin assignment, including the pin name, pin location, pin direction, and I/O standard.

### GPIO Expansion

If users connect any Terasic GPIO-based daughter card to the GPIO connector(s) on DE10-Nano, the DE10-Nano System Builder can generate a project that include the corresponding module, as shown in **Figure 4-5**. It will also generate the associated pin assignment automatically, including pin name, pin location, pin direction, and I/O standard.

### Project Generation

When users press the *Generate* button, the DE10-Nano System Builder will generate the corresponding Quartus II files and documents, as listed in **Table 4-1**:

No.	No. Filename Description			
1	<project name="">.v</project>	Top level Verilog HDL file for Quartus II		
2 <project name="">.qpf Quartus II Project File</project>		Quartus II Project File		
3 <project name="">.qsf Quartus II Setting File</project>		Quartus II Setting File		
4 <project name="">.sdc Synopsis Design Constraints file for Quartus</project>		Synopsis Design Constraints file for Quartus II		
5	<project name="">.htm</project>	Pin Assignment Document		

 Table 4-1 Files generated by the DE10-Nano System Builder

Users can add custom logic into the project in Quartus II and compile the project to generate the SRAM Object File (.sof).

his chapter provides examples of advanced designs implemented by RTL or Qsys on the DE10-Nano board. These reference designs cover the features of peripherals connected to the FPGA, such as A/D Converter. All the associated files can be found in the directory \Demonstrations\FPGA of DE10-Nano System CD.

### Installation of Demonstrations

Install the demonstrations on your computer:

Copy the folder Demonstrations to a local directory of your choice. It is important to make sure the path to your local directory contains NO space. Otherwise it will lead to error in Nios II.

Note Quartus II v16.0 or later is required for all DE10-Nano demonstrations to support Cyclone V SoC device.

# 5.1 DE10-Nano Factory Configuration

The DE10-Nano board has a default configuration bit-stream pre-programmed, which demonstrates some of the basic features on board. The setup required for this demonstration and the location of its files are shown below.

Demonstration Setup, File Locations, and Instructions

- Project directory: \Default
- Bitstream used: DE10\_NANO\_Default.sof or DE10\_NANO\_Default.jic
- Demo batch file : \Default\demo\_batch\test.bat
- Power on the DE10-Nano board with the USB cable connected to the USB-Blaster II port. If necessary (that is, if the default factory configuration is not currently stored in the EPCS device), download the bit stream to the board via JTAG interface.
- You should now be able to observe the LEDs are blinking.

- For the ease of execution, a demo\_batch folder is provided in the project. It is able to not only load the bit stream into the FPGA in command line, but also program or erase .jic file to the EPCS by executing the "test.bat" file shown in Figure 5-1
- If users want to program a new design into the EPCS device, the easiest method is to copy the new .sof file into the demo\_batch folder and execute the "test.bat". Option "2" will convert the .sof to .jic and option"3" will program .jic file into the EPCS device.

# 5.2 ADC Reading

This demonstration illustrates steps to evaluate the performance of the 8-channel 12-bit A/D Converter LTC2308. The DC 5.0V on the 2x5 header is used to drive the analog signals by a trimmer potentiometer. The voltage can be adjusted within the range between 0 and 4.096V. The 12-bit voltage measurement is displayed on the NIOS II console.

Figure 5-2 shows the block diagram of this demonstration.

If the input voltage is -2.0V ~ 2.0V, a pre-scale circuit can be used to adjust it to 0 ~ 4V.

Figure 5-2 Block diagram of ADC reading

**Figure 5-3** depicts the pin arrangement of the 2x5 header. This header is the input source of ADC convertor in this demonstration. Users can connect a trimmer to the specified ADC channel (ADC\_IN0 ~ ADC\_IN7) that provides voltage to the ADC convert. The FPGA will read the associated register in the convertor via serial interface and translates it to voltage value to be displayed on the Nios II console.

## System Requirements

The following items are required for this demonstration.

- DE10-Nano board x1
- Trimmer Potentiometer x1
- Wire Strip x3

#### Demonstration File Locations

- Hardware project directory: \ADC
- Bitstream used: DE10\_NANO\_ADC.sof
- Software project directory: \ADC\software
- Nios II program: DE10\_NANO\_ADC.elf
- Demo batch file : \ADC\demo\_batch\test.bat

#### Demonstration Setup and Instructions

- Connect the trimmer to corresponding ADC channel on the 2x5 header, as shown in Figure 5-4, as well as the +5V and GND signals. The setup shown above is connected to ADC channel 0.
- Execute the demo batch file "**test.bat**" to load the bitstream and software execution file to the FPGA.
- The Nios II console will display the voltage of the specified channel voltage result information

Figure 5-4 Hardware setup for the ADC reading demonstration

## **5.3 HDMI TX**

This section gives instructions to program the HDMI transmitter to generate video pattern and audio source. The entire reference is composed into three parts: video design, audio design, and I2C design. A set of built-in video patterns and audio serial data will be sent to the HDMI transmitter to drive the HDMI display with speaker. Users can hear the beeping sound from the speaker when SW0 is set to 1 on the DE10-Nano board. The resolution can be switched by pressing KEY1.

#### System Block Diagram

**Figure 5-5** shows the system block diagram of this reference design. The HDMI Transmitter is configured via I2C interface by I2C Controller and I2C HDMI Config. It is necessary to configure the HDMI transmitter according to the desired settings.

An interrupt mechanism called Hot Plug Detect (HPD) is implemented in I2C HDMI config. to re-configure HDMI transmitter when HPD interrupt occurs.

The Video Patter Generator was designed to send video patter to HDMI transmitter. Its resolution can be changed by pressing KEY[1]. There must be a PLL Reconfig. To change the PLL dynamically to support different resolutions. The Audio PLL and Audio Generator were designed to send audio pattern to HDMI transmitter. The audio is transmitted via I2S interface in this demo. Users can choose to enable audio generator or not through SW[0].

Figure 5-5 Block Diagram of the HDMI TX Demonstration

DE10-Nano User Manual www.terasic.com March 13, 2017

### Register of HDMI Transmitter (ADV7513)

Users can save lots of developing time by paying attention to the settings of video format and audio frequency in register at address 0x15 and the format of register at address 0xAF prior to the development of HDMI transmitter. This demo uses 48KHz sampling rate and the video format is 24-bit RGB 4:4:4. For more details, please refer to the document ADV7513\_Programming\_Guide\_R0.pdf.

### Audio Generator

The ADV7513 can accommodate 2 to 8 channels of I2S audio at up to a 192 KHz sampling rate. The ADV7513 supports I2S standard, left-justified serial audio, and right-justified serial audio. **Figure 5-6** shows the left-justified serial audio with I2S standard audio of 16-bit per channel.

Figure 5-6 I2S standard audio with 16-bit per channel

If users want to modify the frequency of audio output, the register value at register 0x15 has to be modified according to the document ADV7513\_Programming\_Guide\_R0.pdf. The I2S standard uses MSB to LSB serial way of transmitting. This demo uses sinusoid signal to synthesis sound from a reference of look up table created by calculated sinusoid wave data.

### Video Pattern Generator

The module "Video Pattern Generator" copes with generating video patterns to be presented on the LCD monitor. The pattern is composed in the way of 24-bit RGB 4:4:4 (RGB888 per color pixel without sub-sampling) color encoding, which corresponds to the parallel encoding format defined in **Table 5-1** of the "ADV7513 Hardware User's Guide," as shown below.

