§ §

1 Introduction

This is Volume 2 of the Intel® Pentium® Silver and Intel® Celeron® Processors Datasheet. Volume 2 provides register information for the SoC.

Refer to document #336560 for the Intel® Pentium® Silver and Intel® Celeron® Processors Datasheet, Volume 1.

Throughout this document Intel® Pentium® Silver and Intel® Celeron® Processors is referred as SoC.

Throughout this document Intel® Pentium® Silver and Intel® Celeron® Processors families refer to:

- Intel® Pentium® Silver N5000
- Intel® Pentium® Silver J5005
- Intel® Celeron® N4000 and N4100
- Intel® Celeron® J4105 and J4005

§ §

2 Host Bridge/DRAM Registers

This chapter documents the registers in Bus: 0, Device 0, Function 0.

NOTE: These registers apply to all processors.

2.1 Device ID and Vendor ID Register (DEVICE_ID_VENDOR_ID_0_0_0_PCI) — Offset 0h

This register uniquely identifies any PCI device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 0h	AF08086 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	15h RW/V	**Strap2 Portion of Device ID (DEVICE_ID_STRAP2):** The reset default value of this register is tied to the parameter DEVICE_ID_STRAP2. These bits can be rewritten from SETIDVALUE message 1st DW data byte2, byte3.
22:21	3h RO	**Strap1 Portion of Device ID (DEVICE_ID_STRAP1):** These bits are tied to a C-Unit parameter DEVICE_ID_STRAP1.
20:16	10h RO/V	**Fuse Backed Portion of Device ID (DEVICE_ID_FUSE):** These bits of Device ID are fuse backed.
15:0	8086h RO	**Vendor ID (VENDOR_ID):** Hardwired to Intel's Vendor ID value.

2.2 PCI Status and PCI Command Register (PCI_STATUS_COMMAND_0_0_0_PCI) — Offset 4h

PCI Status is used to record status information for PCI bus related events. PCI Command provides coarse control over a device's ability to generate and respond to PCI cycles.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 4h	7 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	7h RO	**PCI Status and PCI Command (PCI_STATUS_AND_COMMAND):** Hardwired to 32'h00000007, allowing this device to respond to I/O space and Memory Space accesses. This device is also allowed to behave as a bus master.

2.3 PCI Revision ID and PCI Class Code Register (REVISION_ID_CLASS_CODE_0_0_0_PCI) — Offset 8h

Revision ID contains the revision number of the device. Class Code identifies the basic function of the device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 8h	6000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	600h RO	**Class Code 1 (CLASS_CODE1):** Hardwired 16'h0600, indicating this device is a Host Bridge.
15:8	0h RO	**Class Code 0 (CLASS_CODE0):** Hardwired to 8'h00, indicating this device is a Host Bridge.
7:0	0h RW/V	**Revision ID Strap (REVISION_ID_STRAP):** These bits can be rewritten from SETIDVALUE message 1st DW data byte 0.

2.4 Master Latency Timer and Header Type Register (MASTER_LATENCY_TIME_0_0_0_PCI) — Offset Ch

This register defines Latency Timer and layout of the device Configuration Space header.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + Ch	800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RESERVED_1):** Reserved
23:16	80h RO	**Header Type (HEADER_TYPE):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in the Configuration Space) and also whether or not the device contains multiple functions. Hardwired to 8'h80, indicating this is a multi-function device.
15:8	0h RO	**Master Latency Timer (MASTER_LATENCY_TIMER):** This field specifies, in units of PCI bus clocks, the value of the Latency Timer for this PCI bus master. Hardwired to 1'b0.
7:0	0h RO	**Reserved (RESERVED_0):** Reserved

2.5 System Agent Memory Mapped Range Base Address Register (SABAR) — Offset 10h

This register defines the base address for the System Agent Memory Mapped Configuration space. There is no physical memory within this 8KB window that can be addressed. The 8KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset, the System Agent Memory Mapped Configuration space is disabled and must be enabled by writing a 1 to the SABAREN bit.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.6 PCI Subsystem Vendor ID and PCI Subsystem ID (SVID_SID_0_0_0_PCI) — Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Subsystem ID (SUBSYSTEM_ID):** PCI Subsystem ID: This field should be programmed during BIOS initialization.
15:0	0h RW	**Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID):** PCI Subsystem Vendor ID: This field should be programmed by BIOS during bootup to indicate the vendor of the system board.

2.7 Capability Register Pointer (CAPPTR_0_0_0_PCI) — Offset 34h

This register contains a pointer to the first Capability Register in a linked list.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 34h	E0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	E0h RO	**Base Address of First Capability Register (BASE_ADDR):** This pointer is an 8-bit address to an offset within this device's Configuration Space that holds the first Capability Register (CAPID0_CAPCTRL).

2.8 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_LO_0_0_0_PCI) — Offset 48h

This register contains the lower 32bits of the MCHBAR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 48h	FED10001 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	1FDA2h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. MCHBAR[38:15] is {MCHBAR_HI[6:0],MCHBAR_LO[31:15]}. If incoming Request Address[38:15] matches MCHBAR[38:15] then request hits an address in the MCHBAR range.
14:4	0h RO	**Base Address Not Implemented (BASE_ADDR_NOT_IMPLEMENTED):** Hardwired to 0 to indicate size of BAR 32kB.
3:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	1h RW	**MCHBAR Enable (MCHBAREN):** • 0: MCHBAR is disabled and does not claim any memory • 1: MCHBAR memory mapped accesses are claimed and decoded appropriately

2.9 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_HI_0_0_0_PCI) — Offset 4Ch

This register contains the upper 32 bits of the MCHBAR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved
6:0	0h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. If incoming Request Address[38:15] matches MCHBAR[38:15], then request hits an address in the MCHBAR range.

2.10 B-Unit Shadow of GGC (B_CR_GGC_0_0_0_PCI) — Offset 50h

B-Unit shadow of the GMCH Graphics Control Register.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:0] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Graphics Memory Select (GMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics device in VGA nonlinear and Native linear modes. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. This register is also Intel TXT lockable. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD bit 1 of this register is 0. • 00h:0MB • 01h:32MB • 02h:64MB • 03h:96MB • 04h:128MB • 05h:160MB • 06h:192MB • 07h:224MB • 08h:256MB • 09h:288MB • 0Ah:320MB • 0Bh:352MB • 0Ch:384MB • 0Dh:416MB • 0Eh:448MB • 0Fh:480MB • 10h:512MB • 20h:...1024MB... • 30h:...1536MB... • 3Fh:...2016MB • 40h-FFh:Illegal value
7:6	0h RW	**Size of Graphics Translation Table Memory (GGMS):** This field is used to select the amount of Main Memory that is preallocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is preallocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register. Hardware functionality in case of programming this value to Reserved is not guaranteed. 0x0:No Preallocated Memory 0x1:2MB of Preallocated Memory 0x2:4MB of Preallocated Memory 0x3:8MB of Preallocated Memory
5:3	0h RO	**Reserved (RESERVED_0):** Reserved
2	0h RW	**Versatile Acceleration Mode Enable (VAMEN):** Enables the use of the iGFX engines for Versatile Acceleration. • 1: iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. • 0: iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/L	**IGA VGD Disable (IVD):** • 0: Enable. Device 2 IGD claims VGA memory and IO cycles, and the SubClass Code within Device 2 Class Code register is 00. • 1: Disable. Device 2 IGD does not claim VGA cycles Mem and IO, and the Sub Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field bits 7:3 of this register preallocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override B_CR_CAPID0_A[IGD] 1 or via a register DEVEN[3] 0. This register is locked by Intel TXT lock.
0	0h RW	**GGCLCK:** Reserved. Unused by the B-Unit.

2.11 B-Unit Shadow of the DEVEN Register (B_CR_DEVEN_0_0_0_PCI) — Offset 54h

The DEVEN register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 54h	13 h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RESERVED_1):** Reserved
5	0h RW	**Device 3 Function 0 Enable (D3F0EN):** • 0: Bus 0 Device 3 Function 0 is disabled and hidden • 1: Bus 0 Device 3 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 3 capability is disabled.
4	1h RW	**Device 2 Function 0 Enable (D2F0EN):** • 0: Bus 0 Device 2 Function 0 is disabled and hidden • 1: Bus 0 Device 2 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 2 capability is disabled.
3:2	0h RO	**Reserved (RESERVED_0):** Reserved
1	1h RW	**Device 0 Function 1 Enable (D0F1EN):** • 0: Bus 0 Device 1 Function 0 is disabled and hidden • 1: Bus 0 Device 1 Function 0 is enabled and visible This bit will be set to 0b and remain 0b if Device 0/0/1 capability is disabled.
0	1h RO	**Device 0 Function 0 Enable (D0F0EN):** Bus 0 Device 0 Function 0 may not be disabled, and is therefore hardwired to 1.

2.12 Protected Audio Video Path Control (PAVPC_0_0_0_PCI) — Offset 58h

This register contains the control bits for the Protected Audio Video Path.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Protected Content Memory (PCMBASE):** 1M, 2M, 4M, and 8M. Base value programmed from Top of Stolen Memory itself defines the size of the Write Only Protected Content Memory (WOPCM). Separate WOPCM size programming is redundant information and not required. Default 1M size programming.
19:7	0h RO	**Reserved (RSVD2):** Reserved
6	0h RW	**ASMF Enable (ASMFEN):** ASMF method enable • 0: Disabled (default) • 1: Enabled
5	0h RO	**Reserved (RSVD1):** Reserved
4	0h RW	**Override Attack (OVTATTACK):** Override of Unsolicited Connection State Attack and Terminate. • 0: Disable Override. Attack Terminate allowed. • 1: Enable Override. Attack Terminate disallowed.
3	0h RW	**Heavy Mode Select (HVYMODSEL):** This bit is applicable only for PAVP2 operation mode with a bit also set or for PAVP3 mode only if the perApp memory config is disabled due to the clearing of an additional bit 9 in the Crypto Function Control_1 register address 0x320F0. • 0: Lite Mode NonSerpent mode • 1: Serpent Mode Note that PAVP2 or PAVP3 mode selection is done by programming bit 8 of the MFX_MODE Video Mode register.
2	0h RW	**PAVP Register Lock (PAVPLCK):** This lock bit only impacts the Display copy of this register. In the C-Unit, all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit locks all writeable contents in this register when set, including itself. Only a hardware reset can unlock the register again. This lock bit needs to be set only if PAVP is enabled (bit 1 of this register is asserted.)
1	0h RW	**Protected Audio Video Path Enable (PAVPE):** • 0: PAVP functionality is disabled. • 1: PAVP functionality is enabled.
0	0h RW	**Protected Content Memory Enable (PCME):** This field enables Protected Content Memory within Graphics Stolen Memory. This memory is the same as the Write Only Protected Content Memory area whose size is defined by bit 5 of this register. This register is locked when PAVPLCK is set. • 0: Protected Content Memory is disabled and cannot be programmed in this manner when PAVP is enabled. • 1: Protected Content Memory is enabled and is the only programming option available when PAVP is enabled. For non-PAVP3 Mode even for Lite mode configuration this bit should be programmed to 1'b1 and HVYMODESEL to 1'b0. This bit should always be programmed to 1'b1 if bits 1 and 2 (PAVPE and PAVP lock bits) are both set. With perApp Memory configuration support the range check for the Write Only Protected Content Memory area should always happen when this bit is set regardless of Lite or Serpent mode or PAVP2 or PAVP3 mode programming.

2.13 B-Unit PCI Express Enhanced Configuration Range Base Address Low (B_CR_PCIEXBAR_LO_0_0_0_PCI) — Offset 60h

Defines the base address of the PCI Express Enhanced Configuration region. This register contains the lower 32bits of PCIEXBAR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**PCI Express Base Address (PCIEXBAR):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-Unit and A-Unit.
27	0h RO	**ADMSK128:** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.
26	0h RO	**ADMSK64:** Reserved. Unused by SoC since PCIEXBAR is a fixed 256MB region in SoCs.
25:3	0h RO	**Reserved (RESERVED_1):** Reserved
2:1	0h RO	**LENGTH:** Reserved and set to 0 indicating a fixed 256 MB region.
0	0h RW	**PCIEXBAR Range Enable (PCIEXBAREN):** • 0: PCIEXBAR range is disabled. Address may target DRAM or MMIO, depending on other address decode rules. • 1: PCIEXBAR range is enabled. Incoming request address must be compared with PCIEXBAR to determine whether the request targets PCI Express Enhanced Configuration region.

2.14 B-Unit PCI Express Enhanced Configuration Range Base Address High (B_CR_PCIEXBAR_HI_0_0_0_PCI) — Offset 64h

Defines part of the base address of the PCI Express Enhanced Configuration region. See bit field description.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RW	**PCI Express Base Address (PCIEXBAR):** PCIEXBAR[38:28] is {PCIEXBAR_HI[6:0],PCIEXBAR_LO[31:28]}. Describes bits [38:28] of the base address of the contiguous 256MB region for PCI Express Enhanced Configuration region. If bits [38:28] of the request address matches the PCIEXBAR[38:28] then the request targets the PCI Express Enhanced Configuration Space region. A posted memory operation from an IDI agent will be treated as a nonposted operation by the T-unit and A-unit.

2.15 Message Signaled Interrupts Capability Identifier and Message Control (MSI_CAPID) — Offset 90h

This register reflects the capability list of the system agent.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.16 Message Address (MA) — Offset 94h

This register is used by firmware or software to assign an MSI address to the device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.17 Message Data (MD) — Offset 98h

This register is used by firmware/software to assign an MSI data to the device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.18 Error Status Register (ERRSTS) — Offset A0h

This register is used to report various error conditions. An MSI message is generated when any of these flags is set (if enabled by the ERRCMD and PCICMDSTS registers). These bits are set regardless of whether or not the MSI is enabled and generated. This register is reset by powergood reset.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.19 Error Command Register (ERRCMD) — Offset A4h

This register controls the MISA response to various system errors. When a bit in this register is set, an interrupt is generated whenever the corresponding flag is set in the ERRSTS register. The actual generation of the interrupt is globally enabled via the PCI command register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.20 Top of Upper Usable DRAM Low (B_CR_TOUUD_LO_0_0_0_PCI) — Offset A8h

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the lower 32 bits of TOUUD.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.
19:1	0h RO	**Reserved (RESERVED_1):** Reserved
0	0h RW	**LOCK:** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

2.21 Top of Upper Usable DRAM High (B_CR_TOUUD_HI_0_0_0_PCI) — Offset ACh

Defines the top of the upper usable DRAM range and start of the upper MMIO address range. Formerly defined in BMBOUND_HI. This register contains the upper 32 bits of TOUUD.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + ACh	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved
6:0	1h RW	**Top of Upper Usable DRAM (TOUUD):** TOUUD[38:20] is {TOUUD_HI[6:0],TOUUD_LO[31:20]}. Upper usable DRAM address range ends at the preceding byte. Upper MMIO Range starts at this address and extends up to the maximum system addressable memory range. Bits 38:20 are compared with bits 38:20 of the incoming request address to determine whether the request targets the upper usable DRAM range or upper MMIO range. If Request Address[38:20]>=TOUUD[38:20] and any bit in Request Address[38:32] is set, request is determined to target the upper MMIO range.

2.22 Base of Data Stolen Memory (BDSM_0_0_0_PCI) — Offset B0h

Defines the Base of the Data Stolen Memory. In addition, the GSM range is defined to end at the preceding byte. See BGSM register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Base of Data Stolen Memory (BDSM):** This register contains the base address of the Data Stolen Memory. The limit for the Data Stolen Memory is TOLUD-1. This range is not decoded by the system agent, but is a sub-region of BGSM decoded by the Integrated Graphics Device. Incoming Request Address[31:20] is compared against BDSM[31:20] and TOLUD[31:20] to determine if the address falls in the range. The comparison check is as follows: BDSM[31:20]<=Address[31:20] && Address[31:20]<TOLUD[31:20] and Address[38:32]==0. Request SAI is then checked against the allowed SAIs to determine if access is allowed.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW	**BDSM Register Lock (LOCK):** This lock bit only impacts the Display copy of this register. In the C-Unit all register protection is implemented with SAI policy groups. This bit is maintained in the C-Unit for software observability. Display description: This bit will lock all writeable settings in this register, including itself.

2.23 Base of Graphics Stolen Memory (B_CR_BGSM_0_0_0_PCI) — Offset B4h

Defines the Base of the Graphics Stolen Memory. In addition, the SMM range is defined to end at the preceding byte. See TSEGMB register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + B4h	7B800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	7B8h RW	**Base of Graphics Stolen Memory (BGSM):** This register contains the base address of the Graphics Stolen Memory. The limit for the Graphics Stolen Memory is TOLUD-1. Incoming Request Address[31:20] is compared against BGSM[31:20] and TOLUD[31:20] to determine if the address falls in the range. The comparison check is as follows: BGSM[31:20]<=Address[31:20] && Address[31:20]<TOLUD[31:20] and Address[38:32]==0. Request SAI is then checked against the allowed SAIs to determine if access is allowed.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW	**LOCK:** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

2.24 B-Unit Copy of the TSEG Memory Base (B_CR_TSEGMB_0_0_0_PCI) — Offset B8h

B-Unit copy of the TSEGMB. TSEGMB defines the base of the SMM range and the BGSM register defines the limit of the SMM range. Note: In prior SoCs the base register was defined in SMMRRL register and the limit was defined in the SMMRRH register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + B8h	7B000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	7B0h RW	**Base address of TSEG DRAM Memory (TSEGMB):** BIOS determines the base of TSEG memory which must be at or below Graphics Base of GTT Stolen Memory BGSM. SMM range starts at this base and ends at BGSM1. Incoming Request Address [31:20] will be compared with TSEGMB[31:20] and BGSM[31:20] to determine if the request targets the SMM range. The comparison check is as follows: Address[31:20]>=TSEGMB[31:20] && Address[31:20]<BGSM[31:20] and Address[38:32]==0. If the check passes, the request targets the SMM range. If the protection for the range is enabled, then the request SAI is compared against allowed SAIs specified by BSMRRAC and BSMRWAC registers to determine if access is allowed.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW	**LOCK:** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

2.25 Top of Lower Usable DRAM (B_CR_TOLUD_0_0_0_PCI) — Offset BCh

This register defines the Top of Lower Usable DRAM range and start of the Lower MMIO Address range. Formerly defined in BMBOUND.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + BCh	80000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	800h RW	**Top of Lower Usable DRAM (TOLUD):** Defines the top of lower usable DRAM, which ends at the preceding byte. Lower MMIO Address range starts at this address and continues up to the 4GB Address 0xFFFF_FFFF. Bits 31:20 are compared with incoming request Address[31:20] to determine whether the request targets lower usable DRAM range or the lower MMIO range. If Request Address[31:20]>=TOLUD[31:20] and Request Address[38:32]==0 then the Request Address falls in the Lower MMIO Address range.
19:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW	**LOCK:** Reserved. Lock is unused by B-Unit. Register overwrites are protected via SAI access control policy registers.

2.26 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_LO_SHADOW_0_0_0_PCI) — Offset D0h

This register contains the lower 32bits of the MCHBAR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + D0h	FED10001 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	1FDA2h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. MCHBAR[38:15] is {MCHBAR_HI[6:0],MCHBAR_LO[31:15]}. If incoming Request Address[38:15] matches MCHBAR[38:15] then request hits an address in the MCHBAR range.
14:4	0h RO	**Base Address Not Implemented (BASE_ADDR_NOT_IMPLEMENTED):** Hardwired to 0 to indicate size of BAR 32kB.
3:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	1h RW	**MCHBAR Enable (MCHBAREN):** • 0: MCHBAR is disabled and does not claim any memory • 1: MCHBAR memory mapped accesses are claimed and decoded appropriately

2.27 B-Unit Copy of the MCHBAR (B_CR_MCHBAR_HI_SHADOW_0_0_0_PCI) — Offset D4h

This register contains the upper 32 bits of the MCHBAR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved
6:0	0h RW	**Base Address of MCHBAR (BASE_ADDR):** Defines the base address of the MCHBAR. If incoming Request Address[38:15] matches MCHBAR[38:15], then request hits an address in the MCHBAR range.

2.28 Message Data Register (MCRX) — Offset D8h

This register provides the extensions to complete the message fields over SBI. Its contents are used to fill in the upper address or offset bits of the SBI request and are cleared upon a write to the MCR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

2.29 Scratchpad (SKPD_0_0_0_PCI) — Offset DCh

This register holds 32 writable bits with no functionality behind them. It is for the convenience of BIOS and graphics drivers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Scratchpad (SKPD):** 1 DWORD of data storage.

2.30 Capability ID0 Capability Control (CAPID0_CAPCTRL0_0_0_0_PCI) — Offset E0h

Control bits in this register describe the attributes of CAPID0_A and CAPID0_B capability registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + E0h	10C0009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RESERVED_0):** Reserved
27:24	1h RO	**Capability ID Version (CAPID_VER):** This field has the value 0001b to identify the first revision of the CAPID register definition.
23:16	Ch RO	**Capability ID0 Structure Length (CAPIDLEN):** This field has the value 0Ch to indicate the structure length 12 bytes. This is the total size of this CAPCTRL and the CAPID0_A and CAPID0_B registers in the following bytes.
15:8	0h RO	**Next Capability Register Pointer (NEXT_CAP):** This field is hardwired to 00h, indicating the end of the capabilities linked list.
7:0	9h RO	**Capability ID (CAP_ID):** This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers.

2.31 Capability ID0 A (B_CR_CAPID0_A_0_0_0_PCI) — Offset E4h

Control of bits in this register is only required for SKU differentiation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + E4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Spare 31-24 (SPARE31_24):** Reserved for future capabilities.
23	0h RW	**VTd Disable (VTDD):** • 0: Enable VTd • 1: Disable VTd
22	0h RW	**Fuse Spare 22 (FUSE_SPARE22):** Fuse backed spare.
21	0h RW	**Fuse Spare 21 (FUSE_SPARE21):** Fuse backed spare.
20	0h RW	**Fuse Spare 20 (FUSE_SPARE20):** Fuse backed spare.
19	0h RW	**Fuse Spare 19 (FUSE_SPARE19):** Fuse backed spare.
18	0h RW	**Fuse Spare 18 (FUSE_SPARE18):** Fuse backed spare.
17:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW	**Camarillo DPTF Disable (CDD):** • 0: DPTF Camarillo associated memory spaces are accessible. • 1: DPTF Camarillo associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF can not be set.
14	0h RW	**Fuse Spare 14 (FUSE_SPARE14):** Fuse backed spare.
13	0h RW	**Fuse Spare 13 (FUSE_SPARE13):** Fuse backed spare.
12	0h RW	**Fuse Spare 12 (FUSE_SPARE12):** Fuse backed spare.
11	0h RW	**Internal Graphics Disable (IGD):** • 0: There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. • 1: There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.
10	0h RO	**Device ID Override Enable (DIDOE):** Controls if there is an override of Dev2 GFX device ID. Hardwired to 1b0. • 0: Disable ability to override DID -- For production • 1: Enable ability to override DID -- For debug and samples only

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RO	**Control Device ID Value (CDID):** Controls the value of Dev2 GFX device ID. Hardwired to 2b00. Identifier assigned to the core/primary PCI device.The corresponding two bit capability ID programming is: • 00: Desktop • 01: Mobile • 10: Server • 11: Marketing Spare
7:0	0h RW	**Spare 7-0 (SPARE7_0):** Reserved for future capabilities.

2.32 Capability ID0 B (B_CR_CAPID0_B_0_0_0_PCI) — Offset E8h

Control of bits in this register is only required for SKU differentiation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Imaging Unit Memory/IO Disable (IMGU_DIS):** • 0: Imaging Unit associated memory spaces are accessible. • 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for Iunit can not be set.
30	0h RW	**Fuse Spare 30 (FUSE_SPARE30):** Fuse backed spare.
29	0h RW	**Fuse Spare 29 (FUSE_SPARE29):** Fuse backed spares potentially to be used for PKGTYP encoding.
28	0h RW	**Fuse Spare 28 (FUSE_SPARE28):** Fuse backed spares potentially to be used for PKGTYP encoding.
27	0h RW	**Fuse Spare 27 (FUSE_SPARE27):** Fuse backed spares potentially to be used for PKGTYP encoding.
26	0h RW	**Fuse Spare 26 (FUSE_SPARE26):** Fuse backed spares potentially to be used for PKGTYP encoding.
25	0h RW	**Fuse Spare 25 (FUSE_SPARE25):** Fuse backed spares potentially to be used for PKGTYP encoding.
24	0h RW	**SVM Disable (SVMDIS):** • 0: Enable SVM mode • 1: Disable SVM mode
23:0	0h RW	**Spare 23-0 (SPARE23_0):** Reserved for future capabilities.

2.33 Design and Engineering Backup Register 0 (DEBUP0_0_0_0_PCI) — Offset F4h

Reserved for future spare usage.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Spare bits[31:0] (SPARE_RW):** Spare RW bits for future usage.

2.34 Design and Engineering Backup Register 1 (DEBUP1_0_0_0_PCI) — Offset FCh

Reserved for future spare usage.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:0] + FCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Spare bits[31:0] (SPARE_RW):** Spare RW bits for future usage.

§ §

3 Host Memory Mapped Configuration Space (MCHBAR) Registers

This chapter documents the MCHBAR registers. Base address of these registers are defined in the MCHBAR_0_0_0_PCI register in Bus: 0, Device: 0, Function: 0.

NOTE: These registers apply to all processors.

3.1 DRAM Rank Population 0 (D_CR_DRP0) — Offset 1000h

Rank configuration register.

This register is start of dunit 8, LPDDR4 Channel 1.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1000h	10000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: Reserved. • 001: Reserved. • 010: LPDDR4. • 011: Reserved. • 100: DDR4. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC.
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM/UDIMM. • 01: BGA. • 10: NA. • 11: uniDIMM/SODIMM/UDIMM with Rank 1 mirrored (DDR4 Only).
18:17	0h RO	**Reserved (RSVD18_17):** Reserved
16	0h RW	**Fine Bank Group Interleaving Enable (FBGINTEN):** When enabled, D-unit will use a lower order address bit in the bank hashing function (DDR4 Only). • 0: Bank Group Interleave disabled. • 1: Bank Group Interleave enabled. Note: BAHEN must be set for this bit to take effect.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit. • 1: PMI Dual Data Mode is enabled. Note: Dual Data Mode must be enable for DDR3L/DDR4 configurations.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

3.2 DRAM Timing Register 9A (D_CR_DTR9A) — Offset 1004h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1004h	14A546 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD31_23):** Reserved
22:18	5h RW	**Write to Write DQ Delay Same Bank Group Same Rank (TWWSR_L):** Specifies the delay from a DRAM Write to another Write command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tWWSR_L = tCCD_L.
17:13	5h RW	**Read to Read DQ Delay Same Bank Group Same Rank (TRRSR_L):** Specifies the delay from a DRAM Read to another Read command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tRRSR_L = tCCD_L.
12:6	15h RW	**Write to Read DQ Delay Same Bank Group Same Rank (TWRSR_L):** Specifies the delay from a DRAM Read to Write command within the same bank group of the same rank (in DRAM clocks). • DDR4 Equation: tWRSR_L = CWL + tDQSSmax + BL/2 + tWPST + tWTR_L.
5:0	6h RW	**Row Activation to Row Activation to Same Bank Group Delay [tRRD_L] (TRRD_L):** Specifies the minimum delay (in DRAM clocks) between two DRAM Activate commands to different banks within the same bank group of a rank. (DDR4 Only)

3.3 DRAM Timing Register 0A (D_CR_DTR0A) — Offset 1008h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1008h	820702CB h

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/DDR4/LPDDR3/WIO2: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. TCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
26:22	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 32 x DRAM Clocks). LPDDR3/LPDDR4/WIO2: tXSDLL = 0. DDR3L/DDR4: tXSDLL = tDLLK. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
21:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L/DDR4: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/WIO2: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note: this CR should be constrained to a minimum of 4 in LPDDR3/DDR3L/WIO2 and minimum of 8 in LPDDR4/DDR4. Note: Derating adds 1.875ns to this timing.

3.4 DRAM Timing Register 1A (D_CR_DTR1A) — Offset 100Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 100Ch	30481218 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L/DDR4: tZQCL/tZQoper - Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL - ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.

Bit Range	Default & Access	Field Name (ID): Description
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L/DDR4/LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only.

3.5 DRAM Timing Register 2A (D_CR_DTR2A) — Offset 1010h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1010h	46080C30 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
21	0h RO	**Reserved (RSVD21):** Reserved
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

3.6 DRAM Timing Register 3A (D_CR_DTR3A) — Offset 1014h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1014h	3002EA28 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = NA. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • WIO2 Equation: = NA. • DDR3L/DDR4 Equation: = tRTP.

Bit Range	Default & Access	Field Name (ID): Description
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands by the amount programmed in this field (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L/DDR4 Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L/DDR4 only. tCMD must be set to 1N for LPDDR3/LPDDR4/WIO2.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). • WIO2 Equation: NA. Note: Masked Write operation in LPDDR4 is always BL16 and in WIO2 is always BL4. D-Unit applies this timing for same rank as well as same bank.

3.7 DRAM Timing Register 4A (D_CR_DTR4A) — Offset 1018h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1018h	30209149 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L/DDR4 Equation: tWRDR = CWL + tDQSSmax + BL/2 - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.

Bit Range	Default & Access	Field Name (ID): Description
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - tWPRE). • DDR3L/DDR4 Equation: tRWDR = CL + tDQSCKmax + BL/2 - (CWL - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/DDR3L/DDR4 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE.

3.8 DRAM Timing Register 5A (D_CR_DTR5A) — Offset 101Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 101Ch	304200C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4/WIO2: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). Equation: tWWSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR. • DDR4 Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR_S.

Bit Range	Default & Access	Field Name (ID): Description
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L/DDR4 Equation: tRWSR = CL + tDQSCKmax + BL/2 - CWL + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.

3.9 DRAM Timing Register 6A (D_CR_DTR6A) — Offset 1020h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1020h	20100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For WIO2/LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L/DDR4, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Reserved (RSVD18_15):** Reserved
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). This is the channel block time for the MR19 command issued as part of LPDDR4 DQS Retraining flow. For all other MR commands this is the rank block time. Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the channel quiet time before issuing MRR/MRW command. (in DRAM clocks). • LPDDR3 Equation: = tXP + tMRRI - 4. • LPDDR4 Equation: = tXP + tMRRI - 8. • DDR3L Equation: = CWL + BL/2 + 1 - 8 • DDR4 Equation: = CWL + BL/2 + 1 - 16. Note: D-Unit treats MRR as a read and MRW/MRS as a write and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

3.10 DRAM Timing Register 7A (D_CR_DTR7A) — Offset 1024h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1024h	D060C06 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L, DDR4 and WIO2 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + 1.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

3.11 DRAM Timing Register 8A (D_CR_DTR8A) — Offset 1028h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1028h	CC50A18 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency published in the DDRIO PHY and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter published in the DDRIO PHY and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

3.12 D-Unit ODT Control Register A (D_CR_DOCRA) — Offset 102Ch

Specifies the parameters to control DRAM ODT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 102Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L/DDR4) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = 6. DDR4 Equation: RDODTSTOP = 5 + tRPRE. Note: Add 1 if DOCRx.RDODTSTART = CL - CWL in 2N mode.
13	0h RO	**Reserved (RSVD13):** Reserved
12:9	0h RW	**Read command to ODT assertion delay (DDR3L/DDR4) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L/DDR4 Equation: RDODTSTART = CL - CWL + tWPRE - tRPRE. Note: In DDR3L/DDR4 2N mode add 1 to enable termination at the start of read data burst.
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP = 6. DDR4 Equation: WRODTSTOP = 5 + tWPRE. Note: Add 1 if DOCRx.WRODTSTART = 0 in 2N mode.
4	0h RO	**Reserved (RSVD4):** Reserved
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L/DDR4 Equation: WRODTSTART = 0 Note: In DDR3L/DDR4 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion).

3.13 D-Unit Power Management Control 0 (D_CR_DPMC0) — Offset 1030h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1030h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

3.14 D-Unit Power Management Control 1 (D_CR_DPMC1) — Offset 1034h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1034h	10000028 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. • 0 - Enable Repeaters clock gating. • 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. • 0 - Enable IOSF-SB EP clock gating. • 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)

Bit Range	Default & Access	Field Name (ID): Description
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

3.15 DRAM Refresh Control (D_CR_DRFC) — Offset 1038h

Specifies the parameters to control scheduling of refresh commands.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1038h	20001750 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	1h RW	**Maintenance Operation Channel Block Time (MNTCHNBLKTIME):** Specifies the amount of time that D-unit will block the channel before any DRAM maintenance operation is issued. (in SPIDclk)
28:25	0h RW	**Maintenance Operation Delay CAS Count (MNTDLYCASCOUNT):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc.) needs to be performed, D-unit delays the maintenance operation and allows this many read or write requests to be scheduled before allowing the maintenance operation. Note: This mode does not apply to Panic refreshes.
24:22	0h RO	**Reserved (RSVD24_22):** Reserved
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RO	**Reserved (RSVD17_16):** Reserved
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Stop issuing refresh commands and accumulating refresh debits. (does not stop tREFI counter). • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

3.16 D-Unit Scheduler Control (D_CR_DSCH) — Offset 103Ch

Specifies parameters to control scheduling of commands to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 103Ch	3901C08 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Early Write DQ Enable (EARLY_DQ_EN):** Enables D-unit to send the write data to the PHY one clock earlier than WL value (WL - 1). Note: Applicable to DDR3L and DDR4 only.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data (STATIC_0). • 01: Always write read valid one SPID clock before data (STATIC_1). • 10: Write read valid up to 2 SPID clocks before data (DYNAMIC). • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15	0h RO	**Reserved (RSVD15):** Reserved
14:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty. For WIO2, when in-order mode is enabled (01 or 10), D_CR_DSCH_BYPASSEN must be set to 0
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** When set new page hit/empty read requests will bypass D-Unit pipeline stages to save latency 0 - Disable Idle Bypass 1 - Enable Idle Bypass Note: Only applies to WIO2, this bit is reserved for other technologies
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4 and WIO2. • LPDDR4: = MWr tCCD = MWr BL/2 = 8. • WIO2: NA.

3.17 DRAM Calibration Control (D_CR_DCAL) — Offset 1040h

Specifies parameters to control ZQ Calibration.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1040h	1057 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit. In LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3/DDR3L/DDR4) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

3.18 DRAM Mode Registers Shadow Copy (D_CR_MR_SHADOW) — Offset 1048h

This register contains a copy of Mode Regsiters in the DRAM so that D-unit can only modify certain bits without affecting other values.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1048h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:16	0h RW	**MR Value 2 (MR_VALUE2):** MR3 Shadow Register (DDR4): BIOS writes the correct value of MR3 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR3 into DDR4 to enter and exit MPR mode.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	0h RW	**MR Value (MR_VALUE):** MR3 Shadow Register (WIO2): BIOS sets the value of this field at boot time based on the DRAM device configuration. D-Unit merges the value in MR3_THERM_OFFSET with this field and writes the result into DRAM MR3 MR2 Shadow Register (DDR3L): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry. MR4 Shadow Register (DDR4): BIOS writes the correct value of MR4 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR4 into DDR4 DRAM after temperature read out.

3.19 VNN Scaling Timer Control (D_CR_VNNTIMER) — Offset 104Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 104Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

3.20 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL) — Offset 1050h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1050h	6C000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last temperature sensor read from Rank 1 DRAM Mode Register. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last temperature sensor read from Rank 0 DRAM Mode Register. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit initiates temperature sensor read from DRAM mode register to determine required refresh rate (in 4x tREFI units).
7	0h RW	**Temperature Controlled Refresh Range Enable (DDR4 Only) (TCRREN):** When set, after a DRAM temperature read out (MPR sequence), D-unit writes a 1 to bit 2 of MR_SHADOW.MR_VALUE when temperature sensor read out for that rank indicates a value higher than 0x1, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR4 of DDR4 for each enabled rank.
6	0h RW/V	**TQ Poll Start Rank 1 (TQPOLL_START_R1):** When set Dunit will initiate temperature sensor read for Rank 1. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
5	0h RW/V	**TQ Poll Start Rank 0 (TQPOLL_START_R0):** When set Dunit will initiate temperature sensor read for Rank 0. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of MR_SHADOW.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last temperature sensor read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables temperature sensor read on Self Refresh Exit. If disabled, D-Unit will not initiate MR Read sequence to read temperature value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read the DRAM's temperature sensor value periodically.

3.21 Temperature Offset Control (D_CR_TQOFFSET) — Offset 1054h

Specifies temperature offset and refresh rate adjustments requested by software.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1054h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** (WIO2 only) Everytime MR3_OFFSET_UPDATE is set, D-Unit merges the value in this field with MR3_VALUE and writes the result to MR3 in DRAM

3.22 D-Unit Control Operations (D_CR_DCO) — Offset 1058h

Specifies D-Unit initialization and control operation.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1058h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit must be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved

3.23 Data Scrambler (D_CR_SCRAMCTRL) — Offset 10A4h

Specifies parameters to control data scrambling in D-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 10A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycles. • 10: Clock Gate every 3 cycles. • 11: Clock Gate every 4 cycles.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

3.24 Error Injection Address Register (D_CR_ERR_INJ) — Offset 10ACh

Contains the target address for ECC error injection.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 10ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/ under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved

3.25 Error Injection Control Register (D_CR_ERR_INJ_CTL) — Offset 10B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 10B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

3.26 Error Log Register (D_CR_ERR_ECC_LOG) — Offset 10B4h

Detected ECC errors are captured in this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 10B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CLEAR:** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

3.27 D-Unit Fuse Status (D_CR_DFUSESTAT) — Offset 10BCh

Contains the values read from D-Unit fuses.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 10BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: fus_dun_wio2_dis. • [7:7]: fus_dun_ddr3l_dis. • [8:8]: fus_dun_ddr4_dis. • [15:9]: reserved.

3.28 Major Mode Control (D_CR_MMC) — Offset 1124h

Specifies parameters to control read/write major mode operation and transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1124h	2B01A518 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved
17:12	1Ah RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

3.29 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB) — Offset 1128h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1128h	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

3.30 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD) — Offset 112Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 112Ch	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

3.31 Access Class Initial Priority (D_CR_ACCIP) — Offset 1130h

Each field of this register defines the initial priority of one access class.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1130h	17C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

3.32 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0) — Offset 1134h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1134h	1F52940 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.33 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1) — Offset 1138h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1138h	14000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.34 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2) — Offset 113Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 113Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.35 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3) — Offset 1140h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1140h	1F29400 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.36 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4) — Offset 1144h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1144h	1F5294A h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.37 Deadline Threshold (D_CR_DL_THRS) — Offset 1148h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1148h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

3.38 Major Mode Blocking Rules Control (D_CR_MM_BLK) — Offset 114Ch

This register controls blocking rules enforced in RMM and WMM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 114Ch	1800 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

3.39 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD) — Offset 1154h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1154h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW/V	**SUSPENDP:** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND:** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved
0	0h RW/V	**WAKE:** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

3.40 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL) — Offset 1180h

LPDDR4 DQS Retraining control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1180h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3	0h RW/V	**DQS Retrain Start Rank 1 (DQS_RETRAIN_START_R1):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank1. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
2	0h RW/V	**DQS Retrain Start Rank 0 (DQS_RETRAIN_START_R0):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank0. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

3.41 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE) — Offset 1184h

Controls the data bits swizzling crossbar for MR4.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1184h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

3.42 DRAM Rank Population 0 (D_CR_DRP0) — Offset 1200h

Rank configuration register.

This register is start of dunit 9 LPDDR4 Channel 2.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1200h	10000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: Reserved. • 001: Reserved. • 010: LPDDR4. • 011: Reserved. • 100: DDR4. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC.
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM/UDIMM. • 01: BGA. • 10: NA. • 11: uniDIMM/SODIMM/UDIMM with Rank 1 mirrored (DDR4 Only).
18:17	0h RO	**Reserved (RSVD18_17):** Reserved
16	0h RW	**Fine Bank Group Interleaving Enable (FBGINTEN):** When enabled, D-unit will use a lower order address bit in the bank hashing function (DDR4 Only). • 0: Bank Group Interleave disabled. • 1: Bank Group Interleave enabled. Note: BAHEN must be set for this bit to take effect.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit. • 1: PMI Dual Data Mode is enabled. Note: Dual Data Mode must be enable for DDR3L/DDR4 configurations.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

3.43 DRAM Timing Register 9A (D_CR_DTR9A) — Offset 1204h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1204h	14A546 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD31_23):** Reserved
22:18	5h RW	**Write to Write DQ Delay Same Bank Group Same Rank (TWWSR_L):** Specifies the delay from a DRAM Write to another Write command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tWWSR_L = tCCD_L.
17:13	5h RW	**Read to Read DQ Delay Same Bank Group Same Rank (TRRSR_L):** Specifies the delay from a DRAM Read to another Read command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tRRSR_L = tCCD_L.
12:6	15h RW	**Write to Read DQ Delay Same Bank Group Same Rank (TWRSR_L):** Specifies the delay from a DRAM Read to Write command within the same bank group of the same rank (in DRAM clocks). • DDR4 Equation: tWRSR_L = CWL + tDQSSmax + BL/2 + tWPST + tWTR_L.
5:0	6h RW	**Row Activation to Row Activation to Same Bank Group Delay [tRRD_L] (TRRD_L):** Specifies the minimum delay (in DRAM clocks) between two DRAM Activate commands to different banks within the same bank group of a rank. (DDR4 Only)

3.44 DRAM Timing Register 0A (D_CR_DTR0A) — Offset 1208h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1208h	820702CB h

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/DDR4/LPDDR3/WIO2: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. TCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
26:22	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 32 x DRAM Clocks). LPDDR3/LPDDR4/WIO2: tXSDLL = 0. DDR3L/DDR4: tXSDLL = tDLLK. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
21:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L/DDR4: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/WIO2: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3/DDR3L/WIO2 and minimum of 8 in LPDDR4/DDR4. Note: Derating adds 1.875ns to this timing.

3.45 DRAM Timing Register 1A (D_CR_DTR1A) — Offset 120Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 120Ch	30481218 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L/DDR4: tZQCL/tZQoper - Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL - ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.

Bit Range	Default & Access	Field Name (ID): Description
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L/DDR4/LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only. Not used in DDR3L/DDR4/LPDDR3/WIO2.

3.46 DRAM Timing Register 2A (D_CR_DTR2A) — Offset 1210h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1210h	46080C30 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
21	0h RO	**Reserved (RSVD21):** Reserved
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

3.47 DRAM Timing Register 3A (D_CR_DTR3A) — Offset 1214h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1214h	3002EA28 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • WIO2 Equation: = NA. • DDR3L/DDR4 Equation: = tRTP.

Bit Range	Default & Access	Field Name (ID): Description
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands by the amount programmed in this field (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L/DDR4 Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L/DDR4 only. tCMD must be set to 1N for LPDDR3/LPDDR4/WIO2.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). • WIO2 Equation: NA. Note: Masked Write operation in LPDDR4 is always BL16 and in WIO2 is always BL4. D-Unit applies this timing for same rank as well as same bank.

3.48 DRAM Timing Register 4A (D_CR_DTR4A) — Offset 1218h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1218h	30209149 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L/DDR4 Equation: tWRDR = CWL + tDQSSmax + BL/2 - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.

Bit Range	Default & Access	Field Name (ID): Description
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - tWPRE). • DDR3L/DDR4 Equation: tRWDR = CL + tDQSCKmax + BL/2 - (CWL - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/DDR3L/DDR4 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE.

3.49 DRAM Timing Register 5A (D_CR_DTR5A) — Offset 121Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 121Ch	304200C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4/WIO2: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). Equation: tWWSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR. • DDR4 Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR_S.

Bit Range	Default & Access	Field Name (ID): Description
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L/DDR4 Equation: tRWSR = CL + tDQSCKmax + BL/2 - CWL + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.

3.50 DRAM Timing Register 6A (D_CR_DTR6A) — Offset 1220h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1220h	20100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For WIO2/LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L/DDR4, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Reserved (RSVD18_15):** Reserved
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). This is the channel block time for the MR19 command issued as part of LPDDR4 DQS Retraining flow. For all other MR commands this is the rank block time. Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the channel quiet time before issuing MRR/MRW command. (in DRAM clocks). • LPDDR3 Equation: = tXP + tMRRI - 4. • LPDDR4 Equation: = tXP + tMRRI - 8. • DDR3L Equation: = CWL + BL/2 + 1 - 8 • DDR4 Equation: = CWL + BL/2 + 1 - 16. Note: D-Unit treats MRR as a read and MRW/MRS as a write and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

3.51 DRAM Timing Register 7A (D_CR_DTR7A) — Offset 1224h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1224h	D060C06 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L, DDR4 and WIO2 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + 1.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

3.52 DRAM Timing Register 8A (D_CR_DTR8A) — Offset 1228h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1228h	CC50A18 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency published in the DDRIO PHY and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter published in the DDRIO PHY and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

3.53 D-Unit ODT Control Register A (D_CR_DOCRA) — Offset 122Ch

Specifies the parameters to control DRAM ODT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 122Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L/DDR4) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = 6. DDR4 Equation: RDODTSTOP = 5 + tRPRE. Note: Add 1 if DOCRx.RDODTSTART = CL - CWL in 2N mode.
13	0h RO	**Reserved (RSVD13):** Reserved
12:9	0h RW	**Read command to ODT assertion delay (DDR3L/DDR4) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L/DDR4 Equation: RDODTSTART = CL - CWL + tWPRE - tRPRE. Note: In DDR3L/DDR4 2N mode add 1 to enable termination at the start of read data burst.
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP = 6. DDR4 Equation: WRODTSTOP = 5 + tWPRE. Note: Add 1 if DOCRx.WRODTSTART = 0 in 2N mode.
4	0h RO	**Reserved (RSVD4):** Reserved
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L/DDR4 Equation: WRODTSTART = 0 Note: In DDR3L/DDR4 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion).

3.54 D-Unit Power Management Control 0 (D_CR_DPMC0) — Offset 1230h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1230h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

3.55 D-Unit Power Management Control 1 (D_CR_DPMC1) — Offset 1234h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1234h	10000028 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. • 0 - Enable Repeaters clock gating. • 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. • 0 - Enable IOSF-SB EP clock gating. • 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)

Bit Range	Default & Access	Field Name (ID): Description
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

3.56 DRAM Refresh Control (D_CR_DRFC) — Offset 1238h

Specifies the parameters to control scheduling of refresh commands.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1238h	20001750 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	1h RW	**Maintenance Operation Channel Block Time (MNTCHNBLKTIME):** Specifies the amount of time that D-unit will block the channel before any DRAM maintenance operation is issued. (in SPIDclk)
28:25	0h RW	**Maintenance Operation Delay CAS Count (MNTDLYCASCOUNT):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc.) needs to be performed, D-unit delays the maintenance operation and allows this many read or write requests to be scheduled before allowing the maintenance operation. Note: This mode does not apply to Panic refreshes.
24:22	0h RO	**Reserved (RSVD24_22):** Reserved
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RO	**Reserved (RSVD17_16):** Reserved
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Stop issuing refresh commands and accumulating refresh debits. (does not stop tREFI counter). • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

3.57 D-Unit Scheduler Control (D_CR_DSCH) — Offset 123Ch

Specifies parameters to control scheduling of commands to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 123Ch	3901C08 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Early Write DQ Enable (EARLY_DQ_EN):** Enables D-unit to send the write data to the PHY one clock earlier than WL value (WL - 1). Note: Applicable to DDR3L and DDR4 only.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data (STATIC_0). • 01: Always write read valid one SPID clock before data (STATIC_1). • 10: Write read valid up to 2 SPID clocks before data (DYNAMIC). • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15	0h RO	**Reserved (RSVD15):** Reserved
14:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty. For WIO2, when in-order mode is enabled (01 or 10), D_CR_DSCH_BYPASSEN must be set to 0
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** When set new page hit/empty read requests will bypass D-Unit pipeline stages to save latency 0 - Disable Idle Bypass 1 - Enable Idle Bypass Note: Only applies to WIO2, this bit is reserved for other technologies
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4 and WIO2. • LPDDR4: = MWr tCCD = MWr BL/2 = 8. • WIO2: NA.

3.58 DRAM Calibration Control (D_CR_DCAL) — Offset 1240h

Specifies parameters to control ZQ Calibration.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1240h	1057 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit. In LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3/DDR3L/DDR4) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

3.59 DRAM Mode Registers Shadow Copy (D_CR_MR_SHADOW) — Offset 1248h

This register contains a copy of Mode Regsiters in the DRAM so that D-unit can only modify certain bits without affecting other values.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1248h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:16	0h RW	**MR Value 2 (MR_VALUE2):** MR3 Shadow Register (DDR4): BIOS writes the correct value of MR3 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR3 into DDR4 to enter and exit MPR mode.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	0h RW	**MR Value (MR_VALUE):** MR3 Shadow Register (WIO2): BIOS sets the value of this field at boot time based on the DRAM device configuration. D-Unit merges the value in MR3_THERM_OFFSET with this field and writes the result into DRAM MR3 MR2 Shadow Register (DDR3L): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry. MR4 Shadow Register (DDR4): BIOS writes the correct value of MR4 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR4 into DDR4 DRAM after temperature read out.

3.60 VNN Scaling Timer Control (D_CR_VNNTIMER) — Offset 124Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 124Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

3.61 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL) — Offset 1250h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1250h	6C000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last temperature sensor read from Rank 1 DRAM Mode Register. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last temperature sensor read from Rank 0 DRAM Mode Register. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit initiates temperature sensor read from DRAM mode register to determine required refresh rate (in 4x tREFI units).
7	0h RW	**Temperature Controlled Refresh Range Enable (DDR4 Only) (TCRREN):** When set, after a DRAM temperature read out (MPR sequence), D-unit writes a 1 to bit 2 of MR_SHADOW.MR_VALUE when temperature sensor read out for that rank indicates a value higher than 0x1, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR4 of DDR4 for each enabled rank.
6	0h RW/V	**TQ Poll Start Rank 1 (TQPOLL_START_R1):** When set Dunit will initiate temperature sensor read for Rank 1. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
5	0h RW/V	**TQ Poll Start Rank 0 (TQPOLL_START_R0):** When set Dunit will initiate temperature sensor read for Rank 0. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of MR_SHADOW.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last temperature sensor read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables temperature sensor read on Self Refresh Exit. If disabled, D-Unit will not initiate MR Read sequence to read temperature value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read the DRAM's temperature sensor value periodically.

3.62 Temperature Offset Control (D_CR_TQOFFSET) — Offset 1254h

Specifies temperature offset and refresh rate adjustments requested by software.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1254h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** (WIO2 only) Everytime MR3_OFFSET_UPDATE is set, D-Unit merges the value in this field with MR3_VALUE and writes the result to MR3 in DRAM

3.63 D-Unit Control Operations (D_CR_DCO) — Offset 1258h

Specifies D-Unit initialization and control operation.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1258h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit must be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved

3.64 Data Scrambler (D_CR_SCRAMCTRL) — Offset 12A4h

Specifies parameters to control data scrambling in D-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 12A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycles. • 10: Clock Gate every 3 cycles. • 11: Clock Gate every 4 cycles.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

3.65 Error Injection Address Register (D_CR_ERR_INJ) — Offset 12ACh

Contains the target address for ECC error injection.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 12ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/ under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved

3.66 Error Injection Control Register (D_CR_ERR_INJ_CTL) — Offset 12B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 12B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

3.67 Error Log Register (D_CR_ERR_ECC_LOG) — Offset 12B4h

Detected ECC errors are captured in this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 12B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CLEAR:** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

3.68 D-Unit Fuse Status (D_CR_DFUSESTAT) — Offset 12BCh

Contains the values read from D-Unit fuses.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 12BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: fus_dun_wio2_dis. • [7:7]: fus_dun_ddr3l_dis. • [8:8]: fus_dun_ddr4_dis. • [15:9]: reserved.