#### Table 5-1 Display modes of the HDMI TX demonstration

Pixel Data [23:0]																	
17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R[7:0]				G[7:0]					B[7:0]								

A set of display modes is implemented for presenting the generated video patterns. The module "Video Source Selector" controls the selection of current video timing among built-in display modes listed in **Table 5-2.** The module "Mode Control" allows users to switch current display mode alternatively via KEY1.

#### Table 5-2 Built-in display modes for the HDMI TX demonstration

Pattern ID	Video Format	PCLK (MHZ)
0	640x480@60P	25
1	720x480@60P	27
2	1024x768@60P	65
3	1280x1024@60P	108
4	1920x1080@60P	148.5

#### Demonstration File Locations

- Hardware project directory: \HDMI\_TX
- Bitstream used: DE10\_Nano\_HDMI\_TX.sof
- Demo batch file : \HDMI\_TX\demo\_batch\test.bat

### Demonstration Setup and Instructions

- Please make sure both Quartus II and USB-Blaster II driver are installed on the host PC.
- Connect the DE10-Nano board to the LCD monitor through a HDMI cable.
- Power on the DE10-Nano board
- Launch the "test.bat" batch file from the "\HDMI\_TX\demo\_batch" folder. After the programming and configuration are successful, the screen should look like the one shown in Figure 5-7.

Figure 5-7 Launch the HDMI TX demonstration from the "demo\_batch" folder

Wait for a few seconds for the LCD monitor to be powered up. There will be a pre-defined video pattern shown on the monitor, as shown in **Figure 5-8**. The SW0 is used to enable/disable the sound output on the DE10-Nano board. When you switch the SW0 button to an upper position, you will hear a "beep" sound from the speaker of the HDMI display.

Figure 5-8 The video pattern in the HDMI TX demonstration

# 5.4 DDR3\_VIP

This demonstration shows how to use HPS DDR3 as an external buffer of the frame buffer IP in an FPGA based video pattern generator. The video pattern generator is implemented based on the VIP (Video and Image Processing) suite. Before running the FPGA demo, users have to boot the DE10-Nano from HPS to execute the **Preloader, Bootloader, and soc\_system.rbf** programs from the microSD card for HPS and DDR3 initialization. The required microSD card image, **terasic\_hps\_ddr3.img**, is provided in the DE10-Nano System CD.

#### System Block Diagram

**Figure 5-9** shows the system block diagram of this reference design. In this HPS site, the **Preloader, Bootloader, and soc\_system.rbf** programs are loaded from the microSD card and are executed to initialize the HPS and DDR3 memory. The **Bootloader** will make the HPS LED light up to indicate the DDR3 is ready, at which point the user runs the **soc\_system.rbf**; this will configure the FPGA.

Figure 5-9 Block Diagram of the DDR3\_VIP Demonstration

ter asic

In the FPGA site, the terasic\_hps\_ddr3 sub-system, provided by Terasic, is used to provide a bridge between the FPGA and the HPS DDR3. The VIP suite is used to implement the pattern generator, and the HPS DDR3 is used as a buffer for the VIP **Frame Buffer II**. The frame buffer accesses the DDR3 through the FPGA-to-HPS interface and SDRAM Controller. The FPGA-to-HPS interface is configured as a 128-bits Avalon Memory-Mapped Bidirectional port. The VIP **Test Pattern Generator II** is used to generate a 1024x767 color pattern, the VIP **Clocked Video Output II** is used to generate VGA video format. For HDMI displaying, the on-board HDMI transmitter chip is used to display the video pattern. The I2C\_HDMI\_Config block is used to configure HDMI TX chip through the I2C interface of the HDMI chip. For details about the HDMI TX chip controller, please refer to HDMI\_TX example in this kit.

### DDR3 Access Interface

In this demonstration, a QSYS sub-system **terasic\_hps\_ddr3.qsys** is used to provide a bridge between the FPGA and the HPS DDR3 controller. terasic\_hps\_ddr3 sub-system is included in the Qsys top design, and both **mem\_master\_wr** and **mem\_master\_rd** AVMM master ports of **Frame Buffer II (4K Ready)** are connected to the **f2h\_sdram0\_data** AVMM slave port of **terasic\_hps\_ddr3** as shown in **Figure 5-10**. Interfaces **hps\_0\_hps\_io** and **memory** are exported for connecting to HPS pins in Quartus top as shown in **Figure 5-11**.

Figure 5-10 Qsys top of DDR3\_VIP

Figure 5-11 Pin connections on Quartus top

# ■ FPGA configure from HPS

You can also configure the FGPA through the usb-blaster JTAG interface. The FPGA can also be configured by **Bootloader** in the microSD card. When the DE10-Nano is booted from HPS, the Bootloader will configure the FPGA by the configuration file **soc\_system.rbf** which is also provided in the microSD card. The **soc\_system.rbf** file can be generated from a .sof file by applying a batch file **sof\_to\_rbf.bat**. The batched file is provided by Terasic, and is located in the VIP\_DDR3 folder. The batch call utility **quarthps\_cpf.exe** to translate DDR3\_VIP.sof to soc\_system.rbf.

Before copying this **soc\_system.rbf** into the MicroSD card, please make sure the microSD card is programmed with the Linux Image file terasic\_hsp\_ddr3\_init.img which is located at

CD\Demonstration\FPGA\SdcardImage\terasic\_hps\_ddr3.img

For details about how to program the terasic\_hps\_ddr3.img into the microSD card, please refer to Getting\_Started\_Guide.pdf document in this kit.

The procedures on how to generate and copy the soc\_system.rbf into the microSD card are listed below:

- Make sure the DDR3\_VIP.sof file is up to date on the DDR3\_VIP project folder
- Execute sof\_to\_rbf.bat to generate **soc\_system.rbf**
- Make sure the microSD card is programmed to contain the Linux image erasic\_hps\_ddr3.img
- Insert the MicroSD card into your host PC
- Copy **soc\_system.rbf** to root folder of the microSD card. (Overwrite soc\_system.rbf if there is an old version)

# Demonstration File Locations

The Quartus project information is shown below:

- FPGA Quartus project location: CD\Demonstrations\FPGA\DDR3\_VIP
- Demo batch file location : CD\Demonstrations\FPGA\DDR3\_VIP\demo\_batch
- Bitstream File Name: DDR3\_VIP.sof
- RBF Filename: soc\_system.rbf

The location of the Linux image to program microSD is specified below. Please refer to Getting\_Started\_Guide.pdf about how to program the Linux image into a microSD card by using Win32DiskImager.exe.

CD\Demonstrations\FPGA\SdcardImage\ terasic\_hps\_ddr3.img

# Demonstration Setup and Instructions by SOF File

Please follow the instruction listed below to configure the FPGA with the .sof file through the usb-blaster JTAG interface to perform the demonstration.

- Make sure both Quartus II and USB-Blaster II drivers are installed on the host PC
- Connect the DE10-Nano board to the LCD monitor through an HDMI cable
- Program terasic\_hps\_ddr3.img into a microSD card
- Insert the microSD card into the DE10-Nano board
- Make sure the MSEL[4:0] is set to 01010
- Connect a mini-USB cable to UB2 port of DE10-Nano and the host PC

- Power on the DE10-Nano board
- Wait until HPS LED0 is lighted. This indicate the DDR3 is ready
- Launch the "test.bat" batch file from the "\DDR3\_VIP\demo\_batch" folder. After the programming and configuration are successful, the screen should look like the one shown in Figure 5-12.
- Wait for a few seconds for the LCD monitor to be powered up. There will be a pre-defined 1024x768 video pattern shown on the monitor, as shown in **Figure 5-13**.