3.69 Major Mode Control (D_CR_MMC) — Offset 1324h

Specifies parameters to control read/write major mode operation and transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1324h	2B01A518 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved
17:12	1Ah RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

3.70 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB) — Offset 1328h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1328h	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

3.71 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD) — Offset 132Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 132Ch	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

3.72 Access Class Initial Priority (D_CR_ACCIP) — Offset 1330h

Each field of this register defines the initial priority of one access class.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1330h	17C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

3.73 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0) — Offset 1334h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1334h	1F52940 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.74 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1) — Offset 1338h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1338h	14000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.75 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2) — Offset 133Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 133Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.76 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3) — Offset 1340h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1340h	1F29400 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.77 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4) — Offset 1344h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1344h	1F5294A h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.78 Deadline Threshold (D_CR_DL_THRS) — Offset 1348h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1348h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

3.79 Major Mode Blocking Rules Control (D_CR_MM_BLK) — Offset 134Ch

This register controls blocking rules enforced in RMM and WMM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 134Ch	1800 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

3.80 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD) — Offset 1354h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1354h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW/V	**SUSPENDP:** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND:** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved
0	0h RW/V	**WAKE:** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

3.81 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL) — Offset 1380h

LPDDR4 DQS Retraining control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1380h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3	0h RW/V	**DQS Retrain Start Rank 1 (DQS_RETRAIN_START_R1):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank1. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
2	0h RW/V	**DQS Retrain Start Rank 0 (DQS_RETRAIN_START_R0):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank0. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

3.82 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE) — Offset 1384h

Controls the data bits swizzling crossbar for MR4.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1384h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

3.83 DRAM Rank Population 0 (D_CR_DRP0) — Offset 1400h

Rank configuration register.

This register is start of dunit 10 LPRRD4 Channel 0, DDR4 Channel 0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1400h	10000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: Reserved. • 001: Reserved. • 010: LPDDR4. • 011: Reserved. • 100: DDR4. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC.
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM/UDIMM. • 01: BGA. • 10: NA. • 11: uniDIMM/SODIMM/UDIMM with Rank 1 mirrored (DDR4 Only).
18:17	0h RO	**Reserved (RSVD18_17):** Reserved
16	0h RW	**Fine Bank Group Interleaving Enable (FBGINTEN):** When enabled, D-unit will use a lower order address bit in the bank hashing function (DDR4 Only). • 0: Bank Group Interleave disabled. • 1: Bank Group Interleave enabled. Note: BAHEN must be set for this bit to take effect.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit. • 1: PMI Dual Data Mode is enabled. Note: Dual Data Mode must be enable for DDR3L/DDR4 configurations.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

3.84 DRAM Timing Register 9A (D_CR_DTR9A) — Offset 1404h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1404h	14A546 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD31_23):** Reserved
22:18	5h RW	**Write to Write DQ Delay Same Bank Group Same Rank (TWWSR_L):** Specifies the delay from a DRAM Write to another Write command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tWWSR_L = tCCD_L.
17:13	5h RW	**Read to Read DQ Delay Same Bank Group Same Rank (TRRSR_L):** Specifies the delay from a DRAM Read to another Read command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tRRSR_L = tCCD_L.
12:6	15h RW	**Write to Read DQ Delay Same Bank Group Same Rank (TWRSR_L):** Specifies the delay from a DRAM Read to Write command within the same bank group of the same rank (in DRAM clocks). • DDR4 Equation: tWRSR_L = CWL + tDQSSmax + BL/2 + tWPST + tWTR_L.
5:0	6h RW	**Row Activation to Row Activation to Same Bank Group Delay [tRRD_L] (TRRD_L):** Specifies the minimum delay (in DRAM clocks) between two DRAM Activate commands to different banks within the same bank group of a rank. (DDR4 Only)

3.85 DRAM Timing Register 0A (D_CR_DTR0A) — Offset 1408h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1408h	820702CB h

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/DDR4/LPDDR3/WIO2: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. TCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
26:22	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 32 x DRAM Clocks). LPDDR3/LPDDR4/WIO2: tXSDLL = 0. DDR3L/DDR4: tXSDLL = tDLLK. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
21:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L/DDR4: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/WIO2: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3/DDR3L/WIO2 and minimum of 8 in LPDDR4/DDR4. Note: Derating adds 1.875ns to this timing.

3.86 DRAM Timing Register 1A (D_CR_DTR1A) — Offset 140Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 140Ch	30481218 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L/DDR4: tZQCL/tZQoper - Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL - ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.

Bit Range	Default & Access	Field Name (ID): Description
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L/DDR4/LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only. Not used in DDR3L/DDR4/LPDDR3/WIO2.

3.87 DRAM Timing Register 2A (D_CR_DTR2A) — Offset 1410h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1410h	46080C30 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
21	0h RO	**Reserved (RSVD21):** Reserved
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

3.88 DRAM Timing Register 3A (D_CR_DTR3A) — Offset 1414h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1414h	3002EA28 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • WIO2 Equation: NA. • DDR3L/DDR4 Equation: = tRTP.

Bit Range	Default & Access	Field Name (ID): Description
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands by the amount programmed in this field (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L/DDR4 Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L/DDR4 only. tCMD must be set to 1N for LPDDR3/LPDDR4/WIO2.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). • WIO2 Equation: NA. Note: Masked Write operation in LPDDR4 is always BL16 and in WIO2 is always BL4. D-Unit applies this timing for same rank as well as same bank, refer to D-Unit for more details.

3.89 DRAM Timing Register 4A (D_CR_DTR4A) — Offset 1418h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1418h	30209149 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L/DDR4 Equation: tWRDR = CWL + tDQSSmax + BL/2 - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.

Bit Range	Default & Access	Field Name (ID): Description
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - tWPRE). • DDR3L/DDR4 Equation: tRWDR = CL + tDQSCKmax + BL/2 - (CWL - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/DDR3L/DDR4 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE.

3.90 DRAM Timing Register 5A (D_CR_DTR5A) — Offset 141Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 141Ch	304200C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4/WIO2: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). Equation: tWWSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR. • DDR4 Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR_S.

Bit Range	Default & Access	Field Name (ID): Description
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L/DDR4 Equation: tRWSR = CL + tDQSCKmax + BL/2 - CWL + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.

3.91 DRAM Timing Register 6A (D_CR_DTR6A) — Offset 1420h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1420h	20100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For WIO2/LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L/DDR4, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Reserved (RSVD18_15):** Reserved
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). This is the channel block time for the MR19 command issued as part of LPDDR4 DQS Retraining flow. For all other MR commands this is the rank block time. Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the channel quiet time before issuing MRR/MRW command. (in DRAM clocks). • LPDDR3 Equation: = tXP + tMRRI - 4. • LPDDR4 Equation: = tXP + tMRRI - 8. • DDR3L Equation: = CWL + BL/2 + 1 - 8 • DDR4 Equation: = CWL + BL/2 + 1 - 16. Note: D-Unit treats MRR as a read and MRW/MRS as a write and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

3.92 DRAM Timing Register 7A (D_CR_DTR7A) — Offset 1424h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1424h	D060C06 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L, DDR4 and WIO2 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + 1.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

3.93 DRAM Timing Register 8A (D_CR_DTR8A) — Offset 1428h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1428h	CC50A18 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency published in the DDRIO PHY and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter published in the DDRIO PHY and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

3.94 D-Unit ODT Control Register A (D_CR_DOCRA) — Offset 142Ch

Specifies the parameters to control DRAM ODT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 142Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L/DDR4) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = 6. DDR4 Equation: RDODTSTOP = 5 + tRPRE. Note: Add 1 if DOCRx.RDODTSTART = CL - CWL in 2N mode.
13	0h RO	**Reserved (RSVD13):** Reserved
12:9	0h RW	**Read command to ODT assertion delay (DDR3L/DDR4) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L/DDR4 Equation: RDODTSTART = CL - CWL + tWPRE - tRPRE. Note: In DDR3L/DDR4 2N mode add 1 to enable termination at the start of read data burst.
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP = 6. DDR4 Equation: WRODTSTOP = 5 + tWPRE. Note: Add 1 if DOCRx.WRODTSTART = 0 in 2N mode.
4	0h RO	**Reserved (RSVD4):** Reserved
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L/DDR4 Equation: WRODTSTART = 0 Note: In DDR3L/DDR4 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion).

3.95 D-Unit Power Management Control 0 (D_CR_DPMC0) — Offset 1430h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1430h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

3.96 D-Unit Power Management Control 1 (D_CR_DPMC1) — Offset 1434h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1434h	10000028 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. • 0 - Enable Repeaters clock gating. • 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. • 0 - Enable IOSF-SB EP clock gating. • 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)

Bit Range	Default & Access	Field Name (ID): Description
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

3.97 DRAM Refresh Control (D_CR_DRFC) — Offset 1438h

Specifies the parameters to control scheduling of refresh commands.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1438h	20001750 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	1h RW	**Maintenance Operation Channel Block Time (MNTCHNBLKTIME):** Specifies the amount of time that D-unit will block the channel before any DRAM maintenance operation is issued. (in SPIDclk)
28:25	0h RW	**Maintenance Operation Delay CAS Count (MNTDLYCASCOUNT):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc.) needs to be performed, D-unit delays the maintenance operation and allows this many read or write requests to be scheduled before allowing the maintenance operation. Note: This mode does not apply to Panic refreshes.
24:22	0h RO	**Reserved (RSVD24_22):** Reserved
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RO	**Reserved (RSVD17_16):** Reserved
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Stop issuing refresh commands and accumulating refresh debits. (does not stop tREFI counter). • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

3.98 D-Unit Scheduler Control (D_CR_DSCH) — Offset 143Ch

Specifies parameters to control scheduling of commands to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 143Ch	3901C08 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Early Write DQ Enable (EARLY_DQ_EN):** Enables D-unit to send the write data to the PHY one clock earlier than WL value (WL - 1). Note: Applicable to DDR3L and DDR4 only.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data (STATIC_0). • 01: Always write read valid one SPID clock before data (STATIC_1). • 10: Write read valid up to 2 SPID clocks before data (DYNAMIC). • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15	0h RO	**Reserved (RSVD15):** Reserved
14:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty. For WIO2, when in-order mode is enabled (01 or 10), D_CR_DSCH_BYPASSEN must be set to 0
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** When set new page hit/empty read requests will bypass D-Unit pipeline stages to save latency 0 - Disable Idle Bypass 1 - Enable Idle Bypass Note: Only applies to WIO2, this bit is reserved for other technologies
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4 and WIO2. • LPDDR4: = MWr tCCD = MWr BL/2 = 8. • WIO2: = NA.

3.99 DRAM Calibration Control (D_CR_DCAL) — Offset 1440h

Specifies parameters to control ZQ Calibration.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1440h	1057 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit. In LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3/DDR3L/DDR4) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

3.100 DRAM Mode Registers Shadow Copy (D_CR_MR_SHADOW) — Offset 1448h

This register contains a copy of Mode Regsiters in the DRAM so that D-unit can only modify certain bits without affecting other values.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1448h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:16	0h RW	**MR Value 2 (MR_VALUE2):** MR3 Shadow Register (DDR4): BIOS writes the correct value of MR3 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR3 into DDR4 to enter and exit MPR mode.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	0h RW	**MR Value (MR_VALUE):** MR3 Shadow Register (WIO2): BIOS sets the value of this field at boot time based on the DRAM device configuration. D-Unit merges the value in MR3_THERM_OFFSET with this field and writes the result into DRAM MR3 MR2 Shadow Register (DDR3L): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry. MR4 Shadow Register (DDR4): BIOS writes the correct value of MR4 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR4 into DDR4 DRAM after temperature read out.

3.101 VNN Scaling Timer Control (D_CR_VNNTIMER) — Offset 144Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 144Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

3.102 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL) — Offset 1450h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1450h	6C000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last temperature sensor read from Rank 1 DRAM Mode Register. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last temperature sensor read from Rank 0 DRAM Mode Register. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit initiates temperature sensor read from DRAM mode register to determine required refresh rate (in 4x tREFI units).
7	0h RW	**Temperature Controlled Refresh Range Enable (DDR4 Only) (TCRREN):** When set, after a DRAM temperature read out (MPR sequence), D-unit writes a 1 to bit 2 of MR_SHADOW.MR_VALUE when temperature sensor read out for that rank indicates a value higher than 0x1, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR4 of DDR4 for each enabled rank.
6	0h RW/V	**TQ Poll Start Rank 1 (TQPOLL_START_R1):** When set Dunit will initiate temperature sensor read for Rank 1. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
5	0h RW/V	**TQ Poll Start Rank 0 (TQPOLL_START_R0):** When set Dunit will initiate temperature sensor read for Rank 0. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of MR_SHADOW.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last temperature sensor read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables temperature sensor read on Self Refresh Exit. If disabled, D-Unit will not initiate MR Read sequence to read temperature value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read the DRAM's temperature sensor value periodically.

3.103 Temperature Offset Control (D_CR_TQOFFSET) — Offset 1454h

Specifies temperature offset and refresh rate adjustments requested by software.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1454h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** (WIO2 only) Everytime MR3_OFFSET_UPDATE is set, D-Unit merges the value in this field with MR3_VALUE and writes the result to MR3 in DRAM

3.104 D-Unit Control Operations (D_CR_DCO) — Offset 1458h

Specifies D-Unit initialization and control operation.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1458h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit must be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved

3.105 Data Scrambler (D_CR_SCRAMCTRL) — Offset 14A4h

Specifies parameters to control data scrambling in D-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 14A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycles. • 10: Clock Gate every 3 cycles. • 11: Clock Gate every 4 cycles.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

3.106 Error Injection Address Register (D_CR_ERR_INJ) — Offset 14ACh

Contains the target address for ECC error injection.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 14ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/ under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved

3.107 Error Injection Control Register (D_CR_ERR_INJ_CTL) — Offset 14B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 14B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

3.108 Error Log Register (D_CR_ERR_ECC_LOG) — Offset 14B4h

Detected ECC errors are captured in this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 14B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CLEAR:** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

3.109 D-Unit Fuse Status (D_CR_DFUSESTAT) — Offset 14BCh

Contains the values read from D-Unit fuses.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 14BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: fus_dun_wio2_dis. • [7:7]: fus_dun_ddr3l_dis. • [8:8]: fus_dun_ddr4_dis. • [15:9]: reserved.

3.110 Major Mode Control (D_CR_MMC) — Offset 1524h

Specifies parameters to control read/write major mode operation and transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1524h	2B01A518 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved
17:12	1Ah RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

3.111 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB) — Offset 1528h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1528h	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

3.112 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD) — Offset 152Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 152Ch	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

3.113 Access Class Initial Priority (D_CR_ACCIP) — Offset 1530h

Each field of this register defines the initial priority of one access class.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1530h	17C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

3.114 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0) — Offset 1534h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1534h	1F52940 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.115 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1) — Offset 1538h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1538h	14000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.116 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2) — Offset 153Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 153Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.117 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3) — Offset 1540h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1540h	1F29400 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.118 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4) — Offset 1544h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1544h	1F5294A h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.119 Deadline Threshold (D_CR_DL_THRS) — Offset 1548h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1548h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

3.120 Major Mode Blocking Rules Control (D_CR_MM_BLK) — Offset 154Ch

This register controls blocking rules enforced in RMM and WMM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 154Ch	1800 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

3.121 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD) — Offset 1554h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1554h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW/V	**SUSPENDP:** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND:** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved
0	0h RW/V	**WAKE:** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

3.122 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL) — Offset 1580h

LPDDR4 DQS Retraining control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1580h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3	0h RW/V	**DQS Retrain Start Rank 1 (DQS_RETRAIN_START_R1):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank1. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
2	0h RW/V	**DQS Retrain Start Rank 0 (DQS_RETRAIN_START_R0):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank0. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

3.123 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE) — Offset 1584h

Controls the data bits swizzling crossbar for MR4.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1584h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

3.124 DRAM Rank Population 0 (D_CR_DRP0) — Offset 1600h

Rank configuration register.

This register is start of dunit 11 LPDDR4 Channel 3, DDR4 Channel 1.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1600h	10000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: Reserved. • 001: Reserved. • 010: LPDDR4. • 011: Reserved. • 100: DDR4. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC.
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM/UDIMM. • 01: BGA. • 10: NA. • 11: uniDIMM/SODIMM/UDIMM with Rank 1 mirrored (DDR4 Only).
18:17	0h RO	**Reserved (RSVD18_17):** Reserved
16	0h RW	**Fine Bank Group Interleaving Enable (FBGINTEN):** When enabled, D-unit will use a lower order address bit in the bank hashing function (DDR4 Only). • 0: Bank Group Interleave disabled. • 1: Bank Group Interleave enabled. Note: BAHEN must be set for this bit to take effect.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit. • 1: PMI Dual Data Mode is enabled. Note: Dual Data Mode must be enable for DDR3L/DDR4 configurations.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

3.125 DRAM Timing Register 9A (D_CR_DTR9A) — Offset 1604h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1604h	14A546 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD31_23):** Reserved
22:18	5h RW	**Write to Write DQ Delay Same Bank Group Same Rank (TWWSR_L):** Specifies the delay from a DRAM Write to another Write command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tWWSR_L = tCCD_L.
17:13	5h RW	**Read to Read DQ Delay Same Bank Group Same Rank (TRRSR_L):** Specifies the delay from a DRAM Read to another Read command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tRRSR_L = tCCD_L.
12:6	15h RW	**Write to Read DQ Delay Same Bank Group Same Rank (TWRSR_L):** Specifies the delay from a DRAM Read to Write command within the same bank group of the same rank (in DRAM clocks). • DDR4 Equation: tWRSR_L = CWL + tDQSSmax + BL/2 + tWPST + tWTR_L.
5:0	6h RW	**Row Activation to Row Activation to Same Bank Group Delay [tRRD_L] (TRRD_L):** Specifies the minimum delay (in DRAM clocks) between two DRAM Activate commands to different banks within the same bank group of a rank. (DDR4 Only)

3.126 DRAM Timing Register 0A (D_CR_DTR0A) — Offset 1608h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1608h	820702CB h

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/DDR4/LPDDR3/WIO2: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. TCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
26:22	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 32 x DRAM Clocks). LPDDR3/LPDDR4/WIO2: tXSDLL = 0. DDR3L/DDR4: tXSDLL = tDLLK. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
21:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L/DDR4: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/WIO2: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3/DDR3L/WIO2 and minimum of 8 in LPDDR4/DDR4. Note: Derating adds 1.875ns to this timing.

3.127 DRAM Timing Register 1A (D_CR_DTR1A) — Offset 160Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 160Ch	30481218 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L/DDR4: tZQCL/tZQoper - Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL - ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.

Bit Range	Default & Access	Field Name (ID): Description
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L/DDR4/LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only. Not used in DDR3L/DDR4/LPDDR3/WIO2.

3.128 DRAM Timing Register 2A (D_CR_DTR2A) — Offset 1610h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1610h	46080C30 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
21	0h RO	**Reserved (RSVD21):** Reserved
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

3.129 DRAM Timing Register 3A (D_CR_DTR3A) — Offset 1614h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1614h	3002EA28 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • WIO2 Equation: = NA. • DDR3L/DDR4 Equation: = tRTP.

Bit Range	Default & Access	Field Name (ID): Description
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands by the amount programmed in this field (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L/DDR4 Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L/DDR4 only. tCMD must be set to 1N for LPDDR3/LPDDR4/WIO2.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). • WIO2 Equation: NA. Note: Masked Write operation in LPDDR4 is always BL16 and in WIO2 is always BL4. D-Unit applies this timing for same rank as well as same bank.

3.130 DRAM Timing Register 4A (D_CR_DTR4A) — Offset 1618h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1618h	30209149 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L/DDR4 Equation: tWRDR = CWL + tDQSSmax + BL/2 - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.

Bit Range	Default & Access	Field Name (ID): Description
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - tWPRE). • DDR3L/DDR4 Equation: tRWDR = CL + tDQSCKmax + BL/2 - (CWL - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/DDR3L/DDR4 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE.

3.131 DRAM Timing Register 5A (D_CR_DTR5A) — Offset 161Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 161Ch	304200C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4/WIO2: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). Equation: tWWSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR. • DDR4 Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR_S.

Bit Range	Default & Access	Field Name (ID): Description
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L/DDR4 Equation: tRWSR = CL + tDQSCKmax + BL/2 - CWL + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.

3.132 DRAM Timing Register 6A (D_CR_DTR6A) — Offset 1620h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1620h	20100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For WIO2/LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L/DDR4, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Reserved (RSVD18_15):** Reserved
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). This is the channel block time for the MR19 command issued as part of LPDDR4 DQS Retraining flow. For all other MR commands this is the rank block time. Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the channel quiet time before issuing MRR/MRW command. (in DRAM clocks). • LPDDR3 Equation: = tXP + tMRRI - 4. • LPDDR4 Equation: = tXP + tMRRI - 8. • DDR3L Equation: = CWL + BL/2 + 1 - 8 • DDR4 Equation: = CWL + BL/2 + 1 - 16. Note: D-Unit treats MRR as a read and MRW/MRS as a write and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

3.133 DRAM Timing Register 7A (D_CR_DTR7A) — Offset 1624h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1624h	D060C06 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L, DDR4 and WIO2 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + 1.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

3.134 DRAM Timing Register 8A (D_CR_DTR8A) — Offset 1628h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1628h	CC50A18 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency published in the DDRIO PHY and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter published in the DDRIO PHY and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

3.135 D-Unit ODT Control Register A (D_CR_DOCRA) — Offset 162Ch

Specifies the parameters to control DRAM ODT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 162Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L/DDR4) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = 6. DDR4 Equation: RDODTSTOP = 5 + tRPRE. Note: Add 1 if DOCRx.RDODTSTART = CL - CWL in 2N mode.
13	0h RO	**Reserved (RSVD13):** Reserved
12:9	0h RW	**Read command to ODT assertion delay (DDR3L/DDR4) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L/DDR4 Equation: RDODTSTART = CL - CWL + tWPRE - tRPRE. Note: In DDR3L/DDR4 2N mode add 1 to enable termination at the start of read data burst.
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP = 6. DDR4 Equation: WRODTSTOP = 5 + tWPRE. Note: Add 1 if DOCRx.WRODTSTART = 0 in 2N mode.
4	0h RO	**Reserved (RSVD4):** Reserved
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L/DDR4 Equation: WRODTSTART = 0 Note: In DDR3L/DDR4 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion).

3.136 D-Unit Power Management Control 0 (D_CR_DPMC0) — Offset 1630h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1630h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

3.137 D-Unit Power Management Control 1 (D_CR_DPMC1) — Offset 1634h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1634h	10000028 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. • 0 - Enable Repeaters clock gating. • 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. • 0 - Enable IOSF-SB EP clock gating. • 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)

Bit Range	Default & Access	Field Name (ID): Description
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

3.138 DRAM Refresh Control (D_CR_DRFC) — Offset 1638h

Specifies the parameters to control scheduling of refresh commands.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1638h	20001750 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	1h RW	**Maintenance Operation Channel Block Time (MNTCHNBLKTIME):** Specifies the amount of time that D-unit will block the channel before any DRAM maintenance operation is issued. (in SPIDclk)
28:25	0h RW	**Maintenance Operation Delay CAS Count (MNTDLYCASCOUNT):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc.) needs to be performed, D-unit delays the maintenance operation and allows this many read or write requests to be scheduled before allowing the maintenance operation. Note: This mode does not apply to Panic refreshes.
24:22	0h RO	**Reserved (RSVD24_22):** Reserved
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RO	**Reserved (RSVD17_16):** Reserved
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Stop issuing refresh commands and accumulating refresh debits. (does not stop tREFI counter). • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

3.139 D-Unit Scheduler Control (D_CR_DSCH) — Offset 163Ch

Specifies parameters to control scheduling of commands to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 163Ch	3901C08 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Early Write DQ Enable (EARLY_DQ_EN):** Enables D-unit to send the write data to the PHY one clock earlier than WL value (WL - 1). Note: Applicable to DDR3L and DDR4 only.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data (STATIC_0). • 01: Always write read valid one SPID clock before data (STATIC_1). • 10: Write read valid up to 2 SPID clocks before data (DYNAMIC). • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15	0h RO	**Reserved (RSVD15):** Reserved
14:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty. For WIO2, when in-order mode is enabled (01 or 10), D_CR_DSCH_BYPASSEN must be set to 0
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** When set new page hit/empty read requests will bypass D-Unit pipeline stages to save latency 0 - Disable Idle Bypass 1 - Enable Idle Bypass Note: Only applies to WIO2, this bit is reserved for other technologies
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4 and WIO2. • LPDDR4: = MWr tCCD = MWr BL/2 = 8. • WIO2: = NA.

3.140 DRAM Calibration Control (D_CR_DCAL) — Offset 1640h

Specifies parameters to control ZQ Calibration.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1640h	1057 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit. In LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3/DDR3L/DDR4) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

3.141 DRAM Mode Registers Shadow Copy (D_CR_MR_SHADOW) — Offset 1648h

This register contains a copy of Mode Regsiters in the DRAM so that D-unit can only modify certain bits without affecting other values.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1648h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:16	0h RW	**MR Value 2 (MR_VALUE2):** MR3 Shadow Register (DDR4): BIOS writes the correct value of MR3 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR3 into DDR4 to enter and exit MPR mode.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	0h RW	**MR Value (MR_VALUE):** MR3 Shadow Register (WIO2): BIOS sets the value of this field at boot time based on the DRAM device configuration. D-Unit merges the value in MR3_THERM_OFFSET with this field and writes the result into DRAM MR3 MR2 Shadow Register (DDR3L): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry. MR4 Shadow Register (DDR4): BIOS writes the correct value of MR4 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR4 into DDR4 DRAM after temperature read out.

3.142 VNN Scaling Timer Control (D_CR_VNNTIMER) — Offset 164Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 164Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

3.143 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL) — Offset 1650h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1650h	6C000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last temperature sensor read from Rank 1 DRAM Mode Register. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last temperature sensor read from Rank 0 DRAM Mode Register. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit initiates temperature sensor read from DRAM mode register to determine required refresh rate (in 4x tREFI units).
7	0h RW	**Temperature Controlled Refresh Range Enable (DDR4 Only) (TCRREN):** When set, after a DRAM temperature read out (MPR sequence), D-unit writes a 1 to bit 2 of MR_SHADOW.MR_VALUE when temperature sensor read out for that rank indicates a value higher than 0x1, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR4 of DDR4 for each enabled rank.
6	0h RW/V	**TQ Poll Start Rank 1 (TQPOLL_START_R1):** When set Dunit will initiate temperature sensor read for Rank 1. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
5	0h RW/V	**TQ Poll Start Rank 0 (TQPOLL_START_R0):** When set Dunit will initiate temperature sensor read for Rank 0. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of MR_SHADOW.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last temperature sensor read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables temperature sensor read on Self Refresh Exit. If disabled, D-Unit will not initiate MR Read sequence to read temperature value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read the DRAM's temperature sensor value periodically.

3.144 Temperature Offset Control (D_CR_TQOFFSET) — Offset 1654h

Specifies temperature offset and refresh rate adjustments requested by software.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1654h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** (WIO2 only) Everytime MR3_OFFSET_UPDATE is set, D-Unit merges the value in this field with MR3_VALUE and writes the result to MR3 in DRAM

3.145 D-Unit Control Operations (D_CR_DCO) — Offset 1658h

Specifies D-Unit initialization and control operation.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1658h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit must be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved

3.146 Data Scrambler (D_CR_SCRAMCTRL) — Offset 16A4h

Specifies parameters to control data scrambling in D-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 16A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycles. • 10: Clock Gate every 3 cycles. • 11: Clock Gate every 4 cycles.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

3.147 Error Injection Address Register (D_CR_ERR_INJ) — Offset 16ACh

Contains the target address for ECC error injection.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 16ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/ under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved

3.148 Error Injection Control Register (D_CR_ERR_INJ_CTL) — Offset 16B0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 16B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

3.149 Error Log Register (D_CR_ERR_ECC_LOG) — Offset 16B4h

Detected ECC errors are captured in this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 16B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CLEAR:** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

3.150 D-Unit Fuse Status (D_CR_DFUSESTAT) — Offset 16BCh

Contains the values read from D-Unit fuses.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 16BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: fus_dun_wio2_dis. • [7:7]: fus_dun_ddr3l_dis. • [8:8]: fus_dun_ddr4_dis. • [15:9]: reserved.

3.151 Major Mode Control (D_CR_MMC) — Offset 1724h

Specifies parameters to control read/write major mode operation and transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1724h	2B01A518 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved
17:12	1Ah RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

3.152 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB) — Offset 1728h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1728h	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

3.153 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD) — Offset 172Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 172Ch	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

3.154 Access Class Initial Priority (D_CR_ACCIP) — Offset 1730h

Each field of this register defines the initial priority of one access class.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1730h	17C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

3.155 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0) — Offset 1734h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1734h	1F52940 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.156 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1) — Offset 1738h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1738h	14000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.157 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2) — Offset 173Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 173Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.158 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3) — Offset 1740h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1740h	1F29400 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.159 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4) — Offset 1744h

This register defines the aging policy for access class 3. Each field of this register defines the number of CASes that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1744h	1F5294A h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.160 Deadline Threshold (D_CR_DL_THRS) — Offset 1748h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1748h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

3.161 Major Mode Blocking Rules Control (D_CR_MM_BLK) — Offset 174Ch

This register controls blocking rules enforced in RMM and WMM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 174Ch	1800 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

3.162 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD) — Offset 1754h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1754h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW/V	**SUSPENDP:** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND:** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved
0	0h RW/V	**WAKE:** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

3.163 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL) — Offset 1780h

LPDDR4 DQS Retraining control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1780h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3	0h RW/V	**DQS Retrain Start Rank 1 (DQS_RETRAIN_START_R1):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank1. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
2	0h RW/V	**DQS Retrain Start Rank 0 (DQS_RETRAIN_START_R0):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank0. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

3.164 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE) — Offset 1784h

Controls the data bits swizzling crossbar for MR4.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1784h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

3.165 DRAM Rank Population 0 (D_CR_DRP0) — Offset 1A00h

Rank configuration register.

This is the start of multicast dunit registers. Writing to these will write to all active dunits.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A00h	10000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**DRAM Device Per Rank (DRAMDEVICE_PR):** Specifies the number of DRAM devices that are ganged together to form a single rank. • 00: 1 DRAM device in each rank. • 01: 2 DRAM devices in each rank. • 10: 4 DRAM devices in each rank. • 11: 8 DRAM devices in each rank. Note: The actual number of devices is one more than the value programmed when ECC is enabled.
29:28	1h RW	**Address Decode (ADDRDEC):** Specifies the address mapping to be used: • 00: 1KB (A). • 01: 2KB (B). • 10: 4KB (C). • 11: Reserved.
27:25	0h RW	**Burst Length Mode (BLMODE):** • 000: Fixed BL8. • 001: Onthefly BL8. • 010: Fixed BL16. • 011: Onthefly BL16. • 100: Fixed BL32. • 101: Onthefly BL32. • 110-111: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**DRAM Type (DRAMTYPE):** • 000: Reserved. • 001: Reserved. • 010: LPDDR4. • 011: Reserved. • 100: DDR4. • 101-111: Reserved. Note: The D-Unit should only use this field if allowed by fuse.
21	0h RW	**ECC Enable (ECCEN):** • 0: ECC is disabled. • 1: ECC is enabled. This bit determines if the D-Unit treats the PMI BE_ECC bits as ECC bits or Byte Enables. The D-Unit should not allow this bit to be set if ECC is disabled by fuse. This should only be used in configurations that support ECC.
20:19	0h RW	**CA Swizzle Type (CASWIZZLE):** • 00: uniDIMM/SODIMM/UDIMM. • 01: BGA. • 10: NA. • 11: uniDIMM/SODIMM/UDIMM with Rank 1 mirrored (DDR4 Only).
18:17	0h RO	**Reserved (RSVD18_17):** Reserved
16	0h RW	**Fine Bank Group Interleaving Enable (FBGINTEN):** When enabled, D-unit will use a lower order address bit in the bank hashing function (DDR4 Only). • 0: Bank Group Interleave disabled. • 1: Bank Group Interleave enabled. Note: BAHEN must be set for this bit to take effect.
15	0h RW	**Bank Address Hashing Enable (BAHEN):** • 0: Bank Address Hashing disabled. • 1: Bank Address Hashing enabled.
14	0h RW	**Rank Select Interleave Enable (RSIEN):** • 0: Rank Select Interleaving disabled. • 1: Rank Select Interleaving enabled.
13:9	0h RO	**Reserved (RSVD13_9):** Reserved
8:6	0h RW	**DRAM Device Density (DDEN):** Density of the DRAM devices populated on Ranks 0 and 1. • 000: 4 Gb. • 001: 6 Gb. • 010: 8 Gb. • 011: 12 Gb. • 100: 16 Gb. • 101-111: Reserved. Note: For LPDDR4 this value is the die density.
5:4	0h RW	**DRAM Device Data Width (DWID):** Data width of the DRAM device populated on Ranks 0 and 1. • 00: x8. • 01: x16. • 10: x32. • 11: x64.
3	0h RO	**Reserved (RSVD3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Dual Data Mode Enable (DDMEN):** • 0: PMI Dual Data Mode is disabled in D-Unit. • 1: PMI Dual Data Mode is enabled. Note: Dual Data Mode must be enable for DDR3L/DDR4 configurations.
1	0h RW	**Rank Enable 1 (RKEN1):** Enable Rank 1: Must be set to 1 to enable use of this rank.
0	0h RW	**Rank Enable 0 (RKEN0):** Enable Rank 0: Must be set to 1 to enable use of this rank. Note: Setting this bit to 0 is not a functional mode.

3.166 DRAM Timing Register 9A (D_CR_DTR9A) — Offset 1A04h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A04h	14A546 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD31_23):** Reserved
22:18	5h RW	**Write to Write DQ Delay Same Bank Group Same Rank (TWWSR_L):** Specifies the delay from a DRAM Write to another Write command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tWWSR_L = tCCD_L.
17:13	5h RW	**Read to Read DQ Delay Same Bank Group Same Rank (TRRSR_L):** Specifies the delay from a DRAM Read to another Read command within the same bank group of the same rank (in DRAM clocks). DDR4 Equation: tRRSR_L = tCCD_L.
12:6	15h RW	**Write to Read DQ Delay Same Bank Group Same Rank (TWRSR_L):** Specifies the delay from a DRAM Read to Write command within the same bank group of the same rank (in DRAM clocks). • DDR4 Equation: tWRSR_L = CWL + tDQSSmax + BL/2 + tWPST + tWTR_L.
5:0	6h RW	**Row Activation to Row Activation to Same Bank Group Delay [tRRD_L] (TRRD_L):** Specifies the minimum delay (in DRAM clocks) between two DRAM Activate commands to different banks within the same bank group of a rank. (DDR4 Only)

3.167 DRAM Timing Register 0A (D_CR_DTR0A) — Offset 1A08h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A08h	820702CB h

Bit Range	Default & Access	Field Name (ID): Description
31:27	10h RW	**Valid Clocks Before CKE High [tCKCKEH/tCSCKEH/tCKSRX] (TCKCKEH):** Number of valid clocks before CKE high (in DRAM clocks). • LPDDR4: The value in this register covers both tCKCKEH and tCSCKEH. • DDR3L/DDR4/LPDDR3/WIO2: The value covers tCKSRX which is defined as the number of valid DRAM clocks that have to toggle before the issuing of the Self Refresh Exit SRX. This value is also used if the clock frequency is changed or the clock is stopped or tristated during Power Down i.e. the number valid DRAM clocks that have to toggle before the issuing of the Power Down Exit PDX command. TCKCKEH can be used to compensate for clock stabilization delays in the motherboard. Note: D-unit hardware enforces minimum of two SPID clock before CKEH, any value in this register is the additional time.
26:22	8h RW	**Exit Self-Refresh to Valid Commands Requiring a Locked DLL Delay [tXSDLL] (TXSDLL):** D-Unit waits max(tXSR+tZQCL/tZQCS, tXSDLL) before allowing traffic to DRAM (in 32 x DRAM Clocks). LPDDR3/LPDDR4/WIO2: tXSDLL = 0. DDR3L/DDR4: tXSDLL = tDLLK. Note: In the equation above, tZQCL/tZQCS = 0 if no ZQ is performed on SR exit.
21:12	70h RW	**Exit Self-Refresh to Valid Command Delay [tXS/tXSR] (TXSR):** DDR3L/DDR4: tXS - Delay between Self Refresh Exit SRX to any DRAM Command not requiring DLL Lock. LPDDR/WIO2: tXSR - Delay between Self Refresh Exit SRX to any DRAM Command. (in DRAM clocks).
11:6	Bh RW	**Activate RAS to CAS Command Delay [tRCD] (TRCD):** Specifies the delay between a DRAM Activate command and a DRAM Read or Write command to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.
5:0	Bh RW	**Precharge to Activate Command Delay of a Single Bank [tRPpb] (TRPPB):** Specifies the delay between a DRAM Precharge command and a DRAM Activate command to the same bank (in DRAM Clocks). Note : this CR should be constrained to a minimum of 4 in LPDDR3/DDR3L/WIO2 and minimum of 8 in LPDDR4/DDR4. Note: Derating adds 1.875ns to this timing.

3.168 DRAM Timing Register 1A (D_CR_DTR1A) — Offset 1A0Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A0Ch	30481218 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Exit Power Down to Next Command Delay [tXP] (TXP):** Specifies the delay from the DRAM Power Down Exit (PDX) command to any valid command (in DRAM clocks). Note: The value in this field must be programmed to tXPDLL when Slow Exit Mode Power-down is enabled for DDR3L.
26	0h RO	**Reserved (RSVD26):** Reserved
25:14	120h RW	**ZQ (long) Calibration Time [tZQCL/tZQCAL] (TZQCL):** • LPDDR3/DDR3L/DDR4: tZQCL/tZQoper - Specifies the delay between the DRAM ZQ Calibration Long (ZQCL) command and any DRAM command during normal operation. • LPDDR4: tZQCAL - ZQ Calibration time (in DRAM clocks). Note: This field defines the ZQ Calibration Long delay during normal operation. It is not the same as tZQinit which uses the same ZQCL command but the delay is longer. tZQinit applies only during poweron initialization of the DRAM devices and tZQoper applies during normal operation. BIOS executes the DRAM initialization sequence so it has to ensure tZQinit is met and not the D-Unit.

Bit Range	Default & Access	Field Name (ID): Description
13:6	48h RW	**ZQ Short Calibration Time [tZQCS] (TZQCS):** ZQCS to any DRAM Command Delay: Specifies the delay between the DRAM ZQ Calibration Short (ZQCS) command and any DRAM command (in DRAM clocks). DDR3L/DDR4/LPDDR3 only. LPDDR4 does not support ZQCS command
5:0	18h RW	**ZQ Latch Time [tZQLAT] (TZQLAT):** Specifies the delay between the DRAM ZQ Calibration Latch command and any DRAM command (in DRAM clocks). LPDDR4 only. Not used in DDR3L/DDR4/LPDDR3/WIO2.

3.169 DRAM Timing Register 2A (D_CR_DTR2A) — Offset 1A10h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A10h	46080C30 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	118h RW	**All Bank Refresh Cycle Time [tRFCab] (NRFCAB):** Specifies the delay between the REFab command to the next valid command. (in DRAM clocks)
21	0h RO	**Reserved (RSVD21):** Reserved
20:17	4h RW	**CKE Minimum Pulse Width [tCKE] (TCKE):** Specifies the minimum time from CKEL to CKEH (in DRAM clocks).
16	0h RO	**Reserved (RSVD16):** Reserved
15:0	C30h RW	**Refresh Interval Time [tREFI] (NREFI):** Specifies the average time between refresh commands. JEDEC Base Refresh Interval time (in DRAM clocks). Note: D-Unit will ignore the 2 LSBs of this field.

3.170 DRAM Timing Register 3A (D_CR_DTR3A) — Offset 1A14h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A14h	3002EA28 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Read to Precharge Delay [tRDPRE] (TRTP):** Specifies the minimum delay between the DRAM Read and Precharge commands to the same bank (in DRAM clocks). • LPDDR3 Equation: = BL/2 + tRTP - 4. • LPDDR4 Equation: = BL/2 + Max (8, tRTP) - 8. • WIO2 Equation: NA. • DDR3L/DDR4 Equation: = tRTP.

Bit Range	Default & Access	Field Name (ID): Description
26:20	0h RW	**CAS to CAS Command Delay Adder (TCCD_INC):** Specifies the number of clocks to be added to turnaround times (for Stretch Mode). It increases delay between Read to Read or Read to Write commands by the amount programmed in this field (in 4 x DRAM clocks).
19:13	17h RW	**Write to Precharge Command Delay [tWRPRE] (TWTP):** Specifies the minimum delay between the DRAM Write command and the Precharge command to the same bank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWTP = BL/2 + WL + tWR + 1. • DDR3L/DDR4 Equation: tWTP = BL/2 + CWL + tWR.
12:11	1h RW	**DRAM Command Valid Duration (TCMD):** Specifies the number of DRAM clocks a command is held valid on the DRAM Address and Control buses. 1N is the DDR3 basic requirement. 2N is the extended mode for board signal integrity. • 0h: Reserved. • 1h: 1 DRAM Clock (1N). • 2h: 2 DRAM Clocks (2N). • 3h: Reserved. Note: DDR3L/DDR4 only. tCMD must be set to 1N for LPDDR3/LPDDR4/WIO2.
10:6	8h RW	**Write Latency [WL/CWL] (TCWL):** The delay between the internal write command and the availability of the first word of DRAM input data (in DRAM clocks).
5:0	28h RW	**Write CAS to Masked Write CAS Delay Same Bank (TWMWSB):** Specifies the minimum delay between DRAM Write command to Masked Write command to same bank (in DRAM clocks). • LPDDR4 Equation: tWMWSB = tCCDMW (BL16) or tCCDMW + 8 (BL32). • WIO2 Equation: NA. Note: Masked Write operation in LPDDR4 is always BL16 and in WIO2 is always BL4. D-Unit applies this timing for same rank as well as same bank.

3.171 DRAM Timing Register 4A (D_CR_DTR4A) — Offset 1A18h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A18h	30209149 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	30h RW	**Four Bank Activate Window [tFAW] (TFAW):** A rolling timeframe in which a maximum of four Activate commands can be issued to the same rank. This is to limit the peak current draw from the DRAM devices (in DRAM clocks).
23:18	8h RW	**Write to Read DQ Delay Different Ranks (TWRDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Read data burst of a different rank (in DRAM clocks). • LPDDR3 Equation: tWRDR = WL + tDQSSmax + BL/2 - (RL + tDQSCKmin - tRPRE). • LPDDR4 Equation: tWRDR = WL - RL + BL/2 + 4 - tDQSCKmin. • DDR3L/DDR4 Equation: tWRDR = CWL + tDQSSmax + BL/2 - (CL + tDQSCKmin - tRPRE). Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.

Bit Range	Default & Access	Field Name (ID): Description
17:12	9h RW	**Read to Write DQ Delay Different Ranks (TRWDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/LPDDR4 Equation: tRWDR = RL + tDQSCKmax + BL/2 - (WL - tWPRE). • DDR3L/DDR4 Equation: tRWDR = CL + tDQSCKmax + BL/2 - (CWL - tWPRE). Note: For LPDDR3/4 using ODT, this latency may need to be adjusted by tODTon. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.
11:6	5h RW	**Write to Write DQ Delay Different Ranks (TWWDR):** Specifies the delay from the start of a Write data burst of one rank to the start of a Write data burst of a different rank (in DRAM clocks). • LPDDR3/DDR3L/DDR4 Equation: tWWDR = BL/2 + tDQSSmax - tDQSSmin + tWPRE. • LPDDR4 Equation: tWWDR = BL/2 + 4 - tDQSSmin. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj.
5:0	9h RW	**Read to Read DQ Delay Different Ranks (TRRDR):** Specifies the delay from the start of a Read data burst of one rank to the Start of a Read data burst of a different rank (in DRAM clocks). • Equation: tRRDR = BL/2 + tDQSCKmax - tDQSCKmin + tRPRE.

3.172 DRAM Timing Register 5A (D_CR_DTR5A) — Offset 1A1Ch

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A1Ch	304200C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	6h RW	**Row Activation to Row Activation Delay [tRRD] (TRRD):** Specifies the minimum delay in DRAM clocks between two DRAM Activate commands to the same rank but different banks (tRC is the minimum delay between activations of the same bank). Note: Derating adds 1.875ns to this timing.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	0h RW	**Derate Increment (TDERATE_INC):** Specifies the additional delay that is added to DRAM timing when indicated by MR4 status. (in DRAM clocks) LPDDR3/LPDDR4/WIO2: Value is 1.875ns. Note: The value in this register is only added to these timing parameters: tRCD, tRAS, tRP and tRRD.
22:18	10h RW	**Write to Write DQ Delay Same Rank (TWWSR):** Specifies the delay from a DRAM Write to another Write command of the same rank (in DRAM clocks). Equation: tWWSR = tCCD.
17:13	10h RW	**Read to Read DQ Delay Same Rank (TRRSR):** Specifies the delay from a DRAM Read to another Read command of the same rank (in DRAM clocks). Equation: tRRSR = tCCD.
12:6	3h RW	**Write to Read DQ Delay Same Rank (TWRSR):** Specifies the delay from a DRAM Read to Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tWRSR = WL + tDQSSmax + BL/2 + tWTR. • DDR3L Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR. • DDR4 Equation: tWRSR = CWL + tDQSSmax + BL/2 + tWTR_S.

Bit Range	Default & Access	Field Name (ID): Description
5:0	2h RW	**Read to Write DQ Delay Same Rank (TRWSR):** Specifies the delay from a DRAM Read to a Write command of the same rank (in DRAM clocks). • LPDDR3/LPDDR4/WIO2 Equation: tRWSR = RL + tDQSCKmax + BL/2 - WL + tWPRE. • DDR3L/DDR4 Equation: tRWSR = CL + tDQSCKmax + BL/2 - CWL + tWPRE. Note: For LPDDR3/4 using ODT, this latency may need to be increased by tODToffadj. Note: For DDR3L/DDR4 using ODT, this latency may need to be increased by one clock.

3.173 DRAM Timing Register 6A (D_CR_DTR6A) — Offset 1A20h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A20h	20100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	20h RW	**Opportunistic Refresh Idle Timer (OREFDLY):** Rank idle period that defines an opportunity for refresh (in DRAM clocks).
23:19	2h RW	**Valid Clocks After CKE Low [tCKELCK/tCKELCS/tCPDED/tCKSRE] (TCKCKEL):** Specifies the amount of time that DRAM clocks need to toggle after CKE goes low (in DRAM Clocks). • For WIO2/LPDDR3, this covers tCPDED. • For LPDDR4, this covers both tCKELCK and tCKELCS. • For DDR3L/DDR4, this is tCKSRE. Note: D-Unit hardware enforces minimum of one SPID clocks after CKEL, any value in this register is the additional time.
18:15	0h RW	**Reserved (RSVD18_15):** Reserved
14:8	0h RW	**Mode Register Read to Any Command Delay (TPSTMRRBLK):** Specifies the quiet time after issuing MRR command (in DRAM Clocks). This is the channel block time for the MR19 command issued as part of LPDDR4 DQS Retraining flow. For all other MR commands this is the rank block time. Note: D-Unit treats MRR as a read and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from MRR to the next read/write.
7	0h RO	**Reserved (RSVD7):** Reserved
6:0	0h RW	**Any Command to Mode Register Read/Write Delay (TPREMRBLK):** Specifies the channel quiet time before issuing MRR/MRW command. (in DRAM clocks). • LPDDR3 Equation: = tXP + tMRRI - 4. • LPDDR4 Equation: = tXP + tMRRI - 8. • DDR3L Equation: = CWL + BL/2 + 1 - 8 • DDR4 Equation: = CWL + BL/2 + 1 - 16. Note: D-Unit treats MRR as a read and MRW/MRS as a write and always applies relevant turnaround times, any value programmed in this CR must be greater than those turnaround times for D-Unit to enforce any additional time from previous read/writes.

3.174 DRAM Timing Register 7A (D_CR_DTR7A) — Offset 1A24h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A24h	D060C06 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**All Bank Precharge to Activate Command Delay [tRPab] (TRPAB):** Specifies the delay between a DRAM Precharge All Bank command and a DRAM Activate command (in DRAM Clocks). Note: This CR should be constrained to a minimum of 4 in LP3 and minimum of 8 in LP4. Note: Derating adds 1.875ns to this timing. • For LPDDR, tRPpb = tRP, tRPab = tRP + 3ns. • For DDR3L, DDR4 and WIO2 8ch tRPpb = tRPab = tRP.
25:23	2h RW	**Mode Register Write to any Command Delay [tMRD/tMRW] (TPSTMRWBLK):** Specifies the quiet time after issuing MRW command (in 8 x DRAM clocks). Note: This time covers for both tMRD and tMRW.
22:16	6h RW	**Write Command to Power Down Delay [tWRPDEN] (TWRPDEN):** Specifies the minimum time between a write command to PowerDown command (in DRAM clocks). Must be at least equal to tWR + tCCD + tWL + 2.
15:9	6h RW	**Read Command to Power Down Delay [tRDPDEN] (TRDPDEN):** Specifies the minimum time between a read command to PowerDown command (in DRAM clocks). Must be at least equal to CL/RL + tDQSCKmax + tCCD + 1.
8:7	0h RO	**Reserved (RSVD8_7):** Reserved
6:0	6h RW	**Row Activation Period [tRAS] (TRAS):** Specifies the minimum delay between the DRAM Activate and Precharge commands to the same bank (in DRAM clocks). Note: Derating adds 1.875ns to this timing.

3.175 DRAM Timing Register 8A (D_CR_DTR8A) — Offset 1A28h

Specifies DRAM timing parameters.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A28h	CC50A18 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	3h RW	**Minimum Self-Refresh Time [tSR/tCKESR] (TCKESR):** Specifies the minimum time that DRAM should remain in SR (in DRAM clocks).
25:21	6h RW	**Minimum Low Power Mode Residency (LPMDRES):** Specifies the minimum time that PHY should remain in LPMode (in DRAM clocks).
20:15	Ah RW	**Low Power Mode Exit to Clock Enable Delay (LPMDTOCKEDLY):** Specifies the minimum time between the LP Mode exit to the CK stop/tristate deassertion and powerdown exit (in DRAM clocks). Note: Must be equal to t_idle_latency published in the DDRIO PHY and less than 0x3C.
14:8	Ah RW	**Clock Stop to Low Power Mode Delay (CKETOLPMDDLY):** Specifies the time between CK stop/tristate to the Low Power Mode entry. This timing parameter is used to delay Low Power Mode entry (in DRAM clocks). Note: Must be at least equal to t_idle_length parameter published in the DDRIO PHY and less than 0x7C.
7:0	18h RW	**Power Down Idle Timer (PWDDLY):** This is a non-JEDEC timing parameter used to delay powerdown entry (in DRAM clocks).

3.176 D-Unit ODT Control Register A (D_CR_DOCRA) — Offset 1A2Ch

Specifies the parameters to control DRAM ODT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**Rank 1 Read ODT Control (R1RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 1. 0 - Read ODT is disabled for Rank 1 1 - Assert ODT to for Rank 0 (non-targeted Rank) Note: This register should be set to 0 for LPDDR3 devices
28	0h RW	**Rank 0 Read ODT Control (R0RDODTCTL):** Specifies the behavior of ODT signals when a Read command is issued to Rank 0. 0 - Read ODT is disabled for Rank 0 1 - Assert ODT to for Rank 1 (non-targeted Rank) Note: This register is reserved for LPDDR3 devices
27:26	0h RW	**Rank 1 Write ODT Control (R1WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 1. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (non-targeted Rank) 10 - Assert ODT to Rank 1 (targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
25:24	0h RW	**Rank 0 Write ODT Control (R0WRODTCTL):** Specifies the behavior of ODT signals when a Write command is issued to Rank 0. 00 - Write ODT is disabled 01 - Assert ODT to Rank 0 (targeted Rank) 10 - Assert ODT to Rank 1 (non-targeted Rank) 11 - Assert ODT to Rank 0 and Rank 1 Note: 10 and 11 are reserved values for LPDDR3
23:18	0h RO	**Reserved (RSVD23_18):** Reserved
17:14	0h RW	**Read ODT assertion to de-assertion delay (DDR3L/DDR4) (RDODTSTOP):** Specifies Read ODT assertion to ODT de-assert delay (in DRAM clocks). DDR3L Equation: RDODTSTOP = 6. DDR4 Equation: RDODTSTOP = 5 + tRPRE. Note: Add 1 if DOCRx.RDODTSTART = CL - CWL in 2N mode.
13	0h RO	**Reserved (RSVD13):** Reserved
12:9	0h RW	**Read command to ODT assertion delay (DDR3L/DDR4) (RDODTSTART):** Specifies Read ODT assertion delay after Read Command (in DRAM clocks). DDR3L/DDR4 Equation: RDODTSTART = CL - CWL + tWPRE - tRPRE. Note: In DDR3L/DDR4 2N mode add 1 to enable termination at the start of read data burst.
8:5	0h RW	**Write ODT Assertion to De-assertion Delay (WRODTSTOP):** Specifies number of clocks after ODT assertion that D-Unit deasserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTOP = RU(tODTon(max)/tCK) + RU((tDQSSmax+tWPST)/tCK) + BL/2 - RD(tODToffmin/tCK) DDR3L Equation: WRODTSTOP = 6. DDR4 Equation: WRODTSTOP = 5 + tWPRE. Note: Add 1 if DOCRx.WRODTSTART = 0 in 2N mode.
4	0h RO	**Reserved (RSVD4):** Reserved
3:0	0h RW	**Write command to ODT assertion delay (WRODTSTART):** Specifies number of clocks after Write command that D-Unit asserts ODT signal (in DRAM clocks). LPDDR3 Equation: WRODTSTART = WL - RU(tODTon(max)/tCK) DDR3L/DDR4 Equation: WRODTSTART = 0 Note: In DDR3L/DDR4 2N mode the value can be set to 0 to assert ODT one DRAM clock earlier than the Write Command (WR) or set to 1 to assert at the same clock as command (CS assertion).