Figure 5-12 Launch the DDR3\_VIP demonstration from the ''demo\_batch'' folder

Figure 5-13 The video pattern in the DDR3\_VIP demonstration

### Demonstration Setup and Instructions by RBF File

Please follow the instructions below to configure FPGA with **soc\_system.rbf** file to perform the demonstration. In this demonstration case, FPGA is configured by **Bootloader** which read the configuration file **soc\_system.rbf** from the microSD card. In this demonstration setup, no USB cable is required.

- Connect the DE10-Nano board to the LCD monitor through a HDMI cable
- Programming terasic\_hps\_ddr3.img into a microSD card
- Copy the RBF file soc\_system.rbf into the microSD card
- Insert the microSD card into the DE10-Nano board
- Make sure the MSEL[4:0] is set to 01010
- Power on the DE10-Nano board
- Wait for a few seconds for the LCD monitor to be powered up. There will be a 1024x768 video pattern shown on the monitor

# 5.5 DDR3\_RTL

This demonstrations describes how the RTL code on FPGA site to access the DDR3 on HPS site and perform write & read back verify test. A Qsys sub-system teraisc\_ddr3.qsys is used in the Qsys top. This sub-system export a Avalon memory-mapped interface for the DDR3 on the HPS site. In this case, the RTL code can access the DDR3 through the Avalon memory-mapped interface.

Before running the FPGA demo, users have to make the DE10-Nano boot from HPS to execute the **Preloader, Bootloader, and soc\_system.rbf** programs from the microSD card for the HPS and DDR3 initialization. The required microSD card image, called **terasic\_hps\_ddr3.img**, are provided in the DE10-Nano System CD.

### System Block Diagram

**Figure 5-14** shows the system block diagram of this reference design. In this HPS site, the **Preloader, Bootloader, and soc\_system.rbf** programs are loaded from the microSD card and is executed to initialize the HPS and DDR3 memory. The **Bootloader** will make the HPS LED light up to indicate the DDR3 is ready; use **soc\_system.rbf** to configure FPGA.

DE10-Nano User Manual www.terasic.com March 13, 2017 In the FPGA site, the **terasic\_hps\_ddr3** sub-system, provided by Terasic, is used to provide a bridge between FPGA and HPS DDR3. **Avalon\_bus\_RW\_test** is a memory test module. It performs memory write and read back verification. It accesses the DDR3 through the FPGA-to-HPS interface and SDRAM Controller. The FPGA-to-HPS interface is configure as a 128-bits Avalon Memory-Mapped Bidirectional port. When users press KEYO, the memory test is started. The test progression and test results will be indicated in the LED[2:0]. The de-bounce block is used to avoid multiple trigger due to the key bounding.

#### DDR3 Access Interface

In this demonstration, a QSYS sub-system **terasic\_hps\_ddr3.qsys** is used to provide a bridge between the FPGA and the HPS DDR3 controller. In the Qsys top design, **terasic\_hps\_ddr3** sub-system is included. The **hps\_f2h\_sdram\_data** interface should be exported to quartus top, such that the test module can access the DDR3 through the Avalon Memory-Mapped interface as shown in **Figure 5-15**. Besides, interfaces **hps\_0\_hps\_io** and **memory** also should be exported for connecting to the HPS pins in Quartus top as shown in **Figure 5-16**.

Figure 5-16 Pin connections on Quartus top

# ■ FPGA configure from HPS

Besides configuring FGPA through the usb-blaster JTAG interface. The FPGA can also be configured via **Bootloader** in the microSD card. When DE10-Nano is booted from HPS, the Bootloader will configure the FPGA by the configuration file **soc\_system.rbf** which is also provided in the microSD card. The **soc\_system.rbf** file can be generated from a .sof by applying a batch file **sof\_to\_rbf.bat**. The batched file is provided by Terasic, and is located in the DDR3\_RTL folder. The batch calls quatus\_cpf.exe and this utility will convert DDR3\_RTL.sof to soc\_system. Before copying this **soc\_system.rbf** into the MicroSD card, please make sure the microSD card is programmed with the Linux Image file terasic\_hsp\_ddr3\_init.img located at

#### CD\Demonstration\FPGA\SdcardImage\terasic\_hps\_ddr3.img

For details about how to program the terasic\_hps\_ddr3.img into the microSD card, Please refer to Getting\_Started\_Guide.pdf document in this kit.

Here are the procedure to generate and copy the **soc\_system.rbf** into the microSD card:

- Make sure the DDR3\_RTL.sof file is up to date on the DDR3\_RTL project folder
- Execute the sof\_to\_rbf.bat to generate **soc\_system.rbf**
- Make sure the re-programmed microSD card contains the Linux image erasic\_hps\_ddr3.img
- Insert the MicroSD card into your host PC
- Copy **soc\_system.rbf** to root folder of the microSD card. (If an old one exists, overwrite it with soc\_system.rbf)

# Demonstration File Locations

The Quartus project information is shown below:

- FPGA Quartus project location: CD\Demonstrations\FPGA\DDR3\_RTL
- Demo batch file location : CD\Demonstrations\FPGA\DDR3\_RTL\demo\_batch
- Bitstream File Name: DDR3\_RTL.sof
- RBF Filename: soc\_system.rbf

The location of the Linux image to program microSD is specified below. Please refer to Getting\_Started\_Guide.pdf about how to program the Linux image into a microSD card by using Win32DiskImager.exe.

CD\Demonstrations\FPGA\SdcardImage\ terasic\_hps\_ddr3.img

# Demonstration Setup and Instructions by SOF File

Please followbelow instructions to configure FPGA with .sof file through the usb-blaster JTAG interface to performance the demonstration.

- Make sure both Quartus II and USB-Blaster II driver are installed on the host PC.
- Program terasic\_hps\_ddr3.img into a microSD card.
- Insert the microSD card into the DE10-Nano board.
- Make sure the MSEL[4:0] is set to 01010.
- Connect a mini-USB cable to UB2 port of DE10-Nano and the host PC.

- Power on the DE10-Nano board
- Wait the HPS LED0 is lighted. This indicates the DDR3 is ready.
- Launch the "test.bat" batch file from the "\DDR3\_RTL\demo\_batch" folder. After the programming and configuration are successful, the screen should look like the one shown in Figure 5-17.
- Press KEY0 to start memory test.
- The LED[3:0] will show test progression and test result. Please refer to Table 5-3 LED representations.

### Demonstration Setup and Instructions by RBF File

Please following instructions below to configure the FPGA with **soc\_system.rbf** file to perform the demonstration. In the case of this demonstration, the FPGA is configured by **Bootloader** which reads the configuration file **soc\_system.rbf** from the microSD card. In this demonstration setup, no USB cable is required.

- Programming terasic\_hps\_ddr3.img into a microSD card.
- Copy the RBF file **soc\_system.rbf** into the microSD card.
- Insert the microSD card into the DE10-Nano board.
- Make sure the MSEL[4:0] is set to 01010.
- Power on the DE10-Nano board.
- Press KEY0 to start memory test.
- The LED[3:0] will show test progression and test result. Please refer to **Table 5-3** LED representations.