3.177 D-Unit Power Management Control 0 (D_CR_DPMC0) — Offset 1A30h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD31_29):** Reserved
28:24	0h RW	**SUSPEND/SUSPENDP Power Management Message Opcode (SUSPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh/PASR mode as the result of a SUSPEND/SUSPENDP message, it sends this 5-bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in SUSPEND will have no effect. Note: This opcode cannot be a PM state where it disables PHY PLLs i.e PM7 in LPDDR PHY.
23	0h RO	**Reserved (RSVD23):** Reserved
22	0h RW	**PM Message Wait for Clock Gate Enable (SRPMCLKW):** Specifies when it is safe to send PM message to the PHY. When enabled, D-Unit waits for SPID Clock to deassert before sending a PM message on SR entry. • 0: D-Unit will not wait for SPID_clk to deassert before sending the PM message to PHY. • 1: D-Unit will wait for SPID_clk to deassert before sending PM message to the PHY. Note: The value must be 1 when DYNPMOP = 7h.
21:17	0h RW	**Dynamic Self-Refresh Power Management Message Opcode (DYNPMOP):** DDRIO PHY Power Mode Opcode: After the D-Unit has placed the DRAM devices in Self Refresh mode as the result of a Dynamic Self-Refresh, it sends this 5bit value to the DDRIO PHY to tell it which power saving mode it should enter. Changing this register value while in self-refresh will only change the PM state for the next entry in DynSR.
16	0h RW	**Dynamic Self-Refresh Enable (DYNSREN):** When set to 1, the D-Unit will automatically control DRAM Self Refresh entry and exit based on interface state and requests in pending queues. When there is no pending request in the queues and PMI is idle, then the D-Unit will place the DRAM devices in Self Refresh mode. The DRAM devices will be brought out of Self-Refresh when idle conditions don't hold.
15:0	0h RW	**Self-Refresh Entry Delay (SREDLY):** Specifies the minimum time the D-Unit will wait before it enters Dynamic Self-Refresh mode when idle (in 16x DRAM Clocks). Note: The value in this field needs to be minimum of 4 in functional mode and minimum of 50 in PSMI mode.

3.178 D-Unit Power Management Control 1 (D_CR_DPMC1) — Offset 1A34h

Specifies the parameters to control D-Unit power management features.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A34h	10000028 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29	0h RW	**D-Unit Repeaters Clock Gate Disable (RPTCLKGTDIS):** Setting this bit to 0 allows majority of the repeaters between D-Unit and PHY to clock gate when there is no activity in order to save power. • 0 - Enable Repeaters clock gating. • 1 - Disable Repeaters clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
28	1h RW	**IOSF-SB End Point Clock Gate Disable (SBEPCLKGTDIS):** Setting this bit to 0 enables the clock gating of IOSF-SB End Points in D-Unit and CPGC when there is no IOSF-SB activity in order to save power. • 0 - Enable IOSF-SB EP clock gating. • 1 - Disable IOSF-SB clock gating. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
27	0h RW	**Local Clock Gate Disable (CLKGTDIS):** Setting this bit to 0 allows the majority of the D-Unit clocks to be gated off when there is no activity in order to save power. When set to 1, D-Unit clockgating is disabled. • 0: Enable. • 1: Disable. Note: This is a de-feature bit and should be set to 0 for normal operation. Note: The value should only change after DRAM Timing Registers (DTR) are programmed.
26	0h RW	**Chip Select Tristate Enable (CSTRIST):** • 0: The DRAM CS pins associated with the enabled ranks are never tristated. • 1: The DRAM CS pins are tristated when DRAM clock is stopped or tristated. Note: CS is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
25:24	0h RW	**Command/Address Tristate (CMDTRIST):** • 00: The DRAM CA pins are never tristated. • 01: The DRAM CA pins are only tristated when all enabled CKE pins are low. • 10: The DRAM CA pins are tristated when not driving a valid command. • 11: Reserved
23:16	0h RW	**Partial Array Self-Refresh Segment Mask (PASR):** This is the Segment Mask used for the MRW to enable PASR during SUSPENDP (Partial Array Self Refresh entry).
15:8	0h RW	**Page Close Timeout Period (PCLSTO):** Specifies the time from the last access of a DRAM page until that page is scheduled to close by sending a Precharge command to DRAM (in 16 x DRAM clocks).
7	0h RW	**Page Close Timeout Disable (PCLSTODIS):** When disabled, D-Unit will not close the DRAM page when idle. • 0: Enable page close timer. • 1: Disable page close timer (Used during DRAM init and DDRIO training).
6	0h RO	**Reserved (RSVD6):** Reserved
5	1h RW	**ODT Tristate Enable (ODTTRIST):** • 0: The DRAM ODT pins associated with the enabled ranks are never tristated. • 1: DRAMs ODT pins are tristated when DRAM clock is stopped or tristated. Note: ODT is not tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1)

Bit Range	Default & Access	Field Name (ID): Description
4:3	1h RW	**Clock Stop/Tristate Enable (ENCKSTP):** Enable/Disable CK Stop/Tristate During Power down. • 00: Disable CK Stop/Tristate During Power down. • 01: Enable CK Stop During Power down. • 10: Enable CK Tristate During Power down. • 11: Reserved Note: CK is not stopped or tristated when global tristate flow is disabled (DCBR.TRISTDIS = 1).
2:1	0h RW	**Low Power Mode Opcode (LPMODEOP):** D-Unit will send the value in this register after it has entered Powerdown Mode and has stopped/tristated the clock. 00: Disable LPMode. Note: LPMODE entry is not possible when global tristate flow is disabled (DCBR.TRISTDIS = 1).
0	0h RW	**Disable Power Down (DISPWRDN):** Setting this bit to 1 disables dynamic control of DRAM Power-Down entry and exit by keeping the CKE pins driven high. BIOS may set it to 1 during DRAM initialization and DDRIO training. This bit should be set to 0 for normal operation. • 0: The D-Unit dynamically controls the CKE pins to place the DRAM devices in Power Down mode and bring them out of Power Down mode. • 1: The D-Unit constantly drives the CKE pins high to keep the DRAM devices from entering Power Down mode when ranks are idle. Note: This bit is overridden if CKEMODE = 1. This bit does not control CKE behavior on SR entry/exit.

3.179 DRAM Refresh Control (D_CR_DRFC) — Offset 1A38h

Specifies the parameters to control scheduling of refresh commands.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A38h	20001750 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	1h RW	**Maintenance Operation Channel Block Time (MNTCHNBLKTIME):** Specifies the amount of time that D-unit will block the channel before any DRAM maintenance operation is issued. (in SPIDclk)
28:25	0h RW	**Maintenance Operation Delay CAS Count (MNTDLYCASCOUNT):** When a critical read request is pending in RPQ and a maintenance operation (MRR, ZQCal, Ref, etc.) needs to be performed, D-unit delays the maintenance operation and allows this many read or write requests to be scheduled before allowing the maintenance operation. Note: This mode does not apply to Panic refreshes.
24:22	0h RO	**Reserved (RSVD24_22):** Reserved
21	0h RW	**Disable Refresh Debt Clear (DISREFDBTCLR):** When set, D-Unit will not clear refresh debt before Self Refresh SR Entry: • 0: D-Unit sends all postponed REF commands to DRAM before it enters Self Refresh. • 1: D-Unit enters SR without clearing the Refresh Debt (for Debug only).

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Refresh Skew Disable (REFSKWDIS):** Disables Skewing of Refresh Counting between Ranks. Each rank has its own refresh counter. By default incrementing these refresh counters are skewed by 1/2 the tREFI period. Setting this bit to a 1 disables this feature and all refresh counters will increment at the same time per tREFI period. Skewing the tREFI counters can improve performance since traffic to all ranks does not have to be blocked to perform refresh. • 0: Incrementing the refresh counters are skewed by 1/2 tREFI period. • 1: All refresh counters will increment at the same time per tREFI period.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RO	**Reserved (RSVD17_16):** Reserved
15	0h RW	**Extra Refresh Debit (EXTRAREFDBT):** When set to 1, D-Unit adds one extra refresh debit (for a total of two) on Self-refresh exit.
14:12	1h RW	**Minimum Refresh Rate (MINREFRATE):** Ensures that refresh rate never drops below a certain limit regardless of TQ polling. • 000: Stop issuing refresh commands and accumulating refresh debits. (does not stop tREFI counter). • 001: 0.25x refresh rate (i.e. 4x tREFI same as no limit). • 010: 0.5x refresh rate (i.e. 2x tREFI). • 011: 1x refresh rate (i.e. 1x tREFI). • 100: 2x refresh rate (i.e. 0.5x tREFI). • 101: 4x refresh rate (i.e. 0.25x tREFI). • 110: 4x refresh rate with derating forced on i.e. 0.25x tREFI. • 111: Reserved.
11:8	7h RW	**Refresh Panic Watermark (REFWMPNC):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank regardless of pending requests. Note: REFWMPNC must be greater than or equal to REFWMHI and greater than 2, Max Value must be less than 8 to not violate 9xtREFI JEDEC requirement.
7:4	5h RW	**Refresh High Watermark (REFWMHI):** When the Refresh counter per rank is greater than this value, the D-Unit will send a REF command to the rank if there is no critical priority requests in the pending queues. Note: Value must be greater or equal to 1 and less than or equal to REFWMPNC.
3:1	0h RO	**Reserved (RSVD3_1):** Reserved
0	0h RW	**Opportunistic Refresh Disable (OREFDIS):** Disable opportunistic scheduling of refresh. • 0: D-Unit will send a REF command only if there is no pending request to that rank. • 1: D-Unit will not send any opportunistic refreshes. Refresh commands are only sent when the refresh counter is greater than REFWMHI. Note: When set, DISREFDBTCLR must also be set to be able to enter SR.

3.180 D-Unit Scheduler Control (D_CR_DSCH) — Offset 1A3Ch

Specifies parameters to control scheduling of commands to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A3Ch	3901C08 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Early Write DQ Enable (EARLY_DQ_EN):** Enables D-unit to send the write data to the PHY one clock earlier than WL value (WL - 1). Note: Applicable to DDR3L and DDR4 only.
30:29	0h RW	**BGF Early Read Data Valid (BGF_EARLY_RDDATA_VALID):** Specifies the number of clocks the D-Unit sends the read data valid through the BGF earlier as compared to the data. • 00: Always write read valid in same SPID clock as data (STATIC_0). • 01: Always write read valid one SPID clock before data (STATIC_1). • 10: Write read valid up to 2 SPID clocks before data (DYNAMIC). • 11: Reserved
28:27	0h RW	**SPID Early Read Data Valid (SPID_EARLY_RDDATA_VALID):** Specifies the delay in SPID clocks from RDDATA_VALID assertion to actual data on SPID. The value should match what is programmed in DDRIO (PHY).
26:21	1Ch RW	**Write Pending Queue Count (WPQCOUNT):** Used to limit the number of available slots in Write Pending Queue/ Write Data Buffer. WPQCOUNT will only recognize changes when PMI ISM is not active.
20:16	10h RW	**Read Pending Queue Count (RPQCOUNT):** Used to limit the number of entries in Read Pending Queue. RPQCOUNT will only recognize changes when PMI ISM is not active.
15	0h RO	**Reserved (RSVD15):** Reserved
14:10	7h RW	**Read Return Data Additional Credits (BLKRDBF_ADD_RDDATA_CR):** Number of additional full cacheline (64B) read data return credits exposed to D-Unit when BLKRDBF is set. Note: The value in this field has no effect on Read return credits when BLKRDBF is not set.
9:8	0h RW	**In-Order Mode (INORDERMODE):** • 0h: In order mode disabled: Commands are sent out of order. • 1h: Partial in order mode: Read and Write CAS commands are sent in the order they were received. ACT and PRE can go out of order. • 2h: Full in order mode serialized test: All DRAM commands CAS ACT PRE associated with a PMI request are issued to DDR before any DRAM commands for a subsequent PMI request. • 3h: Reserved. In order modes should be enabled during init/training/CPGC testing. Should never be changed while the D-Unit queues are nonempty. For WIO2, when in-order mode is enabled (01 or 10), D_CR_DSCH_BYPASSEN must be set to 0
7	0h RW	**Idle Bypass Mode Enable (BYPASSEN):** When set new page hit/empty read requests will bypass D-Unit pipeline stages to save latency 0 - Disable Idle Bypass 1 - Enable Idle Bypass Note: Only applies to WIO2, this bit is reserved for other technologies
6	0h RW	**Block When RDB Full (BLKRDBF):** When set D-Unit stops scheduling new read commands to DRAM when the read data buffer (RDB) is full.
5:4	0h RW	**Stretch Mode (STRETCHMODE):** When stretch mode is enabled, commands are initiated only on Phase 0 of SPIDClk. • 00: Stretch mode is disabled. • 01: Commands are initiated on Phase 0 of every SPID clocks. • 10: Commands are initiated on Phase 0 of even SPID clocks. • 11: Commands are initiated on Phase 0 of odd SPID clocks.
3:0	8h RW	**Masked Write Turnaround Delta (TMWR_TA_DELTA):** The value in this register is subtracted from Masked Write to Read, Masked Write to Write and Masked Write to Masked Write turnaround times to account for half BL MWr commands in LPDDR4 and WIO2. • LPDDR4: = MWr tCCD = MWr BL/2 = 8. • WIO2: = NA.

3.181 DRAM Calibration Control (D_CR_DCAL) — Offset 1A40h

Specifies parameters to control ZQ Calibration.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A40h	1057 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ZQ Calibration Type (ZQCALTYPE):** Determines whether the ZQ Calibration is a long or short calibration command (due to ZQCALSTRT). 0: Short calibration (ZQCS). 1: Long calibration (ZQCL).
30	0h RW/V	**ZQ Calibration Start Rank 1 (ZQCALSTRTR1):** Set this bit to 1 to start the ZQ calibration sequence on Rank 1. This bit will remain a 1 until the ZQ calibration is complete for rank 1, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
29	0h RW/V	**ZQ Calibration Start Rank 0 (ZQCALSTRTR0):** Set this bit to 1 to start the ZQ calibration sequence on Rank 0. This bit will remain a 1 until the ZQ calibration is complete for rank 0, then it will return to 0. 0: ZQ calibration is done. 1: ZQ calibration has started and is in progress.
28:23	0h RO	**Reserved (RSVD28_23):** Reserved
22:21	0h RW	**Self-Refresh Exit ZQ Calibration Control (SRXZQC):** • 00: On DynSR exit ZQ timer determines the ZQ type. When the state is lost (i.e due to AutoPG/S0ix) ZQCL is always performed. • 01: Always perform ZQCL after self refresh exit. In LPDDR4, ZQ with traffic blocked. • 10: Always perform ZQCS on SR exit. For LPDDR4, ZQ while traffic is allowed. • 11: No ZQCL commands are sent (it disables ZQCAL commands on SR exit).
20:18	0h RO	**Reserved (RSVD20_18):** Reserved
17	0h RW	**ZQ Calibration Mode (ZQCLMODE):** Specifies how ZQCal commands are sent to different ranks. • 0: ZQCal commands are sent in parallel to all ranks. • 1: ZQCal commands are sent serially to each rank.
16	0h RW	**Periodic ZQ Calibration Disable (ZQCDIS):** • 0: Periodic ZQ Calibration is Enabled. • 1: Disable periodic ZQ Calibration.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	1057h RW	**ZQ Calibration Interval (ZQINT):** Specifies the time interval between two ZQCS (LPDDR3/DDR3L/DDR4) or ZQ Start (LPDDR4) commands to a DRAM device. (in RTC 32.8KHz clocks)

3.182 DRAM Mode Registers Shadow Copy (D_CR_MR_SHADOW) — Offset 1A48h

This register contains a copy of Mode Regsiters in the DRAM so that D-unit can only modify certain bits without affecting other values.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:16	0h RW	**MR Value 2 (MR_VALUE2):** MR3 Shadow Register (DDR4): BIOS writes the correct value of MR3 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR3 into DDR4 to enter and exit MPR mode.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13:0	0h RW	**MR Value (MR_VALUE):** MR3 Shadow Register (WIO2): BIOS sets the value of this field at boot time based on the DRAM device configuration. D-Unit merges the value in MR3_THERM_OFFSET with this field and writes the result into DRAM MR3 MR2 Shadow Register (DDR3L): BIOS writes the correct value of MR2 register in DDR3L into this field at boot time. D-Unit modifies one bit and rewrites the MR2 into DDR3L DRAM before SR entry. MR4 Shadow Register (DDR4): BIOS writes the correct value of MR4 register in DDR4 into this field at boot time. D-Unit modifies one bit and rewrites the MR4 into DDR4 DRAM after temperature read out.

3.183 VNN Scaling Timer Control (D_CR_VNNTIMER) — Offset 1A4Ch

Specifies parameters for VNN Scaling Timer in D-Unit. The values in this register will be set by P-code during VNN scaling period.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**VNN Scaling Timer Enable (VNN_TIMER_EN):** • 0: The D-Unit VNN Scaling Timer is disabled. • 1: The D-Unit VNN Scaling Timer is enabled.
30:12	0h RO	**Reserved (RSVD30_12):** Reserved
11:0	0h RW	**VNN Timer Time (VNN_TIMER_TIME):** The final timer value (in 16 x DRAM clocks).

3.184 Periodic DRAM Temperature Polling Control (TQ) (D_CR_TQCTL) — Offset 1A50h

Specifies the control for periodic temperature monitoring and control of DRAM device.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A50h	6C000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	3h RW/V	**TQ Data Rank 1 (TQDATAR1):** If Rank 1 is disabled, this value will remain zero. This field contains the data of the last temperature sensor read from Rank 1 DRAM Mode Register. It is overwritten with each command.
28:26	3h RW/V	**TQ Data Rank 0 (TQDATAR0):** This field contains the data of the last temperature sensor read from Rank 0 DRAM Mode Register. It is overwritten with each command.
25:22	0h RO	**Reserved (RSVD25_22):** Reserved
21:8	0h RW	**TQ Poll Period (TQPOLLPER):** This sets the frequency by which the D-Unit initiates temperature sensor read from DRAM mode register to determine required refresh rate (in 4x tREFI units).
7	0h RW	**Temperature Controlled Refresh Range Enable (DDR4 Only) (TCRREN):** When set, after a DRAM temperature read out (MPR sequence), D-unit writes a 1 to bit 2 of MR_SHADOW.MR_VALUE when temperature sensor read out for that rank indicates a value higher than 0x1, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR4 of DDR4 for each enabled rank.
6	0h RW/V	**TQ Poll Start Rank 1 (TQPOLL_START_R1):** When set Dunit will initiate temperature sensor read for Rank 1. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
5	0h RW/V	**TQ Poll Start Rank 0 (TQPOLL_START_R0):** When set Dunit will initiate temperature sensor read for Rank 0. Hardware will clear the bit once the MR read command is issued for this rank. Note: TQPOLLEN mus be 0 before this bit is set.
4	0h RW	**Self Refresh Temperature Range Enable (DDR3 Only) (SRTEN):** When set, before every Self refresh entry, D-Unit writes a 1 to bit 7 of MR_SHADOW.MR_VALUE when TQDATA for that rank indicates a value higher then 0x3, and writes a 0 to that bit otherwise. The new MR_VALUE is then written into MR2 of DDR3 for each enabled rank.
3	1h RW	**Enable Dynamic Timing Derating (ENDERATE):** When set to 1, the Dynamic Timing Derating is enabled. When the D-Unit determines (via TQ polling) that the DRAM requires timing derating in addition to refresh interval adjustment, the D-Unit will automatically adjust the relevant timing parameters.
2	0h RW	**Enable TQ Data Push (TQDATAPUSHEN):** When set to 1, D-Unit pushes the data form the last temperature sensor read to a punit register.
1	0h RW	**Enable TQ Poll on Self-Refresh Exit (TQPOLLSREN):** This bit enables temperature sensor read on Self Refresh Exit. If disabled, D-Unit will not initiate MR Read sequence to read temperature value on Self-Refresh exit.
0	0h RW	**Enable Periodic TQ Poll (TQPOLLEN):** This bit enables periodic TQ Poll. If disabled, D-Unit will not read the DRAM's temperature sensor value periodically.

3.185 Temperature Offset Control (D_CR_TQOFFSET) — Offset 1A54h

Specifies temperature offset and refresh rate adjustments requested by software.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:11	0h RO	**Reserved (RSVD15_11):** Reserved
10:8	0h RW	**MR4 Adder (MR4_ADDER):** D-Unit adds the value of this field to TQDATA read from MR4 the resulting value is used to control refresh rate and AC timing derating.
7:3	0h RO	**Reserved (RSVD7_3):** Reserved
2	0h RW/V	**MR3 Offset Update (MR3_OFFSET_UPDATE):** When set, D-Unit writes the merged value of MR3_VALUE and MR3_THERM_OFFSET into MR3 of DRAM. D-Unit clears this bit once the value is written.
1:0	0h RW	**MR3 Thermal Offset (MR3_THERM_OFFSET):** (WIO2 only) Everytime MR3_OFFSET_UPDATE is set, D-Unit merges the value in this field with MR3_VALUE and writes the result to MR3 in DRAM

3.186 D-Unit Control Operations (D_CR_DCO) — Offset 1A58h

Specifies D-Unit initialization and control operation.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1A58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Initialization Complete (IC):** Indicates that initialization of the D-Unit has been completed. Memory accesses are permitted and maintenance operation begins. Until this bit is set to a 1, the memory controller will not accept DRAM requests from the Bunit/GSA/2LM (PMI ISMs will not leave idle). Note: Set this bit to 1 only when all other D-Unit registers have been configured. Usually set at the last configuration step by BIOS on cold/warm reset. D-Unit hardware sets this bit on SR exit.
30	0h RO/V	**DDRIO PHY Initialization Complete (DIOIC):** Status indication that the DDRIO PHY initialization is complete reflects the status spid_init_complete signal.
29	0h RO	**Reserved (RSVD29):** Reserved
28	0h RW	**PMI Control Select (PMICTL):** • 0: D-Unit PMI is connected to Bunit/GSA/2LM. • 1: D-Unit PMI is connected to CPGC. Note: D_CR_DSCH_BYPASSEN must be set to 0 in CPGC mode. Note: PMI must be idle and D-Unit BGF_RUN = 0 before changing the value in this register.
27:8	0h RO	**Reserved (RSVD27_8):** Reserved
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**Enable PSMI Mode (PSMIEN):** When enabled, D-Unit will synchronize clock crossing signals. • 0: PSMI Mode is disabled. • 1: PSMI Mode is enabled. Note: Change only allowed when D-Unit is idle.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Maintenance Reset (MNTRST):** Writing a 1 to this field resets all maintenance timers. Clears all states and also clears refresh debt queues. This bit must be cleared by software after at least 3 SPID clocks.
1	0h RW	**Enable Maintenance Operations (MNTEN):** Setting this field to 1 enables all maintenance operations. When DCO.IC is set, the maintenance operations are enabled irrespective of the value of this field.
0	0h RO	**Reserved (RSVD0):** Reserved

3.187 Data Scrambler (D_CR_SCRAMCTRL) — Offset 1AA4h

Specifies parameters to control data scrambling in D-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1AA4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Data Scrambler (SCRM_EN):** When set to 1, data scrambling is enabled. When set to 0, data scrambling is disabled. Should be set before D_CR_BGF_CTL_BGF_RUN is set to 1.
30	0h RO	**Reserved (RSVD30):** Reserved
29:28	0h RW	**Scrambler Clock Gate Select (CLOCKGATE):** This field controls how the scrambler output code is clock gated to reduce power. • 00: Clock gate disabled. • 01: Clock Gate every 2 cycles. • 10: Clock Gate every 3 cycles. • 11: Clock Gate every 4 cycles.
27:16	0h RO	**Reserved (RSVD27_16):** Reserved
15:0	0h RW	**Scrambling Key (KEY):** Sets the key for the scrambler. The key should be a random value that is set following each cold boot.

3.188 Error Injection Address Register (D_CR_ERR_INJ) — Offset 1AACh

Contains the target address for ECC error injection.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1AACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:1	0h RW	**Error Injection Target Address (ADDRESS):** Specifies the PMI address of the write transaction to be injected with the error. Only applicable to Write transactions. Read/ under-fill read of the partial write operation is not affected.
0	0h RO	**Reserved (RSVD0):** Reserved

3.189 Error Injection Control Register (D_CR_ERR_INJ_CTL) — Offset 1AB0h

Controls injecting correctable or uncorrectable errors into the write requests specified by target address.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1AB0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW	**Error Injection Type Higher 32B (SEL_HI):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
2	0h RW	**Error Injection Enable Higher 32B (EN_HI):** When set the error injection is continuously armed for higher 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.
1	0h RW	**Error Injection Type Lower 32B (SEL_LO):** 0 - Uncorrectable Error (UE) is armed for write address matching to inject UE by using the same poisoning scheme, i.e. inverting corresponding write ECC[6:0] on every QW of the 32B data. 1 - Correctable Error (CE) is armed for write address matching to inject CE by inverting corresponding write ECC[0] on every QW of the 32B data.
0	0h RW	**Error Injection Enable Lower 32B (EN_LO):** When set, the error injection is continuously armed for lower 32B of D_CR_ERR_INJ_ADDR write address matching until it is cleared.

3.190 Error Log Register (D_CR_ERR_ECC_LOG) — Offset 1AB4h

Detected ECC errors are captured in this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1AB4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CLEAR:** Setting this bit to one clears all fields in this register, including itself.
30:29	0h RW	**PMI VISA Byte Select (ECC_VISA):** Select ECC or PMI byte on VISA : • 00: ECC byte, • 01: PMI Data Byte [7:0], • 10: PMI Data Byte [63:56], • 11: PMI Data Byte [255:248]
28	0h RW/V	**Correctable Single-bit Error (CERR):** This bit is set when a correctable single-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked to further single bit errors, until this bit is cleared. A multiple bit error that occurs after this bit is set will override the address/error syndrome information.
27	0h RW/V	**Uncorrectable Multiple-bit Error (MERR):** This bit is set when an uncorrectable multiple-bit error occurs on a memory read data transfer. When this bit is set, the address that caused the error and the error syndrome are also logged and they are locked until this bit is cleared.
26:25	0h RW/V	**Error Burst Number (ERR_BURST):** Burst number (in BL8) of the error within a chunk.
24	0h RW/V	**Error Chunk Number (ERR_CHUNK):** Chunk number of the error. 0 - lower 32B chunk has error if MERR/CERR is set 1 - higher 32B chunk has the error if MERR/CERR is set
23:16	0h RW/V	**Quad Word ECC Syndrome (SYNDROME_QW):** ECC Syndrome for a QW (64 bit) within 32B Address
15:0	0h RW/V	**Request Tag (TAG):** Read Return Tag matches with the PMI Request Tag which triggered the error log.

3.191 D-Unit Fuse Status (D_CR_DFUSESTAT) — Offset 1ABCh

Contains the values read from D-Unit fuses.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1ABCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD31_16):** Reserved
15:0	0h RO/V	**D-Unit Fuse Status (FUSESTAT):** D-Unit fuse bits are captured into this register and are available to be read. • [0]: fus_dun_ecc_dis. • [3:1]: fus_dun_max_supported_device_size[2:0]. • [4:4]: fus_dun_lpddr3_dis. • [5:5]: fus_dun_lpddr4_dis. • [6:6]: fus_dun_wio2_dis. • [7:7]: fus_dun_ddr3l_dis. • [8:8]: fus_dun_ddr4_dis. • [15:9]: reserved.

3.192 Major Mode Control (D_CR_MMC) — Offset 1B24h

Specifies parameters to control read/write major mode operation and transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B24h	2B01A518 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:27	5h RW	**RAW Conflict Read Priority for WMM Transition (RAW_WMM):** If a conflict read reaches this priority (or greater depending on access class occupancy), WMM will be triggered to unblock the corresponding write. D-Unit will stay in WMM until corresponding write is issued. Note: The value in this bit must not be higher than lowest terminal priority level of each access class.
26	0h RO	**Reserved (RSVD26):** Reserved
25:23	6h RW	**Read Isoch Trigger Priority (RIMPRIO):** If any read in the RPQ is at this programmable priority, RIM is triggered.
22:18	0h RO	**Reserved (RSVD22_18):** Reserved
17:12	1Ah RW	**Write Isoch Threshold (WIMTHRS):** When the number of entries in WPQ is greater than or equal to this value (higher than WMM entry watermark, less than WPQ size), it triggers write isoch mode (WIM).
11:6	14h RW	**Write Major Mode Exit Watermark (WMMEXIT):** When the number of entries in WPQ is less than this value, the D-Unit will switch back to read major mode.
5:0	18h RW	**Write Major Mode Entry Watermark (WMMENTRY):** When the number of entries in WPQ is greater than or equal to this value, the D-Unit will switch to write major mode (WMM). Note: the value must not be set to 0.

3.193 Major Mode RD/WR Counter (Set A and B) (D_CR_MMRDWR_AB) — Offset 1B28h

Minimum read and maximum write counter control. This register defines the minimum number of reads in RMM and maximum number of writes in WMM before a mode transition happens.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B28h	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes B (MAXWRB):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set B).

Bit Range	Default & Access	Field Name (ID): Description
19:14	8h RW	**Min Reads B (MINRDB):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set B).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes A (MAXWRA):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set A).
5:0	8h RW	**Min Reads A (MINRDA):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set A).

3.194 Major Mode RD/WR Counter (Set C and D) (D_CR_MMRDWR_CD) — Offset 1B2Ch

Minimum read and maximum write counter control. This register defines the minumum number of reads in RMM and maximum number of writes in WMM before a mode transition happens (sets C and D).

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B2Ch	1020408 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD31_26):** Reserved
25:20	10h RW	**Max Writes D (MAXWRD):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set D).
19:14	8h RW	**Min Reads D (MINRDD):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set D).
13:12	0h RO	**Reserved (RSVD13_12):** Reserved
11:6	10h RW	**Max Writes C (MAXWRC):** Maximum number of writes D-Unit can send in WMM mode before returning to RMM (set C).
5:0	8h RW	**Min Reads C (MINRDC):** Minimum number of reads that has to be serviced before a switch to WMM is allowed (set C).

3.195 Access Class Initial Priority (D_CR_ACCIP) — Offset 1B30h

Each field of this register defines the initial priority of one access class.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B30h	17C2 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD31_15):** Reserved
14:12	1h RW	**Access Class 4 Initial Priority (AC4IP):** Initial priority level of read requests coming with access class 4.
11:9	3h RW	**Access Class 3 Initial Priority (AC3IP):** Initial priority level of read requests coming with access class 3.
8:6	7h RW	**Access Class 2 Initial Priority (AC2IP):** Initial priority level of read requests coming with access class 2.
5:3	0h RW	**Access Class 1 Initial Priority (AC1IP):** Initial priority level of read requests coming with access class 1.
2:0	2h RW	**Access Class 0 Initial Priority (AC0IP):** Initial priority level of read requests coming with access class 0.

3.196 Access Class 0 Priority Promotion Control (D_CR_RD_PROM0) — Offset 1B34h

This register defines the priority promotion policy for access class 0. Each field of this register defines the number of Cases that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B34h	1F52940 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.197 Access Class 1 Priority Promotion Control (D_CR_RD_PROM1) — Offset 1B38h

This register defines the priority promotion policy for access class 1. Each field of this register defines the number of Cases that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the associated level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B38h	14000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	Ah RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.198 Access Class 2 Priority Promotion Control (D_CR_RD_PROM2) — Offset 1B3Ch

This register defines the priority promotion policy for access class 2. Each field of this register defines the number of Cases that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

Bit Range	Default & Access	Field Name (ID): Description
24:20	0h RW	**Priority 5 Residency (P5RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
19:15	0h RW	**Priority 4 Residency (P4RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
14:10	0h RW	**Priority 3 Residency (P3RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of CASes that pass before a request in this priority promotes to the next priority level.

3.199 Access Class 3 Priority Promotion Control (D_CR_RD_PROM3) — Offset 1B40h

This register defines the aging policy for access class 3. Each field of this register defines the number of Cases that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B40h	1F29400 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
19:15	5h RW	**Priority 4 Residency (P4RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
14:10	5h RW	**Priority 3 Residency (P3RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
9:5	0h RW	**Priority 2 Residency (P2RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
4:0	0h RW	**Priority 1 Residency (P1RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.

3.200 Access Class 4 Priority Promotion Control (D_CR_RD_PROM4) — Offset 1B44h

This register defines the aging policy for access class 3. Each field of this register defines the number of Cases that pass before the request is promoted to the next priority level. A value of 31 indicates the request should never be promoted to the next level and the request has reached its maximum priority.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B44h	1F5294A h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD31_30):** Reserved
29:25	0h RW	**Priority 6 Residency (P6RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
24:20	1Fh RW	**Priority 5 Residency (P5RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
19:15	Ah RW	**Priority 4 Residency (P4RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
14:10	Ah RW	**Priority 3 Residency (P3RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
9:5	Ah RW	**Priority 2 Residency (P2RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.
4:0	Ah RW	**Priority 1 Residency (P1RES):** Number of Cases that pass before a request in this priority promotes to the next priority level.

3.201 Deadline Threshold (D_CR_DL_THRS) — Offset 1B48h

Specifies when the request with initial priority 0 get promoted to a higher priority level.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B48h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD31_11):** Reserved
10:0	6h RW	**Deadline Threshold (DEADLINE_THRS):** A requests with initial priority of 0 will exit priority 0 when its deadline is equal or less than this value plus current time. This field does not affect the priority of any requests in access classes with initial priority bigger than 0.

3.202 Major Mode Blocking Rules Control (D_CR_MM_BLK) — Offset 1B4Ch

This register controls blocking rules enforced in RMM and WMM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B4Ch	1800 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD31_25):** Reserved
24	0h RW	**WMM Regular Rule 1 (WMM_REG_R1):** Disable WMM unsafe write page hits block safe write page misses same bank.
23:20	0h RO	**Reserved (RSVD23_20):** Reserved
19	0h RW	**WMM Priority Rule 4 (WMM_PRIO_R4):** Disable WMM unsafe priority 1 read miss block write hit to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
18	0h RW	**WMM Priority Rule 3 (WMM_PRIO_R3):** Disable WMM unsafe priority 1 write hit block write miss to same bank. Note: This rule does not block the bank that is being blocked by WMM_PRIO_R1. Priority rules 1,3 and 4 should be enabled/disabled together.
17	0h RW	**WMM Priority Rule 2 (WMM_PRIO_R2):** Disable WMM CAS block rule.
16	0h RW	**WMM Priority Rule 1 (WMM_PRIO_R1):** Disable WMM unsafe top priority 1 write miss block write hit same bank. Priority rules 1, 3 and 4 should be enabled/disabled together.
15:14	0h RO	**Reserved (RSVD15_14):** Reserved
13	0h RW	**RMM Regular Rule 6 (RMM_REG_R6):** Disable RMM unsafe write page hits block safe write page misses same bank.
12	1h RW	**RMM Regular Rule 5 (RMM_REG_R5):** Disable RMM unsafe read page miss block all safe and unsafe write page hit to the same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R4 is also 0.
11	1h RW	**RMM Regular Rule 4 (RMM_REG_R4):** Disable RMM unsafe write page hit block safe read page miss same bank. Note: This field must not be set to 0 (enabled) if RMM_REG_R5 is also 0.
10	0h RW	**RMM Regular Rule 3 (RMM_REG_R3):** Disable RMM unsafe read page hit block safe read and write page miss same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3 and RMM_PRIO_R1.
9	0h RW	**RMM Regular Rule 2 (RMM_REG_R2):** Disable RMM unsafe read page empty block safe write page empty same rank.
8	0h RW	**RMM Regular Rule 1 (RMM_REG_R1):** Disable RMM unsafe read page hit block safe write page hit same rank.
7:4	0h RO	**Reserved (RSVD7_4):** Reserved
3	0h RW	**RMM Priority Rule 4 (RMM_PRIO_R4):** Disable RMM unsafe critical read miss block read and write hit to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R3. Priority rules 1, 3 and 4 should be enabled/disabled together.
2	0h RW	**RMM Priority Rule 3 (RMM_PRIO_R3):** Disable RMM unsafe critical read hit block read and write miss to same bank. Note: This rule does not block the bank that is being blocked by RMM_PRIO_R1. Priority rules 1, 3 and 4 should be enabled/disabled together.
1	0h RW	**RMM Priority Rule 2 (RMM_PRIO_R2):** Disable RMM CAS block rule.
0	0h RW	**RMM Priority Rule 1 (RMM_PRIO_R1):** Disable RMM unsafe top critical read miss block read and write hit same bank. Note: Priority rules 1, 3 and 4 should be enabled/disabled together.

3.203 DRAM Self-Refresh Command (D_CR_DRAM_SR_CMD) — Offset 1B54h

Self refresh command register to allow sending WAKE and SUSPEND messages to D-Unit. (Only one bit can be set at a time). Posted writes to this register are not completed until hardware clears the field.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD31_4):** Reserved
3	0h RW/V	**SUSPENDP:** A SUSPENDP message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in self refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware after the PHY indicates the transition requested in the PM message has been completed. D-Unit will perform an MRW to MR17 with an opcode as defined by DPMC0.PASR before it places the DRAM into Self-Refresh.
2	0h RW/V	**SUSPEND:** A SUSPEND message will put the DRAM into self-refresh mode. The D-Unit will complete servicing outstanding memory requests and flush all queued Refresh commands to DRAM before putting the DRAM in Self Refresh mode. Finally, a PM message will be sent to the PHY. The bit is cleared by hardware only after the PHY indicates the transition requested in the PM message has been completed. Note: When COLDWAKE is set prior of setting this bit the DRAM will not be placed in SR.
1	0h RO	**Reserved (RSVD1):** Reserved
0	0h RW/V	**WAKE:** Take PHY out of PM states and wakes the DRAM out of self refresh mode. The bit is cleared by hardware only when the DRAM has exited out of self refresh mode and is accessible. Note: When COLDWAKE is set prior of setting this bit the D-Unit will not send SR exit command and will not set the DCO.IC bit.

3.204 DQS Retraining Control (D_CR_DQS_RETRAINING_CTL) — Offset 1B80h

LPDDR4 DQS Retraining control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DQS Periodic Retraining Interval (DQS_RETRAIN_INT):** This sets the frequency by which the D-Unit initiates periodic retraining (in 1x NREFI).
15:14	0h RO	**Reserved (RSVD15_14):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RW	**DQS Oscillator Runtime (DQS_OSC_RT):** After D-Unit starts DQS oscillator, it must wait this amount of time before being able to read the value in MR18 and MR19 (in 16x DRAM clocks). Value in this register must be at least equal to DRAM's MR23 value. + tOSCO.
3	0h RW/V	**DQS Retrain Start Rank 1 (DQS_RETRAIN_START_R1):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank1. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
2	0h RW/V	**DQS Retrain Start Rank 0 (DQS_RETRAIN_START_R0):** When set, Dunit will initiate LPDDR4 DQS training sequence on Rank0. Hardware will clear bit when sequence completes (after issuing MR19). Note: DQS_RETRAIN_EN must be 0 before setting this bit.
1	0h RW	**DQS Retrain SRX Exit (DQS_RETRAIN_SRX_EN):** Enable retraining on SR exit. This bit enables LPDDR4 DQS retraining on Self Refresh Exit. If disabled, D-Unit will not perform retraining on SR exit.
0	0h RW	**DQS Retrain Enable (DQS_RETRAIN_EN):** Periodic retraining enable: This bit enables periodic DQS retraining. If disabled, D-Unit will not perform retraining periodically. Note: Will be enabled only if DCO.IC is set and refreshes are enabled in DRF.MINREFRATE.

3.205 MR4 De-Swizzle Control (D_CR_MR4_DESWIZZLE) — Offset 1B84h

Controls the data bits swizzling crossbar for MR4.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 1B84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD31):** Reserved
30:28	0h RW	**MR4 Bit 2 Select 2nd Byte (MR4_BIT2_SEL2):** Selects bit 2 of MR4 data.
27	0h RO	**Reserved (RSVD27):** Reserved
26:24	0h RW	**MR4 Bit 1 Select 2nd Byte (MR4_BIT1_SEL2):** Selects bit 1 of MR4 data
23	0h RO	**Reserved (RSVD23):** Reserved
22:20	0h RW	**MR4 Bit 0 Select 2nd Byte (MR4_BIT0_SEL2):** Selects bit 0 of MR4 data.
19:18	0h RO	**Reserved (RSVD19_18):** Reserved
17:16	0h RW	**MR4 Byte 2 Select (MR4_BYTE_SEL2):** Selects byte position of the MR4 data for second device.
15	0h RO	**Reserved (RSVD15):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14:12	0h RW	**MR4 Bit 2 Select (MR4_BIT2_SEL):** Selects bit 2 of MR4 data.
11	0h RO	**Reserved (RSVD11):** Reserved
10:8	0h RW	**MR4 Bit 1 Select (MR4_BIT1_SEL):** Selects bit 1 of MR4 data.
7	0h RO	**Reserved (RSVD7):** Reserved
6:4	0h RW	**MR4 Bit 0 Select (MR4_BIT0_SEL):** Selects bit 0 of MR4 data.
3:2	0h RO	**Reserved (RSVD3_2):** Reserved
1:0	0h RW	**MR4 Byte Select (MR4_BYTE_SEL):** Selects byte position of the MR4 data first device.

3.206 Security Control Policy (C_CR_SECURITY_CP_0_0_0_MCHBAR) — Offset 6000h

Control policy register for the Security Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6000h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

3.207 Security Read Access Control Policy (C_CR_SECURITY_RAC_0_0_0_MCHBAR) — Offset 6008h

Read access control policy register for the Security Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6008h	C0061210202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210202h RO	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

3.208 Security Write Access Control Policy (C_CR_SECURITY_WAC_0_0_0_MCHBAR) — Offset 6010h

Write access control policy register for the Security Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6010h	C0061210202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210202h RO	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

3.209 C_CR_BIOSWR_CP (C_CR_BIOSWR_CP_0_0_0_MCHBAR) — Offset 6018h

Control policy register for the BIOS Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6018h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

3.210 BIOSWR Read Access Control (C_CR_BIOSWR_RAC_0_0_0_MCHBAR) — Offset 6020h

Read access control policy register for the BIOS Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6020h	80000C0063010217 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063010217h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

3.211 C_CR_BIOSWR_WAC (C_CR_BIOSWR_WAC_0_0_0_MCHBAR) — Offset 6028h

Write access control policy register for the BIOS Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6028h	400010C0212 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	400010C0212h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

3.212 P_U_CODEWR_ALLRD Control Policy (C_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR) — Offset 6030h

Control policy register for the P-Code/U-Code Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6030h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

3.213 P_U_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR) — Offset 6038h

Read access control policy register for the P-Code/U-Code Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6038h	FFFFFFFFFFFFFFFF h

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

3.214 P_U_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR) — Offset 6040h

Write access control policy register for the P-Code/U-Code Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6040h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001000202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

3.215 BIOS/PMC WR Control Policy (C_CR_BIOS_PMC_WR_CP_0_0_0_MCHBAR) — Offset 6050h

Control policy register for the BIOS/PMC Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6050h	C0061210202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061210202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

3.216 BIOS/PMC WR Read Access Control (C_CR_BIOS_PMC_WR_RAC_0_0_0_MCHBAR) — Offset 6058h

Read access control policy register for the BIOS/PMC Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6058h	80000C0063210217 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063210217h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

3.217 BIOS/PMC WR Write Access Control (C_CR_BIOS_PMC_WR_WAC_0_0_0_MCHBAR) — Offset 6060h

Write access control policy register for the BIOS/PMC Write Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6060h	C00612C0212 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C00612C0212h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

3.218 P_U_PMC_CODEWR_ALLRD Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_CP_0_0_0_MCHBAR) — Offset 6070h

Control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6070h	40001200202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to update the CP, RAC, and WAC registers of the policy group.

3.219 P_U_PMC_CODEWR_ALLRD Read Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_RAC_0_0_0_MCHBAR) — Offset 6078h

Read access control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6078h	FFFFFFFFFFFFFFFF h

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to read the registers contained in the policy group.

3.220 P_U_PMC_CODEWR_ALLRD Write Access Control Policy (C_CR_P_U_PMC_CODEWR_ALLRD_WAC_0_0_0_MCHBAR) — Offset 6080h

Write access control policy register for the P-Code/U-Code/PMC Write, All Read Policy Group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6080h	40001200202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200202h RW	**Security Attribute of Initiator Permission Enable (SAI):** Each bit is associated with the SAI of an agent. When set to 1'b1, the associated agent is granted permission to write the registers contained in the policy group.

3.221 Upstream Device Arbiter Grant Count A2T (A_CR_UPARB_GCNT_DEV_A2T_MCHBAR) — Offset 6400h

Upstream Device arbiter grant count for A-Unit to T-Unit transactions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6400h	1010101 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:24	1h RW	**VC0B Completion Grant Count (VC0B_C):** VC0B completion grant count to T-Unit.
23:22	0h RO	**Reserved (RSVD):** Reserved
21:16	1h RW	**VC0B Posted Grant Count (VC0B_P):** VC0B posted transaction grant count to T-Unit. This is only for MSIs.
15:14	0h RO	**Reserved (RSVD):** Reserved
13:8	1h RW	**VC0A Completion Grant Count (VC0A_C):** VC0A completion grant count to T-Unit.
7:6	0h RO	**Reserved (RSVD):** Reserved
5:0	1h RW	**VC0A Posted Grant Count (VC0A_P):** VC0A posted to T-Unit MSIs.

3.222 Upstream A2B Arbiter Channel 0 Grant Count (A_CR_UPARB_GCNT_A2B_0_MCHBAR) — Offset 6404h

Upstream Class/Target arbiter grant count.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6404h	1010101 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved

3.250 Gazelle Queue Reserved Entries Channels 0-3 (A_CR_GZLQ_RSVD_CH0_3_MCHBAR) — Offset 6474h

Gazelle queue limit for channel ID 0 to 3.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6474h	4040101 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	4h RW	**Channel ID 3 (CHID3):** Gazelle queue limit for Upstream NP on channel ID 3.
23:16	4h RW	**Channel ID 2 (CHID2):** Gazelle queue limit for Upstream NP on channel ID 2.
15:8	1h RW	**Channel ID 1 (CHID1):** Gazelle queue limit for Upstream NP on Channel ID 1.
7:0	1h RW	**Channel ID 0 (CHID0):** Gazelle queue limit for Upstream NP on Channel ID 0.

3.251 Gazelle Queue Reserved Entries Channels 4-7 (A_CR_GZLQ_RSVD_CH4_7_MCHBAR) — Offset 6478h

GazelleQ limit for CHID 0 to 3

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6478h	1010101 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	1h RW	**Channel ID 7 (CHID7):** Gazelle queue limit for Upstream NP on channel ID 7.
23:16	1h RW	**Channel ID 6 (CHID6):** Gazellequeue limit for Upstream NP on channel ID 6.

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RW	**Channel ID 5 (CHID5):** Gazelle queue limit for Upstream NP on channel ID 5.
7:0	1h RW	**Channel ID 4 (CHID4):** Gazelle queue limit for Upstream NP on channel ID 4.

3.252 Spare BIOS (A_CR_SPARE_BIOS_MCHBAR) — Offset 647Ch

Spare CR in MCHBAR.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 647Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SPARE RW Bits (SPARE_RW):** Spare RW 32 bits in BIOSWR policy group.

3.253 Upcmd Credit Maximum Channel 0 (A_CR_UPCMD_CRDTMAX_CH0_0_0_0_MCHBAR) — Offset 6490h

Upcmd Credit Max for PSF0 on Ch0 : Maximum number of credits exposed to PSF0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6490h	4040C h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	4h RW	**Completion Max (CMP_MAX):** Max Cmp credits sent to PSF0 for Chid.

3.261 MOT OUT Base Register (A_CR_MOT_OUT_BASE_0_0_0_MCHBAR) — Offset 64C0h

This register contains the value of the start address of the MOT debug data region. The smallest reserved region for MOT debug data (if enabled) is 16MB. MOT region must be power-of-two sized and naturally

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 64C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR enable (IMR_EN):** IMR Enable: Enables access checking for the MOT region. Note: this does not enable MOT itself merely enables access control checks for transactions that attempt to access the MOT buffer.
30	0h RO	**Trace Enable (TR_EN):** Asset Classification (AC)[0]: Trace Enable: Enables snooping of transactions to the IMR region by tracing agents such as MOT. Reserved and set to 0 for the MOT region, since otherwise this would enable recursive
29	0h RO	**Reserved (RSVD):** Reserved
28:14	0h RW	**MOT_OUT_BASE:** Specifies bits 38:24 of the start address of the MOT memory region. Region size must be a strict poweroftwo at least 16MB and naturally aligned to the size. These bits are compared with the result of the MOT_OUT_MASK[28:14] applied to bits 38:24 of the incoming address to determine if an access falls within the MOT region.
13:0	0h RO	**Reserved (RSVD):** Reserved

3.262 MOT OUT Mask Register (A_CR_MOT_OUT_MASK_0_0_0_MCHBAR) — Offset 64C4h

This register specifies the size of the MOT region. If a request address [39:24] AND-ed with MOT_OUT_MASK[15:0] matches the MOT_OUT_BASE[15:0], then the request falls within the MOT_OUT region

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 64C4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Asset Classification AC[2]: GT Implicit WB Enable: Enables implicit writebacks to protected region from GT caching agent. When set to 1 enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0 inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Asset Classification AC[1]: IA Implicit WB Enable: Enables implicit writebacks to protected region from IA caching agent. When set to 1 enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0 inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RSVD):** Reserved
28:14	0h RW	**MOT OUT Mask (MOT_OUT_MASK):** Specifies the size of the MOT region. If Request Address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[28:14] then the request falls within the MOT_OUT region

Bit Range	Default & Access	Field Name (ID): Description
13:0	0h RO	**Reserved (RSVD):** Reserved

3.263 A-Unit BIOSWR Control Policy (A_CR_BIOSWR_CP_0_0_0_MCHBAR) — Offset 64C8h

This register controls the access policy to the A-Unit BIOS_RAC BIOS_AC BIOS_CP.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 64C8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**BIOS Control Policy (BIOSWR_CP):** Bit vector used to determine which agents are allowed access to the A-Unit BIOSWR Registers based on the value from the agents 6 bit SAI field. This register is selfreferential the access policy provided applies to access to the control register itself.

3.264 A-Unit BIOSWR Ready Access Control (A_CR_BIOSWR_RAC_0_0_0_MCHBAR) — Offset 64D0h

This register configures the Read Access Policy for the A-Unit BIOS policy configuration registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit BIOS policy group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 64D0h	80000C0063010217 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	80000C0063010217h RW	**BIOS Read Access Control (BIOSWR_RAC):** Bit vector used to determine which agents are allowed Rd access to the A-Unit BIOSWR Register based on the value from the agents 6 bit SAI field.

3.265 BIOSWR Write Access Control (A_CR_BIOSWR_WAC_0_0_0_MCHBAR) — Offset 64D8h

This register configures the Write Access Policy for the A-Unit BIOSWR registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit BIOS policy group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 64D8h	C0061000212 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061000212h RW	**BIOS Write Access Control (BIOSWR_WAC):** Bit vector used to determine which agents are allowed Wr access to the A-Unit BIOSWR registers based on the value from the agents 6 bit SAI field.