# Chapter 6 Examples for HPS SoC

his chapter provides several C-code examples based on the Intel SoC Linux built by Yocto project. These examples demonstrate major features of peripherals connected to HPS interface on DE10-Nano board such as users LED/KEY, I2C interfaced G-sensor. All the associated files can be found in the directory Demonstrations/SOC of the DE10-Nano System CD. Please refer to Chapter 5 "**Running Linux on the DE10-Nano board**" from the *Getting\_Started\_Guide.pdf* to run Linux on DE10-Nano board.

#### Installation of the Demonstrations

To install the demonstrations on the host computer:

Copy the directory *Demonstrations* into a local directory of your choice. SoC EDS V16.0 is required for users to compile the c-code project.

# 6.1 Hello Program

This demonstration shows how to develop first HPS program with SoC EDS tool. Please refer to My\_First\_HPS.pdf from the system CD for more details.

The major procedures to develop and build HPS project are:

- Install SoC EDS on the host PC.
- Create program .c/.h files with a generic text editor
- Create a "Makefile" with a generic text editor
- Build the project under SoC EDS

#### Program File

The main program for the Hello World demonstration is:

```
#include <stdio.h>
int main(int argc, char **argv) {
    printf("Hello World!\r\n");
    return( 0 );
}
```

#### Makefile

A Makefile is required to compile a project. The Makefile used for this demo is:

```
#
    TARGET = my_first_hps
    ΰ
    CROSS_COMPILE = arm-linux-gnueabihf-
    CFLAGS = -g -Wall -I $(SOCEDS_DEST_ROOT)/ip/altera/hps/altera_hps/hwlib/include
LDFLAGS = -g -Wall
    CC = $ (CROSS_COMPILE) gcc
    ARCH= arm
    build: $(TARGET)
    $(TARGET): main.o
      $(CC) $(LDFLAGS) $^ -o $0
    %.o : %.c
       $(CC) $(CFLAGS) -c $< -o $@
     .PHONY: clean
    clean:
rm -f $(TARGET) *.a *.o *~
```

#### Compile

Please launch SoC EDS Command Shell to compile a project by executing

EX : C:\altera\16.0\embedded\Embedded\_Command\_Shell.bat

The "cd" command can change the current directory to where the Hello World project is located. The "make" command will build the project. The executable file "my first hps" will be generated after the compiling process is successful. The "clean all" command removes all temporary files.

#### **Demonstration Source Code**

- Build tool: SoC EDS v16.0
- Project directory: \Demonstration\SoC\my\_first\_hps
- Binary file: my\_first\_hps
- Build command: make ("make clean" to remove all temporary files)
- Execute command: ./my\_first\_hps

#### Demonstration Setup

- Connect a USB cable to the USB-to-UART connector (J4) on the DE10-Nano board and the host PC.
- Copy the demo file "my\_first\_hps" into a microSD card under the "/home/root" folder in Linux.
- Insert the booting microSD card into the DE10-Nano board.
- Power on the DE10-Nano board.
- Launch PuTTY to establish the connection between the UART port of DE10-Dano board and the host PC. Type "root" with the password "terasic" to login LXDE Linux.
- Type "./my\_first\_hps" in the UART terminal of PuTTY to start the program, and the "Hello World!" message will be displayed in the terminal.

# 6.2 Users LED and KEY

This demonstration shows how to control the users LED and KEY by accessing the register of GPIO controller through the memory-mapped device driver. The memory-mapped device driver allows developer to access the system physical memory.

### Function Block Diagram

**Figure 6-1** shows the function block diagram of this demonstration. The users LED and KEY are connected to the **GPIO1** controller in HPS. The behavior of GPIO controller is controlled by the register in GPIO controller. The registers can be accessed by application software through the memory-mapped device driver, which is built into SoC Linux.

Figure 6-1 Block diagram of GPIO demonstration

# Block Diagram of GPIO Interface

The HPS provides three general-purpose I/O (GPIO) interface modules. **Figure 6-2** shows the block diagram of GPIO Interface. GPIO[28..0] is controlled by the GPIO0 controller and GPIO[57..29] is controlled by the GPIO1 controller. GPIO[70..58] and input-only GPI[13..0] are controlled by the GPIO2 controller.

Figure 6-2 Block diagram of GPIO Interface

#### GPIO Register Block

The behavior of I/O pin is controlled by the registers in the register block. There are three 32-bit registers in the GPIO controller used in this demonstration. The registers are:

- gpio\_swporta\_dr: write output data to output I/O pin
- **gpio\_swporta\_ddr**: configure the direction of I/O pin
- **gpio\_ext\_porta**: read input data of I/O input pin

The **gpio\_swporta\_ddr** configures the LED pin as output pin and drives it high or low by writing data to the **gpio\_swporta\_dr** register. The first bit (least significant bit) of **gpio\_swporta\_dr** controls the direction of first IO pin in the associated GPIO controller and the second bit controls the direction of second IO pin in the associated GPIO controller and so on. The value "1" in the register bit indicates the I/O direction is output, while the value "0" in the register bit indicates the I/O direction is input.

DE10-Nano User Manual The first bit of **gpio\_swporta\_dr** register controls the output value of first I/O pin in the associated GPIO controller, the second bit controls the output value of second I/O pin in the associated GPIO controller and so on. The value "1" in the register bit indicates the output value is high, and the value "0" indicates the output value is low.

The status of KEY can be queried by reading the value of **gpio\_ext\_porta** register. The first bit represents the input status of first IO pin in the associated GPIO controller, and the second bit represents the input status of second IO pin in the associated GPIO controller and so on. The value "1" in the register bit indicates the input state is high, and the value "0" indicates the input state is low.

### GPIO Register Address Mapping

HPS

The registers of HPS peripherals are mapped to HPS base address space 0xFC000000 with 64KB size. The registers of the GPIO1 controller are mapped to the base address 0xFF708000 with 4KB size, and the registers of the GPIO2 controller are mapped to the base address 0xFF70A000 with 4KB size, as shown in **Figure 6-3**.

tle	Identifier	Offset
eserved		0x0
SPI Flash Controller Module	QSPIREGS	0xFF705000
		0xFF705100
Manager Module	FPC	
CP ID Mapper Registers	ACPIDMAr	
PIO Module	GPIO0	0xFF708000
eserved		0xFF708080
PIO Module	GPIO1	0xFF709000
eserved		0xFF709080
PIO Module	GPIO2	0xFF70A000
eserved		0xFF70A080
6	EGS	0xFF800000
		0xFF880000

Figure 6-3 GPIO address map

#### **Software API**

Developers can use the following software API to access the register of GPIO controller.

- open: open memory mapped device driver
- mmap: map physical memory to user space
- alt\_read\_word: read a value from a specified register
- alt\_write\_word: write a value into a specified register
- munmap: clean up memory mapping
- close: close device driver.

Developers can also use the following MACRO to access the register

- alt\_setbits\_word: set specified bit value to one for a specified register
- alt\_clrbits\_word: set specified bit value to zero for a specified register

The program must include the following header files to use the above API to access the registers of GPIO controller.

#include <stdio.h></stdio.h>
#include <unistd.h></unistd.h>
#include <fcntl.h></fcntl.h>
#include <sys mman.h=""></sys>
#include "hwlib.h"
#include "socal/socal.h"
#include "socal/hps.h"
#include "socal/alt_gpio.h"

## LED and KEY Control

**Figure 6-4** shows the HPS users LED and KEY pin assignment for the DE10-Nano board. The LED is connected to HPS\_GPI053 and the KEY is connected to HPS\_GPI054. They are controlled by the GPI01 controller, which also controls HPS\_GPI029 ~ HPS\_GPI057.

	A20	HPS_LED
HPS_GPIO53	J18	HPS KEY
HPS GPIO54		

#### Figure 6-4 Pin assignment of LED and KEY

**Figure 6-5** shows the **gpio\_swporta\_ddr** register of the GPIO1 controller. The bit-0 controls the pin direction of HPS\_GPIO29. The bit-24 controls the pin direction of HPS\_GPIO53, which connects to HPS\_LED, the bit-25 controls the pin direction of HPS\_GPIO54, which connects to HPS\_KEY, and so on. The pin direction of HPS\_LED and HPS\_KEY are controlled by the bit-24 and bit-25 in the **gpio\_swporta\_ddr** register of the GPIO1 controller, respectively. Similarly, the output status of HPS\_LED is controlled by the bit-24 in the **gpio\_swporta\_dr** register of the GPIO1 controller. The status of KEY can be queried by reading the value of the bit-24 in the **gpio\_ext\_porta** register of the GPIO1 controller.

Figure 6-5 gpio\_swporta\_ddr register in the GPIO1 controller

The following mask is defined in the demo code to control LED and KEY direction and LED's output value.

#define USER_IO_DIR	(0x0100000)
#define BIT_LED	(0x0100000)
#define BUTTON_MASK	(0x0200000)

The following statement is used to configure the LED associated pins as output pins.

alt_setbits_word(	(	virtual_base		+
```	_GPIO1_	_SWPORTA_DDR_ADDR	)	&
(uint32_t)(HW_REG	S_MASK	())), USER_IO_DIR);		

The following statement is used to turn on the LED.

alt_setbits_word(	( virtual_base		+
( ( uint32_t )(	ALT_GPIO1_SWPORTA_DR_ADDR	)	&
( uint32_t )( HW_RI	EGS_MASK ) ) ), BIT_LED );		

The following statement is used to read the content of **gpio\_ext\_porta** register. The bit mask is used to check the status of the key.

alt_read_word(	( virtual_base		+
( ( uint32_t )(	ALT_GPIO1_EXT_PORTA_ADDR	)	&
(uint32_t)(HW_REGS_	_MASK ) ) ) );		

## Demonstration Source Code

- Build tool: SoC EDS V16.0
- Project directory: \Demonstration\SoC\hps\_gpio
- Binary file: hps\_gpio
- Build command: make ('make clean' to remove all temporal files)
- Execute command: ./hps\_gpio

#### Demonstration Setup

- Connect a USB cable to the USB-to-UART connector (J4) on the DE10-Nano board and the host PC.
- Copy the executable file "hps\_gpio" into the microSD card under the "/home/root" folder in Linux.
- Insert the booting micro SD card into the DE10-Nano board.
- Power on the DE10-Nano board.
- Launch PuTTY to establish the connection between the UART port of DE10-Dano board and the host PC. Type "root" with the password "terasic" to login LXDE Linux.
- Type "./hps\_gpio " in the UART terminal of PuTTY to start the program.

- HPS\_LED will flash twice and users can control the user LED with push-button.
- Press HPS\_KEY to light up HPS\_LED.
- Press "CTRL + C" to terminate the application.

# 6.3 I2C Interfaced G-sensor

This demonstration shows how to control the G-sensor by accessing its registers through the built-in I2C kernel driver in Linux BSP.

#### Function Block Diagram

**Figure 6-6 s**hows the function block diagram of this demonstration. The G-sensor on the DE10-Nano board is connected to the **I2C0** controller in HPS. The G-Sensor I2C 7-bit device address is 0x53. The system I2C bus driver is used to access the register files in the G-sensor. The G-sensor interrupt signal is connected to the PIO controller. This demonstration uses polling method to read the register data.

#### Figure 6-6 Block diagram of the G-sensor demonstration

#### ■ I2C Driver

The procedures to read a register value from G-sensor register files by the existing I2C bus driver in the system are:

- 1. Open I2C bus driver "/dev/i2c-0": file = open("/dev/i2c-0", O\_RDWR);
- 2. Specify G-sensor's I2C address 0x53: ioctl(file, I2C\_SLAVE, 0x53);
- 3. Specify desired register index in g-sensor: write(file, &Addr8, sizeof(unsigned char));
- 4. Read one-byte register value: read(file, &Data8, sizeof(unsigned char));

The G-sensor I2C bus is connected to the I2C0 controller, as shown in the **Figure 6-7**. The driver name given is '/dev/i2c-0'.

I2C0 SDA	A19	HPS_I2C0_SDAT
12C0_SCL	~	HPS_I2C0_SCLK

Figure 6-7 Connection of HPS I2C signals

The step 4 above can be changed to the following to write a value into a register.

write(file, &Data8, sizeof(unsigned char));

The step 4 above can also be changed to the following to read multiple byte values.

read(file, &szData8, sizeof(szData8)); // where szData is an array of bytes

The step 4 above can be changed to the following to write multiple byte values.

write(file, &szData8, sizeof(szData8)); // where szData is an array of bytes

#### G-sensor Control

The ADI ADXL345 provides I2C and SPI interfaces. I2C interface is selected by setting the CS pin to high on the DE10-Nano board.

The ADI ADXL345 G-sensor provides user-selectable resolution up to 13-bit  $\pm$  16g. The resolution can be configured through the DATA\_FORAMT(0x31) register. The data format in this demonstration is configured as:

- Full resolution mode
- ± 16g range mode
- Left-justified mode

The X/Y/Z data value can be derived from the DATAX0(0x32), DATAX1(0x33), DATAY0(0x34), DATAY1(0x35), DATAZ0(0x36), and DATAX1(0x37) registers. The DATAX0 represents the least significant byte and the DATAX1 represents the most significant byte. It is recommended to perform multiple-byte read of all registers to prevent change in data between sequential registers read. The following statement reads 6 bytes of X, Y, or Z value.

read(file, szData8, sizeof(szData8)); // where szData is an array of six-bytes

DE10-Nano User Manual

#### Demonstration Source Code

- Build tool: SoC EDS v16.0
- Project directory: \Demonstration\SoC\hps\_gsensor
- Binary file: gsensor
- Build command: make ('make clean' to remove all temporal files)
- Execute command: ./gsensor [loop count]

#### Demonstration Setup

- Connect a USB cable to the USB-to-UART connector (J4) on the DE10-Nano board and the host PC.
- Copy the executable file "gsensor" into the microSD card under the "/home/root" folder in Linux.
- Insert the booting microSD card into the DE10-Nano board.
- Power on the DE10-Nano board.
- Launch PuTTY to establish the connection between the UART port of DE10-Dano board and the host PC. Type "root" with the password "terasic" to login LXDE Linux.
- Execute "./gsensor" in the UART terminal of PuTTY to start the G-sensor polling.
- The demo program will show the X, Y, and Z values in the PuTTY, as shown in **Figure 6-8**.