3.266 AUnit Pcode/Ucode Write, All Read Control Policy Register (A_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR) — Offset 64E0h

AUnit Pcode/Ucode Write, All Read Control Policy: This register controls the access policy to the Aunit P_U_CODEWR_ALLRD_RAC P_U_CODEWR_ALLRD_WAC

Type	Size	Offset	Default

63:0	FFFFFFFFFFFFFFFFh RO	**IMRGLOBAL_BM Read Access Control (IMRGLOBAL_BM_RAC):** Bit vector used to determine which agents are allowed Rd access to the A-Unit IMRGLOBAL_BM Register based on the value from the agents 6 bit SAI field.

3.274 A_IMRGLOBAL_BM Write Access Control (A_CR_IMRGLOBAL_BM_WAC_0_0_0_MCHBAR) — Offset 6520h

This register configures the Write Access Policy for the A-Unit IMRGLOBAL_BM registers. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to A-Unit IMRGLOBAL_BM policy group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6520h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**IMRGLOBAL_BM Write Access Control (IMRGLOBAL_BM_WAC):** Bit vector used to determine which agents are allowed Wr access to the A-Unit IMRGLOBAL_BM registers based on the value from the agents 6 bit SAI field.

3.275 Uncorrectable Error Status Register (A_CR_UNCERRSTS_0_0_0_MCHBAR) — Offset 6588h

Errors that have been seen in aunit. The error is only logged if the respective bit in UNCERRMSK is 0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6588h	0 h

3.277 Slice and Channel Hash (A_CR_SLICE_CHANNEL_HASH_0_0_0_MCHBAR) — Offset 65C0h

A-Unit slice and channel hash function.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 65C0h	3C00000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**LOCK:** Intended usage is for BIOS to set the LOCK when it updates the CR. A-Unit implements only storage for this bit. No hardware exists to implement hardware locking. NOTE: B-Unit copy of this bit is used by ucode to protect WRMSR to the B-Unit's CR. Ucode has no access to the A-Unit's copy of the CR.

Bit Range	Default & Access	Field Name (ID): Description
62:52	0h RO	**Reserved (RSVD):** Reserved
51:38	0h RW	**Channel Hash Mask (CH_HASH_MASK):** When both PMI channels in a slice are enabled, this field specifies the Channel Hash Mask to be applied on Addr[19:6] postremap DRAM address of the request to compute which PMI channel a request must be routed to. Relevant only when HVM mode is disabled and only for requests that do not fall under the MOT region. B-Unit will override the programmed value to include the Channel Selector bit See SLICEHASH.INTERLEAVE_MODE field. Note that HVM mode and MOT regions have special hash requirements and hence they do not use the CH_HASH_MASK.
37:36	3h RW	**Channel Enabled for Slice 1 (SYM_SLICE1_CHANNEL_ENABLED):** Specifies which channel is enabled for Slice 1, This is for those cases where Channel 0 or 1 could be disabled for Slice 1 If both bits are set then channel select will be based on the Channel Select logic
35:34	3h RW	**Channel Enabled for Slice 0 (SYM_SLICE0_CHANNEL_ENABLED):** Specifies which channel is enabled for Slice 0, This is for those cases where Channel 0 or 1 could be disabled for Slice 0 If both bits are set then channel select will be based on the Channel Select logic
33	0h RO	**Reserved (RSVD):** Reserved
32	0h RW	**Channel 1 Disabled (CH_1_DISABLED):** Channel 1 in both slices are disabled no memory address mapped to ch 1. All requests sent to channel 0.
31	0h RW	**Enable PMI Dual Data Mode (ENABLE_PMI_DUAL_DATA_MODE):** When set to 1, Single Command Interface and Dual Data Interface for Reads and Writes
30:20	0h RO	**Reserved (RSVD):** Reserved
19:6	0h RW	**Slice Hash Mask (SLICE_HASH_MASK):** When both slices are enabled this field specifies the Slice Hash Mask to be applied on Addr[19:6] physical address of the request to compute which slice a request must be routed to. Relevant only when HVM mode is disabled and only for physical addresses that do not fall under the Asymmetric Memory Region and the MOT region. B-Unit will override the programmed value to include the Slice Selector bit See INTERLEAVE_MODE field. Note that HVM mode nonaddress IDI requests asymmetric memory region and MOT regions have special hash requirements and hence they do not use the SLICE_HASH_MASK.
5	0h RO	**Reserved (RSVD):** Reserved
4	0h RW	**Slice 0 Mem Disabled (SLICE_0_MEM_DISABLED):** Slice 0 is disabled for memory accesses; no memory address mapped to Slice 0 and all memory requests sent to Slice 1.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**Interleave Mode (INTERLEAVE_MODE):** Default interleave mode that specifies how the Slice Selector and Channel Selector bits are to be determined. Relevant only when HVM mode is disabled and only for system memory addresses that do not fall under the MOT region or the Asymmetric memory region in the System Address Map. Legal encodings are 0x0 0x1 and 0x2. An encoding of 0x3 is treated as if it was 0x2. When both slices and all four PMI channels are enabled: • 0h: Default Slice Selector is Addr[10] and Default Channel Selector is Addr[11] • 1h: Default Slice Selector is Addr[11] and Default Channel Selector is Addr[12] • 2h: Default Slice Selector is Addr[12] and Default Channel Selector is Addr[13] When both slices are enabled but only one channel in each slice enabled: • 0h: Default Slice Selector is Addr[10] • 1h: Default Slice Selector is Addr[11] • 2h: Default Slice Selector is Addr[12] When only SLICE0 is enabled and both channels on that slice are enabled: • 0h: Default Channel Selector is Addr[10] • 1h: Default Channel Selector is Addr[11] • 2h: Default Channel Selector is Addr[12] When SLICE0 and only one channel in that slice is enabled this field is not relevant. B-Unit overrides the setting of the SLICE_HASH_MASK to always include the Slice Selector bit. Similarly, B-Unit overrides the setting of the CH_HASH_MASK to always include the Channel Selector bit.
1	0h RW	**HVM Mode (HVM_MODE):** • 0: HVM mode is disabled. • 1: HVM mode is enabled. When HVM mode is enabled, Slice Hash and Channel Hash is done as follows: Both slices and all four PMI channels enabled: • Slice Hash is Request Physical Addr[29] • Channel Hash is PostRemap Addr[30] Both slices enabled but only one PMI channel in each slice enabled: • Slice Hash is Request Physical Addr[29] Only one SLICE0 enabled but both PMI channels in SLICE0 enabled: • Channel Hash is PostRemap Addr[29] When HVM_MODE is enabled TOLUD must be set at 2GB.
0	0h RW	**Slice 1 Disabled (SLICE_1_DISABLED):** Slice 1 is disabled; no memory address mapped to Slice 1. All request sent to Slice 0.

3.278 Mirror Range Register (A_CR_MIRROR_RANGE_0_0_0_MCHBAR) — Offset 65C8h

Mirror Range: This register defines base and limit of the 8M aligned region in memory that captures the mirror writes. Since b[22:0] are assumed to be 0's the smallest size of the region is 8M

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 65C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:48	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
47:32	0h RW	**Mirror Limit Address (MIRROR_LIMIT):** Mirror Limit: specifies b38:b23 of HPA indicating the end of mirror packet buffer region
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**MIRROR_BASE:** Mirror Base: specifies b38:b23 of HPA indicating the start of mirror packet buffer region

3.279 ASYM MEM REGION 0 CONFIGURATION WITH NO INTERLEAVING (A_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR) — Offset 65D0h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 65D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 0, With No Interleaving (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM Region Slice 0 (SLICE0_ASYM_CHANNEL_SELECT):** Specifies which Channel in ASYM Slice 0 request is sent
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_LIMIT):** Specifies bits [38:31] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Base Address for Asymmetric Memory Region, Slice 0, With No Interleaving (SLICE0_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	**Reserved (RSVD):** Reserved

3.280 ASYM MEM REGION 1 CONFIGURATION WITH NO INTERLEAVING (A_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR) — Offset 65D4h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 65D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Asymmetric Region in Slice 1, With No Interleaving (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM SLICE 1 (SLICE1_ASYM_CHANNEL_SELECT):** Specifies Channel for ASYM Region Slice 1
29:19	0h RW	**Limit Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_LIMIT):** Specifies bits [38:31] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Limit Address for Asymmetric Memory Region, Slice 1, With No Interleaving (SLICE1_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	**Reserved (RSVD):** Reserved

3.281 Two-Way Asymmetric Memory Region Configuration (A_CR_ASYM_2WAY_MEM_REGION_0_0_0_MCHBAR) — Offset 65D8h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 65D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Two-Way Asymmetric Memory Configuration (ASYM_2WAY_INTERLEAVE_ENABLE):** Setting this bit to 0 disables Interleave Asymmetric memory region 1, setting it to 1 enables the region.
30:28	0h RO	**Reserved (RSVD):** Reserved
27:17	0h RW	**Limit Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_LIMIT):** Specifies bits [38:28] of the highest address of Interleave Asymmetric Region, all the lower bits of the region's highest address are equal to 1.
16:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Base Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_BASE):** Specifies bits [38:28] of the base address of Interleave Asymmetric Region; all the lower bits of the region's base address are equal to 0.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**Two-Way Asymmetric Interleave Mode (ASYM_2WAY_INTLV_MODE):** Going with 2 bits here. 2'b00 : Asymmetric memory Split between Channel 0 of Slice 0 and Slice 1 2'b01 : Asymmetric memory split between Channel 1 of Slice 0 and Slice 1 2'b10 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 0 2'b11 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 1

3.282 B-Unit Miscellaneous Configuration (B_CR_BMISC_0_0_0_MCHBAR) — Offset 6800h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6800h	7 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RESERVED_0):** Reserved
3	0h RW	**Send Boot Vector to DRAM (SEND_BOOT_VECTOR_TO_DRAM):** When set, IA accesses to 0xFFFF_0000 to 0XFFFF_FFFF will be sent to memory, regardless of the Host IO Boundary setting in TOLUD.
2	1h RW	**ABSEGINDRAM:** When this bit is set, reads and writes targeting A or Bsegments are routed to DRAM. Asegment corresponds to the memory range 0xA_0000 to 0xA_FFFF. Bsegment corresponds to the memory ranges 0xB_0000 to 0xB_7FFF and 0xB_8000 to 0xB_FFFF.
1	1h RW	**Read FSeg from DRAM (READ_FSEG_FROM_DRAM):** When this bit is set, reads targeting Fsegment are routed to DRAM. Fsegment corresponds to the memory range 0xF_0000 to 0xF_FFFF.
0	1h RW	**Read ESeg from DRAM (READ_ESEG_FROM_DRAM):** When this bit is set, reads targeting Esegment are routed to DRAM. Esegment corresponds to the memory range 0xE_0000 to 0xE_FFFF.

3.283 Security Control Policy (B_CR_SECURITY_CP_0_0_0_MCHBAR) — Offset 6808h

This register controls the access policy to the B-Unit SEC Read Access Control Policy SECURITY_RAC, Write Access Control policy registers SECURITY_WAC, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6808h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RO	**Security Control Policy (SEC_SAI_POL_63):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
62	0h RO	**Security Control Policy (SEC_SAI_POL_62):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
61	0h RO	**Security Control Policy (SEC_SAI_POL_61):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
60	0h RO	**Security Control Policy (SEC_SAI_POL_60):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
59	0h RO	**Security Control Policy (SEC_SAI_POL_59):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
58	0h RO	**Security Control Policy (SEC_SAI_POL_58):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
57	0h RO	**Security Control Policy (SEC_SAI_POL_57):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
56	0h RO	**Security Control Policy (SEC_SAI_POL_56):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
55	0h RO	**Security Control Policy (SEC_SAI_POL_55):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
54	0h RO	**Security Control Policy (SEC_SAI_POL_54):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
53	0h RO	**Security Control Policy (SEC_SAI_POL_53):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
52	0h RO	**Security Control Policy (SEC_SAI_POL_52):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
51	0h RO	**Security Control Policy (SEC_SAI_POL_51):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
50	0h RO	**Security Control Policy (SEC_SAI_POL_50):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
49	0h RO	**Security Control Policy (SEC_SAI_POL_49):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
48	0h RO	**Security Control Policy (SEC_SAI_POL_48):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
47	0h RO	**Security Control Policy (SEC_SAI_POL_47):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
46	0h RO	**Security Control Policy (SEC_SAI_POL_46):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
45	0h RO	**Security Control Policy (SEC_SAI_POL_45):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RO	**Security Control Policy (SEC_SAI_POL_44):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
43	0h RO	**Security Control Policy (SEC_SAI_POL_43):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
42	0h RO	**Security Control Policy (SEC_SAI_POL_42):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
41	0h RO	**Security Control Policy (SEC_SAI_POL_41):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
40	0h RO	**Security Control Policy (SEC_SAI_POL_40):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
39	0h RO	**Security Control Policy (SEC_SAI_POL_39):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
38	0h RO	**Security Control Policy (SEC_SAI_POL_38):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
37	0h RO	**Security Control Policy (SEC_SAI_POL_37):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
36	0h RO	**Security Control Policy (SEC_SAI_POL_36):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
35	0h RO	**Security Control Policy (SEC_SAI_POL_35):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
34	0h RO	**Security Control Policy (SEC_SAI_POL_34):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.
33	0h RO	**Security Control Policy (SEC_SAI_POL_33):** Bit vector used to determine which agents are allowed access to the SECURITY_RAC, SECURITY_WAC and SECURITY_CP registers, based on the value from each agent's 6bit SAI field.

4	0h RO	**Security SAI Write Access Policy (SEC_SAI_POL_4):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.
3	0h RO	**Security SAI Write Access Policy (SEC_SAI_POL_3):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.
2	0h RO	**Security SAI Write Access Policy (SEC_SAI_POL_2):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.
1	1h RO	**Security SAI Write Access Policy (SEC_SAI_POL_1):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.
0	0h RO	**Security SAI Write Access Policy (SEC_SAI_POL_0):** Bit vector used to determine which agents are allowed write access to the B-Unit Security Group Configuration registers, based on each agent's 6bit encoded SAI value.

3.286 Slice 0 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE0) — Offset 6868h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6868h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases.

3.287 Slice 1 Memory Access Count (B_CR_MEM_ACCESS_COUNT_SLICE1) — Offset 686Ch

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 686Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Memory Access Count (MEM_ACCESS_COUNT):** Counts the number of PMI transactions that the B-Unit has sent to any PMI channel. Counts both reads and writes. Counter is not saturating and will roll over to zero. It is up to the consumer of the counter to handle roll over cases.

3.288 IMR0 Base (B_CR_BIMR0BASE_0_0_0_MCHBAR) — Offset 6870h

This register, along with IMR0MASK, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6870h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR0 Base (IMR0_BASE):** Specifies bits 38:10 of the start address of IMR0 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR0MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR0 defined region.

3.289 IMR0 Mask (B_CR_BIMR0MASK_0_0_0_MCHBAR) — Offset 6874h

This register, along with IMR0BASE, IMR0RAC, and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR0RAC and IMR0WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6874h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR0 Mask (IMR0_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR0BASE[28:0] value. A match indicates that the incoming address falls within the IMR0 region.

3.290 IMR0 Control Policy (B_CR_BIMR0CP_0_0_0_MCHBAR) — Offset 6878h

This register controls the access policy to the Read Access Policy BIMR0RAC, Write Access Policy BIMR0WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6878h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
47	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR0 Control Policy (IMR0_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR0 Control Policy (IMR0_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR0RAC, BIMR0WAC and BIMR0CP registers based on the value from each agent's 6bit SAI field.

3.291 IMR0 Read Access Policy (B_CR_BIMR0RAC_0_0_0_MCHBAR) — Offset 6880h

This register, along with IMR0BASE, IMR0MASK and IMR0WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR0. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6880h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR0 Read Access Policy 63 (IMR0_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR0 Read Access Policy 62 (IMR0_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
61	0h RO	**IMR0 Read Access Policy 61 (IMR0_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR0 Read Access Policy 60 (IMR0_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR0 Read Access Policy 59 (IMR0_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR0 Read Access Policy 58 (IMR0_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR0 Read Access Policy 57 (IMR0_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR0 Read Access Policy 56 (IMR0_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR0 Read Access Policy 55 (IMR0_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR0 Read Access Policy 54 (IMR0_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR0 Read Access Policy 53 (IMR0_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR0 Read Access Policy 52 (IMR0_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR0 Read Access Policy 51 (IMR0_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR0 Read Access Policy 50 (IMR0_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR0 region, based on each agent's 6bit encoded SAI value.

18	0h RO	**IMR0 Write Access Policy 18 (IMR0_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR0 Write Access Policy 17 (IMR0_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR0 Write Access Policy 16 (IMR0_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR0 Write Access Policy 15 (IMR0_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR0 Write Access Policy 14 (IMR0_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR0 Write Access Policy 13 (IMR0_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR0 Write Access Policy 12 (IMR0_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR0 Write Access Policy 11 (IMR0_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR0 Write Access Policy 10 (IMR0_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR0 Write Access Policy 9 (IMR0_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR0 Write Access Policy 8 (IMR0_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR0 Write Access Policy 7 (IMR0_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR0 Write Access Policy 6 (IMR0_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR0 Write Access Policy 5 (IMR0_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR0 Write Access Policy 4 (IMR0_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR0 Write Access Policy 3 (IMR0_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR0 Write Access Policy 2 (IMR0_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR0 Write Access Policy 1 (IMR0_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR0 Write Access Policy 0 (IMR0_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR0 region, based on each agent's 6bit encoded SAI value.

3.293 IMR1 Base (B_CR_BIMR1BASE_0_0_0_MCHBAR) — Offset 6890h

This register, along with IMR1MASK, IMR1RAC, and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6890h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR1 Base (IMR1_BASE):** Specifies bits 38:10 of the start address of IMR1 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR1MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR1 defined region.

3.294 IMR1 Mask (B_CR_BIMR1MASK_0_0_0_MCHBAR) — Offset 6894h

This register, along with IMR1BASE, IMR1RAC, and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR1RAC and IMR1WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6894h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR1 Mask (IMR1_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR1BASE[28:0] value. A match indicates that the incoming address falls within the IMR1 region.

3.295 IMR1 Control Policy (B_CR_BIMR1CP_0_0_0_MCHBAR) — Offset 6898h

This register controls the access policy to the Read Access Policy BIMR1RAC, Write Access Policy BIMR1WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6898h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
55	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
36	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR1 Control Policy (IMR1_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR1 Control Policy (IMR1_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR1RAC, BIMR1WAC and BIMR1CP registers based on the value from each agent's 6bit SAI field.

3.296 IMR1 Read Access Policy (B_CR_BIMR1RAC_0_0_0_MCHBAR) — Offset 68A0h

This register, along with IMR1BASE, IMR1MASK and IMR1WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR1 Read Access Policy 63 (IMR1_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR1 Read Access Policy 62 (IMR1_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR1 Read Access Policy 61 (IMR1_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR1 Read Access Policy 60 (IMR1_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR1 Read Access Policy 59 (IMR1_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR1 Read Access Policy 58 (IMR1_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR1 Read Access Policy 57 (IMR1_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR1 Read Access Policy 56 (IMR1_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR1 Read Access Policy 55 (IMR1_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR1 Read Access Policy 54 (IMR1_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR1 Read Access Policy 53 (IMR1_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR1 Read Access Policy 52 (IMR1_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR1 Read Access Policy 51 (IMR1_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR1 Read Access Policy 50 (IMR1_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR1 Read Access Policy 49 (IMR1_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

5	0h RW	**IMR1 Read Access Policy 5 (IMR1_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR1 Read Access Policy 4 (IMR1_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR1 Read Access Policy 3 (IMR1_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR1 Read Access Policy 2 (IMR1_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR1 Read Access Policy 1 (IMR1_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR1 Read Access Policy 0 (IMR1_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR1 region, based on each agent's 6bit encoded SAI value.

3.297 IMR1 Write Access Policy (B_CR_BIMR1WAC_0_0_0_MCHBAR) — Offset 68A8h

This register, along with IMR1BASE, IMR1MASK and IMR1RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR1 Write Access Policy 63 (IMR1_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR1 Write Access Policy 62 (IMR1_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR1 Write Access Policy 61 (IMR1_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR1 Write Access Policy 60 (IMR1_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR1 Write Access Policy 59 (IMR1_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR1 Write Access Policy 58 (IMR1_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR1 Write Access Policy 57 (IMR1_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR1 Write Access Policy 56 (IMR1_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR1 Write Access Policy 55 (IMR1_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR1 Write Access Policy 54 (IMR1_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR1 Write Access Policy 53 (IMR1_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR1 Write Access Policy 52 (IMR1_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR1 Write Access Policy 51 (IMR1_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR1 Write Access Policy 50 (IMR1_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR1 Write Access Policy 49 (IMR1_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR1 Write Access Policy 48 (IMR1_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR1 Write Access Policy 47 (IMR1_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR1 Write Access Policy 46 (IMR1_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR1 Write Access Policy 45 (IMR1_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.

19	0h RO	**IMR1 Write Access Policy 19 (IMR1_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR1 Write Access Policy 18 (IMR1_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR1 Write Access Policy 17 (IMR1_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR1 Write Access Policy 16 (IMR1_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR1 Write Access Policy 15 (IMR1_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR1 Write Access Policy 14 (IMR1_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR1 Write Access Policy 13 (IMR1_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR1 Write Access Policy 12 (IMR1_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR1 Write Access Policy 11 (IMR1_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR1 Write Access Policy 10 (IMR1_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR1 Write Access Policy 9 (IMR1_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR1 Write Access Policy 8 (IMR1_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR1 Write Access Policy 7 (IMR1_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**IMR1 Write Access Policy 6 (IMR1_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR1 Write Access Policy 5 (IMR1_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR1 Write Access Policy 4 (IMR1_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR1 Write Access Policy 3 (IMR1_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR1 Write Access Policy 2 (IMR1_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR1 Write Access Policy 1 (IMR1_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR1 Write Access Policy 0 (IMR1_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR1 region, based on each agent's 6bit encoded SAI value.

3.298 IMR2 Base (B_CR_BIMR2BASE_0_0_0_MCHBAR) — Offset 68B0h

This register, along with IMR2MASK, IMR2RAC, and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR2 Base (IMR2_BASE):** Specifies bits 38:10 of the start address of IMR2 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR2MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR2 defined region.

3.299 IMR2 Mask (B_CR_BIMR2MASK_0_0_0_MCHBAR) — Offset 68B4h

This register, along with IMR2BASE, IMR2RAC, and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR2RAC and IMR2WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR2 Mask (IMR2_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR2BASE[28:0] value. A match indicates that the incoming address falls within the IMR2 region.

3.300 IMR2 Control Policy (B_CR_BIMR2CP_0_0_0_MCHBAR) — Offset 68B8h

This register controls the access policy to the Read Access Policy BIMR2RAC, Write Access Policy BIMR2WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68B8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR2 Control Policy (IMR2_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR2 Control Policy (IMR2_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR2RAC, BIMR2WAC and BIMR2CP registers based on the value from each agent's 6bit SAI field.

3.301 IMR2 Read Access Policy (B_CR_BIMR2RAC_0_0_0_MCHBAR) — Offset 68C0h

This register, along with IMR2BASE, IMR2MASK and IMR2WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR2. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR2 Read Access Policy 63 (IMR2_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR2 Read Access Policy 62 (IMR2_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR2 Read Access Policy 61 (IMR2_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR2 Read Access Policy 60 (IMR2_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR2 Read Access Policy 59 (IMR2_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RO	**IMR2 Read Access Policy 58 (IMR2_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR2 Read Access Policy 57 (IMR2_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR2 Read Access Policy 56 (IMR2_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR2 Read Access Policy 55 (IMR2_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR2 Read Access Policy 54 (IMR2_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR2 Read Access Policy 53 (IMR2_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR2 Read Access Policy 52 (IMR2_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR2 Read Access Policy 51 (IMR2_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR2 Read Access Policy 50 (IMR2_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR2 Read Access Policy 49 (IMR2_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR2 Read Access Policy 48 (IMR2_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR2 Read Access Policy 47 (IMR2_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR2 Read Access Policy 46 (IMR2_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR2 Read Access Policy 45 (IMR2_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR2 Read Access Policy 44 (IMR2_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR2 Read Access Policy 43 (IMR2_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR2 Read Access Policy 42 (IMR2_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR2 Read Access Policy 41 (IMR2_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR2 Read Access Policy 40 (IMR2_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RO	**IMR2 Read Access Policy 39 (IMR2_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR2 Read Access Policy 38 (IMR2_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR2 Read Access Policy 37 (IMR2_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR2 Read Access Policy 36 (IMR2_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR2 Read Access Policy 35 (IMR2_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR2 Read Access Policy 34 (IMR2_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR2 Read Access Policy 33 (IMR2_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR2 Read Access Policy 32 (IMR2_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR2 Read Access Policy 31 (IMR2_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR2 Read Access Policy 30 (IMR2_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR2 Read Access Policy 29 (IMR2_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR2 Read Access Policy 28 (IMR2_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR2 Read Access Policy 27 (IMR2_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR2 Read Access Policy 26 (IMR2_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR2 Read Access Policy 25 (IMR2_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR2 Read Access Policy 24 (IMR2_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR2 Read Access Policy 23 (IMR2_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR2 Read Access Policy 22 (IMR2_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR2 region, based on each agent's 6bit encoded SAI value.

3.302 IMR2 Write Access Policy (B_CR_BIMR2WAC_0_0_0_MCHBAR) — Offset 68C8h

This register, along with IMR2BASE, IMR2MASK and IMR2RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR2. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR2 Write Access Policy 63 (IMR2_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR2 Write Access Policy 62 (IMR2_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR2 Write Access Policy 61 (IMR2_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR2 Write Access Policy 60 (IMR2_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR2 Write Access Policy 59 (IMR2_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR2 Write Access Policy 58 (IMR2_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR2 Write Access Policy 57 (IMR2_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR2 Write Access Policy 56 (IMR2_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR2 Write Access Policy 55 (IMR2_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR2 Write Access Policy 54 (IMR2_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR2 Write Access Policy 53 (IMR2_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR2 Write Access Policy 52 (IMR2_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR2 Write Access Policy 51 (IMR2_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR2 Write Access Policy 50 (IMR2_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR2 Write Access Policy 49 (IMR2_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR2 Write Access Policy 48 (IMR2_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR2 Write Access Policy 47 (IMR2_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR2 Write Access Policy 46 (IMR2_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR2 Write Access Policy 45 (IMR2_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR2 Write Access Policy 44 (IMR2_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR2 Write Access Policy 43 (IMR2_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR2 Write Access Policy 42 (IMR2_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR2 Write Access Policy 41 (IMR2_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR2 Write Access Policy 40 (IMR2_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR2 Write Access Policy 39 (IMR2_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR2 Write Access Policy 38 (IMR2_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR2 Write Access Policy 37 (IMR2_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR2 Write Access Policy 36 (IMR2_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR2 Write Access Policy 35 (IMR2_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
34	0h RW	**IMR2 Write Access Policy 34 (IMR2_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR2 Write Access Policy 33 (IMR2_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR2 Write Access Policy 32 (IMR2_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR2 Write Access Policy 31 (IMR2_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR2 Write Access Policy 30 (IMR2_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR2 Write Access Policy 29 (IMR2_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR2 Write Access Policy 28 (IMR2_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR2 Write Access Policy 27 (IMR2_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR2 Write Access Policy 26 (IMR2_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR2 Write Access Policy 25 (IMR2_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR2 Write Access Policy 24 (IMR2_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR2 Write Access Policy 23 (IMR2_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR2 Write Access Policy 22 (IMR2_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR2 Write Access Policy 21 (IMR2_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR2 Write Access Policy 20 (IMR2_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR2 Write Access Policy 19 (IMR2_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR2 Write Access Policy 18 (IMR2_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR2 Write Access Policy 17 (IMR2_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR2 Write Access Policy 16 (IMR2_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**IMR2 Write Access Policy 15 (IMR2_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR2 Write Access Policy 14 (IMR2_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR2 Write Access Policy 13 (IMR2_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR2 Write Access Policy 12 (IMR2_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR2 Write Access Policy 11 (IMR2_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR2 Write Access Policy 10 (IMR2_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR2 Write Access Policy 9 (IMR2_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR2 Write Access Policy 8 (IMR2_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR2 Write Access Policy 7 (IMR2_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR2 Write Access Policy 6 (IMR2_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR2 Write Access Policy 5 (IMR2_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR2 Write Access Policy 4 (IMR2_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR2 Write Access Policy 3 (IMR2_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR2 Write Access Policy 2 (IMR2_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR2 Write Access Policy 1 (IMR2_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR2 Write Access Policy 0 (IMR2_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR2 region, based on each agent's 6bit encoded SAI value.

3.303 IMR3 Base (B_CR_BIMR3BASE_0_0_0_MCHBAR) — Offset 68D0h

This register, along with IMR3MASK, IMR3RAC, and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or

from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR3 Base (IMR3_BASE):** Specifies bits 38:10 of the start address of IMR3 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR3MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR3 defined region.

3.304 IMR3 Mask (B_CR_BIMR3MASK_0_0_0_MCHBAR) — Offset 68D4h

This register, along with IMR3BASE, IMR3RAC, and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR3RAC and IMR3WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
28:0	0h RW	**Mask 0 IMR3 Mask (IMR3_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR3BASE[28:0] value. A match indicates that the incoming address falls within the IMR3 region.

3.305 IMR3 Control Policy (B_CR_BIMR3CP_0_0_0_MCHBAR) — Offset 68D8h

This register controls the access policy to the Read Access Policy BIMR3RAC, Write Access Policy BIMR3WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68D8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
52	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.

21	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR3 Control Policy (IMR3_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR3 Control Policy (IMR3_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR3 Control Policy (IMR3_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR3 Control Policy (IMR3_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR3RAC, BIMR3WAC and BIMR3CP registers based on the value from each agent's 6bit SAI field.

3.306 IMR3 Read Access Policy (B_CR_BIMR3RAC_0_0_0_MCHBAR) — Offset 68E0h

This register, along with IMR3BASE, IMR3MASK and IMR3WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR3. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68E0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR3 Read Access Policy 63 (IMR3_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR3 Read Access Policy 62 (IMR3_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR3 Read Access Policy 61 (IMR3_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR3 Read Access Policy 60 (IMR3_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR3 Read Access Policy 59 (IMR3_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR3 Read Access Policy 58 (IMR3_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR3 Write Access Policy 63 (IMR3_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR3 Write Access Policy 62 (IMR3_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR3 Write Access Policy 61 (IMR3_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RO	**IMR3 Write Access Policy 60 (IMR3_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR3 Write Access Policy 59 (IMR3_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR3 Write Access Policy 58 (IMR3_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR3 Write Access Policy 57 (IMR3_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR3 Write Access Policy 56 (IMR3_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR3 Write Access Policy 55 (IMR3_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR3 Write Access Policy 54 (IMR3_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR3 Write Access Policy 53 (IMR3_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR3 Write Access Policy 52 (IMR3_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR3 Write Access Policy 51 (IMR3_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR3 Write Access Policy 50 (IMR3_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR3 Write Access Policy 49 (IMR3_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR3 Write Access Policy 48 (IMR3_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR3 Write Access Policy 47 (IMR3_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR3 Write Access Policy 46 (IMR3_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR3 Write Access Policy 45 (IMR3_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR3 Write Access Policy 44 (IMR3_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR3 Write Access Policy 43 (IMR3_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR3 Write Access Policy 42 (IMR3_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
41	0h RW	**IMR3 Write Access Policy 41 (IMR3_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR3 Write Access Policy 40 (IMR3_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR3 Write Access Policy 39 (IMR3_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR3 Write Access Policy 38 (IMR3_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR3 Write Access Policy 37 (IMR3_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR3 Write Access Policy 36 (IMR3_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR3 Write Access Policy 35 (IMR3_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR3 Write Access Policy 34 (IMR3_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR3 Write Access Policy 33 (IMR3_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR3 Write Access Policy 32 (IMR3_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR3 Write Access Policy 31 (IMR3_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR3 Write Access Policy 30 (IMR3_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR3 Write Access Policy 29 (IMR3_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR3 Write Access Policy 28 (IMR3_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR3 Write Access Policy 27 (IMR3_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR3 Write Access Policy 26 (IMR3_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR3 Write Access Policy 25 (IMR3_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR3 Write Access Policy 24 (IMR3_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR3 Write Access Policy 23 (IMR3_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO	**IMR3 Write Access Policy 22 (IMR3_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR3 Write Access Policy 21 (IMR3_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR3 Write Access Policy 20 (IMR3_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR3 Write Access Policy 19 (IMR3_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR3 Write Access Policy 18 (IMR3_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR3 Write Access Policy 17 (IMR3_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR3 Write Access Policy 16 (IMR3_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR3 Write Access Policy 15 (IMR3_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR3 Write Access Policy 14 (IMR3_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR3 Write Access Policy 13 (IMR3_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR3 Write Access Policy 12 (IMR3_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR3 Write Access Policy 11 (IMR3_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR3 Write Access Policy 10 (IMR3_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR3 Write Access Policy 9 (IMR3_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR3 Write Access Policy 8 (IMR3_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR3 Write Access Policy 7 (IMR3_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR3 Write Access Policy 6 (IMR3_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR3 Write Access Policy 5 (IMR3_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR3 Write Access Policy 4 (IMR3_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR3 Write Access Policy 3 (IMR3_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR3 Write Access Policy 2 (IMR3_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR3 Write Access Policy 1 (IMR3_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR3 Write Access Policy 0 (IMR3_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR3 region, based on each agent's 6bit encoded SAI value.

3.308 IMR4 Base (B_CR_BIMR4BASE_0_0_0_MCHBAR) — Offset 68F0h

This register, along with IMR4MASK, IMR4RAC, and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68F0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR4 Base (IMR4_BASE):** Specifies bits 38:10 of the start address of IMR4 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR4MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR4 defined region.

3.309 IMR4 Mask (B_CR_BIMR4MASK_0_0_0_MCHBAR) — Offset 68F4h

This register, along with IMR4BASE, IMR4RAC, and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or

from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR4RAC and IMR4WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 68F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR4 Mask (IMR4_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR4BASE[28:0] value. A match indicates that the incoming address falls within the IMR4 region.

3.310 IMR4 Control Policy (B_CR_BIMR4CP_0_0_0_MCHBAR) — Offset 68F8h

This register controls the access policy to the Read Access Policy BIMR4RAC, Write Access Policy BIMR4WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 68F8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
41	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR4 Control Policy (IMR4_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR4 Control Policy (IMR4_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR4RAC, BIMR4WAC and BIMR4CP registers based on the value from each agent's 6bit SAI field.

3.311 IMR4 Read Access Policy (B_CR_BIMR4RAC_0_0_0_MCHBAR) — Offset 6900h

This register, along with IMR4BASE, IMR4MASK and IMR4WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR4. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6900h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR4 Read Access Policy 63 (IMR4_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR4 Read Access Policy 62 (IMR4_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR4 Read Access Policy 61 (IMR4_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR4 Read Access Policy 60 (IMR4_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR4 Read Access Policy 59 (IMR4_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR4 Read Access Policy 58 (IMR4_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR4 region, based on each agent's 6bit encoded SAI value.

39	0h RO	**IMR4 Write Access Policy 39 (IMR4_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR4 Write Access Policy 38 (IMR4_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR4 Write Access Policy 37 (IMR4_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR4 Write Access Policy 36 (IMR4_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR4 Write Access Policy 35 (IMR4_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR4 Write Access Policy 34 (IMR4_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR4 Write Access Policy 33 (IMR4_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR4 Write Access Policy 32 (IMR4_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IMR4 Write Access Policy 31 (IMR4_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR4 Write Access Policy 30 (IMR4_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR4 Write Access Policy 29 (IMR4_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR4 Write Access Policy 28 (IMR4_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR4 Write Access Policy 27 (IMR4_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR4 Write Access Policy 26 (IMR4_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR4 Write Access Policy 25 (IMR4_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR4 Write Access Policy 24 (IMR4_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR4 Write Access Policy 23 (IMR4_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR4 Write Access Policy 22 (IMR4_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR4 Write Access Policy 21 (IMR4_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR4 Write Access Policy 20 (IMR4_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR4 Write Access Policy 19 (IMR4_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR4 Write Access Policy 18 (IMR4_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR4 Write Access Policy 17 (IMR4_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR4 Write Access Policy 16 (IMR4_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR4 Write Access Policy 15 (IMR4_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR4 Write Access Policy 14 (IMR4_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR4 Write Access Policy 13 (IMR4_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR4 Write Access Policy 12 (IMR4_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR4 Write Access Policy 11 (IMR4_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR4 Write Access Policy 10 (IMR4_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR4 Write Access Policy 9 (IMR4_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR4 Write Access Policy 8 (IMR4_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR4 Write Access Policy 7 (IMR4_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR4 Write Access Policy 6 (IMR4_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR4 Write Access Policy 5 (IMR4_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR4 Write Access Policy 4 (IMR4_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR4 Write Access Policy 3 (IMR4_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR4 Write Access Policy 2 (IMR4_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR4 Write Access Policy 1 (IMR4_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR4 Write Access Policy 0 (IMR4_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR4 region, based on each agent's 6bit encoded SAI value.

3.313 IMR5 Base (B_CR_BIMR5BASE_0_0_0_MCHBAR) — Offset 6910h

This register, along with IMR5MASK, IMR5RAC, and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6910h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR5 Base (IMR5_BASE):** Specifies bits 38:10 of the start address of IMR5 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR5MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR5 defined region.

3.314 IMR5 Mask (B_CR_BIMR5MASK_0_0_0_MCHBAR) — Offset 6914h

This register, along with IMR5BASE, IMR5RAC, and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR5RAC and IMR5WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6914h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR5 Mask (IMR5_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR5BASE[28:0] value. A match indicates that the incoming address falls within the IMR5 region.

3.315 IMR5 Control Policy (B_CR_BIMR5CP_0_0_0_MCHBAR) — Offset 6918h

This register controls the access policy to the Read Access Policy BIMR5RAC, Write Access Policy BIMR5WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6918h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR5 Control Policy (IMR5_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR5 Control Policy (IMR5_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR5RAC, BIMR5WAC and BIMR5CP registers based on the value from each agent's 6bit SAI field.

3.316 IMR5 Read Access Policy (B_CR_BIMR5RAC_0_0_0_MCHBAR) — Offset 6920h

This register, along with IMR5BASE, IMR5MASK and IMR5WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR5. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default

14	0h RO	**IMR5 Write Access Policy 14 (IMR5_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR5 Write Access Policy 13 (IMR5_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR5 Write Access Policy 12 (IMR5_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR5 Write Access Policy 11 (IMR5_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR5 Write Access Policy 10 (IMR5_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR5 Write Access Policy 9 (IMR5_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR5 Write Access Policy 8 (IMR5_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR5 Write Access Policy 7 (IMR5_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR5 Write Access Policy 6 (IMR5_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR5 Write Access Policy 5 (IMR5_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR5 Write Access Policy 4 (IMR5_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR5 Write Access Policy 3 (IMR5_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR5 Write Access Policy 2 (IMR5_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR5 Write Access Policy 1 (IMR5_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR5 Write Access Policy 0 (IMR5_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR5 region, based on each agent's 6bit encoded SAI value.

3.318 IMR6 Base (B_CR_BIMR6BASE_0_0_0_MCHBAR) — Offset 6930h

This register, along with IMR6MASK, IMR6RAC, and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6930h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR6 Base (IMR6_BASE):** Specifies bits 38:10 of the start address of IMR6 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR6MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR6 defined region.

3.319 IMR6 Mask (B_CR_BIMR6MASK_0_0_0_MCHBAR) — Offset 6934h

This register, along with IMR6BASE, IMR6RAC, and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR6RAC and IMR6WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6934h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR6 Mask (IMR6_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR6BASE[28:0] value. A match indicates that the incoming address falls within the IMR6 region.

3.320 IMR6 Control Policy (B_CR_BIMR6CP_0_0_0_MCHBAR) — Offset 6938h

This register controls the access policy to the Read Access Policy BIMR6RAC, Write Access Policy BIMR6WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6938h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**IMR6 Control Policy (IMR6_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR6 Control Policy (IMR6_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR6RAC, BIMR6WAC and BIMR6CP registers based on the value from each agent's 6bit SAI field.

3.321 IMR6 Read Access Policy (B_CR_BIMR6RAC_0_0_0_MCHBAR) — Offset 6940h

This register, along with IMR6BASE, IMR6MASK and IMR6WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6940h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR6 Read Access Policy 63 (IMR6_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR6 Read Access Policy 62 (IMR6_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR6 Read Access Policy 61 (IMR6_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR6 Read Access Policy 60 (IMR6_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR6 Read Access Policy 59 (IMR6_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR6 Read Access Policy 58 (IMR6_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR6 Read Access Policy 57 (IMR6_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR6 Read Access Policy 56 (IMR6_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR6 Read Access Policy 55 (IMR6_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR6 Read Access Policy 54 (IMR6_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR6 Read Access Policy 53 (IMR6_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR6 Read Access Policy 52 (IMR6_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR6 Read Access Policy 51 (IMR6_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR6 Read Access Policy 50 (IMR6_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR6 Read Access Policy 49 (IMR6_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR6 Read Access Policy 48 (IMR6_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR6 Read Access Policy 47 (IMR6_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR6 Read Access Policy 46 (IMR6_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR6 Read Access Policy 45 (IMR6_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

12	0h RW	**IMR6 Read Access Policy 12 (IMR6_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR6 Read Access Policy 11 (IMR6_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR6 Read Access Policy 10 (IMR6_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR6 Read Access Policy 9 (IMR6_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR6 Read Access Policy 8 (IMR6_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR6 Read Access Policy 7 (IMR6_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR6 Read Access Policy 6 (IMR6_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR6 Read Access Policy 5 (IMR6_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR6 Read Access Policy 4 (IMR6_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR6 Read Access Policy 3 (IMR6_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR6 Read Access Policy 2 (IMR6_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR6 Read Access Policy 1 (IMR6_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR6 Read Access Policy 0 (IMR6_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR6 region, based on each agent's 6bit encoded SAI value.

3.322 IMR6 Write Access Policy (B_CR_BIMR6WAC_0_0_0_MCHBAR) — Offset 6948h

This register, along with IMR6BASE, IMR6MASK and IMR6RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR6. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6948h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR6 Write Access Policy 63 (IMR6_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR6 Write Access Policy 62 (IMR6_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR6 Write Access Policy 61 (IMR6_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR6 Write Access Policy 60 (IMR6_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR6 Write Access Policy 59 (IMR6_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR6 Write Access Policy 58 (IMR6_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR6 Write Access Policy 57 (IMR6_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR6 Write Access Policy 56 (IMR6_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR6 Write Access Policy 55 (IMR6_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR6 Write Access Policy 54 (IMR6_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR6 Write Access Policy 53 (IMR6_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR6 Write Access Policy 52 (IMR6_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR6 Write Access Policy 51 (IMR6_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR6 Write Access Policy 50 (IMR6_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR6 Write Access Policy 49 (IMR6_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR6 Write Access Policy 48 (IMR6_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR6 Write Access Policy 47 (IMR6_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

25	0h RW	**IMR6 Write Access Policy 25 (IMR6_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR6 Write Access Policy 24 (IMR6_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR6 Write Access Policy 23 (IMR6_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR6 Write Access Policy 22 (IMR6_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR6 Write Access Policy 21 (IMR6_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR6 Write Access Policy 20 (IMR6_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR6 Write Access Policy 19 (IMR6_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR6 Write Access Policy 18 (IMR6_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR6 Write Access Policy 17 (IMR6_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR6 Write Access Policy 16 (IMR6_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR6 Write Access Policy 15 (IMR6_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR6 Write Access Policy 14 (IMR6_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR6 Write Access Policy 13 (IMR6_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR6 Write Access Policy 12 (IMR6_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR6 Write Access Policy 11 (IMR6_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR6 Write Access Policy 10 (IMR6_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR6 Write Access Policy 9 (IMR6_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR6 Write Access Policy 8 (IMR6_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR6 Write Access Policy 7 (IMR6_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR6 Write Access Policy 6 (IMR6_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR6 Write Access Policy 5 (IMR6_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR6 Write Access Policy 4 (IMR6_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR6 Write Access Policy 3 (IMR6_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR6 Write Access Policy 2 (IMR6_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR6 Write Access Policy 1 (IMR6_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR6 Write Access Policy 0 (IMR6_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR6 region, based on each agent's 6bit encoded SAI value.

3.323 IMR7 Base (B_CR_BIMR7BASE_0_0_0_MCHBAR) — Offset 6950h

This register, along with IMR7MASK, IMR7RAC, and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6950h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR7 Base (IMR7_BASE):** Specifies bits 38:10 of the start address of IMR7 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR7MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR7 defined region.

3.324 IMR7 Mask (B_CR_BIMR7MASK_0_0_0_MCHBAR) — Offset 6954h

This register, along with IMR7BASE, IMR7RAC, and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR7RAC and IMR7WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6954h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR7 Mask (IMR7_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR7BASE[28:0] value. A match indicates that the incoming address falls within the IMR7 region.

3.325 IMR7 Control Policy (B_CR_BIMR7CP_0_0_0_MCHBAR) — Offset 6958h

This register controls the access policy to the Read Access Policy BIMR7RAC, Write Access Policy BIMR7WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6958h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.

36	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR7 Control Policy (IMR7_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR7 Control Policy (IMR7_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR7RAC, BIMR7WAC and BIMR7CP registers based on the value from each agent's 6bit SAI field.

3.326 IMR7 Read Access Policy (B_CR_BIMR7RAC_0_0_0_MCHBAR) — Offset 6960h

This register, along with IMR7BASE, IMR7MASK and IMR7WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR7. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6960h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR7 Read Access Policy 63 (IMR7_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR7 Read Access Policy 62 (IMR7_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR7 Read Access Policy 61 (IMR7_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR7 Read Access Policy 60 (IMR7_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR7 Read Access Policy 59 (IMR7_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR7 Read Access Policy 58 (IMR7_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR7 Read Access Policy 57 (IMR7_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR7 Read Access Policy 56 (IMR7_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR7 Read Access Policy 55 (IMR7_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR7 Read Access Policy 54 (IMR7_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR7 Read Access Policy 53 (IMR7_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR7 Read Access Policy 52 (IMR7_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR7 Read Access Policy 51 (IMR7_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR7 Read Access Policy 50 (IMR7_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR7 Read Access Policy 49 (IMR7_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR7 Read Access Policy 48 (IMR7_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR7 Read Access Policy 47 (IMR7_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR7 Read Access Policy 46 (IMR7_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR7 Read Access Policy 45 (IMR7_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR7 Read Access Policy 44 (IMR7_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR7 Read Access Policy 43 (IMR7_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR7 Read Access Policy 42 (IMR7_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR7 Read Access Policy 41 (IMR7_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR7 Read Access Policy 40 (IMR7_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR7 Read Access Policy 39 (IMR7_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR7 Read Access Policy 38 (IMR7_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR7 Read Access Policy 37 (IMR7_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR7 Read Access Policy 36 (IMR7_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR7 Read Access Policy 35 (IMR7_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR7 Read Access Policy 34 (IMR7_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR7 Read Access Policy 33 (IMR7_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR7 Read Access Policy 32 (IMR7_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR7 Read Access Policy 31 (IMR7_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR7 Read Access Policy 30 (IMR7_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR7 Read Access Policy 29 (IMR7_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR7 Read Access Policy 28 (IMR7_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR7 Read Access Policy 27 (IMR7_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR7 Read Access Policy 26 (IMR7_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR7 Read Access Policy 25 (IMR7_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR7 Read Access Policy 24 (IMR7_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR7 Read Access Policy 23 (IMR7_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR7 Read Access Policy 22 (IMR7_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR7 Read Access Policy 21 (IMR7_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR7 Read Access Policy 20 (IMR7_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR7 Read Access Policy 19 (IMR7_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR7 region, based on each agent's 6bit encoded SAI value.

3.327 IMR7 Write Access Policy (B_CR_BIMR7WAC_0_0_0_MCHBAR) — Offset 6968h

This register, along with IMR7BASE, IMR7MASK and IMR7RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR7. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6968h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR7 Write Access Policy 63 (IMR7_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR7 Write Access Policy 62 (IMR7_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR7 Write Access Policy 61 (IMR7_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR7 Write Access Policy 60 (IMR7_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR7 Write Access Policy 59 (IMR7_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RO	**IMR7 Write Access Policy 58 (IMR7_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

5	0h RW	**IMR7 Write Access Policy 5 (IMR7_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR7 Write Access Policy 4 (IMR7_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR7 Write Access Policy 3 (IMR7_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR7 Write Access Policy 2 (IMR7_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR7 Write Access Policy 1 (IMR7_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR7 Write Access Policy 0 (IMR7_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR7 region, based on each agent's 6bit encoded SAI value.

3.328 IMR8 Base (B_CR_BIMR8BASE_0_0_0_MCHBAR) — Offset 6970h

This register, along with IMR8MASK, IMR8RAC, and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6970h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR8 Base (IMR8_BASE):** Specifies bits 38:10 of the start address of IMR8 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR8MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR8 defined region.

3.329 IMR8 Mask (B_CR_BIMR8MASK_0_0_0_MCHBAR) — Offset 6974h

This register, along with IMR8BASE, IMR8RAC, and IMR8WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR8RAC and IMR8WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6974h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR8 Mask (IMR8_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR8BASE[28:0] value. A match indicates that the incoming address falls within the IMR8 region.

3.330 IMR8 Control Policy (B_CR_BIMR8CP_0_0_0_MCHBAR) — Offset 6978h

This register controls the access policy to the Read Access Policy BIMR8RAC, Write Access Policy BIMR8WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6978h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR8 Control Policy (IMR8_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR8RAC, BIMR8WAC and BIMR8CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IMR8 Write Access Policy 31 (IMR8_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR8 Write Access Policy 30 (IMR8_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR8 Write Access Policy 29 (IMR8_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR8 Write Access Policy 28 (IMR8_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR8 Write Access Policy 27 (IMR8_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR8 Write Access Policy 26 (IMR8_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR8 Write Access Policy 25 (IMR8_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR8 Write Access Policy 24 (IMR8_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR8 Write Access Policy 23 (IMR8_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR8 Write Access Policy 22 (IMR8_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR8 Write Access Policy 21 (IMR8_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR8 Write Access Policy 20 (IMR8_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR8 Write Access Policy 19 (IMR8_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR8 Write Access Policy 18 (IMR8_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR8 Write Access Policy 17 (IMR8_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR8 Write Access Policy 16 (IMR8_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR8 Write Access Policy 15 (IMR8_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR8 Write Access Policy 14 (IMR8_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR8 Write Access Policy 13 (IMR8_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR8 Write Access Policy 12 (IMR8_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR8 Write Access Policy 11 (IMR8_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR8 Write Access Policy 10 (IMR8_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR8 Write Access Policy 9 (IMR8_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR8 Write Access Policy 8 (IMR8_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR8 Write Access Policy 7 (IMR8_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR8 Write Access Policy 6 (IMR8_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR8 Write Access Policy 5 (IMR8_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR8 Write Access Policy 4 (IMR8_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR8 Write Access Policy 3 (IMR8_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR8 Write Access Policy 2 (IMR8_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR8 Write Access Policy 1 (IMR8_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR8 Write Access Policy 0 (IMR8_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR8 region, based on each agent's 6bit encoded SAI value.

3.333 IMR9 Base (B_CR_BIMR9BASE_0_0_0_MCHBAR) — Offset 6990h

This register, along with IMR9MASK, IMR9RAC, and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6990h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR9 Base (IMR9_BASE):** Specifies bits 38:10 of the start address of IMR9 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR9MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR9 defined region.

3.334 IMR9 Mask (B_CR_BIMR9MASK_0_0_0_MCHBAR) — Offset 6994h

This register, along with IMR9BASE, IMR9RAC, and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR9RAC and IMR9WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6994h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR9 Mask (IMR9_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR9BASE[28:0] value. A match indicates that the incoming address falls within the IMR9 region.

3.335 IMR9 Control Policy (B_CR_BIMR9CP_0_0_0_MCHBAR) — Offset 6998h

This register controls the access policy to the Read Access Policy BIMR9RAC, Write Access Policy BIMR9WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6998h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR9 Control Policy (IMR9_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR9 Control Policy (IMR9_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR9RAC, BIMR9WAC and BIMR9CP registers based on the value from each agent's 6bit SAI field.