```
coot@DE10_NANO:~# chmod +x gsensor
coot@DE10_NANO:~# ./gsensor
===== gsensor test =====
id=E5h
[1]X=12 mg, Y=-32 mg, Z=908 mg
[2]X=12 mg, Y=-28 mg, Z=964 mg
[3]X=12 mg, Y=-28 mg, Z=964 mg
[4]X=8 mg, Y=-32 mg, Z=960 mg
[5]X=12 mg, Y=-32 mg, Z=960 mg
```

Figure 6-8 Terminal output of the G-sensor demonstration

• Press "CTRL + C" to terminate the program.

# 6.4 Setup USB Wi-Fi Dongle

This section describes how to setup the Wi-Fi USB dongle under Linux, so Linux user can wirelessly connect to the Wi-Fi AP (Access Point) through the Wi-Fi USB Dongle and finally connect to the internet. The Wi-Fi AP is assumed to have the DHCP server capability and is connected to the internet. You should also make sure you know the SSID and Password of the Wi-Fi AP.

#### System Diagram

**Figure 6-9** shows the block diagram of this demonstration. The Wi-Fi AP assumes you have the DHCP server capability and is connected to the LAN (Local Area Network) or the internet. The USB Wi-Fi Dongle connects to the Wi-Fi AP and gets an address IP from the Wi-Fi AP. Through the Wi-Fi AP, the USB-Dongle will be able to communicate with the devices connected to the LAN or the internet.

Figure 6-9 System diagram of USB Wi-Fi dongle

#### ■ Wi-Fi Setup Procedure

- Connect a USB cable to the USB-to-UART connector (J4) on the DE10-Nano board and the host PC.
- Use a USB OTG cable to connect the USB Wi-Fi Dongle and the micro USB port on the DE10-Nano.
- Power on the DE10-Nano board.
- Launch PuTTY to establish the connection between the UART port of the

DE10-Nano User Manual www.terasic.com March 13, 2017 DE10-Nano board and the host PC. Type "root" with the password "terasic" to login to the LXDE Linux.

- Type "**ifconfig wlan0 up**" in the UART terminal of PuTTY to start wlan0 network interface.
- Type "iwlist wlan0 scan | grep ESSID" in the UART terminal to search nearby Wi-Fi AP. Make sure your Wi-Fi AP is found.

• Type "vim /etc/wpa\_supplicant/wpa\_supplicant.conf" in the UART terminal to edit Wi-Fi configuration file.

 In the configuration file, replace "Your\_SSID" and "Your\_WPA-Key\_ASCII" with the SSID and password for your Wi-Fi AP, in respectively.

• Type "ifup wlan0" in the UART terminal to connect to the Wi-Fi AP.

```
root@DE10_NANO:~# ifup wlan0

 Make sure Wi-Fi AP is connected to the internet. Type "ping -c 4 www.terasic.com" in the UART terminal to check internet connection status. If 0% packet loss is reported, it means the connection is good.

# **6.5 Query Internet Time**

This demonstration shows how clients use timing web server and query the internet time through Internet. The time information will be shown on the UART terminal with the format HH:MM:SS. The DE10-Nano connects to Ethernet through wire RJ45 Port or wireless Wi-Fi USB-Dongle. For details about how to setup the Wi-Fi USB-Dongle, please refer to the chapter **6.4 Setup USB Wi-Fi Dongle**.

#### Function Block Diagram

**Figure 6-10** shows the function block diagram of the Query Internet Time. A free third-party library **libcurl** is to handle URL transfer tasks. The main program uses "http get" request to query web content and directly display the response content on the NIOS II terminal.

Figure 6-10 Function block diagram of Internet Time demonstration

#### URL transfer library: libcurl

The **libcurl** library is designed for the client site of the network. The library implements complex internet protocol but provides simple C API for developers. The developers for client program can easily communicate to the server by calling the API exported in the library.

For details, please refer to https://curl.haxx.se/libcurl/

terasic

DE10-Nano User Manual

#### How to Query Internet Time

The internet time information is available at <u>http://demo.terasic.com</u>. Sending URL <u>http://demo.terasic.com/time/</u> to the web server, it will respond with current time in the following format HH:MM:SS.

#### Demonstration Source Code

- Build tool: SoC EDS V16.0
- Project directory: \Demonstration\SoC\_Advanced\NET\_Time
- Binary file: NET\_Time
- Build command: make ('make clean' to remove all temporal files)
- Execute command: ./NET\_Time

#### Demonstration Setup

- Connect a USB cable to the USB-to-UART connector (J4) on the DE10-Nano board and the host PC.
- Copy the executable file "NET\_Time" into the microSD card under the "/home/root" folder in Linux.
- Insert the booting micro SD card into the DE10-Nano board.
- Power on the DE10-Nano board.
- Launch PuTTY to establish the connection between the UART port of DE10-Nona board and the host PC. Type "root" with the password "terasic" to login LXDE Linux.
- Type "./NET\_Time" in the UART terminal of PuTTY to start the program.

- The UTC(Universal Time Coordinated) time will be display on the UART terminal.
- Press "CTRL + C" to terminate the application.

# Chapter 7 *Examples* for using both HPS SoC and FGPA

his Chapter demonstrates how to use the HPS/ARM to communicate with FPGA. We will introduce the GHRD project for DE10-Nano development board. And we develop one ARM C Project which demonstrates how HPS/ARM program controls the green LEDs connected to FPGA. We will shows how HPS controls the FPGA LED through Lightweight HPS-to-FPGA Bridge. The FPGA is configured by HPS through FPGA manager in HPS.

# 7.1 Required Background

This section pre-assumed the developers have the following background knowledge:

#### FPGA RTL Design

- Basic Quartus II operation skill
- Basic RTL coding skill
- Basic Qsys operation skill
- Knowledge about Memory-Mapped Interface

#### C Program Design

- Basic SoC EDS(Embedded Design Suite) operation skill
- Basic C coding and compiling skill
- Skill to Create a Linux Boot SD-Card for DE10-Nano with a given image file
- Skill to boot Linux from SD-Card on DE10-Nano Skill to cope files into Linux file system on DE10-Nano Basic Linux command operation skill

# 7.2 System Requirements

Before starting this tutorial, please note that the following items are required to complete the demonstration project:

Terasic DE10-Nano FPGA board, includes

- Mini USB Cable for UART terminal
- Micros SD-Card, at 4GB minimum
- Micros SD-Card Card Reader
- A x86 PC
  - Windows 7 64 bit operation system Installed
  - One USB Port
  - Quartus II 16.0 or Later Installed
  - SoC EDS 16.0 or Later Installed
  - Win32 Disk Imager Installed

# 7.3 AXI bridges in Intel SoC FPGA

In Intel SoC FPGA, the HPS logic and FPGA fabric are connected through the AXI (Advanced eXtensible Interface) bridge. For HPS logic to communicate with FPGA fabric, Intel system integration tool **Qsys** should be used for the system design to add **HPS** component. From the AXI master port of the HPS component, HPS can access those Qsys components whose memory-mapped slave ports are connected to the master port.

The HPS contains the following HPS-FPGA AXI bridges.

- FPGA-to-HPS Bridge
- HPS-to-FPGA Bridge
- Lightweight HPS-to-FPGA Bridge

**Figure 7-1** shows a block diagram of the AXI bridges in the context of the FPGA fabric and the L3 interconnect to the HPS. Each master (M) and slave (S) interface is shown with its data width(s). The clock domain for each interconnect is noted in parentheses.

Figure 7-1 AXI Bridge Block Diagram

The HPS-to-FPGA bridge is mastered by the level 3 (L3) main switch and the lightweight HPS-to-FPGA bridge is mastered by the L3 slave peripheral switch.

The FPGA-to-HPS bridge masters the L3 main switch, allowing any master implemented in the FPGA fabric to access most slaves in the HPS. For example, the FPGA-to-HPS bridge can access the accelerator coherency.

All three bridges contain global programmer view GPV register. The GPV register control the behavior of the bridge. It is able to access to the GPV registers of all three bridges through the lightweight HPS-to-FPGA bridge.

This Demo introduces to users how to use the HPS/ARM to communicate with FPGA. This project includes GHRD project for the DE10-Nano one ARM C Project which demonstrates how HPS/ARM program controls the green LEDs connected to FPGA.

# 7.4 GHRD Project

The term GHRD is short for Golden Hardware Reference Design. The GRD project provide by Terasic for the DE10-Nano development board is located in the CD folder: CD-ROM\Demonstration\SOC\_FPGA\ DE10\_NANO\_SoC\_GHRD.

The project consists of the following components:

- ARM Cortex<sup>™</sup>-A9 MPCore HPS
- Two user push-button inputs
- Four user DIP switch inputs
- Seven user I/O for LED outputs
- 64KB of on-chip memory
- JTAG to Avalon master bridges
- Interrupt capturer for use with System Console
- System ID

The memory map of system peripherals in the FPGA portion of the SoC as viewed by the MPU starts at the lightweight HPS-to-FPGA base address 0xFF20\_0000. The MPU can access these peripherals through the Address offset setting in the Qsys. User can open the GHRD project with Quartus II Software. Then open the soc\_system.qsys file with the Qsys tool. **Figure 7-2** lists the address map of the peripherals which are connected to the lightweight HPS-to-FPGA.

All the Avalon Conduit signals of these peripherals are connected to the I/O pins of the SoCFPGA on DE10-Nano board as shown in the **Figure 7-3**.

**Figure 7-3** Connection in the top design

# 7.5 Compile and Programming

In the Qsys tool, click the menu item "Generate $\rightarrow$ Generate..." to generate source code for the system and then close the Qsys tool. Now, users can start the compile process by clicking the menu item "Processing $\rightarrow$ Start Compilation".

Because .tcl files of SDRAM DDR3 controller for HPS had been executed in GHRD project, developers can skip this procedure. If developers' Quartus project is not developed based on the GHRD project, please remember to execute the .tcl files of SDRAM DDR3 controller, as show in **Figure 7-4**, before executing 'Start Compilation'.

The TCL Scripts dialog can be launched by clicking the menu item "Tools $\rightarrow$ TCL Scripts...". <qsys\_system\_name>\_**parameters.tcl** and <qsys\_system\_name>\_**pin\_assignments.tcl** tcl files should be executed, where <qsys\_system\_name> is the name of your Qsys system. Run this script to assign constrains tor the SDRAM DDR3 component.

Figure 7-4 Running the SDRAM Controller tcl

Now, users can start the compile process by clicking the menu item "Processing->Start Compilation". When the compilation process is completed successfully, **DE10\_NANO\_SoC\_GHRD.sof** is generated in the DE10\_NANO\_SoC\_GHRD\output\_files folder. Users can use this file to configure FPGA by Quartus Programming through the DE10-Nano on-board USB-Blaster II.

# 7.6 Develop the C Code

This section introduces how to design an ARM C program to control the **led\_pio** PIO controller. SoC EDS is used to compile the C project. For ARM program to control the **led\_pio** PIO component, **led\_pio** address is required. The Linux built-in driver '/dev/mem' and mmap system-call are used to map the physical base address of **led\_pio** component to a virtual address which can be directly accessed by Linux application software.

#### HPS Header File

pio\_led component information is required for ARM C program as the program will attempt to control the component. This section describes how to use a given Linux shell batch file to extract the Qsys HPS information to a header file which will be included in the C program later.

The batch file mentioned above is called as **generate\_hps\_qsys\_header.sh**. It is located in the same folder as DE10\_NANO\_SoC\_GHRD Quartus project. To generate the header file, launch SoC EDS command shell, go to the Quartus project folder, and execute **generate\_hps\_qsys\_header.sh** by typing './**generate\_hps\_qys\_header.sh**''. Then, press ENTER key, a header file **hps\_0.h** will be generated. In the header file, the **led\_pio** base address is represented by a constant LED\_PIO\_BASE as show in **Figure 7-5**. The **led\_pio** width is represented by a constant LED\_PIO\_DATA\_WIDTH. These two constants will be used in the C program demonstration code.

```
1/*
  * Macros for device 'led pio', class 'altera avalon pio'
 * The macros are prefixed with 'LED PIO '.
 * The prefix is the slave descriptor.
 */
 #define LED PIO COMPONENT TYPE altera avalon pio
 #define LED PIO COMPONENT NAME led pio
 #define LED PIO BASE 0x10040
 #define LED PIO SPAN 16
 #define LED PIO END 0x1004f
 #define LED PIO BIT CLEARING EDGE REGISTER 0
 #define LED PIO BIT MODIFYING OUTPUT REGISTER 0
 #define LED PTO CAPTURE 0
 #define LED PIO DATA WIDTH 8
 #define LED PIO DO TEST BENCH WIRING 0
 #define LED PIO DRIVEN SIM VALUE 0
 #define LED PIO EDGE TYPE NONE
 #define LED PIO FREQ 5000000
```

Figure 7-5 pio\_led information defined in hps\_0.h

## Map LED\_PIO Address

This section will describe how to map the pio\_led physical address into a virtual address which is accessible by an application software. **Figure 7-6** shows the C program to derive the virtual address of **led\_pio** base address. First, **open** system-call is used to open memory device driver "/dev/mem", and then the **mmap** system-call is used to map HPS physical address into a virtual address represented by the void pointer variable **virtual\_base**. The demo code maps the physical base address (HW\_REGS\_BASE = 0xfc000000) of the peripheral region into a based virtual address by adding their offset relative to the peripheral region, users can calculate their virtual address by adding their offset relative to the peripheral region to the based virtual address **virtual\_base**. Based on the rule, the virtual address of led\_pio can be calculated by adding the below two offset addresses to **virtual\_base**.

- Offset address of Lightweight HPS-to-FPGA AXI bus relative to HPS base address
- Offset address of Pio\_led relative to Lightweight HPS-to-FPGA AXI bus

The first offset address is 0xff200000 which is defined as a constant ALT\_LWFPGASLVS\_OFST in the header hps.h. The hps.h is a header of SoC EDS. It is located in the Quartus installation folder:

 $D:\latera\end{tabular} bedded\ip\attera\hps\attera\hps\hwlib\include\soc\_cv\_av\socal$ 

The second offset address is 0x10040 which is defined as LED\_PIO\_BASE in the hps\_0.h header file which is generated in above section.