3.336 IMR9 Read Access Policy (B_CR_BIMR9RAC_0_0_0_MCHBAR) — Offset 69A0h

This register, along with IMR9BASE, IMR9MASK and IMR9WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR9. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR9 Read Access Policy 63 (IMR9_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR9 Read Access Policy 62 (IMR9_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR9 Read Access Policy 61 (IMR9_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR9 Read Access Policy 60 (IMR9_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR9 Read Access Policy 59 (IMR9_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR9 Read Access Policy 58 (IMR9_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR9 region, based on each agent's 6bit encoded SAI value.

38	0h RW	**IMR9 Write Access Policy 38 (IMR9_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR9 Write Access Policy 37 (IMR9_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR9 Write Access Policy 36 (IMR9_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR9 Write Access Policy 35 (IMR9_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR9 Write Access Policy 34 (IMR9_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR9 Write Access Policy 33 (IMR9_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR9 Write Access Policy 32 (IMR9_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR9 Write Access Policy 31 (IMR9_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR9 Write Access Policy 30 (IMR9_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR9 Write Access Policy 29 (IMR9_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR9 Write Access Policy 28 (IMR9_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR9 Write Access Policy 27 (IMR9_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR9 Write Access Policy 26 (IMR9_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR9 Write Access Policy 25 (IMR9_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR9 Write Access Policy 24 (IMR9_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR9 Write Access Policy 23 (IMR9_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR9 Write Access Policy 22 (IMR9_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR9 Write Access Policy 21 (IMR9_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**IMR9 Write Access Policy 20 (IMR9_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR9 Write Access Policy 19 (IMR9_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR9 Write Access Policy 18 (IMR9_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR9 Write Access Policy 17 (IMR9_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR9 Write Access Policy 16 (IMR9_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR9 Write Access Policy 15 (IMR9_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR9 Write Access Policy 14 (IMR9_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR9 Write Access Policy 13 (IMR9_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR9 Write Access Policy 12 (IMR9_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR9 Write Access Policy 11 (IMR9_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR9 Write Access Policy 10 (IMR9_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR9 Write Access Policy 9 (IMR9_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR9 Write Access Policy 8 (IMR9_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR9 Write Access Policy 7 (IMR9_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR9 Write Access Policy 6 (IMR9_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR9 Write Access Policy 5 (IMR9_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR9 Write Access Policy 4 (IMR9_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR9 Write Access Policy 3 (IMR9_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR9 Write Access Policy 2 (IMR9_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR9 Write Access Policy 1 (IMR9_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR9 Write Access Policy 0 (IMR9_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR9 region, based on each agent's 6bit encoded SAI value.

3.338 IMR10 Base (B_CR_BIMR10BASE_0_0_0_MCHBAR) — Offset 69B0h

This register, along with IMR10MASK, IMR10RAC, and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR10 Base (IMR10_BASE):** Specifies bits 38:10 of the start address of IMR10 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR10MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR10 defined region.

3.339 IMR10 Mask (B_CR_BIMR10MASK_0_0_0_MCHBAR) — Offset 69B4h

This register, along with IMR10BASE, IMR10RAC, and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR10 Mask (IMR10_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR10BASE[28:0] value. A match indicates that the incoming address falls within the IMR10 region.

3.340 IMR10 Control Policy (B_CR_BIMR10CP_0_0_0_MCHBAR) — Offset 69B8h

This register controls the access policy to the Read Access Policy BIMR10RAC, Write Access Policy BIMR10WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69B8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**IMR10 Control Policy (IMR10_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR10 Control Policy (IMR10_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP registers based on the value from each agent's 6bit SAI field.

3.341 IMR10 Read Access Policy (B_CR_BIMR10RAC_0_0_0_MCHBAR) — Offset 69C0h

This register, along with IMR10BASE, IMR10MASK and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default

1	0h RW	**IMR10 Write Access Policy 1 (IMR10_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR10 Write Access Policy 0 (IMR10_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

3.343 IMR11 Base (B_CR_BIMR11BASE_0_0_0_MCHBAR) — Offset 69D0h

This register, along with IMR11MASK, IMR11RAC, and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR11 Base (IMR11_BASE):** Specifies bits 38:10 of the start address of IMR11 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR11MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR11 defined region.

3.344 IMR11 Mask (B_CR_BIMR11MASK_0_0_0_MCHBAR) — Offset 69D4h

This register, along with IMR11BASE, IMR11RAC, and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR11 Mask (IMR11_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR11BASE[28:0] value. A match indicates that the incoming address falls within the IMR11 region.

3.345 IMR11 Control Policy (B_CR_BIMR11CP_0_0_0_MCHBAR) — Offset 69D8h

This register controls the access policy to the Read Access Policy BIMR11RAC, Write Access Policy BIMR11WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69D8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.

1	1h RW	**IMR11 Control Policy (IMR11_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR11 Control Policy (IMR11_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers based on the value from each agent's 6bit SAI field.

3.346 IMR11 Read Access Policy (B_CR_BIMR11RAC_0_0_0_MCHBAR) — Offset 69E0h

This register, along with IMR11BASE, IMR11MASK and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69E0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR11 Read Access Policy 63 (IMR11_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR11 Read Access Policy 62 (IMR11_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

15	0h RO	**IMR11 Read Access Policy 15 (IMR11_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR11 Read Access Policy 14 (IMR11_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR11 Read Access Policy 13 (IMR11_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR11 Read Access Policy 12 (IMR11_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR11 Read Access Policy 11 (IMR11_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR11 Read Access Policy 10 (IMR11_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR11 Read Access Policy 9 (IMR11_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR11 Read Access Policy 8 (IMR11_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR11 Read Access Policy 7 (IMR11_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**IMR11 Read Access Policy 6 (IMR11_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR11 Read Access Policy 5 (IMR11_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR11 Read Access Policy 4 (IMR11_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR11 Read Access Policy 3 (IMR11_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR11 Read Access Policy 2 (IMR11_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR11 Read Access Policy 1 (IMR11_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR11 Read Access Policy 0 (IMR11_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

3.347 IMR11 Write Access Policy (B_CR_BIMR11WAC_0_0_0_MCHBAR) — Offset 69E8h

This register, along with IMR11BASE, IMR11MASK and IMR11RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR11 Write Access Policy 63 (IMR11_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR11 Write Access Policy 62 (IMR11_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR11 Write Access Policy 61 (IMR11_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR11 Write Access Policy 60 (IMR11_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

13	0h RW	**IMR11 Write Access Policy 13 (IMR11_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR11 Write Access Policy 12 (IMR11_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR11 Write Access Policy 11 (IMR11_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR11 Write Access Policy 10 (IMR11_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR11 Write Access Policy 9 (IMR11_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR11 Write Access Policy 8 (IMR11_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR11 Write Access Policy 7 (IMR11_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR11 Write Access Policy 6 (IMR11_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR11 Write Access Policy 5 (IMR11_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR11 Write Access Policy 4 (IMR11_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR11 Write Access Policy 3 (IMR11_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR11 Write Access Policy 2 (IMR11_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR11 Write Access Policy 1 (IMR11_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR11 Write Access Policy 0 (IMR11_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

3.348 IMR12 Base (B_CR_BIMR12BASE_0_0_0_MCHBAR) — Offset 69F0h

This register, along with IMR12MASK, IMR12RAC, and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69F0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR12 Base (IMR12_BASE):** Specifies bits 38:10 of the start address of IMR12 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR12MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR12 defined region.

3.349 IMR12 Mask (B_CR_BIMR12MASK_0_0_0_MCHBAR) — Offset 69F4h

This register, along with IMR12BASE, IMR12RAC, and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 69F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR12 Mask (IMR12_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR12BASE[28:0] value. A match indicates that the incoming address falls within the IMR12 region.

3.350 IMR12 Control Policy (B_CR_BIMR12CP_0_0_0_MCHBAR) — Offset 69F8h

This register controls the access policy to the Read Access Policy BIMR12RAC, Write Access Policy BIMR12WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 69F8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
59	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.

5	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR12 Control Policy (IMR12_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR12 Control Policy (IMR12_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers based on the value from each agent's 6bit SAI field.

3.351 IMR12 Read Access Policy (B_CR_BIMR12RAC_0_0_0_MCHBAR) — Offset 6A00h

This register, along with IMR12BASE, IMR12MASK and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A00h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR12 Read Access Policy 63 (IMR12_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR12 Read Access Policy 62 (IMR12_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR12 Read Access Policy 61 (IMR12_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR12 Read Access Policy 60 (IMR12_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR12 Read Access Policy 59 (IMR12_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR12 Read Access Policy 58 (IMR12_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR12 Read Access Policy 57 (IMR12_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR12 Read Access Policy 56 (IMR12_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR12 Read Access Policy 55 (IMR12_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
54	0h RW	**IMR12 Read Access Policy 54 (IMR12_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR12 Read Access Policy 53 (IMR12_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR12 Read Access Policy 52 (IMR12_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR12 Read Access Policy 51 (IMR12_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR12 Read Access Policy 50 (IMR12_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

4	0h RW	**IMR12 Read Access Policy 4 (IMR12_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR12 Read Access Policy 3 (IMR12_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR12 Read Access Policy 2 (IMR12_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR12 Read Access Policy 1 (IMR12_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR12 Read Access Policy 0 (IMR12_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

3.352 IMR12 Write Access Policy (B_CR_BIMR12WAC_0_0_0_MCHBAR) — Offset 6A08h

This register, along with IMR12BASE, IMR12MASK and IMR12RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default

16	0h RW	**IMR12 Write Access Policy 16 (IMR12_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR12 Write Access Policy 15 (IMR12_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR12 Write Access Policy 14 (IMR12_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR12 Write Access Policy 13 (IMR12_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR12 Write Access Policy 12 (IMR12_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR12 Write Access Policy 11 (IMR12_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR12 Write Access Policy 10 (IMR12_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR12 Write Access Policy 9 (IMR12_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR12 Write Access Policy 8 (IMR12_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR12 Write Access Policy 7 (IMR12_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR12 Write Access Policy 6 (IMR12_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR12 Write Access Policy 5 (IMR12_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR12 Write Access Policy 4 (IMR12_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR12 Write Access Policy 3 (IMR12_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR12 Write Access Policy 2 (IMR12_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR12 Write Access Policy 1 (IMR12_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR12 Write Access Policy 0 (IMR12_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

3.353 IMR13 Base (B_CR_BIMR13BASE_0_0_0_MCHBAR) — Offset 6A10h

This register, along with IMR13MASK, IMR13RAC, and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR13 Base (IMR13_BASE):** Specifies bits 38:10 of the start address of IMR13 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR13MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR13 defined region.

3.354 IMR13 Mask (B_CR_BIMR13MASK_0_0_0_MCHBAR) — Offset 6A14h

This register, along with IMR13BASE, IMR13RAC, and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR13 Mask (IMR13_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR13BASE[28:0] value. A match indicates that the incoming address falls within the IMR13 region.

3.355 IMR13 Control Policy (B_CR_BIMR13CP_0_0_0_MCHBAR) — Offset 6A18h

This register controls the access policy to the Read Access Policy BIMR13RAC, Write Access Policy BIMR13WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A18h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR13 Control Policy (IMR13_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR13 Control Policy (IMR13_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers based on the value from each agent's 6bit SAI field.

3.356 IMR13 Read Access Policy (B_CR_BIMR13RAC_0_0_0_MCHBAR) — Offset 6A20h

This register, along with IMR13BASE, IMR13MASK and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR13 Read Access Policy 63 (IMR13_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR13 Read Access Policy 62 (IMR13_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR13 Read Access Policy 61 (IMR13_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR13 Read Access Policy 60 (IMR13_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR13 Read Access Policy 59 (IMR13_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR13 Read Access Policy 58 (IMR13_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR13 Read Access Policy 57 (IMR13_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR13 Read Access Policy 56 (IMR13_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR13 Read Access Policy 55 (IMR13_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR13 Read Access Policy 54 (IMR13_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR13 Read Access Policy 53 (IMR13_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR13 Read Access Policy 52 (IMR13_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR13 Read Access Policy 51 (IMR13_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR13 Read Access Policy 50 (IMR13_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR13 Read Access Policy 49 (IMR13_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR13 Read Access Policy 48 (IMR13_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR13 Read Access Policy 47 (IMR13_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR13 Read Access Policy 46 (IMR13_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR13 Read Access Policy 45 (IMR13_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR13 Read Access Policy 44 (IMR13_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR13 Read Access Policy 43 (IMR13_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR13 Read Access Policy 42 (IMR13_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR13 Read Access Policy 41 (IMR13_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR13 Read Access Policy 40 (IMR13_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR13 Read Access Policy 39 (IMR13_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR13 Read Access Policy 38 (IMR13_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR13 Read Access Policy 37 (IMR13_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR13 Read Access Policy 36 (IMR13_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR13 Read Access Policy 35 (IMR13_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR13 Read Access Policy 34 (IMR13_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

1	0h RW	**IMR13 Read Access Policy 1 (IMR13_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR13 Read Access Policy 0 (IMR13_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

3.357 IMR13 Write Access Policy (B_CR_BIMR13WAC_0_0_0_MCHBAR) — Offset 6A28h

This register, along with IMR13BASE, IMR13MASK and IMR13RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A28h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR13 Write Access Policy 63 (IMR13_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR13 Write Access Policy 62 (IMR13_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR13 Write Access Policy 61 (IMR13_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR13 Write Access Policy 60 (IMR13_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR13 Write Access Policy 59 (IMR13_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RO	**IMR13 Write Access Policy 58 (IMR13_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR13 Write Access Policy 57 (IMR13_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR13 Write Access Policy 56 (IMR13_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR13 Write Access Policy 55 (IMR13_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR13 Write Access Policy 54 (IMR13_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR13 Write Access Policy 53 (IMR13_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR13 Write Access Policy 52 (IMR13_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR13 Write Access Policy 51 (IMR13_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR13 Write Access Policy 50 (IMR13_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR13 Write Access Policy 49 (IMR13_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR13 Write Access Policy 48 (IMR13_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR13 Write Access Policy 47 (IMR13_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR13 Write Access Policy 46 (IMR13_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR13 Write Access Policy 45 (IMR13_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR13 Write Access Policy 44 (IMR13_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR13 Write Access Policy 43 (IMR13_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR13 Write Access Policy 42 (IMR13_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR13 Write Access Policy 41 (IMR13_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR13 Write Access Policy 40 (IMR13_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RO	**IMR13 Write Access Policy 39 (IMR13_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR13 Write Access Policy 38 (IMR13_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR13 Write Access Policy 37 (IMR13_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR13 Write Access Policy 36 (IMR13_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

33	0h RW	**IMR13 Write Access Policy 33 (IMR13_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR13 Write Access Policy 32 (IMR13_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR13 Write Access Policy 31 (IMR13_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR13 Write Access Policy 30 (IMR13_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR13 Write Access Policy 29 (IMR13_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR13 Write Access Policy 28 (IMR13_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR13 Write Access Policy 27 (IMR13_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR13 Write Access Policy 26 (IMR13_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR13 Write Access Policy 25 (IMR13_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR13 Write Access Policy 24 (IMR13_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR13 Write Access Policy 23 (IMR13_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR13 Write Access Policy 22 (IMR13_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR13 Write Access Policy 21 (IMR13_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**IMR13 Write Access Policy 20 (IMR13_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR13 Write Access Policy 19 (IMR13_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR13 Write Access Policy 18 (IMR13_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR13 Write Access Policy 17 (IMR13_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR13 Write Access Policy 16 (IMR13_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR13 Write Access Policy 15 (IMR13_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR13 Write Access Policy 14 (IMR13_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR13 Write Access Policy 13 (IMR13_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR13 Write Access Policy 12 (IMR13_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR13 Write Access Policy 11 (IMR13_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR13 Write Access Policy 10 (IMR13_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR13 Write Access Policy 9 (IMR13_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR13 Write Access Policy 8 (IMR13_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR13 Write Access Policy 7 (IMR13_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR13 Write Access Policy 6 (IMR13_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR13 Write Access Policy 5 (IMR13_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR13 Write Access Policy 4 (IMR13_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR13 Write Access Policy 3 (IMR13_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR13 Write Access Policy 2 (IMR13_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR13 Write Access Policy 1 (IMR13_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR13 Write Access Policy 0 (IMR13_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

3.358 IMR14 Base (B_CR_BIMR14BASE_0_0_0_MCHBAR) — Offset 6A30h

This register, along with IMR14MASK, IMR14RAC, and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR14 Base (IMR14_BASE):** Specifies bits 38:10 of the start address of IMR14 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR14MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR14 defined region.

3.359 IMR14 Mask (B_CR_BIMR14MASK_0_0_0_MCHBAR) — Offset 6A34h

This register, along with IMR14BASE, IMR14RAC, and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR14 Mask (IMR14_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR14BASE[28:0] value. A match indicates that the incoming address falls within the IMR14 region.

3.360 IMR14 Control Policy (B_CR_BIMR14CP_0_0_0_MCHBAR) — Offset 6A38h

This register controls the access policy to the Read Access Policy BIMR14RAC, Write Access Policy BIMR14WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A38h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**IMR14 Control Policy (IMR14_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR14 Control Policy (IMR14_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers based on the value from each agent's 6bit SAI field.

3.361 IMR14 Read Access Policy (B_CR_BIMR14RAC_0_0_0_MCHBAR) — Offset 6A40h

This register, along with IMR14BASE, IMR14MASK and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR14 Read Access Policy 63 (IMR14_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR14 Read Access Policy 62 (IMR14_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR14 Read Access Policy 61 (IMR14_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR14 Read Access Policy 60 (IMR14_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR14 Read Access Policy 59 (IMR14_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR14 Read Access Policy 58 (IMR14_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR14 Read Access Policy 57 (IMR14_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR14 Read Access Policy 56 (IMR14_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR14 Read Access Policy 55 (IMR14_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR14 Read Access Policy 54 (IMR14_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
53	0h RO	**IMR14 Read Access Policy 53 (IMR14_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR14 Read Access Policy 52 (IMR14_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR14 Read Access Policy 51 (IMR14_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR14 Read Access Policy 50 (IMR14_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR14 Read Access Policy 49 (IMR14_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR14 Read Access Policy 48 (IMR14_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR14 Read Access Policy 47 (IMR14_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR14 Read Access Policy 46 (IMR14_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR14 Read Access Policy 45 (IMR14_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR14 Read Access Policy 44 (IMR14_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR14 Read Access Policy 43 (IMR14_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR14 Read Access Policy 42 (IMR14_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR14 Read Access Policy 41 (IMR14_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR14 Read Access Policy 40 (IMR14_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR14 Read Access Policy 39 (IMR14_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR14 Read Access Policy 38 (IMR14_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR14 Read Access Policy 37 (IMR14_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR14 Read Access Policy 36 (IMR14_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR14 Read Access Policy 35 (IMR14_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
34	0h RW	**IMR14 Read Access Policy 34 (IMR14_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR14 Read Access Policy 33 (IMR14_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR14 Read Access Policy 32 (IMR14_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR14 Read Access Policy 31 (IMR14_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR14 Read Access Policy 30 (IMR14_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR14 Read Access Policy 29 (IMR14_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR14 Read Access Policy 28 (IMR14_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR14 Read Access Policy 27 (IMR14_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR14 Read Access Policy 26 (IMR14_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR14 Read Access Policy 25 (IMR14_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR14 Read Access Policy 24 (IMR14_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR14 Read Access Policy 23 (IMR14_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR14 Read Access Policy 22 (IMR14_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR14 Read Access Policy 21 (IMR14_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR14 Read Access Policy 20 (IMR14_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR14 Read Access Policy 19 (IMR14_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

3.362 IMR14 Write Access Policy (B_CR_BIMR14WAC_0_0_0_MCHBAR) — Offset 6A48h

This register, along with IMR14BASE, IMR14MASK and IMR14RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR14 Write Access Policy 63 (IMR14_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR14 Write Access Policy 62 (IMR14_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR14 Write Access Policy 61 (IMR14_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

59	0h RW	**IMR14 Write Access Policy 59 (IMR14_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR14 Write Access Policy 58 (IMR14_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR14 Write Access Policy 57 (IMR14_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR14 Write Access Policy 56 (IMR14_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR14 Write Access Policy 55 (IMR14_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR14 Write Access Policy 54 (IMR14_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR14 Write Access Policy 53 (IMR14_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR14 Write Access Policy 52 (IMR14_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR14 Write Access Policy 51 (IMR14_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR14 Write Access Policy 50 (IMR14_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR14 Write Access Policy 49 (IMR14_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR14 Write Access Policy 48 (IMR14_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR14 Write Access Policy 47 (IMR14_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR14 Write Access Policy 46 (IMR14_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR14 Write Access Policy 45 (IMR14_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0h RW	**IMR14 Write Access Policy 44 (IMR14_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR14 Write Access Policy 43 (IMR14_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR14 Write Access Policy 42 (IMR14_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR14 Write Access Policy 41 (IMR14_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR14 Write Access Policy 40 (IMR14_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR14 Write Access Policy 39 (IMR14_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR14 Write Access Policy 38 (IMR14_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR14 Write Access Policy 37 (IMR14_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR14 Write Access Policy 36 (IMR14_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR14 Write Access Policy 35 (IMR14_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR14 Write Access Policy 34 (IMR14_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR14 Write Access Policy 33 (IMR14_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR14 Write Access Policy 32 (IMR14_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IMR14 Write Access Policy 31 (IMR14_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR14 Write Access Policy 30 (IMR14_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR14 Write Access Policy 29 (IMR14_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR14 Write Access Policy 28 (IMR14_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR14 Write Access Policy 27 (IMR14_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR14 Write Access Policy 26 (IMR14_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR14 Write Access Policy 25 (IMR14_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR14 Write Access Policy 24 (IMR14_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR14 Write Access Policy 23 (IMR14_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR14 Write Access Policy 22 (IMR14_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR14 Write Access Policy 21 (IMR14_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR14 Write Access Policy 20 (IMR14_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR14 Write Access Policy 19 (IMR14_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR14 Write Access Policy 18 (IMR14_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR14 Write Access Policy 17 (IMR14_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR14 Write Access Policy 16 (IMR14_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR14 Write Access Policy 15 (IMR14_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR14 Write Access Policy 14 (IMR14_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR14 Write Access Policy 13 (IMR14_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR14 Write Access Policy 12 (IMR14_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR14 Write Access Policy 11 (IMR14_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR14 Write Access Policy 10 (IMR14_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR14 Write Access Policy 9 (IMR14_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR14 Write Access Policy 8 (IMR14_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR14 Write Access Policy 7 (IMR14_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR14 Write Access Policy 6 (IMR14_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR14 Write Access Policy 5 (IMR14_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR14 Write Access Policy 4 (IMR14_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR14 Write Access Policy 3 (IMR14_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR14 Write Access Policy 2 (IMR14_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR14 Write Access Policy 1 (IMR14_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR14 Write Access Policy 0 (IMR14_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

3.363 IMR15 Base (B_CR_BIMR15BASE_0_0_0_MCHBAR) — Offset 6A50h

This register, along with IMR15MASK, IMR15RAC, and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR15 Base (IMR15_BASE):** Specifies bits 38:10 of the start address of IMR15 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR15MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR15 defined region.

3.364 IMR15 Mask (B_CR_BIMR15MASK_0_0_0_MCHBAR) — Offset 6A54h

This register, along with IMR15BASE, IMR15RAC, and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR15 Mask (IMR15_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR15BASE[28:0] value. A match indicates that the incoming address falls within the IMR15 region.

3.365 IMR15 Control Policy (B_CR_BIMR15CP_0_0_0_MCHBAR) — Offset 6A58h

This register controls the access policy to the Read Access Policy BIMR15RAC, Write Access Policy BIMR15WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A58h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR15 Control Policy (IMR15_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR15 Control Policy (IMR15_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers based on the value from each agent's 6bit SAI field.

3.366 IMR15 Read Access Policy (B_CR_BIMR15RAC_0_0_0_MCHBAR) — Offset 6A60h

This register, along with IMR15BASE, IMR15MASK and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR15 Read Access Policy 63 (IMR15_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR15 Read Access Policy 62 (IMR15_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR15 Read Access Policy 61 (IMR15_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR15 Read Access Policy 60 (IMR15_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR15 Read Access Policy 59 (IMR15_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR15 Read Access Policy 58 (IMR15_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR15 Read Access Policy 57 (IMR15_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR15 Read Access Policy 56 (IMR15_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR15 Read Access Policy 55 (IMR15_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR15 Read Access Policy 54 (IMR15_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR15 Read Access Policy 53 (IMR15_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR15 Read Access Policy 52 (IMR15_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR15 Read Access Policy 51 (IMR15_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR15 Read Access Policy 50 (IMR15_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR15 Read Access Policy 49 (IMR15_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR15 Read Access Policy 48 (IMR15_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR15 Read Access Policy 47 (IMR15_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR15 Read Access Policy 46 (IMR15_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR15 Read Access Policy 45 (IMR15_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR15 Read Access Policy 44 (IMR15_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR15 Read Access Policy 43 (IMR15_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR15 Read Access Policy 42 (IMR15_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR15 Read Access Policy 41 (IMR15_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR15 Read Access Policy 40 (IMR15_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR15 Read Access Policy 39 (IMR15_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR15 Read Access Policy 38 (IMR15_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR15 Read Access Policy 37 (IMR15_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR15 Read Access Policy 36 (IMR15_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR15 Read Access Policy 35 (IMR15_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR15 Read Access Policy 34 (IMR15_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR15 Read Access Policy 33 (IMR15_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR15 Read Access Policy 32 (IMR15_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR15 Read Access Policy 31 (IMR15_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR15 Read Access Policy 30 (IMR15_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR15 Read Access Policy 29 (IMR15_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR15 Read Access Policy 28 (IMR15_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR15 Read Access Policy 27 (IMR15_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR15 Read Access Policy 26 (IMR15_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR15 Read Access Policy 25 (IMR15_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR15 Read Access Policy 24 (IMR15_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR15 Read Access Policy 23 (IMR15_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR15 Read Access Policy 22 (IMR15_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR15 Read Access Policy 21 (IMR15_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR15 Read Access Policy 20 (IMR15_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR15 Read Access Policy 19 (IMR15_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR15 Read Access Policy 18 (IMR15_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR15 Read Access Policy 17 (IMR15_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR15 Read Access Policy 16 (IMR15_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR15 Read Access Policy 15 (IMR15_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR15 Read Access Policy 14 (IMR15_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR15 Read Access Policy 13 (IMR15_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR15 Read Access Policy 12 (IMR15_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR15 Read Access Policy 11 (IMR15_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR15 Read Access Policy 10 (IMR15_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR15 Read Access Policy 9 (IMR15_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR15 Read Access Policy 8 (IMR15_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR15 Read Access Policy 7 (IMR15_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**IMR15 Read Access Policy 6 (IMR15_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR15 Read Access Policy 5 (IMR15_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR15 Read Access Policy 4 (IMR15_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR15 Read Access Policy 3 (IMR15_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR15 Read Access Policy 2 (IMR15_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR15 Read Access Policy 1 (IMR15_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR15 Read Access Policy 0 (IMR15_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

3.367 IMR15 Write Access Policy (B_CR_BIMR15WAC_0_0_0_MCHBAR) — Offset 6A68h

This register, along with IMR15BASE, IMR15MASK and IMR15RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR15 Write Access Policy 63 (IMR15_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR15 Write Access Policy 62 (IMR15_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR15 Write Access Policy 61 (IMR15_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR15 Write Access Policy 60 (IMR15_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR15 Write Access Policy 59 (IMR15_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RO	**IMR15 Write Access Policy 58 (IMR15_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR15 Write Access Policy 57 (IMR15_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR15 Write Access Policy 56 (IMR15_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

44	0h RW	**IMR15 Write Access Policy 44 (IMR15_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
43	0h RW	**IMR15 Write Access Policy 43 (IMR15_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
42	0h RW	**IMR15 Write Access Policy 42 (IMR15_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
41	0h RW	**IMR15 Write Access Policy 41 (IMR15_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR15 Write Access Policy 40 (IMR15_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RO	**IMR15 Write Access Policy 39 (IMR15_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR15 Write Access Policy 38 (IMR15_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR15 Write Access Policy 37 (IMR15_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR15 Write Access Policy 36 (IMR15_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR15 Write Access Policy 35 (IMR15_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR15 Write Access Policy 34 (IMR15_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR15 Write Access Policy 33 (IMR15_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR15 Write Access Policy 32 (IMR15_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR15 Write Access Policy 31 (IMR15_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR15 Write Access Policy 30 (IMR15_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR15 Write Access Policy 29 (IMR15_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR15 Write Access Policy 28 (IMR15_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR15 Write Access Policy 27 (IMR15_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR15 Write Access Policy 26 (IMR15_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR15 Write Access Policy 25 (IMR15_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR15 Write Access Policy 24 (IMR15_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR15 Write Access Policy 23 (IMR15_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR15 Write Access Policy 22 (IMR15_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR15 Write Access Policy 21 (IMR15_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**IMR15 Write Access Policy 20 (IMR15_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR15 Write Access Policy 19 (IMR15_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR15 Write Access Policy 18 (IMR15_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR15 Write Access Policy 17 (IMR15_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR15 Write Access Policy 16 (IMR15_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR15 Write Access Policy 15 (IMR15_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR15 Write Access Policy 14 (IMR15_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR15 Write Access Policy 13 (IMR15_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR15 Write Access Policy 12 (IMR15_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR15 Write Access Policy 11 (IMR15_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR15 Write Access Policy 10 (IMR15_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR15 Write Access Policy 9 (IMR15_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR15 Write Access Policy 8 (IMR15_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR15 Write Access Policy 7 (IMR15_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR15 Write Access Policy 6 (IMR15_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR15 Write Access Policy 5 (IMR15_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR15 Write Access Policy 4 (IMR15_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR15 Write Access Policy 3 (IMR15_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR15 Write Access Policy 2 (IMR15_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR15 Write Access Policy 1 (IMR15_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR15 Write Access Policy 0 (IMR15_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

3.368 IMR16 Base (B_CR_BIMR16BASE_0_0_0_MCHBAR) — Offset 6A70h

This register, along with IMR16MASK, IMR16RAC, and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR16 Base (IMR16_BASE):** Specifies bits 38:10 of the start address of IMR16 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR16MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR16 defined region.

3.369 IMR16 Mask (B_CR_BIMR16MASK_0_0_0_MCHBAR) — Offset 6A74h

This register, along with IMR16BASE, IMR16RAC, and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR16 Mask (IMR16_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR16BASE[28:0] value. A match indicates that the incoming address falls within the IMR16 region.

3.370 IMR16 Control Policy (B_CR_BIMR16CP_0_0_0_MCHBAR) — Offset 6A78h

This register controls the access policy to the Read Access Policy BIMR16RAC, Write Access Policy BIMR16WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A78h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR16 Control Policy (IMR16_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR16 Control Policy (IMR16_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.

10	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR16 Control Policy (IMR16_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**IMR16 Control Policy (IMR16_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR16 Control Policy (IMR16_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers based on the value from each agent's 6bit SAI field.

3.371 IMR16 Read Access Policy (B_CR_BIMR16RAC_0_0_0_MCHBAR) — Offset 6A80h

This register, along with IMR16BASE, IMR16MASK and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IMR16 Write Access Policy 31 (IMR16_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR16 Write Access Policy 30 (IMR16_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR16 Write Access Policy 29 (IMR16_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR16 Write Access Policy 28 (IMR16_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR16 Write Access Policy 27 (IMR16_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR16 Write Access Policy 26 (IMR16_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR16 Write Access Policy 25 (IMR16_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR16 Write Access Policy 24 (IMR16_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR16 Write Access Policy 23 (IMR16_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR16 Write Access Policy 22 (IMR16_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR16 Write Access Policy 21 (IMR16_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR16 Write Access Policy 20 (IMR16_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR16 Write Access Policy 19 (IMR16_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR16 Write Access Policy 18 (IMR16_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR16 Write Access Policy 17 (IMR16_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR16 Write Access Policy 16 (IMR16_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR16 Write Access Policy 15 (IMR16_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR16 Write Access Policy 14 (IMR16_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR16 Write Access Policy 13 (IMR16_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR16 Write Access Policy 12 (IMR16_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR16 Write Access Policy 11 (IMR16_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR16 Write Access Policy 10 (IMR16_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR16 Write Access Policy 9 (IMR16_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR16 Write Access Policy 8 (IMR16_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR16 Write Access Policy 7 (IMR16_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR16 Write Access Policy 6 (IMR16_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR16 Write Access Policy 5 (IMR16_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR16 Write Access Policy 4 (IMR16_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR16 Write Access Policy 3 (IMR16_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR16 Write Access Policy 2 (IMR16_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR16 Write Access Policy 1 (IMR16_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR16 Write Access Policy 0 (IMR16_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

3.373 IMR17 Base (B_CR_BIMR17BASE_0_0_0_MCHBAR) — Offset 6A90h

This register, along with IMR17MASK, IMR17RAC, and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR17 Base (IMR17_BASE):** Specifies bits 38:10 of the start address of IMR17 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR17MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR17 defined region.

3.374 IMR17 Mask (B_CR_BIMR17MASK_0_0_0_MCHBAR) — Offset 6A94h

This register, along with IMR17BASE, IMR17RAC, and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6A94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR17 Mask (IMR17_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR17BASE[28:0] value. A match indicates that the incoming address falls within the IMR17 region.

3.375 IMR17 Control Policy (B_CR_BIMR17CP_0_0_0_MCHBAR) — Offset 6A98h

This register controls the access policy to the Read Access Policy BIMR17RAC, Write Access Policy BIMR17WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6A98h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR17 Control Policy (IMR17_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR17 Control Policy (IMR17_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers based on the value from each agent's 6bit SAI field.

3.376 IMR17 Read Access Policy (B_CR_BIMR17RAC_0_0_0_MCHBAR) — Offset 6AA0h

This register, along with IMR17BASE, IMR17MASK and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6AA0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR17 Read Access Policy 63 (IMR17_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
62	0h RO	**IMR17 Read Access Policy 62 (IMR17_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
61	0h RO	**IMR17 Read Access Policy 61 (IMR17_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
60	0h RO	**IMR17 Read Access Policy 60 (IMR17_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
59	0h RW	**IMR17 Read Access Policy 59 (IMR17_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
58	0h RO	**IMR17 Read Access Policy 58 (IMR17_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
57	0h RO	**IMR17 Read Access Policy 57 (IMR17_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
56	0h RW	**IMR17 Read Access Policy 56 (IMR17_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
55	0h RW	**IMR17 Read Access Policy 55 (IMR17_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
54	0h RW	**IMR17 Read Access Policy 54 (IMR17_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
53	0h RO	**IMR17 Read Access Policy 53 (IMR17_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
52	0h RO	**IMR17 Read Access Policy 52 (IMR17_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
51	0h RO	**IMR17 Read Access Policy 51 (IMR17_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
50	0h RW	**IMR17 Read Access Policy 50 (IMR17_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
49	0h RW	**IMR17 Read Access Policy 49 (IMR17_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
48	0h RW	**IMR17 Read Access Policy 48 (IMR17_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
47	0h RO	**IMR17 Read Access Policy 47 (IMR17_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
46	0h RO	**IMR17 Read Access Policy 46 (IMR17_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
45	0h RO	**IMR17 Read Access Policy 45 (IMR17_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**IMR17 Read Access Policy 44 (IMR17_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

33	0h RW	**IMR17 Read Access Policy 33 (IMR17_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR17 Read Access Policy 32 (IMR17_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
31	0h RO	**IMR17 Read Access Policy 31 (IMR17_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR17 Read Access Policy 30 (IMR17_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR17 Read Access Policy 29 (IMR17_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR17 Read Access Policy 28 (IMR17_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR17 Read Access Policy 27 (IMR17_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR17 Read Access Policy 26 (IMR17_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**IMR17 Read Access Policy 25 (IMR17_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR17 Read Access Policy 24 (IMR17_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR17 Read Access Policy 23 (IMR17_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR17 Read Access Policy 22 (IMR17_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR17 Read Access Policy 21 (IMR17_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR17 Read Access Policy 20 (IMR17_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR17 Read Access Policy 19 (IMR17_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR17 Read Access Policy 18 (IMR17_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR17 Read Access Policy 17 (IMR17_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR17 Read Access Policy 16 (IMR17_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR17 Read Access Policy 15 (IMR17_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR17 Read Access Policy 14 (IMR17_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR17 Read Access Policy 13 (IMR17_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR17 Read Access Policy 12 (IMR17_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR17 Read Access Policy 11 (IMR17_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR17 Read Access Policy 10 (IMR17_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR17 Read Access Policy 9 (IMR17_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR17 Read Access Policy 8 (IMR17_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR17 Read Access Policy 7 (IMR17_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**IMR17 Read Access Policy 6 (IMR17_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR17 Read Access Policy 5 (IMR17_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR17 Read Access Policy 4 (IMR17_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR17 Read Access Policy 3 (IMR17_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR17 Read Access Policy 2 (IMR17_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR17 Read Access Policy 1 (IMR17_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR17 Read Access Policy 0 (IMR17_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

3.377 IMR17 Write Access Policy (B_CR_BIMR17WAC_0_0_0_MCHBAR) — Offset 6AA8h

This register, along with IMR17BASE, IMR17MASK and IMR17RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

23	0h RO	**IMR17 Write Access Policy 23 (IMR17_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR17 Write Access Policy 22 (IMR17_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR17 Write Access Policy 21 (IMR17_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**IMR17 Write Access Policy 20 (IMR17_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR17 Write Access Policy 19 (IMR17_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR17 Write Access Policy 18 (IMR17_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR17 Write Access Policy 17 (IMR17_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR17 Write Access Policy 16 (IMR17_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR17 Write Access Policy 15 (IMR17_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR17 Write Access Policy 14 (IMR17_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR17 Write Access Policy 13 (IMR17_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR17 Write Access Policy 12 (IMR17_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR17 Write Access Policy 11 (IMR17_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR17 Write Access Policy 10 (IMR17_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR17 Write Access Policy 9 (IMR17_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR17 Write Access Policy 8 (IMR17_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR17 Write Access Policy 7 (IMR17_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR17 Write Access Policy 6 (IMR17_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR17 Write Access Policy 5 (IMR17_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR17 Write Access Policy 4 (IMR17_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR17 Write Access Policy 3 (IMR17_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR17 Write Access Policy 2 (IMR17_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR17 Write Access Policy 1 (IMR17_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR17 Write Access Policy 0 (IMR17_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

3.378 IMR18 Base (B_CR_BIMR18BASE_0_0_0_MCHBAR) — Offset 6AB0h

This register, along with IMR18MASK, IMR18RAC, and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AB0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR18 Base (IMR18_BASE):** Specifies bits 38:10 of the start address of IMR18 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR18MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR18 defined region.

3.379 IMR18 Mask (B_CR_BIMR18MASK_0_0_0_MCHBAR) — Offset 6AB4h

This register, along with IMR18BASE, IMR18RAC, and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AB4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR18 Mask (IMR18_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR18BASE[28:0] value. A match indicates that the incoming address falls within the IMR18 region.

3.380 IMR18 Control Policy (B_CR_BIMR18CP_0_0_0_MCHBAR) — Offset 6AB8h

This register controls the access policy to the Read Access Policy BIMR18RAC, Write Access Policy BIMR18WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6AB8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
58	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
50	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
39	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
31	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
12	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**IMR18 Control Policy (IMR18_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR18 Control Policy (IMR18_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers based on the value from each agent's 6bit SAI field.

3.381 IMR18 Read Access Policy (B_CR_BIMR18RAC_0_0_0_MCHBAR) — Offset 6AC0h

This register, along with IMR18BASE, IMR18MASK and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6AC0h	0 h

41	0h RW	**IMR18 Write Access Policy 41 (IMR18_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
40	0h RW	**IMR18 Write Access Policy 40 (IMR18_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
39	0h RO	**IMR18 Write Access Policy 39 (IMR18_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
38	0h RW	**IMR18 Write Access Policy 38 (IMR18_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
37	0h RO	**IMR18 Write Access Policy 37 (IMR18_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
36	0h RW	**IMR18 Write Access Policy 36 (IMR18_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
35	0h RO	**IMR18 Write Access Policy 35 (IMR18_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
34	0h RW	**IMR18 Write Access Policy 34 (IMR18_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
33	0h RW	**IMR18 Write Access Policy 33 (IMR18_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
32	0h RW	**IMR18 Write Access Policy 32 (IMR18_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IMR18 Write Access Policy 31 (IMR18_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
30	0h RW	**IMR18 Write Access Policy 30 (IMR18_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
29	0h RW	**IMR18 Write Access Policy 29 (IMR18_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
28	0h RW	**IMR18 Write Access Policy 28 (IMR18_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
27	0h RW	**IMR18 Write Access Policy 27 (IMR18_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
26	0h RW	**IMR18 Write Access Policy 26 (IMR18_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
25	0h RW	**IMR18 Write Access Policy 25 (IMR18_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
24	0h RW	**IMR18 Write Access Policy 24 (IMR18_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
23	0h RO	**IMR18 Write Access Policy 23 (IMR18_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
22	0h RO	**IMR18 Write Access Policy 22 (IMR18_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
21	0h RW	**IMR18 Write Access Policy 21 (IMR18_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
20	0h RO	**IMR18 Write Access Policy 20 (IMR18_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
19	0h RO	**IMR18 Write Access Policy 19 (IMR18_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
18	0h RO	**IMR18 Write Access Policy 18 (IMR18_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR18 Write Access Policy 17 (IMR18_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR18 Write Access Policy 16 (IMR18_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR18 Write Access Policy 15 (IMR18_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR18 Write Access Policy 14 (IMR18_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR18 Write Access Policy 13 (IMR18_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR18 Write Access Policy 12 (IMR18_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR18 Write Access Policy 11 (IMR18_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR18 Write Access Policy 10 (IMR18_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR18 Write Access Policy 9 (IMR18_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR18 Write Access Policy 8 (IMR18_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR18 Write Access Policy 7 (IMR18_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR18 Write Access Policy 6 (IMR18_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR18 Write Access Policy 5 (IMR18_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR18 Write Access Policy 4 (IMR18_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR18 Write Access Policy 3 (IMR18_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR18 Write Access Policy 2 (IMR18_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
1	0h RW	**IMR18 Write Access Policy 1 (IMR18_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR18 Write Access Policy 0 (IMR18_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR18 region, based on each agent's 6bit encoded SAI value.

3.383 IMR19 Base (B_CR_BIMR19BASE_0_0_0_MCHBAR) — Offset 6AD0h

This register, along with IMR19MASK, IMR19RAC, and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AD0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0h RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:0	0h RW	**Base 0 IMR19 Base (IMR19_BASE):** Specifies bits 38:10 of the start address of IMR19 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR19MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR19 defined region.

3.384 IMR19 Mask (B_CR_BIMR19MASK_0_0_0_MCHBAR) — Offset 6AD4h

This register, along with IMR19BASE, IMR19RAC, and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AD4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables return to the requester of implicit writeback HITM data from GT. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_0):** Reserved
28:0	0h RW	**Mask 0 IMR19 Mask (IMR19_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR19BASE[28:0] value. A match indicates that the incoming address falls within the IMR19 region.

3.385 IMR19 Control Policy (B_CR_BIMR19CP_0_0_0_MCHBAR) — Offset 6AD8h

This register controls the access policy to the Read Access Policy BIMR19RAC, Write Access Policy BIMR19WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6AD8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
62	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
61	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
60	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
59	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
58	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
57	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
56	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
55	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
54	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
53	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
52	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
51	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
50	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
49	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
48	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
47	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
46	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
45	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
44	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
43	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
42	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
41	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
40	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
39	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
38	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
37	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
36	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
35	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
34	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
33	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
32	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
30	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
29	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
28	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
27	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
26	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
25	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
24	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
23	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
22	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
21	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
20	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
19	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
18	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
17	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
16	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
15	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
14	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
13	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
11	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
10	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
9	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
8	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
7	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
6	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
5	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
4	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
3	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
2	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
1	1h RW	**IMR19 Control Policy (IMR19_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.
0	0h RW	**IMR19 Control Policy (IMR19_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC and BIMR19CP registers based on the value from each agent's 6bit SAI field.

3.386 IMR19 Read Access Policy (B_CR_BIMR19RAC_0_0_0_MCHBAR) — Offset 6AE0h

This register, along with IMR19BASE, IMR19MASK and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default

18	0h RO	**IMR19 Write Access Policy 18 (IMR19_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
17	0h RW	**IMR19 Write Access Policy 17 (IMR19_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
16	0h RW	**IMR19 Write Access Policy 16 (IMR19_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
15	0h RO	**IMR19 Write Access Policy 15 (IMR19_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
14	0h RO	**IMR19 Write Access Policy 14 (IMR19_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
13	0h RW	**IMR19 Write Access Policy 13 (IMR19_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
12	0h RW	**IMR19 Write Access Policy 12 (IMR19_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
11	0h RO	**IMR19 Write Access Policy 11 (IMR19_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
10	0h RO	**IMR19 Write Access Policy 10 (IMR19_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
9	0h RO	**IMR19 Write Access Policy 9 (IMR19_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
8	0h RW	**IMR19 Write Access Policy 8 (IMR19_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
7	0h RW	**IMR19 Write Access Policy 7 (IMR19_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
6	0h RW	**IMR19 Write Access Policy 6 (IMR19_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
5	0h RW	**IMR19 Write Access Policy 5 (IMR19_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
4	0h RW	**IMR19 Write Access Policy 4 (IMR19_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
3	0h RW	**IMR19 Write Access Policy 3 (IMR19_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
2	0h RW	**IMR19 Write Access Policy 2 (IMR19_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**IMR19 Write Access Policy 1 (IMR19_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
0	0h RO	**IMR19 Write Access Policy 0 (IMR19_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

3.388 MOT Out Base (B_CR_MOT_OUT_BASE_0_0_0_MCHBAR) — Offset 6AF0h

This register contains the value of the start address of the MOT debug data region. The smallest reserved region for MOT debug data, if enabled, is 16MB. The MOT region must be power of two sized and naturally aligned to its size. The MOT region is evenly distributed between the slices and interleaved on a 4K granularity. When generating addresses, B-Unit MOT H/W within each slice ensures that the addresses it generates are within the region mapped to that slice.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AF0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IMR Enable (IMR_EN):** Enables access checking for the MOT region. Note: this does not enable MOT itself, but merely enables access control checks for transactions that attempt to access the MOT buffer.
30	0h RO	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents such as MOT. Reserved and set to 0 for the MOT region, since otherwise this would enable recursive tracing and corrupt MOT buffer.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:14	0h RW	**MOT_OUT Base (MOT_OUT_BASE):** Specifies bits 38:24 of the start address of the MOT memory region. Region size must be a strict power of two, at least 16MB, and naturally aligned to the size. These bits are compared with the result of the MOT_OUT_MASK[28:14] applied to bits 38:24 of the incoming address to determine if an access falls within the MOT region.
13:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.389 MOT Out Mask (B_CR_MOT_OUT_MASK_0_0_0_MCHBAR) — Offset 6AF4h

This register specifies the size of the MOT region. If a request address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[38:24], then the request falls within the MOT_OUT region.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6AF4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
30	0h RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
29	0h RO	**Reserved (RESERVED_1):** Reserved
28:14	0h RW	**MOT Out Mask (MOT_OUT_MASK):** Specifies the size of the MOT region. If Request Address [38:24] ANDed with MOT_OUT_MASK[28:14] matches the MOT_OUT_BASE[28:14] then the request falls within the MOT_OUT region.
13:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.390 MOT Buffer Control Policy (B_CR_BMOT_BUF_CP_0_0_0_MCHBAR) — Offset 6AF8h

This register controls the access policy to BMOT_BUF_RAC, BMOT_BUF_WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6AF8h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
62	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
61	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
60	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
59	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
58	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
57	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
56	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
55	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
54	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
53	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
52	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
51	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
50	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
49	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
48	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
47	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
46	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
45	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
44	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
43	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
42	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
41	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
40	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
39	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
38	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
37	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
36	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
35	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
34	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
33	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
32	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
31	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
30	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
29	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
28	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
27	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
26	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
25	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
24	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
23	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
22	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
20	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
19	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
18	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
17	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
16	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
15	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
14	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
13	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
12	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
11	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
10	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
9	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
8	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
7	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
6	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
5	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
4	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
3	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
1	1h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.
0	0h RW	**MOT Buffer Control Policy (MOT_BUF_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the BMOT_BUF_RAC, BMOT_BUF_WAC and BMOT_BUF_CP registers, based on the value from each agent's 6bit SAI field.

3.391 MOT Buffer Read Access Policy (B_CR_BMOT_BUF_RAC_0_0_0_MCHBAR) — Offset 6B00h

This register, along with MOTBASE, MOTMASK and MOT_BUF_WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to MOT. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default

28	0h RW	**MOT Read Access Policy 28 (MOT_BUF_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
27	0h RW	**MOT Read Access Policy 27 (MOT_BUF_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
26	0h RW	**MOT Read Access Policy 26 (MOT_BUF_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
25	0h RW	**MOT Read Access Policy 25 (MOT_BUF_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
24	0h RW	**MOT Read Access Policy 24 (MOT_BUF_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
23	0h RO	**MOT Read Access Policy 23 (MOT_BUF_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
22	0h RO	**MOT Read Access Policy 22 (MOT_BUF_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
21	0h RW	**MOT Read Access Policy 21 (MOT_BUF_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
20	0h RO	**MOT Read Access Policy 20 (MOT_BUF_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
19	0h RO	**MOT Read Access Policy 19 (MOT_BUF_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
18	0h RO	**MOT Read Access Policy 18 (MOT_BUF_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
17	0h RW	**MOT Read Access Policy 17 (MOT_BUF_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**MOT Read Access Policy 16 (MOT_BUF_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
15	0h RO	**MOT Read Access Policy 15 (MOT_BUF_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
14	0h RO	**MOT Read Access Policy 14 (MOT_BUF_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
13	0h RW	**MOT Read Access Policy 13 (MOT_BUF_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
12	0h RW	**MOT Read Access Policy 12 (MOT_BUF_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
11	0h RO	**MOT Read Access Policy 11 (MOT_BUF_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
10	0h RO	**MOT Read Access Policy 10 (MOT_BUF_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
9	0h RO	**MOT Read Access Policy 9 (MOT_BUF_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
8	0h RW	**MOT Read Access Policy 8 (MOT_BUF_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
7	0h RW	**MOT Read Access Policy 7 (MOT_BUF_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
6	0h RW	**MOT Read Access Policy 6 (MOT_BUF_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
5	0h RW	**MOT Read Access Policy 5 (MOT_BUF_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
4	1h RW	**MOT Read Access Policy 4 (MOT_BUF_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
3	0h RW	**MOT Read Access Policy 3 (MOT_BUF_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
2	1h RW	**MOT Read Access Policy 2 (MOT_BUF_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
1	1h RW	**MOT Read Access Policy 1 (MOT_BUF_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.
0	1h RO	**MOT Read Access Policy 0 (MOT_BUF_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the MOT region, based on each agent's 6bit encoded SAI value.

3.392 MOT Buffer Write Access Policy (B_CR_BMOT_BUF_WAC_0_0_0_MCHBAR) — Offset 6B08h

This register, along with MOTBASE, MOTMASK and MOT_BUF_RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to MOT. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B08h	60010000 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**MOT Write Access Policy 63 (MOT_BUF_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
62	0h RO	**MOT Write Access Policy 62 (MOT_BUF_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
61	0h RO	**MOT Write Access Policy 61 (MOT_BUF_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
60	0h RO	**MOT Write Access Policy 60 (MOT_BUF_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
59	0h RW	**MOT Write Access Policy 59 (MOT_BUF_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
58	0h RO	**MOT Write Access Policy 58 (MOT_BUF_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
57	0h RO	**MOT Write Access Policy 57 (MOT_BUF_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
56	0h RW	**MOT Write Access Policy 56 (MOT_BUF_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
55	0h RW	**MOT Write Access Policy 55 (MOT_BUF_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
54	0h RW	**MOT Write Access Policy 54 (MOT_BUF_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
53	0h RO	**MOT Write Access Policy 53 (MOT_BUF_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
52	0h RO	**MOT Write Access Policy 52 (MOT_BUF_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
51	0h RO	**MOT Write Access Policy 51 (MOT_BUF_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description

25	0h RW	**MOT Write Access Policy 25 (MOT_BUF_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
24	0h RW	**MOT Write Access Policy 24 (MOT_BUF_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
23	0h RO	**MOT Write Access Policy 23 (MOT_BUF_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
22	0h RO	**MOT Write Access Policy 22 (MOT_BUF_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
21	0h RW	**MOT Write Access Policy 21 (MOT_BUF_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
20	0h RO	**MOT Write Access Policy 20 (MOT_BUF_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
19	0h RO	**MOT Write Access Policy 19 (MOT_BUF_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
18	0h RO	**MOT Write Access Policy 18 (MOT_BUF_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
17	0h RW	**MOT Write Access Policy 17 (MOT_BUF_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
16	1h RW	**MOT Write Access Policy 16 (MOT_BUF_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
15	0h RO	**MOT Write Access Policy 15 (MOT_BUF_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
14	0h RO	**MOT Write Access Policy 14 (MOT_BUF_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
13	0h RW	**MOT Write Access Policy 13 (MOT_BUF_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**MOT Write Access Policy 12 (MOT_BUF_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
11	0h RO	**MOT Write Access Policy 11 (MOT_BUF_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
10	0h RO	**MOT Write Access Policy 10 (MOT_BUF_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
9	0h RO	**MOT Write Access Policy 9 (MOT_BUF_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
8	0h RW	**MOT Write Access Policy 8 (MOT_BUF_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
7	0h RW	**MOT Write Access Policy 7 (MOT_BUF_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
6	0h RW	**MOT Write Access Policy 6 (MOT_BUF_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
5	0h RW	**MOT Write Access Policy 5 (MOT_BUF_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
4	0h RW	**MOT Write Access Policy 4 (MOT_BUF_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
3	0h RW	**MOT Write Access Policy 3 (MOT_BUF_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
2	0h RW	**MOT Write Access Policy 2 (MOT_BUF_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
1	0h RW	**MOT Write Access Policy 1 (MOT_BUF_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.
0	0h RO	**MOT Write Access Policy 0 (MOT_BUF_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the MOT region, based on each agent's 6bit encoded SAI value.

3.393 IMR Global BM Control Policy (B_CR_BIMRGLOBAL_BM_CP_0_0_0_MCHBAR) — Offset 6B10h

Defines the policy register that specifies who is allowed write access to BIMRGLOBAL_BM_WAC register.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B10h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**BM Control Policy (BM_CTRL_POL_63):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
62	0h RW	**BM Control Policy (BM_CTRL_POL_62):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
61	0h RW	**BM Control Policy (BM_CTRL_POL_61):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
60	0h RW	**BM Control Policy (BM_CTRL_POL_60):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
59	0h RW	**BM Control Policy (BM_CTRL_POL_59):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
58	0h RW	**BM Control Policy (BM_CTRL_POL_58):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
57	0h RW	**BM Control Policy (BM_CTRL_POL_57):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
56	0h RW	**BM Control Policy (BM_CTRL_POL_56):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
55	0h RW	**BM Control Policy (BM_CTRL_POL_55):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
54	0h RW	**BM Control Policy (BM_CTRL_POL_54):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
53	0h RW	**BM Control Policy (BM_CTRL_POL_53):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
52	0h RW	**BM Control Policy (BM_CTRL_POL_52):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
51	0h RW	**BM Control Policy (BM_CTRL_POL_51):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
50	0h RW	**BM Control Policy (BM_CTRL_POL_50):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
49	0h RW	**BM Control Policy (BM_CTRL_POL_49):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
48	0h RW	**BM Control Policy (BM_CTRL_POL_48):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
47	0h RW	**BM Control Policy (BM_CTRL_POL_47):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
46	0h RW	**BM Control Policy (BM_CTRL_POL_46):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
45	0h RW	**BM Control Policy (BM_CTRL_POL_45):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
44	0h RW	**BM Control Policy (BM_CTRL_POL_44):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
43	0h RW	**BM Control Policy (BM_CTRL_POL_43):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
42	1h RW	**BM Control Policy (BM_CTRL_POL_42):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
41	0h RW	**BM Control Policy (BM_CTRL_POL_41):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
40	0h RW	**BM Control Policy (BM_CTRL_POL_40):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
39	0h RW	**BM Control Policy (BM_CTRL_POL_39):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
38	0h RW	**BM Control Policy (BM_CTRL_POL_38):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
37	0h RW	**BM Control Policy (BM_CTRL_POL_37):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
36	0h RW	**BM Control Policy (BM_CTRL_POL_36):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
35	0h RW	**BM Control Policy (BM_CTRL_POL_35):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
34	0h RW	**BM Control Policy (BM_CTRL_POL_34):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
33	0h RW	**BM Control Policy (BM_CTRL_POL_33):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
32	0h RW	**BM Control Policy (BM_CTRL_POL_32):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
31	0h RW	**BM Control Policy (BM_CTRL_POL_31):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
30	0h RW	**BM Control Policy (BM_CTRL_POL_30):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
29	0h RW	**BM Control Policy (BM_CTRL_POL_29):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
28	0h RW	**BM Control Policy (BM_CTRL_POL_28):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
27	0h RW	**BM Control Policy (BM_CTRL_POL_27):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
26	0h RW	**BM Control Policy (BM_CTRL_POL_26):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**BM Control Policy (BM_CTRL_POL_25):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
24	1h RW	**BM Control Policy (BM_CTRL_POL_24):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
23	0h RW	**BM Control Policy (BM_CTRL_POL_23):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
22	0h RW	**BM Control Policy (BM_CTRL_POL_22):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
21	0h RW	**BM Control Policy (BM_CTRL_POL_21):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
20	0h RW	**BM Control Policy (BM_CTRL_POL_20):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
19	0h RW	**BM Control Policy (BM_CTRL_POL_19):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
18	0h RW	**BM Control Policy (BM_CTRL_POL_18):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
17	0h RW	**BM Control Policy (BM_CTRL_POL_17):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
16	0h RW	**BM Control Policy (BM_CTRL_POL_16):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
15	0h RW	**BM Control Policy (BM_CTRL_POL_15):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
14	0h RW	**BM Control Policy (BM_CTRL_POL_14):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
13	0h RW	**BM Control Policy (BM_CTRL_POL_13):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
12	0h RW	**BM Control Policy (BM_CTRL_POL_12):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
11	0h RW	**BM Control Policy (BM_CTRL_POL_11):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
10	0h RW	**BM Control Policy (BM_CTRL_POL_10):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
9	1h RW	**BM Control Policy (BM_CTRL_POL_9):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
8	0h RW	**BM Control Policy (BM_CTRL_POL_8):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
7	0h RW	**BM Control Policy (BM_CTRL_POL_7):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**BM Control Policy (BM_CTRL_POL_6):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
5	0h RW	**BM Control Policy (BM_CTRL_POL_5):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
4	0h RW	**BM Control Policy (BM_CTRL_POL_4):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
3	0h RW	**BM Control Policy (BM_CTRL_POL_3):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
2	0h RW	**BM Control Policy (BM_CTRL_POL_2):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
1	1h RW	**BM Control Policy (BM_CTRL_POL_1):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.
0	0h RW	**BM Control Policy (BM_CTRL_POL_0):** Bit vector used to determine which agents are allowed write access to BIMRGLOBAL_BM_WAC, based on each agent's 6bit encoded SAI value.

3.394 IMR Global BM Read Access Control (B_CR_BIMRGLOBAL_BM_RAC_0_0_0_MCHBAR) — Offset 6B18h

Defines the policy register that specifies who is allowed to read the BASE/MASK registers for IMR0-IMR15. This single common policy register protects reads to all base/mask registers.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B18h	FFFFFFFFFFFFFFFF h

Bit Range	Default & Access	Field Name (ID): Description
63:0	FFFFFFFFFFFFFFFFh RO	**BM Read Access Policy (BM_READ_POL):** Bit vector used to determine which agents are allowed read access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

3.395 IMR Global BM Write Access Policy (B_CR_BIMRGLOBAL_BM_WAC_0_0_0_MCHBAR) — Offset 6B20h

Defines the policy register that specifies who is allowed to overwrite the BASE/MASK registers for IMR0-IMR15. This single common policy register protects writes to all base/mask registers.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B20h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**BM Write Access Policy (BM_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
62	0h RW	**BM Write Access Policy (BM_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
61	0h RW	**BM Write Access Policy (BM_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
60	0h RW	**BM Write Access Policy (BM_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
59	0h RW	**BM Write Access Policy (BM_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
58	0h RW	**BM Write Access Policy (BM_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
57	0h RW	**BM Write Access Policy (BM_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
56	0h RW	**BM Write Access Policy (BM_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
55	0h RW	**BM Write Access Policy (BM_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
54	0h RW	**BM Write Access Policy (BM_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
53	0h RW	**BM Write Access Policy (BM_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
52	0h RW	**BM Write Access Policy (BM_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
51	0h RW	**BM Write Access Policy (BM_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
50	0h RW	**BM Write Access Policy (BM_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
49	0h RW	**BM Write Access Policy (BM_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
48	0h RW	**BM Write Access Policy (BM_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
47	0h RW	**BM Write Access Policy (BM_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
46	0h RW	**BM Write Access Policy (BM_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
45	0h RW	**BM Write Access Policy (BM_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
44	0h RW	**BM Write Access Policy (BM_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
43	0h RW	**BM Write Access Policy (BM_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
42	1h RW	**BM Write Access Policy (BM_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
41	0h RW	**BM Write Access Policy (BM_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
40	0h RW	**BM Write Access Policy (BM_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
39	0h RW	**BM Write Access Policy (BM_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
38	0h RW	**BM Write Access Policy (BM_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
37	0h RW	**BM Write Access Policy (BM_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
36	0h RW	**BM Write Access Policy (BM_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
35	0h RW	**BM Write Access Policy (BM_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
34	0h RW	**BM Write Access Policy (BM_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
33	0h RW	**BM Write Access Policy (BM_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
32	0h RW	**BM Write Access Policy (BM_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
31	0h RW	**BM Write Access Policy (BM_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
30	0h RW	**BM Write Access Policy (BM_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
29	0h RW	**BM Write Access Policy (BM_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**BM Write Access Policy (BM_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
27	0h RW	**BM Write Access Policy (BM_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
26	0h RW	**BM Write Access Policy (BM_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
25	0h RW	**BM Write Access Policy (BM_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
24	1h RW	**BM Write Access Policy (BM_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
23	0h RW	**BM Write Access Policy (BM_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
22	0h RW	**BM Write Access Policy (BM_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
21	0h RW	**BM Write Access Policy (BM_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
20	0h RW	**BM Write Access Policy (BM_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
19	0h RW	**BM Write Access Policy (BM_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
18	0h RW	**BM Write Access Policy (BM_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
17	0h RW	**BM Write Access Policy (BM_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
16	0h RW	**BM Write Access Policy (BM_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
15	0h RW	**BM Write Access Policy (BM_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
14	0h RW	**BM Write Access Policy (BM_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
13	0h RW	**BM Write Access Policy (BM_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
12	0h RW	**BM Write Access Policy (BM_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
11	0h RW	**BM Write Access Policy (BM_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
10	0h RW	**BM Write Access Policy (BM_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**BM Write Access Policy (BM_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
8	0h RW	**BM Write Access Policy (BM_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
7	0h RW	**BM Write Access Policy (BM_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

1	1h RW	**BM Write Access Policy (BM_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.
0	0h RW	**BM Write Access Policy (BM_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to all IMRxBASE and IMRxMASK registers, based on each agent's 6bit encoded SAI value.

3.396 Graphics Stolen Memory Control Policy (B_CR_BGSMCP_0_0_0_MCHBAR) — Offset 6B28h

This register controls the access policy to the Read Access Policy BGSMRAC, Write Access Policy BGSMWAC and self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default

3.397 GSM Read Access Policy (B_CR_BGSMRAC_0_0_0_MCHBAR) — Offset 6B30h

This register configures the Read Access Policy to the memory range from BGSM to TOLUD1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B30h	1000600101 00 h

13	0h RW	**SMM Read Access Policy 13 (GSM_SAI_POL_13):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
12	0h RW	**SMM Read Access Policy 12 (GSM_SAI_POL_12):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
11	0h RO	**SMM Read Access Policy 11 (GSM_SAI_POL_11):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
10	0h RO	**SMM Read Access Policy 10 (GSM_SAI_POL_10):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
9	0h RO	**SMM Read Access Policy 9 (GSM_SAI_POL_9):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
8	1h RW	**SMM Read Access Policy 8 (GSM_SAI_POL_8):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
7	0h RW	**SMM Read Access Policy 7 (GSM_SAI_POL_7):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
6	0h RW	**SMM Read Access Policy 6 (GSM_SAI_POL_6):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
5	0h RW	**SMM Read Access Policy 5 (GSM_SAI_POL_5):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
4	0h RW	**SMM Read Access Policy 4 (GSM_SAI_POL_4):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
3	0h RW	**SMM Read Access Policy 3 (GSM_SAI_POL_3):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
2	0h RW	**SMM Read Access Policy 2 (GSM_SAI_POL_2):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
1	0h RW	**SMM Read Access Policy 1 (GSM_SAI_POL_1):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
0	0h RO	**SMM Read Access Policy 0 (GSM_SAI_POL_0):** Bit vector used to determine which agents are allowed read access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

3.398 GSM Write Access Policy (B_CR_BGSMWAC_0_0_0_MCHBAR) — Offset 6B38h

This register configures the Write Access Policy for the memory range from BGSM to TOLUD1. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B38h	100060010100 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**GSM Write Access Policy 63 (GSM_SAI_POL_63):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
62	0h RO	**GSM Write Access Policy 62 (GSM_SAI_POL_62):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
61	0h RO	**GSM Write Access Policy 61 (GSM_SAI_POL_61):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
60	0h RO	**GSM Write Access Policy 60 (GSM_SAI_POL_60):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
59	0h RW	**GSM Write Access Policy 59 (GSM_SAI_POL_59):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
58	0h RO	**GSM Write Access Policy 58 (GSM_SAI_POL_58):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
57	0h RO	**GSM Write Access Policy 57 (GSM_SAI_POL_57):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
56	0h RW	**GSM Write Access Policy 56 (GSM_SAI_POL_56):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
55	0h RW	**GSM Write Access Policy 55 (GSM_SAI_POL_55):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
54	0h RW	**GSM Write Access Policy 54 (GSM_SAI_POL_54):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
53	0h RO	**GSM Write Access Policy 53 (GSM_SAI_POL_53):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
52	0h RO	**GSM Write Access Policy 52 (GSM_SAI_POL_52):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
51	0h RO	**GSM Write Access Policy 51 (GSM_SAI_POL_51):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
50	0h RW	**GSM Write Access Policy 50 (GSM_SAI_POL_50):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
49	0h RW	**GSM Write Access Policy 49 (GSM_SAI_POL_49):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
48	0h RW	**GSM Write Access Policy 48 (GSM_SAI_POL_48):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
47	0h RO	**GSM Write Access Policy 47 (GSM_SAI_POL_47):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
46	0h RO	**GSM Write Access Policy 46 (GSM_SAI_POL_46):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
45	0h RO	**GSM Write Access Policy 45 (GSM_SAI_POL_45):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
44	1h RW	**GSM Write Access Policy 44 (GSM_SAI_POL_44):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
43	0h RW	**GSM Write Access Policy 43 (GSM_SAI_POL_43):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
42	0h RW	**GSM Write Access Policy 42 (GSM_SAI_POL_42):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
41	0h RW	**GSM Write Access Policy 41 (GSM_SAI_POL_41):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
40	0h RW	**GSM Write Access Policy 40 (GSM_SAI_POL_40):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
39	0h RO	**GSM Write Access Policy 39 (GSM_SAI_POL_39):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
38	0h RW	**GSM Write Access Policy 38 (GSM_SAI_POL_38):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
37	0h RO	**GSM Write Access Policy 37 (GSM_SAI_POL_37):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
36	0h RW	**GSM Write Access Policy 36 (GSM_SAI_POL_36):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
35	0h RO	**GSM Write Access Policy 35 (GSM_SAI_POL_35):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
34	0h RW	**GSM Write Access Policy 34 (GSM_SAI_POL_34):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
33	0h RW	**GSM Write Access Policy 33 (GSM_SAI_POL_33):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
32	0h RW	**GSM Write Access Policy 32 (GSM_SAI_POL_32):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
31	0h RO	**GSM Write Access Policy 31 (GSM_SAI_POL_31):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
30	1h RW	**GSM Write Access Policy 30 (GSM_SAI_POL_30):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
29	1h RW	**GSM Write Access Policy 29 (GSM_SAI_POL_29):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
28	0h RW	**GSM Write Access Policy 28 (GSM_SAI_POL_28):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
27	0h RW	**GSM Write Access Policy 27 (GSM_SAI_POL_27):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
26	0h RW	**GSM Write Access Policy 26 (GSM_SAI_POL_26):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
25	0h RW	**GSM Write Access Policy 25 (GSM_SAI_POL_25):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
24	0h RW	**GSM Write Access Policy 24 (GSM_SAI_POL_24):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
23	0h RO	**GSM Write Access Policy 23 (GSM_SAI_POL_23):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
22	0h RO	**GSM Write Access Policy 22 (GSM_SAI_POL_22):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
21	0h RW	**GSM Write Access Policy 21 (GSM_SAI_POL_21):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
20	0h RO	**GSM Write Access Policy 20 (GSM_SAI_POL_20):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
19	0h RO	**GSM Write Access Policy 19 (GSM_SAI_POL_19):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
18	0h RO	**GSM Write Access Policy 18 (GSM_SAI_POL_18):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
17	0h RW	**GSM Write Access Policy 17 (GSM_SAI_POL_17):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
16	1h RW	**GSM Write Access Policy 16 (GSM_SAI_POL_16):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
15	0h RO	**GSM Write Access Policy 15 (GSM_SAI_POL_15):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
14	0h RO	**GSM Write Access Policy 14 (GSM_SAI_POL_14):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
13	0h RW	**GSM Write Access Policy 13 (GSM_SAI_POL_13):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
12	0h RW	**GSM Write Access Policy 12 (GSM_SAI_POL_12):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO	**GSM Write Access Policy 11 (GSM_SAI_POL_11):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
10	0h RO	**GSM Write Access Policy 10 (GSM_SAI_POL_10):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
9	0h RO	**GSM Write Access Policy 9 (GSM_SAI_POL_9):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
8	1h RW	**GSM Write Access Policy 8 (GSM_SAI_POL_8):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
7	0h RW	**GSM Write Access Policy 7 (GSM_SAI_POL_7):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
6	0h RW	**GSM Write Access Policy 6 (GSM_SAI_POL_6):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
5	0h RW	**GSM Write Access Policy 5 (GSM_SAI_POL_5):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
4	0h RW	**GSM Write Access Policy 4 (GSM_SAI_POL_4):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
3	0h RW	**GSM Write Access Policy 3 (GSM_SAI_POL_3):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
2	0h RW	**GSM Write Access Policy 2 (GSM_SAI_POL_2):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
1	0h RW	**GSM Write Access Policy 1 (GSM_SAI_POL_1):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.
0	0h RO	**GSM Write Access Policy 0 (GSM_SAI_POL_0):** Bit vector used to determine which agents are allowed write access to the memory range from BGSM to TOLUD1, based on each agent's 6bit encoded SAI value.

3.399 TPM Control Policy (B_CR_TPM_CP_0_0_0_MCHBAR) — Offset 6B40h

Defines the control policy register for TPM group.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B40h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**TPM Control Policy (CTRL_POL_63):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
62	0h RW	**TPM Control Policy (CTRL_POL_62):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
61	0h RW	**TPM Control Policy (CTRL_POL_61):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
60	0h RW	**TPM Control Policy (CTRL_POL_60):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
59	0h RW	**TPM Control Policy (CTRL_POL_59):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
58	0h RW	**TPM Control Policy (CTRL_POL_58):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
57	0h RW	**TPM Control Policy (CTRL_POL_57):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
56	0h RW	**TPM Control Policy (CTRL_POL_56):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
55	0h RW	**TPM Control Policy (CTRL_POL_55):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
54	0h RW	**TPM Control Policy (CTRL_POL_54):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
53	0h RW	**TPM Control Policy (CTRL_POL_53):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
52	0h RW	**TPM Control Policy (CTRL_POL_52):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
51	0h RW	**TPM Control Policy (CTRL_POL_51):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
50	0h RW	**TPM Control Policy (CTRL_POL_50):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
49	0h RW	**TPM Control Policy (CTRL_POL_49):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
48	0h RW	**TPM Control Policy (CTRL_POL_48):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
47	0h RW	**TPM Control Policy (CTRL_POL_47):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
46	0h RW	**TPM Control Policy (CTRL_POL_46):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
45	0h RW	**TPM Control Policy (CTRL_POL_45):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
44	0h RW	**TPM Control Policy (CTRL_POL_44):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
43	1h RW	**TPM Control Policy (CTRL_POL_43):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
42	1h RW	**TPM Control Policy (CTRL_POL_42):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
41	0h RW	**TPM Control Policy (CTRL_POL_41):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
40	0h RW	**TPM Control Policy (CTRL_POL_40):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
39	0h RW	**TPM Control Policy (CTRL_POL_39):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
38	0h RW	**TPM Control Policy (CTRL_POL_38):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
37	0h RW	**TPM Control Policy (CTRL_POL_37):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
36	0h RW	**TPM Control Policy (CTRL_POL_36):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
35	0h RW	**TPM Control Policy (CTRL_POL_35):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
34	0h RW	**TPM Control Policy (CTRL_POL_34):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
33	0h RW	**TPM Control Policy (CTRL_POL_33):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
32	0h RW	**TPM Control Policy (CTRL_POL_32):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
31	0h RW	**TPM Control Policy (CTRL_POL_31):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

19	0h RW	**TPM Control Policy (CTRL_POL_19):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
18	0h RW	**TPM Control Policy (CTRL_POL_18):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
17	0h RW	**TPM Control Policy (CTRL_POL_17):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
16	1h RW	**TPM Control Policy (CTRL_POL_16):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
15	0h RW	**TPM Control Policy (CTRL_POL_15):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
14	0h RW	**TPM Control Policy (CTRL_POL_14):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
13	0h RW	**TPM Control Policy (CTRL_POL_13):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
12	0h RW	**TPM Control Policy (CTRL_POL_12):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
11	0h RW	**TPM Control Policy (CTRL_POL_11):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
10	0h RW	**TPM Control Policy (CTRL_POL_10):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
9	1h RW	**TPM Control Policy (CTRL_POL_9):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
8	0h RW	**TPM Control Policy (CTRL_POL_8):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
7	0h RW	**TPM Control Policy (CTRL_POL_7):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
6	0h RW	**TPM Control Policy (CTRL_POL_6):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**TPM Control Policy (CTRL_POL_5):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
4	0h RW	**TPM Control Policy (CTRL_POL_4):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
3	0h RW	**TPM Control Policy (CTRL_POL_3):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
2	0h RW	**TPM Control Policy (CTRL_POL_2):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
1	1h RW	**TPM Control Policy (CTRL_POL_1):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.
0	0h RW	**TPM Control Policy (CTRL_POL_0):** Bit vector used to determine which agents are allowed write access to TPM_AC register, based on each agent's 6-bit encoded SAI value.

3.400 TPM Access Control (B_CR_TPM_AC_0_0_0_MCHBAR) — Offset 6B48h

Defines the policy register that specifies who is allowed read/write access to the TPM_SELECTOR register.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B48h	C0061010202 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	C0061010202h RW	**TPM Access Policy (AC_POL):** Bit vector used to determine which agents are allowed read/write access to TPM_SELECTOR, based on each agent's 6-bit encoded SAI value.

3.401 BGSM Control Register (B_CR_BGSM_CTRL_0_0_0_MCHBAR) — Offset 6B50h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B50h	19 h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	1h RW	**RS0 Asset Classification Bit for Graphics and Data Stolen Memory (RS0_EN):** PII transactions from RS0 that hit the Graphics and Data Stolen Memory range will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the RAC/WAC policy registers and b) GSM_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
3	1h RW	**GT Implicit WB Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester depending on the setting of the IA_IWB_EN bit.
2	0h RW	**IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
1	0h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the Graphics Stolen Memory region by tracing agents.
0	1h RW	**Range Check Enable (RANGE_CHECK_EN):** Enables SAI checking for the memory range from BGSM to TOLUD-1

3.402 SMM Control Register (B_CR_BSMR_CTRL_0_0_0_MCHBAR) — Offset 6B54h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B54h	7 h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_0):** Reserved
4	0h RO	**RS0 Asset Classification Bit for SMM Region (RS0_EN):** No PII transaction is allowed access to SMM region. As such RS0 asset classification bit does not apply and hence provisioned as a readonly bit and set to 0.
3	0h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
2	1h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester depending on the setting of the GT_IWB_EN bit.
1	1h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the SMM region by tracing agents.
0	1h RW	**Range Check Enable (RANGE_CHECK_EN):** Enables SAI checking for the SMM memory range: TSEGMB to BGSM.

3.403 Default VTd Control Register (B_CR_BDEFVTDPMR_CTRL_0_0_0_MCHBAR) — Offset 6B58h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B58h	1C h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED_1):** Reserved
4	1h RW	**RS0 Asset Classification Bit for the High and Low VTd PMRs (RS0_EN):** PII transactions from RS0 that hit VTd PMR high and low memory ranges will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the RAC/WAC policy registers and b) VTDPMR_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
3	1h RW	**GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requester. When set to 0, inhibits HITM data from GT from being returned to the requester. HITM data from IA cores may be returned to the requester, depending on the setting of the IA_IWB_EN bit.
2	1h RW	**IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requester. When set to 0, inhibits HITM data from IA cores from being returned to the requester. HITM data from GT may be returned to the requester, depending on the setting of the GT_IWB_EN bit.
1	0h RW	**Trace Enable (TRACE_EN):** Enables snooping of transactions to the Default VTd PHM and PLM regions by tracing agents.
0	0h RO	**Reserved (RESERVED_0):** Reserved

3.404 MOT Trigger Trace Control (B_CR_MOT_TRIG_TRACE_CTRL_0_0_0_MCHBAR) — Offset 6B7Ch

This register is the global MOT enable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B7Ch	E0000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Eh RW	**Flush Timer Period (FLUSH_TIMER_PERIOD):** Specifies the duration of the periodic MOT flush timer. Duration is 2^N cycles of a 19.2 MHz clock, where N is the value specified in the field.
27	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/V	**Sticky Trigger 1 Match (STICKY_TRIGGER_1_MATCH):** 1 indicates Trigger 1 match. Cleared by powergood or explicit SW write.
25	0h RW/V	**Sticky Trigger 0 Match (STICKY_TRIGGER_0_MATCH):** 1 indicates Trigger 0 match. Cleared by powergood or explicit SW write.
24	0h RW/V	**Sticky Filter 1 Match (STICKY_FILTER_1_MATCH):** 1 indicates Filter 1 match. Cleared by powergood or explicit SW write.
23	0h RW/V	**Sticky Filter 0 Match (STICKY_FILTER_0_MATCH):** 1 indicates Filter 0 match. Cleared by powergood or explicit SW write.
22	0h RW/V	**MOT Storage Active (MOT_STORAGE_ACTIVE):** Current status of MOT storage to memory. Used to save/restore trigger state across power states.
21:16	0h RW	**MOT Trace Storage Stop Source (MOT_TRACE_STORAGE_STOP_SOURCE):** A bit field allowing multiple triggers to result in a trace storage stop. Storage stop is the logical OR of trigger sources selected. Note that selecting the same trigger to start and stop trace storage results in start trace storage only. • Bit position 5: External Trigger in 1 • Bit position 4: External Trigger in 0 • Bit position 3: MOT Trigger 1 • Bit position 2: MOT Trigger 0 • Bit position 1: MOT Filter 1 match • Bit position 0: MOT Filter 0 match
15:10	0h RW	**MOT Trace Storage Start Source (MOT_TRACE_STORAGE_START_SOURCE):** A bit field allowing multiple triggers to result in a trace storage start. Storage stop is the logical OR of trigger sources selected. Note that selecting the same trigger to start and stop trace storage results in start trace storage only. For bit positions, see description for MOT_TRACE_STORAGE_STOP_SOURCE field.
9	0h RW	**Enable External Trigger in 1 (ENABLE_EXTERNAL_TRIGGER_IN_1):** • 1 to enable external trigger 1 to MOT from rdu_mid • 0 to disable external trigger 1 to MOT from rdu_mid
8	0h RW	**Enable External Trigger in 0 (ENABLE_EXTERNAL_TRIGGER_IN_0):** • 1 to enable external trigger 0 to MOT from rdu_mid • 0 to disable external trigger 0 to MOT from rdu_mid
7:6	0h RW	**Trigger Out Source (TRIGGER_OUT_SOURCE):** Select source of trigger sent to rdu_mid. • 00b: Filter 0 • 01b: Filter 1 • 10b: Trigger 0 • 11b: Trigger 1
5	0h RW	**Enable External Trigger Out 0 (ENABLE_EXTERNAL_TRIGGER_OUT_0):** • 1: enable external trigger out to from MOT to rdu_mid • 0: disable external trigger out to from MOT to rdu_mid
4	0h RW	**Enable MOT Trigger 1 (ENABLE_MOT_TRIGGER_1):** • 1: enable MOT trigger 1 • 0: disable MOT trigger 1
3	0h RW	**Enable MOT Trigger 0 (ENABLE_MOT_TRIGGER_0):** • 1: enable MOT trigger 0 • 0: disable MOT trigger 0
2	0h RW	**Enable MOT Filter 1 (ENABLE_MOT_FILTER_1):** • 1: enable MOT filter 1 • 0: disable MOT filter 1

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Enable MOT Filter 0 (ENABLE_MOT_FILTER_0):** • 1: enable MOT filter 0 • 0: disable MOT filter 0
0	0h RW	**Global MOT Enable (ENABLE_MOT):** • 1: enable MOT • 0: disable MOT

3.405 MOT Slice 0 Memory Pointer (B_CR_MOT_SLICE_0_MEM_PTR_0_0_0_MCHBAR) — Offset 6B80h

This register contains the memory address pointer used to determine where the MOT slice 0 cache lines are stored. On a write, the B-Unit logic will set itself to the value of the write Extraction of memory contents is performed as reads. On a read, the data returned should match the current value of the pointer reflecting incrementing updates from cache lines that have been stored. It also pins MOT to near or far memory.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B80h	2 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:6	0h RW/V	**MOT Memory Pointer (MOT_MEMORY_POINTER):** The current pointer into MOT slice 0 region. Cache line granularity bits [38:6].
5:2	0h RO	**Reserved (RESERVED_1):** Reserved
1	1h RW	**Near or Far Memory (NEAR_OR_FAR_MEMORY):** Pin MOT slice 0 to near1 or far0 memory. This logic is implemented in the 2LM. Thus, this register bit is shadowed in its entirety in the 2LM. Unused by MOT.
0	0h RW/V	**MOT Buffer Wrap (MOT_BUFFER_WRAP):** Indication that the MOT slice 0 buffer has wrapped since the last clear of this write cleared by power good or explicit SW write.

3.406 MOT Slice 1 Memory Pointer (B_CR_MOT_SLICE_1_MEM_PTR_0_0_0_MCHBAR) — Offset 6B88h

This register contains the memory address pointer used to determine where the MOT slice 1 cache lines are stored. On a write, the B-Unit logic will set itself to the value of the write. Extraction of memory contents are performed as reads. On a read, the data returned should match the current value of the pointer, reflecting incrementing updates from cache lines that have been stored. It also pins MOT to near or far memory.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6B88h	2 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:6	0h RW/V	**MOT Memory Pointer (MOT_MEMORY_POINTER):** The current pointer into MOT slice 1 region. Cache line granularity bits [38:6].
5:2	0h RO	**Reserved (RESERVED_1):** Reserved
1	1h RW	**Near or Far Memory (NEAR_OR_FAR_MEMORY):** Pin MOT slice 1 to near1 or far0 memory. This logic is implemented in the 2LM. Thus, this register is shadowed in its entirety in the 2LM.
0	0h RW/V	**MOT Buffer Wrap (MOT_BUFFER_WRAP):** Indication that the MOT slice 1 buffer has wrapped since the last clear of this write cleared by power good or explicit SW write.

3.407 MOT Slice 0 Record ID (B_CR_MOT_SLICE_0_RECORD_ID_0_0_0_MCHBAR) — Offset 6B90h

This register contains the unique MOT record ID and start trace indication for slice 0. This state needs to be stored in a CR to allow it to persist across autoPG and s0ix transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED_0):** Reserved
26	0h RW/V	**First Packet Captured (FIRST_PKT_CAPTURED):** Indicates that MOT has captured the first data packet after tracing started.
25:0	0h RW/V	**Record ID (RECORD_ID):** The current MOT unique record ID number.

3.408 MOT Slice 1 Record ID (B_CR_MOT_SLICE_1_RECORD_ID_0_0_0_MCHBAR) — Offset 6B94h

This register contains the unique MOT record ID and start trace indication for slice 0. This state needs to be stored in a CR to allow it to persist across autoPG and s0ix transitions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6B94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED_0):** Reserved
26	0h RW/V	**First Packet Captured (FIRST_PKT_CAPTURED):** Indicates that MOT has captured the first data packet after tracing started.
25:0	0h RW/V	**Record ID (RECORD_ID):** The current MOT unique record ID number.

3.409 MOT Filter Match 0 (B_CR_MOT_FILTER_MATCH0_0_0_0_MCHBAR) — Offset 6BA0h

This register contains the value of the MOT 0 access filter Match address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BA0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	0h RW	**MOT 0 Filter Match Address (MOT_0_FILTER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.410 MOT Filter Mask (B_CR_MOT_FILTER_MASK0_0_0_0_MCHBAR) — Offset 6BA8h

This register contains the value of the MOT 0 access filter Mask address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BA8h	7FFFFFFFE0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	3FFFFFFFFh RW	**MOT 0 Filter Mask Address (MOT_0_FILTER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.411 MOT Filter Match 1 (B_CR_MOT_FILTER_MATCH1_0_0_0_MCHBAR) — Offset 6BB0h

This register contains the value of the MOT 1 access filter Match address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BB0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	0h RW	**MOT 1 Filter Match Address (MOT_1_FILTER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.412 MOT Filter Mask 1 (B_CR_MOT_FILTER_MASK1_0_0_0_MCHBAR) — Offset 6BB8h

This register contains the value of the MOT 1 access filter Mask address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BB8h	7FFFFFFFE0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	3FFFFFFFFh RW	**MOT 1 Filter Mask Address (MOT_1_FILTER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.

Bit Range	Default & Access	Field Name (ID): Description
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.413 MOT Filter Misc 0 (B_CR_MOT_FILTER_MISC0_0_0_0_MCHBAR) — Offset 6BC0h

This register contains the value of the MOT 0 access filter Match/Mask Agent LPID.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BC0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0):** Reserved
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: Match • 0: Ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Filter Match Polarity (FILTER_MATCH_POLARITY):** • 1: Filter inversion • 0: Match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: Match writes • 0: Match reads

3.414 MOT Filter Misc 1 (B_CR_MOT_FILTER_MISC1_0_0_0_MCHBAR) — Offset 6BC8h

This register contains the value of the MOT 1 access filter Match/Mask Agent LPID.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BC8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0):** Reserved
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: Match • 0: Ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Filter Match Polarity (FILTER_MATCH_POLARITY):** • 1: Filter inversion • 0: Match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: Match writes • 0: Match reads

3.415 MOT Trigger Match 0 (B_CR_MOT_TRIGGER_MATCH0_0_0_0_MCHBAR) — Offset 6BD0h

This register contains the value of the MOT 0 access trigger Match address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BD0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	0h RW	**MOT 0 Trigger Match Address (MOT_0_TRIGGER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.416 MOT Trigger Mask 0 (B_CR_MOT_TRIGGER_MASK0_0_0_0_MCHBAR) — Offset 6BD8h

This register contains the value of the MOT 0 access trigger Mask address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BD8h	7FFFFFFFE0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	3FFFFFFFFh RW	**MOT 0 Trigger Mask Address (MOT_0_TRIGGER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.417 MOT Trigger Match 1 (B_CR_MOT_TRIGGER_MATCH1_0_0_0_MCHBAR) — Offset 6BE0h

This register contains the value of the MOT 1 access trigger Match address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BE0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	0h RW	**MOT1 Trigger Match Address (MOT_1_TRIGGER_MATCH_ADDRESS):** Access address to match. Match results in trace of access. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.418 MOT Trigger Mask 1 (B_CR_MOT_TRIGGER_MASK1_0_0_0_MCHBAR) — Offset 6BE8h

This register contains the value of the MOT 1 access trigger Mask address.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BE8h	7FFFFFFFE0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:5	3FFFFFFFFh RW	**MOT 1 Trigger Mask Address (MOT_1_TRIGGER_MASK_ADDRESS):** Access address bits to mask. A value of 1 ignores the corresponding address bit. Half cache line granularity bits 38:5 to support legacy devices.
4:0	0h RO	**Reserved (RESERVED_1):** Reserved

3.419 MOT Trigger Misc 0 (B_CR_MOT_TRIGGER_MISC0_0_0_0_MCHBAR) — Offset 6BF0h

This register contains the value of the MOT 0 access trigger Match/Mask Agent LPID.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BF0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0):** Reserved
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: Match • 0: Ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Filter Match Polarity (FILTER_MATCH_POLARITY):** • 1: Filter inversion • 0: Match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: Match writes • 0: Match reads

3.420 MOT Trigger Misc 1 (B_CR_MOT_TRIGGER_MISC1_0_0_0_MCHBAR) — Offset 6BF8h

This register contains the value of the MOT 1 access trigger Match/Mask Agent LPID.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6BF8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	**Reserved (RESERVED_0):** Reserved
34:19	0h RW	**IA Core Match (IA_CORE_MATCH):** Match if transaction originated from one of up to 16 IA cores (one bit per logical processor).
18	0h RW	**GT Match (GT_MATCH):** • 1: Match • 0: Ignore
17:2	0h RW	**VC Match (VC_MATCH):** Match if transaction originated from one of up to 16 virtual channel cores (one bit per VC).
1	0h RW	**Filter Match Polarity (FILTER_MATCH_POLARITY):** • 1: Filter inversion • 0: Match criteria
0	0h RW	**Access Type -- Match Read or Write (ACCESS_TYPE_MATCH_READ_OR_WRITE):** • 1: Match writes • 0: Match reads

3.421 MOT PSMI Sync (B_CR_MOT_PSMI_SYNC_0_0_0_MCHBAR) — Offset 6C00h

This register is used for PSMI sync.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C00h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RESERVED_0):** Reserved
1	0h RW/V	**PSMI Sync 1 (PSMI_SYNC1):** Set by PSMI microcode. Once set, cleared by HW after creation of first MOT record in Slice1.
0	0h RW/V	**PSMI Sync 0 (PSMI_SYNC0):** Set by PSMI microcode. Once set, cleared by HW after creation of first MOT record in Slice0.

3.422 B_CR_BIOSWR_CP (B_CR_BIOSWR_CP_0_0_0_MCHBAR) — Offset 6C08h

This register specifies the control policy for the BIOSWR security policy group. It controls write access to the Read Access Policy BIOSWR_RAC, Write Access Policy BIOSWR_WAC configuration registers, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C08h	40001000202 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_63):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
62	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_62):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
61	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_61):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
60	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_60):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
59	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_59):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
58	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_58):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
57	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_57):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
56	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_56):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
55	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_55):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
54	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_54):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
53	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_53):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
52	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_52):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
51	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_51):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
50	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_50):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
49	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_49):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
48	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_48):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
47	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_47):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
46	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_46):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
45	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_45):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
44	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_44):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
43	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_43):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
42	1h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_42):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
41	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_41):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
40	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_40):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
39	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_39):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
38	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_38):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
37	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_37):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
36	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_36):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
35	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_35):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
34	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_34):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
33	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_33):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
32	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_32):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
31	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_31):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
30	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_30):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
29	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_29):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_28):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
27	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_27):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
26	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_26):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
25	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_25):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
24	1h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_24):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
23	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_23):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
22	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_22):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
21	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_21):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
20	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_20):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
19	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_19):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
18	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_18):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
17	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_17):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
16	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_16):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
15	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_15):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
14	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_14):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
13	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_13):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
12	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_12):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
11	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_11):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
10	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_10):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_9):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
8	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_8):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
7	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_7):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
6	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_6):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
5	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_5):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
4	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_4):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
3	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_3):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
2	0h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_2):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
1	1h RW	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_1):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.
0	0h RO	**Memory Range Control Policy (MEM_RANGE_CTRL_POL_0):** Bit vector used to determine which agents are allowed write access to the BIOSWR_RAC, BIOSWR_WAC, and BIOSWR_CP registers, based on the value from each agent's 6bit SAI field.

3.423 BIOSWR Read Access Policy (B_CR_BIOSWR_RAC_0_0_0_MCHBAR) — Offset 6C10h

This register configures the Read Access Policy for the BIOSWR security policy group. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C10h	80000C0063 0D0217 h

Bit Range	Default & Access	Field Name (ID): Description
63	1h RW	**Memory Range Policy (MEM_RANGE_POL_63):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
62	0h RW	**Memory Range Policy (MEM_RANGE_POL_62):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
61	0h RW	**Memory Range Policy (MEM_RANGE_POL_61):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RW	**Memory Range Policy (MEM_RANGE_POL_60):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
59	0h RW	**Memory Range Policy (MEM_RANGE_POL_59):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
58	0h RW	**Memory Range Policy (MEM_RANGE_POL_58):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
57	0h RW	**Memory Range Policy (MEM_RANGE_POL_57):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
56	0h RW	**Memory Range Policy (MEM_RANGE_POL_56):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
55	0h RW	**Memory Range Policy (MEM_RANGE_POL_55):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
54	0h RW	**Memory Range Policy (MEM_RANGE_POL_54):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
53	0h RW	**Memory Range Policy (MEM_RANGE_POL_53):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
52	0h RW	**Memory Range Policy (MEM_RANGE_POL_52):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
51	0h RW	**Memory Range Policy (MEM_RANGE_POL_51):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
50	0h RW	**Memory Range Policy (MEM_RANGE_POL_50):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
49	0h RW	**Memory Range Policy (MEM_RANGE_POL_49):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
48	0h RW	**Memory Range Policy (MEM_RANGE_POL_48):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
47	0h RW	**Memory Range Policy (MEM_RANGE_POL_47):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
46	0h RW	**Memory Range Policy (MEM_RANGE_POL_46):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
45	0h RW	**Memory Range Policy (MEM_RANGE_POL_45):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
44	0h RW	**Memory Range Policy (MEM_RANGE_POL_44):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
43	1h RW	**Memory Range Policy (MEM_RANGE_POL_43):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
42	1h RW	**Memory Range Policy (MEM_RANGE_POL_42):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
41	0h RW	**Memory Range Policy (MEM_RANGE_POL_41):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
40	0h RW	**Memory Range Policy (MEM_RANGE_POL_40):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
39	0h RW	**Memory Range Policy (MEM_RANGE_POL_39):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
38	0h RW	**Memory Range Policy (MEM_RANGE_POL_38):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
37	0h RW	**Memory Range Policy (MEM_RANGE_POL_37):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
36	0h RW	**Memory Range Policy (MEM_RANGE_POL_36):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
35	0h RW	**Memory Range Policy (MEM_RANGE_POL_35):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.
34	0h RW	**Memory Range Policy (MEM_RANGE_POL_34):** Bit vector used to determine which agents are allowed read access, based on each agent's 6bit encoded SAI value.

3.424 B_CR_BIOSWR_WAC (B_CR_BIOSWR_WAC_0_0_0_MCHBAR) — Offset 6C18h

This register configures the Write Access Policy for the BIOSWR security policy group. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C18h	400010C0212 h

3.425 Destination Override for BIOS1 region (B_CR_BIOS1_DECODE_OVERRIDE_0_0_0_MCHBAR) — Offset 6C20h

Specifies the controls to steer BIOS1 region to an alternate destination instead of the CSE when secure boot mode is enabled

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RESERVED_0):** Reserved
3:0	0h RW	**OVERRIDE:** Bit 0: When set overrides CSE SRAM destination. Bits 3:1 reserved.

3.426 TPM Selector (B_CR_TPM_SELECTOR_0_0_0_MCHBAR) — Offset 6C24h

Specifies where the TPM lives in the platform. B-Unit uses this register to source decode for requests whose addresses fall within the fixed address range for the TPM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RESERVED_0):** Reserved
1:0	0h RW	**TPM Selector (TPM_SELECTOR):** • 0h: fTPM enabled. Target of TPM accesses is the CSE. • 1h: SPI TPM enabled. Target of TPM accesses is SPI. • 2h: LPC TPM enabled. Target of TPM accesses is LPC. • 3h: All TPMs disabled. Target of TPM accesses is the PSF Error Handler.

3.427 B-Unit Pcode/Ucode Write, All Read Control Policy Register (B_CR_P_U_CODEWR_ALLRD_CP_0_0_0_MCHBAR) — Offset 6C28h

This register controls the access policy to the Read Access Policy P_U_CODEWR_ALLRD_RAC and Write Access Policy P_U_CODEWR_ALLRD_WAC configuration registers, and self-referentially to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C28h	4000100020 2 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_63):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
62	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_62):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
61	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_61):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
60	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_60):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
59	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_59):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
58	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_58):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
57	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_57):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
56	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_56):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
55	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_55):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
54	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_54):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
53	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_53):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
52	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_52):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
51	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_51):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
50	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_50):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
49	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_49):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
48	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_48):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
47	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_47):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
46	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_46):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
45	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_45):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
44	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_44):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
43	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_43):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
42	1h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_42):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
41	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_41):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
40	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_40):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
39	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_39):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
38	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_38):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
37	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_37):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
36	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_36):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
35	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_35):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
34	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_34):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
33	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_33):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
32	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_32):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
31	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_31):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_30):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
29	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_29):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
28	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_28):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
27	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_27):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
26	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_26):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
25	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_25):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
24	1h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_24):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
23	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_23):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
22	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_22):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
21	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_21):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
20	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_20):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
19	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_19):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
18	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_18):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
17	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_17):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
16	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_16):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_15):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
14	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_14):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
13	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_13):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
12	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_12):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
11	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_11):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
10	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_10):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
9	1h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_9):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
8	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_8):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
7	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_7):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
6	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_6):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
5	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_5):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
4	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_4):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
3	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_3):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
2	0h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_2):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.
1	1h RW	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_1):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**B-Unit Pcode/Ucode Write, All Read Control Policy (IA_CTRL_POL_0):** Bit vector used to determine which agents are allowed access to the P_U_CODEWR_ALLRD_RAC, P_U_CODEWR_ALLRD_WAC, and P_U_CODEWR_ALLRD_CP registers, based on the value from the agent's 6bit SAI field.

3.428 B-Unit Pcode/Ucode Read Access Policy (B_CR_P_U_CODEWR_ALLRD_RAC_0_0_0_MCHBAR) — Offset 6C30h

This register configures the Read Access Policy for the B-Unit Pcode/Ucode Write, All Read registers.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C30h	FFFFFFFFFFFFFFD7 h

Bit Range	Default & Access	Field Name (ID): Description
63	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_63):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
62	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_62):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
61	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_61):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
60	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_60):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
59	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_59):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
58	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_58):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
57	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_57):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
56	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_56):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
55	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_55):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
54	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_54):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
53	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_53):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
52	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_52):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
51	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_51):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
50	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_50):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
49	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_49):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
48	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_48):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
47	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_47):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
46	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_46):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
45	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_45):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
44	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_44):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
43	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_43):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
42	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_42):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
41	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_41):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
40	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_40):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
39	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_39):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
38	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_38):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
37	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_37):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
36	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_36):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
35	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_35):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
34	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_34):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
33	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_33):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
32	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_32):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
31	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_31):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
30	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_30):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
29	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_29):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
28	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_28):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
27	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_27):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
26	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_26):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
25	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_25):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
24	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_24):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
23	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_23):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
22	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_22):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
21	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_21):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
20	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_20):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
19	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_19):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
18	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_18):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
17	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_17):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
16	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_16):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
15	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_15):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
14	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_14):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
13	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_13):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
12	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_12):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
11	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_11):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
10	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_10):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
9	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_9):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
8	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_8):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
7	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_7):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
6	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_6):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
5	0h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_5):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
4	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_4):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
3	0h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_3):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
2	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_2):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
1	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_1):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.
0	1h RO	**B-Unit Pcode/Ucode Write, All Read SAI Read Access Policy (IA_SAI_POL_0):** Bit vector used to determine which agents are allowed read access to the B-Unit Pcode/Ucode Write, All Read policy registers, based on each agent's 6bit encoded SAI value.

3.429 B-Unit Pcode/Ucode Write Access Policy (B_CR_P_U_CODEWR_ALLRD_WAC_0_0_0_MCHBAR) — Offset 6C38h

This register configures the Write Access Policy for the B-Unit Pcode/Ucode Write, All Read policy registers. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C38h	4000100020 2 h

3.430 Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR) — Offset 6C80h

BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0h RO	**Reserved (RESERVED_0):** Reserved
39	0h RO	**DEFVTDBAR 40 Bit (DEFVTDBAR_40_BIT):** Reserved for future growth to 40bit addressing in uServer.
38:12	0h RW	**Default IOMMU VTd Config Space Base (DEFVTDBAR):** If DEFVTDBAR is enabled, this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the default VTd IOMMU register set. If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12] the request targets the Default VTd BAR.
11:2	0h RO	**Reserved (RESERVED_1):** Reserved
1	0h RW	**LOCK:** Locks the contents of the register including itself. Unused by the B-Unit, and does not implement the intended lock functionality. B-Unit includes this bit to support shadow copies of the register that rely on this lock bit.
0	0h RW/L	**DEFVTDBAR Enable (DEFVTDBAREN):** • 0: DEFVTDBAR is disabled and does not claim any memory • 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

3.431 Gfx VTd BAR (B_CR_GFXVTDBAR_0_0_0_MCHBAR) — Offset 6C88h

BIOS must write GFXVTDBAR and then immediately follow it up with read of DEVEN_0_0_0_PCI, then write (with value from read operation) to DEVEN_0_0_0_PCI to ensure that all copies of GFXVTDBAR in the system are updated.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6C88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_0):** Reserved
38:12	0h RW	**GFXVT Base Address (GFXVTBAR):** This field corresponds to bits 38 to 12 of the base address GFXVT configuration space. BIOS will program this register, resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFXVT register set. If GFXVTBAR is enabled and incoming Request Address[38:12] matches GFXVTBAR[38:12] the request targets the Gfx VTd BAR.
11:2	0h RO	**Reserved (RESERVED_1):** Reserved
1	0h RW	**LOCK:** Locks the contents of the register, including itself. Unused by the B-Unit, and does not implement the intended lock functionality. B-Unit includes this bit to support shadow copies of the register that rely on this lock bit.
0	0h RW/L	**GFXVTBAR Enable (GFXVTBAREN):** • 0: GFXVTBAR is disabled and does not claim any memory. • 1: GFXVTBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

3.432 B-Unit Lites Group 0 Control (B_CR_LITES0_CTL_0_0_0_MCHBAR) — Offset 6C90h

This register controls the functionality of the B-Unit Lites Group 0 mask/match functionality.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 0. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 0. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: Mask/Match hits enabled only for Slice0 • 10: Mask/match hits enabled only for Slice1 • 11: Mask/Match hits enabled for both Slices
7:4	0h RW	**DWord Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 0.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 0.
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/ mask, opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 0. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch, PMI datain for each PMI channel for read data, PMI dataout for each PMI channel for writes, data write from requesters to BRAM in each slice, and read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point, all match criteria for that point must be satisfied.

3.433 B-Unit Lites Group 0 Opcode Match Filter (B_CR_LITES0_OPCODE_MATCH_0_0_0_MCHBAR) — Offset 6C94h

This register contains the IDI and PII opcodes that will enable a Lites Group0 opcode match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points, Badmit in both slices and the U2C request interface, use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and, when clear, will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_PicletReplay • Bit 26: C2U_Req_PRd,U2C_Req_VLW_PicletReplay • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_PicletReplay • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_PicletReplay • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI_noPicletReplay • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI_noPicletReplay • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite_noPicletReplay • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW_noPicletReplay • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI_noPicletReplay • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI_noPicletReplay

3.434 B-Unit Lites Group 0 Agent Match Filter (B_CR_LITES0_AGENT_MATCH_0_0_0_MCHBAR) — Offset 6C98h

This register designates which agents are enabled to trigger a Lites Group0 AgentID match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI transactions from GT for Lites Group0. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions for Lites Group0. Each bit, when set, enables a match for a transaction originating from that VC. When clear, suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions for Lites Group 0. Each bit, when set, enables a match for a transaction originating from that core. When clear, suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

3.435 B-Unit Lites Group 0 U2C IntData Match Filter (B_CR_LITES0_U2CINTDATA_MATCH_0_0_0_MCHBAR) — Offset 6C9Ch

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6C9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Mask for U2C Request IntData[15:0] (INTDATA_MASK):** This mask is for generating Lites Group 0 U2C request alternative view match. If the mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH register must match the corresponding u2c request IntData bit for a match.
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:0] value is compared with this field to generate a match for the U2C request address match.