The virtual address of pio\_led is represented by a void pointer variable **h2p\_lw\_led\_addr.** Application program can directly use the pointer variable to access the registers in the controller of **LED\_PIO**.

```
if( ( fd = open( "/dev/mem", ( O_RDWR | O_SYNC ) ) ) == -1 ) {
    printf( "ERROR: could not open \"/dev/mem\"...\n" );
    return(1);
}
virtual_base = mmap( NULL, HW_REGS_SPAN, ( PROT_READ | PROT_WRITE ), MAP_SHARED, fd, HW_REGS_BASE );
if( virtual_base == MAP_FAILED ) {
    printf( "ERROR: mmap() failed...\n" );
    close( fd );
    return(1);
}
h2p_lw_led_addr=virtual_base + ( ( unsigned long )( ALT_LWFPGASLVS_OFST + LED_PIO_BASE ) & ( unsigned long)( HW_REGS_MASK ) );
```

#### Figure 7-6 LED\_PIO memory map code

# LED Control

C programmers need to understand the Register Map of the PIO core for **LED\_PIO** before they can control it. **Figure 7-7** shows the Register Map for the PIO Core. Each register is 32-bit width. For detail information, please refer to the datasheet of PIO Core. For led control, we just need to write output value to the offset 0 register relative to based address 0x10040. Because the led on DE10-Nano is high active, writing a value 0x00000000 to the offset 0 register will turn off all of the eight green LEDs. There are 8 red LEDs on DE10-Dano and 7 of them are connected to this controller. The last LED (LED0) is used to implement FPGA heartbeat. Writing a value 0x000000ff to the offset 0 register will turn on all of seven green LEDs. In C program, writing a value 0x0000007f to the offset 0 register of pio\_led can be implemented as:

\*(uint32\_t \*) h2p\_lw\_led\_addr= 0x000007f;

The state will assign the void pointer to a uint32\_t pointer, so C compiler knows write a 32-bit value 0x0000007f to the virtual address h2p\_lw\_led\_addr.

Offeet	Davi	inter Nome	DAW	Fields				
Offset	Reg	ister Name	R/W	(n-1)		2	1	0
0	data	read access	R	Data va	ue currently on PIO inputs.

1	direction	(1)	R/W		al direction control for each I/( n to input; 1 sets the direction		alue of 0 s	sets the
2	interruptmask (1) R/W IRQ enable/disable for each input port. Setting a bit to 1 enable/disable for the corresponding port.			nables				
3	edgecapture (1), (2) R/W Edge detection for each input port.		Edge detection for each input port.					
4	outset		w	Specifies which bit of the output port to set.				
5	outclear		W	Specifies which output bit to clear.				

Figure 7-7 Register Map of PIO Core

#### Main Program

In the main program, the LED is controlled to perform LED light sifting operation as shown in **Figure 7-8**. When finishing 60 times of shift cycle, the program will be terminated.

```
loop count = 0;
led_mask = 0x01;
led direction = 0; // 0: left to right direction
while( loop_count < 60 ) {</pre>
  // control led, add ~ because the led is low-active
  *(uint32_t *)h2p_lw_led_addr = ~led_mask;
  // wait 100ms
  usleep( 100*1000 );
  // update led mask
  if (led_direction == 0) {
    led mask <<= 1;
    if (led_mask == (0x01 << (PIO_LED_DATA_WIDTH-1)))</pre>
       led direction = 1;
  }else{
   led mask >>= 1;
    if (led_mask == 0 \times 01) {
      led direction = 0;
      loop count++;
   }
  }
} // while
```

Figure 7-8 Program for LED Shift Operation

#### Makefile and compile

**Figure 7-9** shows the content of Makefile for this C project. The program includes the head files provided by SoC EDS. In the Makefile, ARM-linux cross-compile also be specified.

Figure 7-9 Makefile content

To compile the project, type "make" in the command shell as shown in **Figure 7-10**. Then, type "ls" to check the generated ARM execution file "HPS\_FPGA\_LED".

Figure 7-10 ARM C Project Compilation

Execute the Demo

To execute the demo, please boot the Linux from the SD-card in DE10-Nano. Copy the execution file "HPS\_FPGA\_LED" to the Linux directory, and type "chmod +x HPS\_FPGA\_LED" to add execution attribute to the execute file. Use Quartus Programmer to configure FPGA with the **DE10\_NANO\_SoC\_GHRD.sof** generated in previous chapter. The LED0 will flash as the heat beat of the FPGA. Then, type "./HPS\_FPGA\_LED" to launch the ARM program. The LED[7..1] on DE10-Nano will be expected to perform 60 times of LED light shift operation, and then the program is terminated.

For details about booting the Linux from SD-card, please refer to the document: *Getting\_Started\_Guide.pdf* 

For details about copying files to Linux directory, please refer to the document: *My\_First\_HPS.pdf* 

# Chapter 8 Programming the EPCS Device

his chapter describes how to program the serial configuration (EPCS) device with Serial Flash Loader (SFL) function via the JTAG interface. Users can program EPCS devices with a JTAG indirect configuration (.jic) file, which is converted from a user-specified SRAM object file (.sof) in Quartus. The .sof file is generated after the project compilation is successful. The steps of converting .sof to .jic in Quartus II are listed below.

# 8.1 Before Programming Begins

The FPGA should be set to AS x1 mode i.e. MSEL[4..0] = "10010" to use the Flash as a FPGA configuration device, as shown in **Figure 8-1**.

Figure 8-1 DIP switch (SW10) setting of Active Serial (AS) mode

# 8.2 Convert .SOF File to .JIC File

1. Choose **Convert Programming** Files from the File menu of Quartus II, as shown in **Figure 8-2**.

Figure 8-2 File menu of Quartus II

- 2. Select **JTAG Indirect Configuration File (.jic)** from the **Programming file type** field in the dialog of Convert Programming Files.
- 3. Choose EPCS128 from the Configuration device field.
- 4. Choose Active Serial from the Mode filed.
- 5. Browse to the target directory from the **File name** field and specify the name of output file.

Click on the SOF data in the section of Input files to convert, as shown in Figure 8-3.

# 8.3 Write JIC File into the EPCS Device

When the conversion of SOF-to-JIC file is complete, please follow the steps below to program the EPCS device with the .jic file created in Quartus II Programmer.

- 1. Set MSEL[4..0] = "10010"
- 2. Choose **Programmer** from the Tools menu and the **Chain.cdf** window will appear.
- **3.** Click **Auto Detect** and then select the correct device (5CSEBA6). Both FPGA device and HPS should be detected, as shown in **Figure 8-7.**
- 4. Double click the red rectangle region shown in **Figure 8-7** and the **Select New Programming File** page will appear. Select the .jic file to be programmed.
- 5. Program the EPCS device by clicking the corresponding **Program/Configure** box. A factory default SFL image will be loaded, as shown in **Figure 8-8**.

6. Click Start to program the EPCS device.

Figure 8-7 Two devices are detected in the Quartus II Programmer

Figure 8-8 Quartus II programmer window with one .jic file

# 8.4 Erase the EPCS Device

The steps to erase the existing file in the EPCS device are:

- 1. Set MSEL[4..0] = "10010"
- 2. Choose **Programmer** from the **Tools** menu and the **Chain.cdf** window will appear.
- 3. Click Auto Detect, and then select correct device, both FPGA device and HPS will detected. (See Figure 8-7)
- 4. Double click the red rectangle region shown in **Figure 8-7**, and the **Select New Programming File** page will appear. Select the correct .jic file.
- 5. Erase the EPCS device by clicking the corresponding **Erase** box. A factory default SFL image will be loaded, as shown in **Figure 8-9**.
- 6. Click Start to erase the EPCS device.

Figure 8-9 Erase the EPCS device in Quartus II Programmer

# 8.5 EPCS Programming via nios-2-flash-programmer

Before programming the EPCS via nios-2-flash-programmer, users must add an EPCS patch file nios-flash-override.txt into the Nios II EDS folder. The patch file is available in the folder Demonstation\EPCS\_Patch of DE10-Nano System CD. Please copy this file to the folder [QuartusInstalledFolder]\nios2eds\bin (e.g. C:\altera\14.1\nios2eds\bin)

If the patch file is not included into the Nios II EDS folder, an error will occur as shown in **Figure 8-10**.

Figure 8-10 Error Message "No EPCS Layout Data".