3.436 B-Unit Lites Group 0 Address Match Filter LITES0_ADDR_MATCH (B_CR_LITES0_ADDR_MATCH_0_0_0_MCHBAR) — Offset 6CA0h

This register, together with the LITES0_ADDR_MASK register, specifies the request address values that trigger a Lites Group 0 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6CA0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.437 B-Unit Lites Group 0 Address Mask Filter LITES0_ADDR_MASK

(B_CR_LITES0_ADDR_MASK_0_0_0_MCHBAR) — Offset 6CA8h

This register, together with the LITES0_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 0 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6CA8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.438 B-Unit Lites Group 0 Data Match Filter LITES0_DATA_MATCH (B_CR_LITES0_DATA_MATCH_0_0_0_MCHBAR) — Offset 6CB0h

This register, together with LITES0_DATA_MASK, specifies the data values that will trigger a Lites Group 0 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 0 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CB0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites.

3.439 B-Unit Lites Group 0 Data Mask Filter LITES0_DATA_MASK (B_CR_LITES0_DATA_MASK_0_0_0_MCHBAR) — Offset 6CB4h

This register, together with LITES0_DATA_MATCH, specifies the data values that will trigger a Lites Group 0 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 0 data match/mask registers for generating a Group 0 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CB4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

3.440 B-Unit Lites Group 1 Control (B_CR_LITES1_CTL_0_0_0_MCHBAR) — Offset 6CC0h

This register controls the B-Unit Lites Group 1 mask/match functionality.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CC0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 1. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 1. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: mask/match hits enabled only for Slice0 • 10: mask/match hits enabled only for Slice1 • 11: mask/match hits enabled for both Slices
7:4	0h RW	**DWord Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 1.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 1.
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/mask opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 1. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch, PMI datain for each PMI channel for read data, PMI dataout for each PMI channel for writes, data write from requesters to BRAM in each slice, and read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point, all match criteria for that point must be satisfied.

3.441 B-Unit Lites Group 1 Opcode Match Filter (B_CR_LITES1_OPCODE_MATCH_0_0_0_MCHBAR) — Offset 6CC4h

This register contains the IDI and PII opcodes that will enable a Lites Group1 opcode match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CC4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_PicletReplay • Bit 26: C2U_Req_PRd,U2C_Req_VLW_PicletReplay • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_PicletReplay • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_PicletReplay • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI_noPicletReplay • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI_noPicletReplay • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite_noPicletReplay • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW_noPicletReplay • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI_noPicletReplay • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI_noPicletReplay

3.442 B-Unit Lites Group 1 Agent Match Filter (B_CR_LITES1_AGENT_MATCH_0_0_0_MCHBAR) — Offset 6CC8h

This register designates which agents are enabled to trigger a Lites Group1 AgentID match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CC8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI transactions from GT for Lites Group1. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions for Lites Group1. Each bit, when set, enables a match for a transaction originating from that VC. When clear, each bit suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions, for Lites Group 1. Each bit, when set, enables a match for a transaction originating from that core. When clear, each bit suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

3.443 B-Unit Lites Group 1 U2C IntData Match Filter (B_CR_LITES1_U2CINTDATA_MATCH_0_0_0_MCHBAR) — Offset 6CCCh

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CCCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** Mask for U2C Request IntData[15:0] for generating Lites Group 1 U2C request alternative view match. If the mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH register must match the corresponding u2c request IntData bit for a match.
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:0] value is compared with this field to generate a match for the U2C request address match.

3.444 B-Unit Lites Group 1 Address Match Filter LITES1_ADDR_MATCH (B_CR_LITES1_ADDR_MATCH_0_0_0_MCHBAR) — Offset 6CD0h

This register, together with the LITES1_ADDR_MASK register, specifies the request address values that trigger a Lites Group 1 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6CD0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.445 B-Unit Lites Group 1 Address Mask Filter LITES1_ADDR_MASK

(B_CR_LITES1_ADDR_MASK_0_0_0_MCHBAR) — Offset 6CD8h

This register, together with the LITES1_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 1 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6CD8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.446 B-Unit Lites Group 1 Data Match Filter LITES1_DATA_MATCH (B_CR_LITES1_DATA_MATCH_0_0_0_MCHBAR) — Offset 6CE0h

This register, together with LITES1_DATA_MASK, specifies the data values that will trigger a Lites Group 1 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 1 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CE0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites.

3.447 B-Unit Lites Group 1 Data Mask Filter LITES1_DATA_MASK (B_CR_LITES1_DATA_MASK_0_0_0_MCHBAR) — Offset 6CE4h

This register, together with LITES1_DATA_MATCH, specifies the data values that will trigger a Lites Group 1 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 1 data match/mask registers for generating a Group 1 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CE4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

3.448 B-Unit Lites Group 2 Control (B_CR_LITES2_CTL_0_0_0_MCHBAR) — Offset 6CF0h

This register controls the functionality of the B-Unit Lites Group 2 mask/match functionality.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CF0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 2. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 2. Each bit, when set to 1, enables length match for the PII request. • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: Mask/Match hits enabled only for Slice0 • 10: Mask/match hits enabled only for Slice1 • 11: Mask/Match hits enabled for both Slices
7:4	0h RW	**Dword Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 2.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 2.
2	0h RW	**Alternname UC2 Request View (ALTU2CREQVIEW):** When set, address match/ mask opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set, inverts the polarity of the address match/mask logic, i.e., reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 2. The following are the observation points that contain match filters: Badmit logic within each slice after a transaction is successfully admitted into the B-Unit, U2C request launch PMI datain for each PMI channel read data, PMI dataout for each PMI channel write data, agent data write to BRAM in each slice, read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point all match criteria for that point must be satisfied.

3.449 B-Unit Lites Group 2 Opcode Match Filter (B_CR_LITES2_OPCODE_MATCH_0_0_0_MCHBAR) — Offset 6CF4h

This register contains the IDI and PII opcodes that will enable a Lites Group2 opcode match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CF4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_PicletReplay • Bit 26: C2U_Req_PRd,U2C_Req_VLW_PicletReplay • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_PicletReplay • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_PicletReplay • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI_noPicletReplay • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI_noPicletReplay • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite_noPicletReplay • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW_noPicletReplay • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI_noPicletReplay • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI_noPicletReplay

3.450 B-Unit Lites Group 2 Agent Match Filter (B_CR_LITES2_AGENT_MATCH_0_0_0_MCHBAR) — Offset 6CF8h

This register designates which agents are enabled to trigger a Lites Group2 AgentID match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CF8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI ransactions from GT for Lites Group2. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID, for PII transactions for Lites Group2. Each bit, when set, enables a match for a transaction originating from that VC. When clear, suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions for Lites Group 2. Each bit, when set, enables a match for a transaction originating from that core. When clear, suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

3.451 B-Unit Lites Group 2 U2C IntData Match Filter (B_CR_LITES2_U2CINTDATA_MATCH_0_0_0_MCHBAR) — Offset 6CFCh

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6CFCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** Mask for U2C Request IntData[15:0] for generating Lites Group 2 U2C request alternative view match. If the mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH register must match the corresponding u2c request IntData bit for a match.
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:0] value is compared with this field to generate a match for the U2C request address match.

3.452 B-Unit Lites Group 2 Address Match Filter LITES2_ADDR_MATCH (B_CR_LITES2_ADDR_MATCH_0_0_0_MCHBAR) — Offset 6D00h

This register, together with the LITES2_ADDR_MASK register, specifies the request address values that trigger a Lites Group 2 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6D00h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.453 B-Unit Lites Group 2 Address Mask Filter LITES2_ADDR_MASK

(B_CR_LITES2_ADDR_MASK_0_0_0_MCHBAR) — Offset 6D08h

This register, together with the LITES2_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 2 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6D08h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.454 B-Unit Lites Group 2 Data Match Filter LITES2_DATA_MATCH (B_CR_LITES2_DATA_MATCH_0_0_0_MCHBAR) — Offset 6D10h

This register, together with LITES2_DATA_MASK, specifies the data values that will trigger a Lites Group 2 data filter match. All data observation points PMI data in PMI data out read data to agent both live and nonlive and write data from agent use the same Group 2 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Match (DATA_MATCH):** Data value to match for Lites

3.455 B-Unit Lites Group 2 Data Mask Filter LITES2_DATA_MASK (B_CR_LITES2_DATA_MASK_0_0_0_MCHBAR) — Offset 6D14h

This register, together with LITES2_DATA_MATCH, specifies the data values that will trigger a Lites Group 2 data filter match for Lites. All data observation points PMI data in PMI data out read data to agent both live and nonlive and write data from agent use the same Group 2 data match/mask registers for generating a Group 2 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

3.456 B-Unit Lites Group 3 Control (B_CR_LITES3_CTL_0_0_0_MCHBAR) — Offset 6D20h

This register controls the functionality of the B-Unit Lites Group 3 mask/match functionality.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**IDI Length Match (IDI_LENGTH_MATCH):** Enables length matching for IDI requests for Lites Group 3. Each bit, when set to 1, enables match for that length for an IDI request. Lites logic supports only lengths 0-16B for PRd and PortIn and only 64B for all other opcodes. • Bit 31:64B • Bit 30:16B • Bit 29:15B • Bit 28:14B • Bit 27:13B • Bit 26:12B • Bit 25:11B • Bit 24:10B • Bit 23:9B • Bit 22:8B • Bit 21:7B • Bit 20:6B • Bit 19:5B • Bit 18:4B • Bit 17:3B • Bit 16:2B • Bit 15:1B • Bit 14:0B
13:12	0h RW	**PII Length Match (PII_LENGTH_MATCH):** Enables length matching for PII requests for Lites Group 3. Each bit, when set to 1, enables length match for the PII request: • Bit 13:64B • Bit 12:32B
11:10	0h RO	**Reserved (RESERVED_0):** Reserved
9:8	0h RW	**Slice Match (SLICE_MATCH):** • 00: All mask/match hits are suppressed • 01: Mask/match hits enabled only for Slice0 • 10: Mask/match hits enabled only for Slice1 • 11: Mask/match hits enabled for both Slices
7:4	0h RW	**Dword Select (DWORD_SELECT):** Selects the dword within the 512bit data field that is compared for data mask/matches for Lites Group 3.
3	0h RW	**Enable Data Match (ENABLE_DATA_MATCH):** When set, this field enables data matching on Lites Group 3.
2	0h RW	**Alternate U2C Request View (ALTU2CREQVIEW):** When set, address match/ mask, opcode match and agent match registers are used to generate matches for the U2C request observation point. When clear, Badmit observation point matches are reported on the U2C request observation point.
1	0h RW	**Invert Address Match (INVERT_ADDR_MATCH):** When set inverts the polarity of the address match/mask logic i.e. reports a match for addresses that are not in the specified range.
0	0h RW	**Enable Group (ENABLE_GROUP):** Enables all match filters for Lites Group 3. The following are the observation points that contain match filters Badmit logic within each slice after a transaction is successfully admitted into the B-Unit U2C request launch PMI datain for each PMI channel read data PMI dataout for each PMI channel write data agent data write to BRAM in each slice read data return on the live bypass and nonlive bypass paths in each slice. To report a match at an observation point all match criteria for that point must be satisfied.

3.457 B-Unit Lites Group 3 Opcode Match Filter (B_CR_LITES3_OPCODE_MATCH_0_0_0_MCHBAR) — Offset 6D24h

This register contains the IDI and PII opcodes that will enable a Lites Group3 opcode match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Opcode Match (OPCODE_MATCH):** Bit vector that enables a match on the opcode for C2U IDI requests, PII A2B requests, and U2C IDI requests. All three observation points -- Badmit in both slices, and the U2C request interface -- use this same opcode match register. Each bit, when set, enables a match on the corresponding opcode, and when clear will suppress a match on the corresponding opcode. To match on any opcode, set all bits to 1. • Bit 31: C2U_Req_CRd • Bit 30: C2U_Req_DRd • Bit 29: C2U_Req_DRdPTE • Bit 28: C2U_Req_SetMonitor • Bit 27: C2U_Req_RFO,U2C_Req_LTWrite_PicletReplay • Bit 26: C2U_Req_PRd,U2C_Req_VLW_PicletReplay • Bit 25: C2U_Req_UcRdF • Bit 24: C2U_Req_PortIn,U2C_Req_SnpCode • Bit 23: C2U_Req_IntA,U2C_Req_SnpData • Bit 22: C2U_Req_Lock • Bit 21: C2U_Req_SplitLock,U2C_Req_IntLog_PicletReplay • Bit 20: C2U_Req_Unlock,U2C_Req_IntPhy_PicletReplay • Bit 19: C2U_Req_ItoM • Bit 18: C2U_Req_SpCyc,U2C_Req_SnpInv • Bit 17: C2U_Req_RdMonitor,U2C_Req_StopReq • Bit 16: C2U_Req_ClrMonitor,U2C_Req_StartReq • Bit 15: C2U_Req_CLFlush • Bit 14: C2U_Req_WbMtoI,U2C_Req_IntLog_MSI_noPicletReplay • Bit 13: C2U_Req_WbMtoE,U2C_Req_IntPhy_MSI_noPicletReplay • Bit 12: C2U_Req_WiL • Bit 11: C2U_Req_WCiL • Bit 10: C2U_Req_WCilF • Bit 9: C2U_Req_PortOut • Bit 8: C2U_Req_IntPriUp,U2C_Req_LTWrite_noPicletReplay • Bit 7: C2U_Req_IntLog • Bit 6: C2U_Req_IntPhy • Bit 5: C2U_Req_EOI,U2C_Req_VLW_noPicletReplay • Bit 4: C2U_Req_ItoMWr • Bit 3: A2B_Req_SnoopedRead • Bit 2: A2B_Req_UnSnoopedRead,U2C_Req_IntPhy_IPI_noPicletReplay • Bit 1: A2B_Req_SnoopedWrite • Bit 0: A2B_Req_UnSnoopedWrite,U2C_Req_IntLog_IPI_noPicletReplay

3.458 B-Unit Lites Group 3 Agent Match Filter (B_CR_LITES3_AGENT_MATCH_0_0_0_MCHBAR) — Offset 6D28h

This register designates which agents are enabled to trigger a Lites Group3 AgentID match on a transaction.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D28h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GT Match (GT_MATCH):** This field is used to match IDI ransactions from GT for Lites Group3. When set, enables a match for a transaction originating from GT. When clear, suppresses a match for a transaction from GT.
30:16	0h RW	**VC Match (VC_MATCH):** This field is used to match VC Channel ID for PII transactions, for Lites Group3. Each bit, when set, enables a match for a transaction originating from that VC. When clear, the bit suppresses a match for a transaction from that VC. • Bit 30: VC14 • Bit 29: VC13 • Bit 28: VC12 • Bit 27: VC11 • Bit 26: VC10 • Bit 25: VC9 • Bit 24: VC8 • Bit 23: VC7 • Bit 22: VC6 • Bit 21: VC5 • Bit 20: VC4 • Bit 19: VC3 • Bit 18: VC2 • Bit 17: VC1 • Bit 16: VC0
15:0	0h RW	**CPU Core Match (CPU_CORE_MATCH):** This field is used to match Logical Processor Core ID for CPU IDI transactions, for Lites Group 3. Each bit, when set, enables a match for a transaction originating from that core. When clear, the bit suppresses a match for a transaction from that core. • Bit 15: CPU7 Core1 • Bit 14: CPU7 Core0 • Bit 13: CPU6 Core1 • Bit 12: CPU6 Core0 • Bit 11: CPU5 Core1 • Bit 10: CPU5 Core0 • Bit 9: CPU4 Core1 • Bit 8: CPU4 Core0 • Bit 7: CPU3 Core1 • Bit 6: CPU3 Core0 • Bit 5: CPU2 Core1 • Bit 4: CPU2 Core0 • Bit 3: CPU1 Core1 • Bit 2: CPU1 Core0 • Bit 1: CPU0 Core1 • Bit 0: CPU0 Core0

3.459 B-Unit Lites Group 3 U2C IntData Match Filter (B_CR_LITES3_U2CINTDATA_MATCH_0_0_0_MCHBAR) — Offset 6D2Ch

When U2C alternate view is enabled, this register specifies match criteria for U2C IntData.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**IntData Mask (INTDATA_MASK):** Mask for U2C Request IntData[15:0] for generating Lites Group 3 U2C request alternative view match. If the mask bit in this register is 0, then the corresponding bit in the INTDATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the INTDATA_MATCH register must match the corresponding u2c request IntData bit for a match.
15:0	0h RW	**IntData Match (INTDATA_MATCH):** U2C Request IntData[15:0] value is compared with this field to generate a match for the U2C request address match.

3.460 B-Unit Lites Group 3 Address Match Filter LITES3_ADDR_MATCH (B_CR_LITES3_ADDR_MATCH_0_0_0_MCHBAR) — Offset 6D30h

This register, together with the LITES3_ADDR_MASK register, specifies the request address values that trigger a Lites Group 3 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6D30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Match (ADDRESS_MATCH):** Address value to match for Lites.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.461 B-Unit Lites Group 3 Address Mask Filter LITES3_ADDR_MASK

(B_CR_LITES3_ADDR_MASK_0_0_0_MCHBAR) — Offset 6D38h

This register, together with the LITES3_ADDR_MATCH register, specifies the request address values that trigger a Lites Group 3 address match on a transaction.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 6D38h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved
38:3	0h RW	**Address Mask (ADDRESS_MASK):** Address mask value used for comparing request address during filter operation for Lites. If the mask bit in this register is 0, then the corresponding bit in the ADDR_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the ADDR_MATCH register must match the corresponding request address bit for a match.
2:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.462 B-Unit Lites Group 3 Data Match Filter LITES3_DATA_MATCH (B_CR_LITES3_DATA_MATCH_0_0_0_MCHBAR) — Offset 6D40h

This register, together with LITES3_DATA_MASK, specifies the data values that will trigger a Lites Group 3 data filter match. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 3 data match/mask registers for generating a match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DATA_MATCH:** Data value to match for Lites

3.463 B-Unit Lites Group 3 Data Mask Filter LITES3_DATA_MASK (B_CR_LITES3_DATA_MASK_0_0_0_MCHBAR) — Offset 6D44h

This register, together with LITES3_DATA_MATCH, specifies the data values that will trigger a Lites Group 3 data filter match for Lites. All data observation points -- PMI data in, PMI data out, read data to agent (both live and nonlive) and write data from agent -- use the same Group 3 data match/mask registers for generating a Group 3 data filter match. Data match/mask can be enabled for only one DW of the transaction data. The specific DW can be selected via DWORD_SELECT.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D44h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Mask (DATA_MASK):** Data mask value used for comparing data during filter operations for Lites. If the mask bit in this register is 0, then the corresponding bit in the DATA_MATCH register is ignored. If the mask bit is 1, then the corresponding bit in the DATA_MATCH register must match the corresponding bit of the request data for a match.

3.464 B-Unit Lites and Emon Master Control LITESEMONCTL (B_CR_LITESEMON_CTL_0_0_0_MCHBAR) — Offset 6D48h

This register controls the functionality of the B-Unit Lites Debug functionality and Emon exposure to VISA.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Lites (ENABLE_LITES):** • 0: Lites logic is disabled. All Lites Views will be driven to 0s. • 1: Lites logic is enabled.
30:27	0h RW	**Emon Barb CQ Select (EMON_BARB_CQ_SELECT):** Select barb conflictQ FIFO. • 0000 to 0111: pii0 to pii7 • 1xx0: idi Slice0 • 1xx1: idi Slice1

Bit Range	Default & Access	Field Name (ID): Description
26:24	0h RW	**Emon Barb Ingress Select (EMON_BARB_INGRESS_SELECT):** Select barb ingress FIFO. Bits 2:1 correspond to IDI attach, while bit 0 is for slice in the case that the IDI attach point has a per-slice FIFO. • 000: IDI attach point 0, Slice 0 (or mono_fifo if not using per-slice FIFO for this attach point) • 001: IDI attach point 0, Slice 1 • 010: IDI attach point 1, Slice 0 (or mono_fifo if not using per-slice FIFO for this attach point) • 011: IDI attach point 1, Slice 1 • 100: IDI attach point 2, Slice 0 (or mono_fifo if not using per-slice FIFO for this attach point) • 101: IDI attach point 2, Slice 1 • 110: IDI attach point 3, Slice 0 (or mono_fifo if not using per-slice FIFO for this attach point) • 111: IDI attach point 3, Slice 1
23:13	0h RW	**Emon VC Mask (EMON_VC_MASK):** B-Unit and T-Unit expose only the Emons corresponding to the VC(s) specified in this field (it is a mask).
12:5	0h RW	**Emon IDI Mask (EMON_IDI_MASK):** B-Unit and T-Unit expose only the Emons corresponding to the IDI agent(s) specified in this field (it is a mask). IDI agent refers to GLM modules and GT not Sunits.
4:2	0h RW	**Lites IDI Select (LITES_IDI_SELECT):** B-Unit and T-Unit expose only the views corresponding to the IDI agent specified in this field. IDI agents only refer to GT and GLM modules, not Sunits. Used only on the C2U response views.
1	0h RW	**Lites Slice Select (LITES_SLICE_SELECT):** When set to 0, B-Unit and T-Unit expose only Slice0 views. No Lites observability of any transaction routed to Slice 1. When set to 1, B-Unit and T-Unit expose only Slice1 views. No Lites observability of any transaction routed to Slice0.
0	0h RW	**Lites PMI Select (LITES_PMI_SELECT):** When set to 0, B-Unit exposes only PMI channel 0 views in either slice. No Lites observability of any transaction routed to PMI channel 1 in either slice. When set to 1, B-Unit exposes only PMI Channel 1 views in either slice.

3.465 B-Unit Arbiter Control BARBCTRL0 (B_CR_BARBCTRL0) — Offset 6D4Ch

Specifies the weighting for Agents 03 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiters weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D4Ch	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved
29:24	4h RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21:16	4h RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

3.466 B-Unit Arbiter Control BARBCTRL1 (B_CR_BARBCTRL1) — Offset 6D50h

Specifies the weighting for Agents 4-7 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiter's weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D50h	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved
29:24	4h RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved
21:16	4h RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

3.467 B-Unit Scheduler Control (B_CR_BSCHWT0) — Offset 6D54h

Specifies the weighting for Agents 0-3 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter, to allow other agents' requests to be granted.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D54h	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved
29:24	4h RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved
21:16	4h RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

3.468 B-Unit Scheduler Control (B_CR_BSCHWT1) — Offset 6D58h

Specifies the weighting for Agents 4-7 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D58h	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
29:24	4h RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved
21:16	4h RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

3.469 B-Unit Scheduler Control (B_CR_BSCHWT2) — Offset 6D5Ch

Specifies the weighting for Agents 8-11 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D5Ch	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved
29:24	4h RW	**Agent 11 Weight (AGENT11_WEIGHT):** Arbiter weight for Agent 11.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved
21:16	4h RW	**Agent 10 Weight (AGENT10_WEIGHT):** Arbiter weight for Agent 10.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 9 Weight (AGENT9_WEIGHT):** Arbiter weight for Agent 9.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 8 Weight (AGENT8_WEIGHT):** Arbiter weight for Agent 8.

3.470 B-Unit Scheduler Control (B_CR_BSCHWT3) — Offset 6D60h

Specifies the weighting for Agents 12-15 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D60h	4040404 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RESERVED_0):** Reserved
29:24	4h RW	**Agent 15 Weight (AGENT15_WEIGHT):** Arbiter weight for Agent 15.
23:22	0h RO	**Reserved (RESERVED_1):** Reserved
21:16	4h RW	**Agent 14 Weight (AGENT14_WEIGHT):** Arbiter weight for Agent 14.
15:14	0h RO	**Reserved (RESERVED_2):** Reserved
13:8	4h RW	**Agent 13 Weight (AGENT13_WEIGHT):** Arbiter weight for Agent 13.
7:6	0h RO	**Reserved (RESERVED_3):** Reserved
5:0	4h RW	**Agent 12 Weight (AGENT12_WEIGHT):** Arbiter weight for Agent 12.

3.471 B-Unit Flush Control (B_CR_BWFLUSH) — Offset 6D64h

Controls the policy used to determine when dirty entries must be flushed to DRAM. When the number of dirty entries is lower than a high watermark dirty_hwm the B-Unit will opportunistically flush data to DRAM after the write flush timeout value. When the number of dirty entries exceeds the high water mark, the B-Unit will initiate a highpriority flush and push dirty data to DRAM until the count is once again below the low water mark.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D64h	FF010000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**Flush Threshold (FLUSH_THRESHOLD):** All write commands are blocked at Badmit if the number of write commands in the Flush Pool exceeeds this value.

Bit Range	Default & Access	Field Name (ID): Description
23:17	0h RO	**Reserved (RESERVED_0):** Reserved
16	1h RO/V	**All Entries Flushed (ALL_ENTRIES_FLUSHED):** All dirty entries in the B-Unit, in both slices, have been flushed.
15:8	0h RW	**Dirty Low Water Mark (DIRTY_LWM):** Low water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.
7:0	0h RW	**Dirty High Water Mark (DIRTY_HWM):** High water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.

3.472 B-Unit Flush Weights (B_CR_BFLWT) — Offset 6D68h

Controls B-Unit alternate scheduling of reads and writes to DRAM.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D68h	400 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable Flush Weights (DISABLE_FLUSH_WEIGHTS):** When set to 1, disables flush weights. Flushing of dirty entries will start when Dirty Limit is HWM, and continue until Dirty Limit is LWM. No reads will be scheduled in between.
30:14	0h RO	**Reserved (RESERVED_1):** Reserved
13:8	4h RW	**Write Weights (WRITE_WEIGHTS):** Number of write requests sent to a PMI channel before switching to scheduling ISOC or non-ISOC read requests, when use of flush weights is not disabled. If the flush weights are enabled, this has to be set at least to 1 otherwise Bunit will not schedule any writes and hangs may occur.
7:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.473 Weighted Scheduling Control of High Priority ISOC and Other Requests (B_CR_BISOCWT) — Offset 6D6Ch

Controls alternate scheduling of High Priority ISOC requests and other requests.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D6Ch	80003F0F h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Enable ISOC Requests (ENABLE_ISOC_WEIGHTS):** When set to 1, enables switching from scheduling High Priority ISOC requests to scheduling Best Effort and Low Priority ISOC requests, based on ISOC weights and NONISOC weights.

Bit Range	Default & Access	Field Name (ID): Description
30:14	0h RO	**Reserved (RESERVED_1):** Reserved
13:8	3Fh RW	**ISOC Request Weights (ISOC_REQUEST_WEIGHTS):** Number of high priority isochronous requests sent to a PMI channel before switching to scheduling non-ISOC read or write requests, when use of ISOC weights is not disabled. If the ISOC weights are enabled, this has to be set to at least 1 otherwise Bunit will not schedule any ISOC reads and hangs may occur.
7:6	0h RO	**Reserved (RESERVED_0):** Reserved
5:0	Fh RW	**Non ISOC Request Weights (NON_ISOC_REQUEST_WEIGHTS):** Number of non-high priority isochronous and best effort requests sent to a PMI channel before switching to scheduling ISOC read or write requests, when use of ISOC weights is not disabled. If the ISOC weights are enabled, this has to be set to at least 1 otherwise Bunit will not schedule any non-ISOC reads and hangs may occur.

3.474 B-Unit Control (B_CR_BCTRL2) — Offset 6D70h

Contains basic control information used by the B-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D70h	F0034 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Read Invalidate Timer (ENABLE_READ_INVALIDATE_TIMER):** When set to 1, enables the BRAM to clear the RD_DONE bit and flush dirty data when a timer expires. Used when parity is not enabled, to force the B-Unit to not indefinitely cache previously read lines, and also to cause a flush of dirty data that has been written to the BRAM entry.
30	0h RW	**Enable DRAM Read for Partial Write (ENABLE_DRAM_READ):** The B-Unit has byte enable capability, so it doesn't require a DRAM read when there is a partial write. This bit forces it to perform the read anyway.
29:26	0h RO	**Reserved (RESERVED_2):** Reserved
25	0h RW	**DRAM_ECC_ENABLE:** If DRAM ECC is enabled, the data error bits from the Dunit is used for indicating the derror for the corresponding transactions to the agents and forcing the poison bit when BUNIT PARITY is unsupported and Read for partial writes are enabled
24	0h RW	**MOT Disable Stall Arbiter on Error (MOT_DISABLE_STALL_ARB_ON_ERR):** If the HH widget gets an error, allow transactions to get arbitrated.
23:16	Fh RW	**BRAM Read Invalidate Time (BRAM_READ_INVALIDATE_TIME):** Timer threshold to clear rd_done bits or flush a BRAM entry, if dirty. The value specified is in multiples of 250ns. For each time interval specified, the read done status of one BRAM entry will be cleared based on a BTAG index which is then incremented to point to the next BRAM entry.
15:8	0h RW	**Casual Timer (CASUAL_TIMER):** The number of clock cycles that the B-Unit waits before starting a casual dirty flush. Casual Flush feature will not be enabled by PND2 architecture. Instead, a dirty write will be made eliGBle for scheduling immediately.
7:6	0h RO	**Reserved (RESERVED_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**Enable 64B Write (ENABLE_64B_WRITE):** When set, B-unit will send 64B PMI Write requests for transactions requiring write access to DRAM. Must always be set to one, otherwise functional errors may occur.
4	1h RW	**Enable 64B Read (ENABLE_64B_READ):** When set, B-unit will send 64B PMI read requests for transactions requiring read access to DRAM. Must always be set to one, otherwise functional errors may occur.
3	0h RO	**Demand Scrub Enable (DEMAND_SCRUB_ENABLE):** This mode causes B-Unit to automatically issue a flush to PMI, thus writing correct data back to memory for any read request that returns with a correctable data error.
2	1h RW	**Enable Read Done for Write (ENABLE_READ_DONE_FOR_WRITE):** Enable Any writes (IWB or normal writes) to set the read_done bit in bstat, which enables return of data from the BRAM cache instead of Memory.
1	0h RW	**Miss Valid Entries (MISS_VALID_ENTRIES):** This mode causes reads to clean valid B-Unit buffer entries to look like misses instead of hits. When this bit is set -- even when all requested bytes are valid and present in the BRAM data buffer -- B-Unit will send read requests over the PMI interface to re-fetch the data from DRAM, instead of returning it from the BRAM.
0	0h RW	**Dirty Stall (DIRTY_STALL):** This mode causes reads or writes from any requester interface to dirty valid B-Unit buffer entries to stall on the appropriate requester interface until the entry has been flushed from the B-Unit.

3.475 Asset Classification Bits (B_CR_AC_RS0_0_0_0_MCHBAR) — Offset 6D74h

B-Unit Asset Classification AC[3] bits for IMRs and Special Protected Memory Region. Controls whether RS0 Root Space 0 transactions from PII are allowed access to IMRs and Protected Memory Region.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D74h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RESERVED_0):** Reserved
20	1h RW	**MOT RS Asset Classification (MOT_RS0_EN):** RS Asset Classification bit for the MOT buffer. PII transactions from RS0 that hit the MOT buffer will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list, as specified in the RAC/WAC policy registers, and b) MOT_RS0_EN bit is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.
19:0	0h RW	**IMR RS Asset Classification (IMR_RS0_EN):** RS Asset Classification bit for IMRs 0-19. PII transactions from RS0 that hit an enabled IMR address range will be allowed access only when both of the following conditions are met: a) Request SAI is in the legal permitted list as specified in the IMRs RAC/WAC policy registers and b) IMR_AC_RS bit corresponding to the IMR is set to 1. PII RS0 transactions targeting DRAM that do not hit any enabled IMR or special protected regions will always be allowed access.

3.476 IDI Real-Time Feature Configuration Bits (B_CR_RT_EN_0_0_0_MCHBAR) — Offset 6D78h

IDI Real-Time Feature Configuration register. Controls which IDI attachpoint support Real-Time traffic/transactions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D78h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD):** Reserved
16	0h RW	**IDI Agent Real-Time Traffic Mask Bits (RT_IDI_AGENT):** IDI Agent Real-Time Traffic Mask Bits. Controls which IDI Agent supports Real-Time Traffic/Transactions. Only one IDI Agent needs to be selected for real-time traffic. Currently we don't support multiple IDI agents to be enabled for real-time traffic at the same time. This field will be active only when Bit 0:RT_ENABLE is set to '1'
15:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW	**Real-Time Enable (RT_ENABLE):** Global enable bit for Real-Time Support

3.477 B-Unit Control Register 3 (B_CR_BCTRL3) — Offset 6D7Ch

Specifies miscellaneous controls for the the B-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6D7Ch	40 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**Disable C2U Ingress Slice Anti-Starvation (SLICE_ANTI_STARVE_DISABLE):** When set, B-unit will always make an available request in each instantiated per-slice C2U Ingress FIFO for all IDI attach points eliGBle for arbitration in their respective odd/even sa2xclk clock. When clear, B-Unit will mask a C2U Ingress Slices available request from arbitration when SLICE_ANTI_STARVE_THRESHOLD consecutive requests has been granted for that IDI attach point from the other Slice Ingress FIFO. Has no effect for IDI attach points that do not have per-slice Ingress FIFOs.
7:0	40h RW	**C2U Ingress Slice Anti-Starvation Threshold (SLICE_ANTI_STARVE_THRESHOLD):** Specifies the threshold for the number of consecutive requests B-admit arbiter will grant from the same Slice ingress FIFO for an IDI attachpoint, while the other Slice also has a request available

3.478 Asymmetric Memory Region 0 (B_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR) — Offset 6E40h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Slice 0 Asymmetric Enable (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM Region Slice 0 (SLICE0_ASYM_CHANNEL_SELECT):** Specifies Channel Selected for ASYM Region Mapped To Slice 0
29:19	0h RW	**Slice 0 Asymmetric Limit (SLICE0_ASYM_LIMIT):** Specifies bits [38:28] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1.
18:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Slice 0 Asymmetric Base (SLICE0_ASYM_BASE):** Specifies bits [38:28] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	**Reserved (RSVD):** Reserved

3.479 Asymmetric Memory Region 1 (B_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR) — Offset 6E44h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E44h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Slice 1 Asymmetric Enable (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region.
30	0h RW	**Channel Select for ASYM SLICE 1 (SLICE1_ASYM_CHANNEL_SELECT):** Specifies Channel Selected for ASYM Region Mapped To Slice 1.
29:19	0h RW	**Slice 1 Asymmetric Limit (SLICE1_ASYM_LIMIT):** Specifies bits [38:28] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1.

Bit Range	Default & Access	Field Name (ID): Description
18:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Slice 1 Asymmetric Base (SLICE1_ASYM_BASE):** Specifies bits [38:28] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0.
3:0	0h RO	**Reserved (RSVD):** Reserved

3.480 B-Unit Machine Check Mode Low (B_CR_BMCMODE_LOW) — Offset 6E48h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW	**Machine Check Signal Mode (MC_SIGNAL_MODE):** When set to 1, B-Unit will not allow any transaction with uncorrectable error or subsequent memory transaction to propagate through to Requester. This will essentially hang CPU and CPU will end up with IERR shutdown. Issue: When set to zero B-Unit will allow transaction with an uncorrectable error to propagate and signal MC event to CPU if enabled in IA32_MC5_CTL. If enabled MC event will be taken by CPU cores at the end of instruction boundary after it detected by ROB

3.481 B-Unit Machine Check Mode High (B_CR_BMCMODE_HIGH) — Offset 6E4Ch

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RESERVED_0):** Reserved

3.482 Two-Way Asymmetric Memory Region Configuration (B_CR_ASYM_2WAY_MEM_REGION_0_0_0_MCHBAR) — Offset 6E50h

Specification of asymmetric memory region for the configuration with 2way Interleaved Asymmetric memory. It is only supported if all Slices and all Channels are Enabled

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Two-Way Asymmetric Memory Configuration (ASYM_2WAY_INTERLEAVE_ENABLE):** Setting this bit to 0 disables 2Way Asymmetric Interleaving; setting it to 1 enables the region.
30:28	0h RO	**Reserved (RSVD):** Reserved
27:17	0h RW	**Limit Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_LIMIT):** Specifies bits [38:28] of the highest address of Interleave Asymmetric Region; all the lower bits of the region's highest address are equal to 1.
16:15	0h RO	**Reserved (RSVD):** Reserved
14:4	0h RW	**Base Address for Two-Way Asymmetric Memory Region (ASYM_2WAY_BASE):** Specifies bits [38:28] of the base address of Interleave Asymmetric Region; all the lower bits of the region's base address are equal to 0.
3:2	0h RW	**Two-Way Asymmetric Interleave Mode (ASYM_2WAY_INTLV_MODE):** Going with 2 bits here. 2'b00 : Asymmetric memory Split between Channel 0 of Slice 0 and Slice 1 2'b01 : Asymmetric memory split between Channel 1 of Slice 0 and Slice 1 2'b10 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 0 2'b11 : Asymmetric memory split between Channel 0 and Channel 1 of Slice 1
1:0	0h RO	**Reserved (RSVD):** Reserved

3.483 SGX Status (B_CR_SGX_STATUS_0_0_0_MCHBAR) — Offset 6E54h

Status register that is writable by BUnit to give updates regarding various SGX events

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 6E54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RO/V	**PRMRR Flushed (PRMRR_FLUSHED):** This bit is used to indicate that all transactions that could target the PRMRR region before it was enabled have been flushed to memory. After enabling PRMRR, MCHECK will pole this bit and wait until it is high. 0b: Transactions remain in the BRAM that could target the PRMRR region, but were allocated before PRMRR SAI checks were enforced. 1b: All transactions in the BRAM have passed through the PRMRR SAI checks.

3.484 Thermal Device Mailbox Data0 (P_CR_THERMAL_MAILBOX_DATA0_0_0_0_MCHBAR) — Offset 7000h

This register represents the lower 32b of the thermal mailbox data. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7000h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA:** This field contains the low 32 bits of data associated with specific commands.

3.485 Thermal Device Mailbox Data1 (P_CR_THERMAL_MAILBOX_DATA1_0_0_0_MCHBAR) — Offset 7004h

This register represents the upper 32b of the thermal mailbox data. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7004h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA:** This field contains the low 32 bits of data associated with specific commands.

3.486 Thermal Device Mailbox Interface (P_CR_THERMAL_MAILBOX_INTERFACE_0_0_0_MCHBAR) — Offset 7008h

This register implements the control and response of the Thermal Device Mailbox. Software may use this mailbox to configure and query various parameters into SOC thermal / power control. This particular register is responsible for initiating requests to the thermal device and reading responses. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7008h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Run/Busy (RUN_BUSY):** The run/busy control is used for managing the semaphore on the mailbox interface. Typical usage involves the following flow: • Software waits for the interface run/busy bit to clear. • Software writes the mailbox data registers as appropriate for this command. • Software writes a command encoding and sets the run/busy bit in the interface register. • Software waits for the interface run/busy bit to clear to indicate the command has been handled. • Software queries the completion code in the command field of the interface register to ensure it passed (0b indicates pass) Bit encoding for the run/busy: • 0 = The thermal mailbox is idle or the last request has been completed. Software may initiate new requests. • 1 = The thermal mailbox is busy. The thermal device is still handling a request. Writes to thermal mailbox are not allowed at this time.
30:29	0h RO	**Reserved (RSVD):** Reserved
28:8	0h RW/V	**Additional Parameters (ADDR_CNTL):** This field is used as an additional modifier to the command encoding for incoming mailbox requests. In thermal device mailbox responses, this field is always zero. The applicability of this additional parameter field is handled on a case by case basis for the services supplied by this mailbox
7:0	0h RW/V	**COMMAND:** For incoming requests (where run/busy=1), this field represents the command opcode. For responses (where run/busy=0), this field represents the response completion code. A completion code of 0b indicates passing, all other completion codes indicate failure. For detailed definition of services provided by this mailbox, see the full mailbox specification.

3.487 Thermal Device IRQ and Lock Configuration (P_CR_THERMAL_DEVICE_IRQ_0_0_0_MCHBAR) — Offset 700Ch

IRQ vector number for thermal/power device that is sent to the IOAPIC and Lock field for INTR_LAT_0_0_1_PCI.INTRPIN

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 700Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**LOCK:** Used to lock P_CR_INTR_LAT_0_0_1_PCI.INTPIN. BIOS should set this lock bit before passing control to the OS
30:8	0h RO	**RESERVED:** Reserved
7:0	0h RW	**IRQ:** IRQ vector number for the thermal / power device. This field controls the event vector issues to the IOAPIC. It must be configured by BIOS for INTA support. Recommended setting for Broxton is 24 (18h)

3.488 Package Thermal Interrupt Control (P_CR_PKG_THERM_INTERRUPT_0_0_0_MCHBAR) — Offset 7010h

This register is used to manage processor thermal interrupts, including management of filtering on the virtual thermal sensor control signal. These features are designed to allow software to implement smooth control of thermally significant events for platform thermal management. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7010h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:24	0h RW	**Time Window (TIME_WINDOW):** Virtual Temperature thermal filter RC time constant. Virtual temperature readings are run through an RC filter before they are fed into status and interrupt generation. This filtering allows software smooth control of thermal responses to thermally significant events. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
23:16	0h RW	**Thermal Threshold 2 Temperature (THRESHOLD2_TEMP):** Thermal interrupt threshold temperature in degrees Celsius. Described in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). E.g., a reading of 0x28 == 40'C. This threshold is managed relative to the filtered temperature.
15:8	0h RW	**Thermal Threshold 1 Temperature (THRESHOLD1_TEMP):** Thermal interrupt threshold temperature in degrees Celsius. Described in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). E.g., a reading of 0x28 == 40'C. This threshold is managed relative to the filtered temperature.
7:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Critical Thermal Event Interrupt Enable (CRITICAL_THERMAL_INT_ENABLE):** Enable thermal interrupt generation when the processor has detected a critical thermal event that requires immediate servicing. This event is intended to be an alert indicating thermal control failure and is an early warning of thermal runaway.
1	0h RW	**THRESHOLD2_INT_ENABLE:** When set, enables the generation of a thermal interrupt whenever the Thermal Threshold 2 Temperature is crossed. Interrupts are generated when the threshold is crossed in either direction. Interrupt destination is programmed in the TMBAR configuration space.
0	0h RW	**Threshold 1 Interrupt Enable (THRESHOLD1_INT_ENABLE):** When set, enables the generation of a thermal interrupt whenever the Thermal Threshold 1 Temperature is crossed. Interrupts are generated when the threshold is crossed in either direction. Interrupt destination is programmed in the TMBAR configuration space.

3.489 Package Thermal Status (P_CR_PKG_THERM_STATUS_0_0_0_MCHBAR) — Offset 701Ch

This register is used to monitor the status of the package level virtual thermal sensor and details on the source of package level thermal events. The package level virtual thermal sensor is a filtered version of the mximum temperature observed at any domain within the package. That temperture is applied to the Package Thermal Interrupt configuration for event delivery to software for run-time thermal management. When an event is observed, this register describe the source(s) of that event.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 701Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:16	0h RO/V	**TEMPERATURE:** Virtual maximum SOC temperature in degrees Celsius. Caculated as a maximum of all on-die thermal sensor readings and filtered accoring to the time constant described in the PKG_THERM_INTERRUPT register. Data format is signed, 2's complement with the LSB representing 1'C resolution (S8.7.0).
15:6	0h RO	**Reserved (RSVD):** Reserved
5	0h RW/0C/V	**Critical Thermal Event Log (CRITICAL_THERMAL_EVENT_LOG):** Sticky log bit indicating that the processor has operated out of its thermal specification since the last time software cleared this bit. Set by hardware on a 0 to 1 transition of Critical Thermal Event Status.
4	0h RO/V	**Critical Thermal Event Status (CRITICAL_THERMAL_EVENT_STATUS):** Status bit indicating that the processor is operating outside of its thermal specification. It is intended as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RW/0C/V	**Thermal Threshold 2 Log (THRESHOLD2_LOG):** Sticky log bit that indicates temperature has crossed the software programmable thermal threshold2 in either falling or rising directions.
2	0h RO/V	**Thermal Threshold 2 Status (THRESHOLD2_STATUS):** Indicates that the current filtered temperature (bits 23:16 of this register) is greater than or equal to the Threshold2 defined in the PKG_THERM_INTERRUPT configuration register.
1	0h RW/0C/V	**Thermal Threshold 1 Log (THRESHOLD1_LOG):** Sticky log bit that indicates temperature has crossed the software programmable thermal threshold1 in either falling or rising directions.
0	0h RO/V	**Thermal Threshold 1 Status (THRESHOLD1_STATUS):** Indicates that the current filtered temperature (bits 23:16 of this register) is greater than or equal to the Threshold1 defined in the PKG_THERM_INTERRUPT configuration register.

3.490 LPDDR DRAM Thermal (MR4) Status of Channel 01 (P_CR_MEM_MR4_TEMPERATURE_DEV1_0_0_0_MCHBAR) — Offset 7024h

LPDDR DRAM Thermal (MR4) Status of Channel 01, when there are multiple DRAMs in a rank, the maximun MR4 is reported

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7024h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0:** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 01 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 01 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

3.491 LPDDR DRAM Thermal (MR4) Status of Channel 10 (P_CR_MEM_MR4_TEMPERATURE_DEV2_0_0_0_MCHBAR) — Offset 7028h

LPDDR DRAM Thermal (MR4) Status of Channel 10, when there are multiple DRAMs in a rank, the maximun MR4 is reported

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7028h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_0:** Reserved
5:3	0h RW	**MR4 DRAM thermal status of Channel 10 Rank 1 (MR4_RANK_1):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.
2:0	0h RW	**MR4 DRAM thermal status of Channel 10 Rank 0 (MR4_RANK_0):** This field is updated each read of LPDDR DRAM MR4 Device Temperature Status per rank. Update rate is configured by BIOS.

3.492 Machine Check Error Source Log (P_CR_MCA_ERROR_SRC_0_0_0_MCHBAR) — Offset 702Ch

This register logs error source information i.e IERR or MCERR information for Pcode. The error fields are cleared by HW or BIOS. This register is also shadowed in the I/O space.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 702Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CATERR:** Asserted by HW on IERR or MCERR assertion.
30	0h RW/V	**IERR:** Asserted by HW on IERR assertion.
29	0h RW/V	**MCERR:** Asserted by HW on MCERR assertion.
28:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RW	**RESERVED:** Reserved

3.493 DDR Thermal Throttling Control (P_CR_DDR_THERM_THRT_CTRL_0_0_0_MCHBAR) — Offset 7030h

This register is used to configure thermal throttling policies for memory.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7030h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**RESERVED_1:** Reserved
25	0h RW/V	**DDR3L Refresh Rate (DDR3L_REFRESH_RATE):** This field is to allow platform software to request refresh rate for DDR3L
24	0h RW/V	**DDR3L Throttle Enable (THROTTLE_LEVEL_ENABLE):** When set and DRAM_Type is DDR3L, SOC throttles memory traffic to level specified in THRT_LVL NOTE: This field is ignored if DRAM_Type is not DDR3L
23:16	0h RW/V	**DDR3L Throttle Level (THROTTLE_LEVEL):** Throttle level in %BW, in units of 1%. Default = 0%. Input of 100 or higher is clipped to 100%, NOTE: this field is ignored if DRAM_type is not DDR3L
15:10	0h RO	**RESERVED_0:** Reserved
9	0h RW/V	**Memory Thermal Throttle Enable (MEM_THRT_ENABLE):** When set, memory traffic is throttled if memory MR4 value >= THERM_THRT_THRESHOLD, respectively. Thermal throttling is achieved by applying memory bandwidth clips in the memory subsystem.
8	0h RW/V	**Memory Thermal Throttling Configuration (MEM_THRT_CFG):** Configure memory throttling behavior. Policies are defined as follows: • 0 = Thermal throttling policy uses instanous MR4 status for THERM_THRT_THRESHOLD • 1 = Thermal throttling policy uses time filtered MR4 status for THERM_THRT_THRESHOLD. Filtering time constant is configured in the DDR_THERM_INTERRUPT register.
7	0h RW/V	**Reserved (NM_THERM_THRT_ENABLE):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW/V	**Reserved (NM_THERM_THRT_THRESHOLD):** Reserved
3	0h RW/V	**LPDDR Memory Thermal Throttling Enable (FM_THERM_THRT_ENABLE):** When set, throttling is activated if LPDDR memory MR4 value is greater than or equal to THERM_THRT_THRESHOLD. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this bit should be set to enable LPDDR throttling to keep DRAM within its Tcasemax spec.
2:0	0h RW/V	**LPDDR Memory Thermal Throttling Threshold (FM_THERM_THRT_THRESHOLD):** Configurable threshold of LPDDR memory MR4 value greater than or equal to which thermal throttling is activated. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this field should be configured to avoid DRAM to exceed its Tcasemax spec. • Memory MR4 >= Threshold = Enable thermal throttling • Memory MR4 < Threshold = Disable thermal throttling

3.494 DDR Thermal Interrupt Control (P_CR_DDR_THERM_INTERRUPT_0_0_0_MCHBAR) — Offset 7034h

This register is used to manage DDR thermal interrupts, including management of filtering on the virtual DRAM thermal sensor control signal. These features are designed to allow software to implement smooth control of thermally significant events for platform thermal management.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7034h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:24	0h RW	**Time Window (TIME_WINDOW):** Virtual Temperature thermal filter RC time constant. Virtual temperature readings are run through an RC filter before they are fed into status and interrupt generation. This filtering allows software smooth control of thermal responses to thermally significant events. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
23:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD2_INT_ENABLE):** Reserved
14:12	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD2):** Reserved
11	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD1_INT_ENABLE):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**Reserved (NEAR_MEM_MR4_THRESHOLD1):** Reserved
7	0h RW	**Memory MR4 Threshold 2 Interrupt Enable (FAR_MEM_MR4_THRESHOLD2_INT_ENABLE):** Enable thermal interrupt generation whenever the virtual maximum memory MR4 has crossed THRESHOLD2. Interrupts are triggered when the filtered MR4 temperature crosses in both rising and falling directions.
6:4	0h RW	**Memory MR4 Threshold 2 (FAR_MEM_MR4_THRESHOLD2):** Configurable memory threshold2 value for memory thermal interrupt generation
3	0h RW	**Memory MR4 Threshold 1 Interrupt Enable (FAR_MEM_MR4_THRESHOLD1_INT_ENABLE):** Enable thermal interrupt generation whenever the virtual maximum memory MR4 has crossed THRESHOLD1. Interrupts are triggered when the filtered MR4 temperature crosses in both rising and falling directions.
2:0	0h RW	**Memory MR4 Threshold 1 (FAR_MEM_MR4_THRESHOLD1):** Configurable memory threshold1 value for memory thermal interrupt generation

3.495 DDR Thermal Status (P_CR_DDR_THERM_STATUS_0_0_0_MCHBAR) — Offset 7038h

Status register for monitoring DDR thermal status. Data reported here is aggregated by memory type, and values reported represent the maximum MR4 readings observed in those respective domains. Temperatures are additionally filtered by the MR4 thermal filtering time constant described in the DDR Thermal Interrupt configuration register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7038h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21:19	0h RO/V	**Reserved (NEAR_MEM_MR4):** Reserved
18:16	0h RO/V	**LPDDR Memory MR4 (FAR_MEM_MR4):** Virtual maximum memory MR4 reading. Caculated as a maximum of all LPDDR memory MR4 readingsand filtered accoring to the time constant described in DDR_THERM_INTERRUPT register.
15:8	0h RO	**Reserved (RSVD):** Reserved
7	0h RW/0C/V	**Reserved (NEAR_MEM_MR4_THRESHOLD2_LOG):** Reserved
6	0h RO/V	**Reserved (NEAR_MEM_MR4_THRESHOLD2_STATUS):** Reserved
5	0h RW/0C/V	**Reserved (NEAR_MEM_MR4_THRESHOLD1_LOG):** Reserved
4	0h RO/V	**Reserved (NEAR_MEM_MR4_THRESHOLD1_STATUS):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/0C/V	**Memory MR4 Threshold2 Log (FAR_MEM_MR4_THRESHOLD2_LOG):** Indicates that the virtual maximum memory MR4 has crossed THRESHOLD2 since the last time this register was cleared. The bit is set when the threshold is crossed in either direction. Software may clear this bit.
2	0h RO/V	**Memory MR4 Threshold2 Status (FAR_MEM_MR4_THRESHOLD2_STATUS):** Status bit is set when the virtual maximum memory MR4 reading is greater than or equal to THRESHOLD2. It is cleared when temperature is less than THRESHOLD2
1	0h RW/0C/V	**Memory MR4 Threshold1 Log (FAR_MEM_MR4_THRESHOLD1_LOG):** Indicates that the virtual maximum memory MR4 has crossed THRESHOLD1 since the last time this register was cleared. The bit is set when the threshold is crossed in either direction. Software may clear this bit.
0	0h RO/V	**Memory MR4 Threshold1 Status (FAR_MEM_MR4_THRESHOLD1_STATUS):** Status bit is set when the virtual maximum memory MR4 reading is greater than or equal to THRESHOLD1. It is cleared when temperature is less than THRESHOLD1

3.496 Dram Energy Counter (P_CR_DDR_ENERGY_STATUS_0_0_0_MCHBAR) — Offset 7048h

Reports total energy consumed in DRAM. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by DDR RAPL or OLTM control algorithms if the product supports those features. To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7048h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**JOULES:** Total Joules of energy consumed by all DIMMs. Units are proportional to Joules and are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT.

3.497 DDR RAPL Performance Status (P_CR_DDR_RAPL_PERF_STATUS_0_0_0_MCHBAR) — Offset 704Ch

Memory RAPL performance throttling counter. This counter accumulates time that any channel in the memory controller is bandwidth throttled due to memory RAPL constraints. This counter counts total time (in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units) that any channel is throttled. If two channels are throttled, this counter increments at a 2x rate, so that for 1ms in wall clock time the counter counts 2ms. This counter does not include throttling as a result

of thermal management or MEMHOT. This register is updated at approximately 1ms intervals. This counter is normalized to 'seconds' and is not subject to variation of actual DRAM clock speeds. This register is readonly for software via MMIO MSR and PECI/PCS. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 704Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DDR Bandwidth Throttle Duration (DURATION):** Bandwidth throttle duration counter due to Memory RAPL. Sum across all channels in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units. This data can serve as a proxy for the potential performance impacts of RAPL on memory accesses.

3.498 Package RAPL Performance Status (P_CR_PACKAGE_RAPL_PERF_STATUS_0_0_0_MCHBAR) — Offset 7050h

Counts time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT. If software uses the TURBO_ACTIVATION_RATIO or PECI ACPI P-NOTIFY, the turbo activation ratios described by those features will may elevate the effective OS request (as calculated by this counter) to max turbo. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7050h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Performance Throttle Duration (COUNTS):** Time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT

3.499 IA Core Performance / Power Priority Control (P_CR_PRIMARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR) — Offset 7054h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7054h	0 h

3.506 Temperature Reference and Control (P_CR_TEMPERATURE_TARGET_0_0_0_MCHBAR) — Offset 7074h

This register contains information about the fan speed control target temperature as well as details on the reference temperature for IA core DTS relative temperature reading. **MSR_Name**: TEMPERATURE_TARGET **MSR_Addr**: 0x1A2

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7074h	5A0000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:24	0h RW	**TJ_MAX_TCC_OFFSET:** This field allows platform software to configure the temperature at which thermal monitor engages to be lower than the manufacturing configured maximum constraint. This field is programmed in 1'C units. E.g., if the default silicon configured maximum temperature is 100'C and this field is configured to 10, then the silicon will engage thermal throttling algorithms at 90'C
23:16	5Ah RO_V	**REF_TEMP:** Tjmax a.k.a. Thermal Monitor activation temperature or Prochot Temperature. This is the maximum junction temperature at which thermal throttling aka thermal monitor is activated. This temperature is the maximum temperature at which the silicon is capable of operating at. All IA core digital thermal sensor readings are reported as a relative nagative offset from this reference temperature, such that a readon of zero implies the cores are running at this temperature.
15:8	0h RO/V	**Fan Temperature Target Offset (FAN_TEMP_TARGET_OFFSET):** Fan Temperature Target Offset a.k.a. TControl indicates the relative offset from the the Thermal Monitor Trip Temperature at which fans should be engaged.
7:0	0h RO	**Reserved (RSVD):** Reserved

3.507 BIOS Reset Completion (P_CR_BIOS_RESET_CPL_0_0_0_MCHBAR) — Offset 7078h

This register is used as a means for BIOS to communicate staging to the Punit / Pcode. The exact definition and utility of each bit may differ across products. The general philosophy is that when BIOS is done with stage0, it writes the RST_CPL0 bit and then waits for the PCODE_INIT_DONE0 bit to be set before proceeding to the next step.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7078h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RESERVED0:** Reserved
15	0h RO/V	**Stage7 Pcode Reset Complete (PCODE_INIT_DONE7):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
14	0h RO/V	**Stage6 Pcode Reset Complete (PCODE_INIT_DONE6):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
13	0h RO/V	**Stage5 Pcode Reset Complete (PCODE_INIT_DONE5):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
12	0h RO/V	**Stage4 Pcode Reset Complete (PCODE_INIT_DONE4):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO/V	**Stage3 Pcode Reset Complete (PCODE_INIT_DONE3):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
10	0h RO/V	**Stage2 Pcode Reset Complete (PCODE_INIT_DONE2):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
9	0h RO/V	**Stage1 Pcode Reset Complete (PCODE_INIT_DONE1):** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
8	0h RO/V	**Stage0 Pcode Reset Complete (PCODE_INIT_DONE):** Pcode has completed its actions in response to Stage0 BIOS Reset complete. Between BIOS Stage0 complete and pcode Stage0 complete, pcode will apply all power savings configurations to PCS and will set up C_STATE_LATENCY control MSR settings for IRTL management.
7	0h RW	**Stage7 BIOS Reset Complete (RST_CPL7):** reset complete
6	0h RW	**Stage6 BIOS Reset Complete (RST_CPL6):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
5	0h RW	**Stage5 BIOS Reset Complete (RST_CPL5):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
4	0h RW	**Stage4 BIOS Reset Complete (RST_CPL4):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
3	0h RW	**Stage3 BIOS Reset Complete (RST_CPL3):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
2	0h RW	**Stage2 BIOS Reset Complete (RST_CPL2):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
1	0h RW	**Stage1 BIOS Reset Complete (RST_CPL1):** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
0	0h RW	**Stage0 BIOS Reset Complete (RST_CPL):** Set by BIOS to indicate that all power management configurations as part of reset are complete. This must include Punit patch load done as well as all relevant Punit power management register and mailbox configurations done. Once this bit is set, Punit will allow normal power management to start. Before setting this bit, P-states and C-states support is disabled. BIOS should wait before receiving the Pcode Stage0 reset complete before proceeding with any further steps.

3.508 BIOS_MAILBOX_DATA (P_CR_BIOS_MAILBOX_DATA_0_0_0_MCHBAR) — Offset 7080h

Data register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7080h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA:** This field contains the data associated with specific commands.

3.509 BIOS_MAILBOX_INTERFACE (P_CR_BIOS_MAILBOX_INTERFACE_0_0_0_MCHBAR) — Offset 7084h

Control and Status register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7084h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY:** SW may write to the two mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode. After setting this bit SW will poll this bit until it is cleared. PCODE will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:29	0h RO	**Reserved (RSVD):** Reserved
28:8	0h RW/V	**ADDRESS:** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND:** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

3.510 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR) — Offset 7088h

PUNIT_MMIO: Core Frequency Capabilities This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7088h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ:** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ:** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ:** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.

3.511 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR) — Offset 708Ch

PUNIT_MMIO: Graphics Engine Frequency Capabilities This register describes the frequency capabilities of the integrated graphics engine. Units are 16.67MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 708Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ:** Last resolved ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ:** Maximum supported ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ:** Minimum supported ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.

3.512 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR

(P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR) — Offset 7090h

PUNIT_MMIO: System Agent Frequency Capabilities This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio. Last resolved ratio is updated upon changes to the System Agent frequency.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7090h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO:** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0h RO/V	**MAX_RATIO:** max ratio
15:8	0h RO/V	**RESERVED_1:** Reserved
7:0	0h RO/V	**MIN_RATIO:** min ratio

3.513 Memory Frequency Status (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR) — Offset 7094h

This register reports out the LPDDR memory frequency. The actual capabilities of the SOC with respect to LPDDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7094h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Last Resolved Memory Frequency (LAST_RESOLVED_RATIO):** This field reports out the LPDDR memory frequency in integer multiple of 133.33MHz. This register reflects what BIOS has programmed as the default LPDDR frequency in products that do not support run-time memory frequency control. For products supporting run-time memory frequency control, this field describes the last resolved frequency.
23:16	0h RO/V	**RESERVED_2:** Reserved
15:8	0h RO/V	**RESERVED_1:** Reserved
7:0	0h RO/V	**RESERVED_0:** Reserved

3.514 Package Power SKU and RAPL Power Control Capabilities (P_CR_PACKAGE_POWER_SKU_0_0_0_MCHBAR) — Offset 70A0h

This register describes the the power SKU of the part and limits on time window and power limit configuration allowed in the RAPL PL1 and PL2 configuration registers.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 70A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:55	0h RO	**RESERVED_3:** Reserved
54:48	0h RW	**RAPL Maximum Allowed Time Window (PKG_MAX_WIN):** The maximal time window allowed to be programmed for RAPL PL1 and PL2 controls for the SKU. Higher values will be clamped to this value. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
47	0h RO	**RESERVED_2:** Reserved
46:32	0h RW	**RAPL Maximum Power Limit (PKG_MAX_PWR):** The maximal package power setting allowed for the SKU. Higher values will be clamped to this value. The maximum setting is typical not guaranteed. The default value for this field is determined by fuses. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].
31	0h RO	**RESERVED_1:** Reserved
30:16	0h RW	**Package Minimum Power (PKG_MIN_PWR):** The minimal package power setting allowed for the SKU. Lower values may not be achievable by run-time RAPL PL1 and PL2 control algorithms.
15	0h RO	**RESERVED_0:** Reserved
14:0	0h RW	**PKG_TDP:** The TDP package power setting allowed for the SKU. The TDP setting is typical not guaranteed. The default value for this field is determined by fuses. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].

3.515 Package RAPL Power Limit (P_CR_PACKAGE_RAPL_LIMIT_0_0_0_MCHBAR) — Offset 70A8h

Package RAPL Power Limit allows a software agent to define power limitation for the package domain. Power limitation is defined in terms of average power usage (Watts) over a time window specified. Two power limits and associated time windows can be specified. These power limits are commonly referred to as PL1 (long time window) and PL2 (short time window). Each power limit provides independent clamping control that would permit the processor cores to go below OS-requested state to meet the power

limits. A lock mechanism allow the software agent to enforce power limit settings. Once the lock bit is set, the power limit settings are static and un-modifiable until next RESET.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 70A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**Package RAPL Lock (PKG_PWR_LIM_LOCK):** When set all settings in this register are locked and are treated as Read Only. This lock control is persistent until the next reset. This bit will typically set by BIOS during boot time or resume from Sx.
62:56	0h RSV	**RESERVED_1:** Reserved
55:49	0h RW/L	**Power Limit 2 (PL2) Time Window (PKG_PWR_LIM_2_TIME):** Time window for Power Limit 1 (PL2). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
48	0h RW/L	**Power Limit 2 (PL2) Clamp (PKG_CLMP_LIM_2):** Clamp mode control for PL2. • 0 = PL2 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL2 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
47	0h RW/L	**Power Limit 2 (PL2) Enable (PKG_PWR_LIM_2_EN):** Enable for Power Limit 2 (PL2). Setting this bit activates the power limit and time window defined for PL2.
46:32	0h RW/L	**Power Limit 2 (PL2) (PKG_PWR_LIM_2):** Sets the average power usage limit of the package domain corresponding to the PL2 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL2 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.
31:24	0h RSV	**RESERVED_0:** Reserved
23:17	0h RW/L	**Power Limit 1 (PL1) Time Window (PKG_PWR_LIM_1_TIME):** Time window for Power Limit 1 (PL1). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/L	**Power Limit 1 (PL1) Clamp (PKG_CLMP_LIM_1):** Clamp mode control for PL1. • 0 = PL1 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL1 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
15	0h RW/L	**Power Limit 1 (PL1) Enable (PKG_PWR_LIM_1_EN):** Enable for Power Limit 1 (PL1). Setting this bit activates the power limit and time window defined for PL1.
14:0	0h RW/L	**Power Limit 1 (PL1) (PKG_PWR_LIM_1):** Sets the average power usage limit of the package domain corresponding to the PL1 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL1 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.

3.516 IA_PERF_LIMIT_REASONS (P_CR_IA_PERF_LIMIT_REASONS_0_0_0_MCHBAR) — Offset 70B0h

Interface to allow software to determine what is causing resolved frequency to be clamped below the requested frequency. Status bits are updated by Punit firmware every millisecond and log bits are set upon observing the corresponding status bit being set. Software may clear log bits to track performance limit reasons inbetween reads of this register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**QOS_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
30	0h RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
29	0h RW/0C/V	**FREQUENCY_ATTENUATION_LOG (MCT_LOG):** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
28	0h RW/0C/V	**EDP_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
27	0h RW/0C/V	**MAX_TURBO_LIMIT_LOG (MULTI_CORE_TURBO_LOG):** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
26	0h RW/0C/V	**VR_THERMALERT_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW/0C/V	**IA_UTILIZATION_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
24	0h RW/0C/V	**DEV3_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
23	0h RW/0C/V	**DEV2_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
22	0h RW/0C/V	**DEV3_POWER_THERMAL_LOG (SPARE6_LOG):** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
21	0h RW/0C/V	**DEV2_POWER_THERMAL_LOG (SPARE5_LOG):** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
20	0h RW/0C/V	**POWER_BALANCER_LOG (SPARE4_LOG):** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
19	0h RW/0C/V	**PL2_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
18	0h RW/0C/V	**PL1_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
17	0h RW/0C/V	**THERMAL_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
16	0h RW/0C/V	**PROCHOT_LOG:** Sticky log bit corresponding to the associated status bit in the lower 16 bits. Set by hardware when the status bit asserts. Cleared by software write of zero.
15	0h RO/V	**QOS_STATUS:** Frequency is limited below the quality of service level.
14	0h RO/V	**MAX_EFFICIENCY_FREQ_STATUS:** Frequency is limited below the maxiumum efficiency operation point.
13	0h RO/V	**FREQUENCY_ATTENUATION_STATUS (MCT_STATUS):** Frequency is limited due frequency transition filtering algorithms. This most commonly occurs as a result of high frequency C-state transitions that result in icc-max or turbo ratio limits induced clock frequency transitions.
12	0h RO/V	**EDP_STATUS:** Frequency is limited due electrical data point constraints such as VR icc-max or battery max power limits
11	0h RO/V	**MAX_TURBO_LIMIT_STATUS (MULTI_CORE_TURBO_STATUS):** Frequency is limited due maximum allowed per-core turbo clock frequency constraints. These may be product specific limitations or software programmed limits.
10	0h RO/V	**VR_THERMALERT_STATUS:** Frequency is limited due to a VR thermal excursion.
9	0h RO/V	**IA_UTILIZATION_STATUS:** requency is limited due to autonomous utilization-based P-state control, if supported on Broxton
8	0h RO/V	**DEV3_STATUS:** Frequency is limited due to camera (device3) driver override.
7	0h RO/V	**DEV2_STATUS:** Frequency is limited due to graphics (device2) driver override.
6	0h RO/V	**DEV3_POWER_THERMAL_STATUS (SPARE6_STATUS):** Frequency is limited due to camera (device3) driver override, and specifically as a result of camera being power or thermal limited. IA cores are being forced to run at the camera driver requested level while camera is power or thermally performance limited.
5	0h RO/V	**DEV2_POWER_THERMAL_STATUS (SPARE5_STATUS):** Frequency is limited due to graphics (device2) driver override, and specifically as a result of graphics being power or thermal limited. IA cores are being forced to run at the graphics driver requested level while graphics is power or thermally performance limited.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO/V	**POWER_BALANCER_STATUS (SPARE4_STATUS):** Frequency is limited due to cross-domain performance balancing as a result of package level power limits (either PL1 or PL2)
3	0h RO/V	**PL2_STATUS:** Frequency is limited due to a package-level RAPL PL2 excursion.
2	0h RO/V	**PL1_STATUS:** Frequency is limited due to a package-level RAPL PL1 excursion.
1	0h RO/V	**THERMAL_STATUS:** Frequency is limited due to thermal excursion.
0	0h RO/V	**PROCHOT_STATUS:** requency is limited due to external PROCHOT assertion, if supported on Broxton.

3.517 IA Core C0 Residency Counter (P_CR_TELEM_IA_C0_RESIDENCY_0_0_0_MCHBAR) — Offset 70C0h

This counter measures time that any core is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the IA Frequency Accumulator to calculate the average active clock ratio multiplier on the IA domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that any core is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

3.518 Graphics C0 Residency Counter (P_CR_TELEM_GT_C0_RESIDENCY_0_0_0_MCHBAR) — Offset 70C4h

This counter measures time that graphics is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the Graphics Frequency Accumulator to calculate the average active clock ratio multiplier on the GT domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70C4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that graphics is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

3.519 I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_C0_RESIDENCY_0_0_0_MCHBAR) — Offset 70C8h

This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16. This counter may be used along with the I-unit Frequency Accumulator to calculate the average active clock ratio multiplier on the I-unit domain. **Average Active Frequency = Frequency Accumulator / C0 Residency**

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**C0 Residency (DATA):** This counter measures time that I-unit processing system is active in the C0 state. This counter counts at the crystal clock frequency divided by 16.

3.520 TELEM_IA_FREQ_ACCUMULATOR (P_CR_TELEM_IA_FREQ_ACCUMULATOR_0_0_0_MCHBAR) — Offset 70CCh

Frequency accumulation data counted at ART >> 4

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70CCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA:** Residency data

3.521 Graphics C0 Residency Counter (P_CR_TELEM_GT_FREQ_ACCUMULATOR_0_0_0_MCHBAR) — Offset 70D0h

This counter integrates the current clock ratio multiplier for the Graphics domain at the same rate as the corresponding C0 residency counter. Its primary utility is in assessing the average active frequency of the domain **Average Active Frequency = Frequency Accumulator / C0 Residency**

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Clock Ratio Multiplier Accumulator (DATA):** This counter integrates the current clock ratio of the domain at the same rate as the corresponding C0 residency counter

3.522 I-unit Processing System C0 Residency Counter (P_CR_TELEM_IUNIT_FREQ_ACCUMULATOR_0_0_0_MCHBAR) — Offset 70D4h

This counter integrates the current clock ratio multiplier for the I-unit processing system domain at the same rate as the corresponding C0 residency counter. Its primary utility is in assessing the average active frequency of the domain **Average Active Frequency = Frequency Accumulator / C0 Residency**

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Clock Ratio Multiplier Accumulator (DATA):** This counter integrates the current clock ratio of the domain at the same rate as the corresponding C0 residency counter

3.523 Memory Active Residency (P_CR_TELEM_FAR_MEMORY_ACTIVE_0_0_0_MCHBAR) — Offset 70E8h

This counter measures the total time spent with memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 70E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO/V	**DATA:** This counter measures the total time spent with memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

3.524 Package Temperatures (P_CR_PACKAGE_TEMPERATURES_0_0_0_MCHBAR) — Offset 70F4h

Read-only register used for monitoring thermal status from all domains in the package.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 70F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**System Agent Temperature (SA_TEMPERATURE):** System agent domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
23:16	0h RO/V	**I-unit Temperature (ISP_TEMPERATURE):** Camera domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
15:8	0h RO/V	**Graphics Temperature (GT_TEMPERATURE):** Graphics domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
7:0	0h RO/V	**IA Core Temperature (IA_TEMPERATURE):** Virtual max temperature of all IA cores in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered

3.525 Package Thermal Limit Control (P_CR_THERMAL_LIMIT_CONTROL_0_0_0_MCHBAR) — Offset 7104h

This register is used for run-time control of the package level virtual thermal sensor. This interrupt and threshold is most commonly utilized by drivers wishing to control maximum silicon temperature in order to manage local or system level thermals due to various physical constraints. This temperature configuration applies only to in-die thermal sensors and not to any DRAM related thermal control.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7104h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**ENABLE:** When set, it enables run-time thermal limit control to the THERMAL_LIMIT_TEMP described in this register.
7:0	0h RW	**Package Thermal Limit Temperature (THERMAL_LIMIT_TEMP):** Maximum SOC temperature allowed. Described in a signed, 2's complement format with the least significant bit representing 1'C resolution (S8.7.0). If the setting is higher than the processor's factory configured maximum temperature as described in the TEMPERATURE_TARGET MSR, this field is ignored. This field may be updated at any time.

3.526 Memory Subsystem Frequency Capabilities (P_CR_MEMSS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR) — Offset 7108h

Describes the maximum frequency capabilities of DDR supported on this particular SOC. If the maximum supported frequency reports a zero, it indicates that the respective DRAM technology is not supported on this product.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7108h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Reserved (NUM_NM_CH):** Reserved
29:24	0h RW	**Reserved (WIO_FREQ):** Reserved
23:18	0h RW	**LPDDR4 Max Frequency (LP4_FREQ_HIGH):** This field indicates maximum LPDDR4 frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates LPDDR4 is not supported.
17:12	0h RW	**LPDDR4 Max Frequency at Min Voltage (LP4_FREQ_LOW):** This field indicates maximum LPDDR4 frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as 'Max' frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR4 is not supported.
11:6	0h RW	**LPDDR3 Max Frequency (LP3_FREQ_HIGH):** This field indicates maximum LPDDR3 frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates LPDDR3 is not supported.
5:0	0h RW	**LPDDR3 Max Frequency at Min Voltage (LP3_FREQ_LOW):** This field indicates maximum LPDDR3 frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as 'Max' frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR3 is not supported.

3.527 Memory Controller (MC) BIOS Reset Request and Status (P_CR_MC_BIOS_REQ_0_0_0_MCHBAR) — Offset 7114h

This register is used as the primary interface between BIOS and P-unit with respect to the Memory sub-system reset flow. This register provides both details about the current memory configuration as well as memory power-up sequencing controls. The typical memory subsystem reset and configuration flow is as follows. Each bullet describes the strict sequential ordering of the flow.

- BIOS reads MEMSS_FREQUENCY_CAPABILITIES to discover silicon capabilities.
- BIOS detects LPDDR DRAM frequency and the number of LPDDR channels that have DRAM devices attached. These results are then configured into the LPDDR channel active and frequency configuration fields.
- BIOS discovers if DRAM is currently in self-refresh, and if so, it configures Request Type (REQ_TYPE) to 100b to indicate this state. The SOC then uses this information as a way to ensure proper self-refresh exit flows as part of power-up sequencing.
- Once the lower 16 bits of the MC_BIOS_REQ register are configured based on platform discovery, BIOS sets Run/Busy to initiate firmware to start the memory subsystem reset sequence.

- P-unit firmware executes the initial configuration of PHY settings, and when complete it clears Run/Busy bit
- BIOS executes DDR PHY static configuration flow and initializes PHY PLL, and ensures that both steps are complete
- BIOS sets MC_BIOS_REQ.PHY_CONFIG_COMPLETE and MC_BIOS_REQ.RUN_BUSY to start the next phase
- P-unit firmware initiates the power-up sequence for D-units and Wide I/O collateral logic.
- P-unit firmware sets MC_BIOS_REQ.DUNIT_RESET_COMPLETE and clears the Run/Busy when it is done.
- BIOS observes Run/Busy deassertion and continues with MRC flow to initilize, train, configure memory subsystem settings.
- BIOS sets MC_BIOS_REQ.CPGC_MODE_COMPLETE and MC_BIOS_REQ.RUN_BUSY to start the next phase
- P-unit firmware configures D-unit, PHY to support normal operation of memory subsystem, and when completed, clears the Run/Busy bit
- BIOS waits for MC_BIOS_REQ.RUN_BUSY to clear, and then complete remaining configuration of Dunit and MLMC.
- BIOS executes memory configuration validation and lock sequence with the CSE.
- BIOS sets MC_BIOS_REQ.MEM_INIT_DONE and MC_BIOS_REQ.RUN_BUSY to indicate to Punit that all memory configuration is complete and memory configuration is locked.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7114h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Run/Busy (RUN_BUSY):** This bit indicates that the BIOS request is pending for P-unit firmware processing. BIOS sets this bit together with command details defined in the lower bits of this register. Firmware may only clear this bit after the BIOS request has been observed and completed. • 0 = The MC BIOS reset mailbox is idle or the last request has been completed. Software may initiate new requests. • 1 = The MC BIOS reset mailbox is busy. It is still handling a request. Writes to the mailbox are not allowed at this time.
30:27	0h RW	**RESERVED_2:** Reserved
26:24	0h RW	**DRAM_TYPE:** BIOS programs DRAM type filed: • 001b = Reserved • 010b = LPDDR4 • 100b = Reserved • 101b = DDR4 • else = reserved
23:20	0h RW	**RESERVED_1:** Reserved
19	0h RW	**Memory Init Done (MEM_INIT_DONE):** BIOS programs this bit after memory subsystem is fully configured, including security locking configuration completed

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**CPGC Mode Complete (CPGC_MODE_COMPLETE):** BIOS programs this bit after the memory train/init flow is complete. This initiates P-unit firmware execution of memory and D-unit clock configuration settings for normal operation
17	0h RW	**D-unit Reset Complete (DUNIT_RESET_COMPLETE):** Punit programs this bit after memory subsystem IPs are powered and corresponding reset flows are complete. At this point, those blocks are ready for executing the memory training flow, including initialization to support CPGC mode.
16	0h RW	**Memory PHY Configuration Complete (PHY_CONFIG_COMPLETE):** BIOS programs this bit indicating PHY initial configuration is complete and all DDR PHY PLLs are locked. Upon observation of this flag, P-unit firmware will initiate the power-up sequence of memory subsystem related IPs
15	0h RW	**DDR Channel 11 Active (FM_CH3_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
14	0h RW	**DDR Channel 00 Active (FM_CH2_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
13	0h RW	**DDR Channel 10 Active (FM_CH1_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active
12	0h RW	**DDR Channel 01 Active (FM_CH0_ACTIVE):** BIOS writes this value to indicate a DDR memory channel has DRAM devices active to allow the channel to have active memory traffic. Note, by default, a channel is not active and BIOS needs to explicitly program a value of 1 to indicate that the channel is active. If a channel is fused off on a particular SOC, BIOS input is ignored: • 0 = channel not active • 1 = channel active

10	0h RW	**RESERVED_0:** Reserved
9	0h RW	**RESERVED_3 (REQ_TYPE_SPECIAL):** Reserved
8:6	0h RW	**Request Type (REQ_TYPE):** This field is used to configure reset hints to the P-unit firmware. Encodings include: • 1xxb = Memory is in self-refresh, manual self-refresh exit is required • 0xxb = Memory is not in self-refresh or DRAM contents do not need to be preserved.
5:0	0h RW	**DDR Frequency Configuration (REQ_DATA):** BIOS programs this field to request DDR frequency in integer multiple of 133.33MHz. BIOS reads MEMSS_FREQUENCY_CAPABILITIES register(s) to discover maximum SOC supported capabilities. And BIOS is expected to request only legal DDR frequencies that are equal or lower than the maximum SOC supported capabilities.

3.528 P_CR_MEMSS_FREQUENCY_CAPABILITIES1_0_0_0_MCHBAR — Offset 7118h

Describes the maximum frequency capabilities of DDR supported and DDR configuration on this particular SOC. If the maximum supported frequency reports a zero, it indicates that the respective DRAM technology is not supported on this product.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7118h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RW	**RESERVED_2:** Reserved
24	0h RW	**DDR_CONFIG_LIMITATION:** Describe the DDR configuration limitation of this particular SOC: • 0 = no DDR configuration limitation • 1 = DDR configuration is limited to1ch x 64-bit DDR3L, or 2ch x32 LPDDR3 or LPDDR4
23:18	0h RW	**DDR4_FREQ_HIGH:** This field indicates maximum DDR4 frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates DDR4 is not supported
17:12	0h RW	**DDR4_FREQ_LOW:** This field indicates maximum DDR4 frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as Max frequency, it indicates there is no voltage scaling. A value of zero indicates DDR4 is not supported
11:6	0h RW	**DDR3L Max Frequency (DDR3L_FREQ_HIGH):** This field indicates maximum DDR3L frequency that SOC supports, in integer multiple of 133.33MHz. A value of zero indicates DDR3L is not supported.
5:0	0h RW	**DDR3L Max Frequency at Min Voltage (DDR3L_FREQ_LOW):** This field indicates maximum DDR3L frequency supported at the minimum voltage level, in integer multiple of 133.33MHz. If this frequency is the same as Max frequency, it indicates there is no voltage scaling. A value of zero indicates LPDDR4 is not supported.

3.529 PP1_C0_CORE_CLOCK_0_0_0_MCHBAR (P_CR_PP1_C0_CORE_CLOCK_0_0_0_MCHBAR) — Offset 7160h

GT RC0 residency counter. Holds the accumulated number of CS clks that GT has been in RC0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7160h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA:** Accumulated cycles GT has been in RC0.

3.530 Core Exists Vector (P_CR_CORE_EXISTS_VECTOR_0_0_0_MCHBAR) — Offset 7164h

Indication of the physical presence of IA cores in this silicon. IA core modules are defined as containing pairs of cores and an associated L2 cache. Module existance can therefore be inferred by OR'ing pairs of COREx_EXISTS in this register. This register does not reflect the impact of any software-based core disabling. It always reflects the capabilities of the silicon.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7164h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**CORE3_EXISTS:** Indication of core physical presence
2	0h RW	**CORE2_EXISTS:** Indication of core physical presence
1	0h RW	**CORE1_EXISTS:** Indication of core physical presence
0	0h RW	**CORE0_EXISTS:** Indication of core physical presence

3.531 Software Core Disable Mask (P_CR_CORE_DISABLE_MASK_0_0_0_MCHBAR) — Offset 7168h

Software may disable cores using this interface. The bit definition of this register exactly matches that defined in the CORE_EXISTS_VECTOR register. Punit firmware will apply the mask programmed into this register against the CORE_EXISTS_VECTOR to establish the resolved cores and modules to power up after a cold reset. The flow is as follows:

- Cold boot
- BIOS reads CORE_EXISTS_VECTOR to establish which modules and cores are present
- BIOS writes 1b to the corresponding core that it wishes to **disable**.
- BIOS may disable entire modules by writing 1b to a pair of cores.
- The results of the configuration are maintained in the sustain power well.
- BIOS initiates a cold reset flow at the platform. In a cold reset, the sustain power well maintains power most other rails are power cycled.
- On cold reset exit, Punit firmware inspects the core configuration and launches only the cores requested by BIOS. To software, it will appear as if these cores do not exist.

Software may discover the resolved core exists vector: resolved_core_exists_vector = (!CORE_DISABLE_MASK) & CORE_EXISTS_VECTOR

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7168h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**CORE3_DISABLE_MASK:** core3 disable mask
2	0h RW	**CORE2_DISABLE_MASK:** core2 disable mask
1	0h RW	**CORE1_DISABLE_MASK:** core1 disable mask
0	0h RW	**CORE0_DISABLE_MASK:** core0 disable mask

3.532 PL3 and PL4 Control (P_CR_PL3_CONTROL_0_0_0_MCHBAR) — Offset 71F0h

Control Power Limit 3 (PL3) and Power Limit 4 (PL4) using this register. This limit control is physically different from the same control in the IA core MSR space.

- PL3 is designed to clamp peak sustained power to levels supported by the battery or input power supply and as such manage lifetime degradation of that power delivery element. With PL3, peak power excursions above the limit are allowed so long as they do not exceed the configured duty cycle constraint in this register.
- PL4 is designed to clamp peak instantaneous power to levels below the max supported by the battery or input power supply. These clamps are implemented a priori and the SOC is guaranteed to constrain itself below the PL4 limit always.

Type	Size	Offset	Default
MEM	64 bit	[B:0, D:0, F:0] MCHBAR + 71F0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**LOCK:** Write a 1b to lock this register until next reset. Once locked, no further updates may be written to any bits in the register.
62:48	0h RO	**Reserved (RSVD):** Reserved
47	0h RW/L	**PL4 Enable (PL4_ENABLE):** • 0 = disabled • 1 = enabled

Bit Range	Default & Access	Field Name (ID): Description
46:32	0h RW/L	**PL4 Max Power (PMAX):** Power Limit 'PL4' or Pmax power limit in the units as described PACAKGE_POWER_SKU_UNIT MSR. The SOC guarantees it will never exceed this power limit even for very short time windows.
31	0h RO	**Reserved (RSVD):** Reserved
30:24	0h RW/L	**PL3 Duty Cycle (DUTY_CYCLE):** Power limit excursion duty cycle control for PL3, describing what percentage of time it is allowed for the SOC to exceed the programmed PL3 power limit. 0% implies excursions are not supported ever and 100% implies excursions are always allowed (effectively disabling the feature). Units are in percentage(%). E.g., to allow for 20% excursion time and 80% PL3 power limit clamp time, program a value of 14h. Values greater than 100 (64h) are clipped to 100%.
23:17	0h RW/L	**PL3 Time Window (TIME_WINDOW):** Duration over which duty cycle control will be maintained. The bits of this field describe parameters for a mathematical equation for time window configuration. This time window is strictly adhered to, if the window described is 40ms, then silicon guarantees no excursions to the programmed duty cycle within a rolling 40ms window. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW/L	**PL3 Enable (PL3_ENABLE):** • 0 = disabled • 1 = enabled
14:0	0h RW/L	**PL3 Power Limit (POWER_LIMIT):** Power Limit 3 (PL3) or PAppMax power level. Any SOC power measurement observed above this level is considered as an excursion against the PL3 power limit and duty cycle / time window budget. Units of this power limit are defined by PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.

3.533 Graphics Superqueue Active Clocks (P_CR_PP1_ANY_THREAD_ACTIVITY_0_0_0_MCHBAR) — Offset 7244h

Graphics Superqueue active residency counter. Counts at the crystal clock frequency divided by 16.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7244h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Superqueue Active Residency (SUPERQUEUE_ACTIVE_RESIDENCY):** Graphics Superqueue active residency counter. Counts in crystal reference clocks divided by 16.

3.534 LPDDR DRAM Thermal (MR4) Status of Channel 00 (P_CR_MEM_MR4_TEMPERATURE_DEV3_0_0_0_MCHBAR) — Offset 7248h

LPDDR DRAM Thermal (MR4) Status of Channel 00, when there are multiple DRAMs in a rank, the maximun MR4 is reported

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7248h	0 h

17:16	0h RO/V	**Snoop Required Vector (SNP_REQ_VEC):** Allows Debug to dynamically read this state in the T-Unit.
15	0h RW	**C2U Data Tracking Disabled (C2U_DATA_TRACK_DIS):** When set, this bit disables the tracking of c2u_data for IDI shutdown qualification. A stop_idi sideband request requires that T-unit drain all u2c requests, and wait for all outstanding c2u responses and c2u data to return, before responding with the u2c_done sideband message to SoC.
14	0h RO	**IWB_FORWARDING_EN:** When an IWB comes into to B-unit, let it write the BRAM, even if the btag entry is locked waiting on the memory read return. Also, once written into the BRAM, let the tub2xdata logic consider the ooaq entry as ready to receive data. These two allowances will forward the IWB data to the requester, without waiting on the memory read return.
13:12	0h RW	**Spare 2 (SPARE2):** Spare bits for hardware.

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RW	**SPARE:** Readable and Writable Spare bits. SPARE[0] has been consumed. It is used by PCODE to bypass IDI_SHUTDOWN detection and will force IDI CSM FSM indicator to 1 for pgcb/idle detection.
7	0h RO	**Reserved (RSVD):** Reserved
6	0h RW	**GO-ACK FIFO Empty Check Disable (GO_ACK_FIFO_EMPTY_CHECK_DIS):** When set, the T-unit will NOT wait for the per-agent GO-ACK FIFO to be empty before accepting a stopidi request from the associated agent.
5	0h RW	**IDI_SHUTDOWN Bypass (IDI_SHUTDOWN_BYP):** Used by PCODE to bypass IDI_SHUTDOWN detection and will force IDI CSM FSM indicator to 1 for pgcb/idle detection.
4:1	0h RW	**DPTE Count (DPTE_CNT):** This field controls the number of cycles between sending Dynamic Prefetch Throttle Update Events to each IDI Attach Point. The 4-bit value in this field is N and the Count is 2 to the Nth power. • 0: T-Unit can send a DPTE every cycle. • 1: T-Unit can send a DPTE every 2 cycles. • 2: T-Unit can send a DPTE every 4 cycles. • 3: T-Unit can send a DPTE every 8 cycles. • 4: T-Unit can send a DPTE every 16 cycles. • 15: T-Unit can send a DPTE every 32768 cycles.
0	0h RW	**DPTE Enable (DPTE_EN):** • 0: Dynamic Prefetch Throttle Events are Disabled. • 1: Dynamic Prefetch Throttle Events are Enabled.

3.540 Control (CTL_MCHBAR) — Offset 7810h

Control register for various T-Unit knobs.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7810h	4B000000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved 1 (RESERVED_1):** Reserved
30	1h RW	**ISOCH_BW_FIX_DIS:** Disable A-Unit blocking snooped traffic during IA/GT P-state transitions.
29:24	Bh RW	**ISOCH Shared Reserve (ISOCH_SHARED_RESV):** The number of shared T2A cmd credits to reserve for ISOCH level traffic.
23:22	0h RO	**Reserved 0 (RESERVED_0):** Reserved
21	0h RW	**Use PIC_End NACK (USE_PIC_END_NACK):** Normally, when GLM asserts pm_block_req and interrupt_ready is cleared, T-Unit finishes any active interrupt and then responds back with pic_end.
20	0h RW	**Disable Snooping GT (DISABLE_SNOOPING_GT):** • 0: Default. Snoop GT as normal. • 1: Never snoop GT for any access from an agent.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Disable Opportunistic Slice 1 Schedule (DISABLE_OPPORTUNISTIC_SLICE1_SCHEDULE):** • 0: Default. Global B2X data selector will opportunistically schedule TSlice1 B2X selected data in the odd cycle if TSlice0 B2X selected data is not available. • 1: Global B2X data selector will always schedule TSlice1 B2X selected data only in the even cycle.
18	0h RW	**Disable IOSF High Priority Read Data Return (DISABLE_ISOC_HIGHPRI_RDDATA_RETURN):** Disables IOSF high priority read data returns and treats all read data scheduling as normal priority.
17	0h RW	**Enable NPC Collector (ENABLE_NPC_COLLECTOR):** This bit is not connected to anything.
16	0h RW	**Enable In Order APIC (ENABLE_IN_ORDER_APIC):** When 0, has no affect; When 1, forces all interrupts to bypass the piclets, and wait until all targeted cores are awake before delivering the interrupt. The APIC block will send int_wake to P-Unit for each targeted core. Note that using this bit could cause deadlock.
15	0h RW	**TG Enable High Priority Write Pulls (TG_HIGHPRI_WRITE_PULLS):** Enable High Priority Write Pulls. When 1 the X2B Data Selector will prioritize write pulls that the B-Unit has flagged as high priority over other write pulls.
14	0h RW	**TG Disable Live BRAM Bypass to PII2 (TG_LIVE_DATA_PII2):** Disable Live BRAM Bypass to PII2 Mode. When 1 all data to PII2 Agents will be returned from reading the BRAM.
13	0h RO	**TG Half Tunnel (TG_HALF_TUNNEL):** Enable IDI Half Tunneling. By Default IDI Half Tunneling is not required for proper functionality. This should only be enabled in an Intel Debug setting on Dual Core SoCs.
12	0h RW	**TG Disable nonDRAM Snoops (TG_NDRAMSNP):** Disable nonDRAM Snoops. • 0: SA will snoop nonDRAM Memory Addresses, including Memory Mapped IO MMIO and Memory Mapped Enhanced Config Space. • 1: SA will not snoop nonDRAM Memory Addresses. This includes the standard Memory Read/Write opcodes as well as SetMonitor. There is one exception since the SA will always issue Snoop Invalidate for CLFlush opcodes even if the address is not DRAM. Note: the Monitor Logic can still be armed and triggered using a nonDRAM address.
11	0h RO	**TG Read Data BW Mode (TG_RD_BW_MODE):** Read Data BW Mode. This Configuration Mode only affects behavior on SOCs that support two 64bit DDR3 Channels. For these SOCs this mode bit performs the following function: • 0: Enhanced Read BW mode for 2x64b DDR3 Channels. • 1: Basic Read BW mode. All other SOCs this mode bit performs the following function: • 0: Basic Read BW mode. • 1: Reserved.
10	0h RW	**TG Disable Downstream Posted Push Logic Mode (TG_DW_POST_PUSH_LOG):** Disable Downstream Posted Push Logic Mode. • 0: DRAM Read Completions to IOSF VC0 are stalled in the BRAM until all prior downstream Posted Requests from IDI are pushed into the Aunit. This ensures proper PCI Producer/Consumer Ordering Rules. • 1: Disables the Posted Push Logic. Note this mode violates the Producer/Consumer Ordering rules.
9	0h RW	**TG Set Monitor Snoop Configuration (TG_MON_SNP_CFG):** Set Monitor Snoop Configuration. Defines the Snoop opcode that will be sent for Set Monitor requests from IDI Agents: • 0:SnpCode default • 1:SnpInv

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Broadcast APIC (BCAST_APIC):** Broadcast APIC Mode. When 1 T-Unit will wake up all IDI attach points and broadcast APIC messages to all attach points not just the IDI attach points that needs to receive the APIC message. Note: The T-Unit does not change the APIC ID to the broadcast APIC ID. What is meant by Broadcast is the Interrupt message is sent to all IDI Attach Points. For directed interrupts the directed interrupt is sent to all Attach Points with the unmodified APIC ID. For redirected interrupts the T-Unit performs the standard redirection algorithm fixed roundrobin or PAIR selects 1 APIC ID to send the message but then sends the message to all IDI Attach Points.
7	0h RW	**SNPINV:** SnpInv only when 1 T-Unit will only send SnpInv. This disables all other Snoop types e.g. SnpCode SnpData.
6	0h RW	**UC Code Read Snoop Configuration (UC_CODE_RD_CFG):** Code Read Snoop Configuration. The SA will send the following U2C Request for Code Reads from IDI Agents. • 0: SnpCode default. • 1: SnpInv.
5:4	0h RW	**PII2 Snooped Read (PII2_SNP_RD):** PII2 Snooped Read Configuration. The SA will send the following U2C Request for Snooped Reads from PII2 Agents. • 00b: Reserved. • 01b: SnpCode. • 10b: SnpData. • 11b: SnpInv default. Note: In order to use SnpCode or SnpData the B-Unit must be configured to disable the Owned Feature.
3	0h RW	**Always Snoop IDI Requests (ALWAYS_SNP_IDI):** IDI initiated requests will always be snooped even if Selfsnoop is not set and even if a Snoop Filter indicates no need to snoop.
2	0h RW	**Disable Live BRAM Bypass to IDI (DIS_LIVE_BRAM_BYP_IDI):** Disable Live BRAM Bypass to IDI Mode. When 1 all data to IDI Agents will be returned from reading the BRAM.
1	0h RW	**Outstanding Snoop (OUTSTND_SNP):** 1: Outstanding Snoop Mode. When 1, do not send any snoops if there is an outstanding Snoop from an IDI Read or Write to ECAM memory mapped Config space that has not yet received all Snoop Replies. Also, do not send any snoops if there is an outstanding Snoop from an IDI Read to MMIO that has not yet received all Snoop Replies.
0	0h RW	**Always Snoop PII2 Requests (ALWAYS_SNP_PII2):** Always Snoop PII2 Requests Mode. Before setting this bit note the following: There is a performance optimization in the B-Unit to allow multiple Snooped Writes from PII2 Agents to the same line. The B-Unit converts all but the 1st Snoop Write to be NonSnooped. Because of this, the Snoop Everything Mode should only be enabled if 1 of the following is true: T-Unit 1 Outstanding Snoop Mode is enabled OR B-Unit has been configured to disable request combining. Even when this mode is enabled the T-Unit will never snoop Memory Requests that map to MMIO from a PII2 Agent. These requests are treated as IMR violations and also the snoop is suppressed.

3.541 PSMI Control (PSMI_CTL_MCHBAR) — Offset 7814h

PSMI Control register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7814h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved 2 (RESERVED_2):** Reserved
7	0h RO	**Reserved 1 (RESERVED_1):** Reserved
6:5	0h RW	**Select IDI Attach Point (SEL_IDI_ATTACH):** Selects IDI Attach Point. i.e. Module to capture/replay. • 00b: IDI Attach Point 0 • 01b: IDI Attach Point 1 • 10b: Reserved • 11b: Reserved
4:3	0h RW	**PSMI Gear Ratio (PSMI_GEAR_RATIO):** PSMI Gear Ratio Select. • 00b: IDI transfers can occur every CZclock default • 01b: IDI transfers can occur every 2 CZclocks • 10b: IDI transfers can occur every 4 CZclocks • 11b: IDI transfers can occur every 8 CZclocks
2	0h RO	**Reserved (RESERVED_0):** Reserved
1	0h RW	**PSMI Replay Mode (PSMI_REPLAY_MODE):**
0	0h RW	**SA Capture Mode (SA_CAPTURE_MODE):** Note: If SA Capture Mode is enabled then SSA Replay Mode and P-Unit Replay Mode are ignored.

3.542 Miscellaneous T2A selector (T2A_SELECTOR_MISC_MCHBAR) — Offset 7818h

This register will provide miscellaneous features and controls for the T2A selector downstream block in the T-Unit.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7818h	380014A0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	38h RW	**PII_IDLE_THRESHOLD:** Number of 1x cycles that BT-unit PII idle conditions should exist before the ISM requests idle. The restart time of PII BGFs is on the order of 150 to 210 ns. To avoid this penalty, idle should not be entered too quickly.
23:15	0h RW	**Spare (SPARE1):** Spare register bits for read/write.
14:10	5h RW	**Maximum Downstream Nonposted Requests Issued For VC0b (MAX_DS_NP_VC0B):** Maximum number of downstream nonposted requests the T2A selector can issue for VC0b. This value should be programmed to less than or equal to the MAX_DS_NP field value but hardware will cap it at that value regardless.
9:5	5h RW	**Maximum Downstream Nonposted Requests Issued For VC0a (MAX_DS_NP_VC0A):** Maximum number of downstream nonposted requests the T2A selector can issue for VC0a. This value should be programmed to less than or equal to the MAX_DS_NP field value but hardware will cap it at that value regardless.
4:0	0h RW	**Spare (SPARE0):** Spare register bits for read/write.

3.543 VC Read Ordering CFG (VC_READ_ORDERING_CFG_MCHBAR) — Offset 781Ch

Register that indicates whether a particular B2T agent ID is configured to be inorder 1 or can be outoforder 0 for read accesses. This is will cause the access to be routed through the upstream ordering block value of 1 in the VCs bit or not value of 0 in the VCs bit. This register is not meant to be a dynamic ability to change inorder/outoforder nature and should be programmed by BIOS before devices are allowed to access memory. Note that reset value should work without a write. The IDI attaches are not upstream VCs or subject to the Upstream Ordering Block but to keep the handling generic bits will be hardwired to 0 for each IDI attach in the system.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 781Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved 0 (RESERVED_0):** Reserved
15	0h RW	**UPSTREAM_VC15 (UPSTREAM_VC15_IN_ORDER):** Configuration bit for upstream VC15 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
14	0h RW	**UPSTREAM_VC14 (UPSTREAM_VC14_IN_ORDER):** Configuration bit for upstream VC14 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
13	0h RW	**UPSTREAM_VC13 (UPSTREAM_VC13_IN_ORDER):** Configuration bit for upstream VC13 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
12	0h RW	**UPSTREAM_VC12 (UPSTREAM_VC12_IN_ORDER):** Configuration bit for upstream VC12 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
11	0h RW	**UPSTREAM_VC11 (UPSTREAM_VC11_IN_ORDER):** Configuration bit for upstream VC11 inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
10	0h RW	**UPSTREAM_VC1BMMU_IN_ORDER:** Configuration bit for upstream VC1Bmmus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
9	0h RW	**UPSTREAM_VC0BMMU_IN_ORDER:** Configuration bit for upstream VC0Bmmus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
8	0h RW	**UPSTREAM_VC0AMMU_IN_ORDER:** Configuration bit for upstream VC0Ammus inorder read handling. 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
7	0h RW	**Upstream VCBR In Order (UPSTREAM_VCBR_IN_ORDER):** Configuration bit for upstream VCbrs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC
6	0h RW	**Upstream VC2C In Order (UPSTREAM_VC2C_IN_ORDER):** Configuration bit for upstream VC2cs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Upstream VC2B In Order (UPSTREAM_VC2B_IN_ORDER):** Configuration bit for upstream VC2bs inorder read handling. • 1: Indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block • 0: Indicates that it is an outoforder VC
4	0h RW	**Upstream VC2A In Order (UPSTREAM_VC2A_IN_ORDER):** Configuration bit for upstream VC2as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
3	0h RW	**Upstream VC1B In Order (UPSTREAM_VC1B_IN_ORDER):** Configuration bit for upstream VC1bs inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
2	0h RW	**Upstream VC1A In Order (UPSTREAM_VC1A_IN_ORDER):** Configuration bit for upstream VC1as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
1	0h RW	**Upstream VC0B In Order (UPSTREAM_VC0B_IN_ORDER):** Configuration bit for upstream VC0bs inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
0	0h RW	**Upstream VC0A In Order (UPSTREAM_VC0A_IN_ORDER):** Configuration bit for upstream VC0as inorder read handling. • 1 indicates that it is an inorder VC and reads must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

3.544 VC Write Ordering CFG (VC_WRITE_ORDERING_CFG_MCHBAR) — Offset 7820h

Register that indicates whether a particular B2T agent ID is configured to be inorder 1 or can be outoforder 0 for write accesses. This is will cause the access to be routed through the upstream ordering block value of 1 in the VCs bit or not value of 0 in the VCs bit. This register is not meant to be a dynamic ability to change inorder/outoforder nature and should be programmed by BIOS before devices are allowed to access memory note that reset value should work without a write. The IDI attaches are not upstream VCs or subject to the Upstream Ordering Block but to keep the handling generic bits will be hardwired to 0 for each IDI attach in the system.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7820h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved 0 (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**UPSTREAM_VC15 (UPSTREAM_VC15_IN_ORDER):** Configuration bit for upstream VC15 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
14	0h RW	**UPSTREAM_VC14 (UPSTREAM_VC14_IN_ORDER):** Configuration bit for upstream VC14 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
13	0h RW	**UPSTREAM_VC13 (UPSTREAM_VC13_IN_ORDER):** Configuration bit for upstream VC13 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
12	0h RW	**UPSTREAM_VC12 (UPSTREAM_VC12_IN_ORDER):** Configuration bit for upstream VC12 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
11	0h RW	**UPSTREAM_VC11 (UPSTREAM_VC11_IN_ORDER):** Configuration bit for upstream VC11 inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
10	0h RW	**UPSTREAM_VC1BMMU_IN_ORDER:** Configuration bit for upstream VC1Bmmus inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
9	0h RW	**UPSTREAM_VC0BMMU_IN_ORDER:** Configuration bit for upstream VC0Bmmus inorder write handling. 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. 0 indicates that it is an outoforder VC.
8	0h RW	**Upstream VC0MMU In Order (UPSTREAM_VC0AMMU_IN_ORDER):** Configuration bit for upstream VC0mmus inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
7	0h RW	**Upstream VCBR In Order (UPSTREAM_VCBR_IN_ORDER):** Configuration bit for upstream VCbrs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
6	0h RW	**Upstream VC2C In Order (UPSTREAM_VC2C_IN_ORDER):** Configuration bit for upstream VC2cs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
5	0h RW	**Upstream VC2B In Order (UPSTREAM_VC2B_IN_ORDER):** Configuration bit for upstream VC2bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
4	0h RW	**Upstream VC2A In Order (UPSTREAM_VC2A_IN_ORDER):** Configuration bit for upstream VC2as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
3	0h RW	**Upstream VC1B In Order (UPSTREAM_VC1B_IN_ORDER):** Configuration bit for upstream VC1bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
2	0h RW	**Upstream VC1A In Order (UPSTREAM_VC1A_IN_ORDER):** Configuration bit for upstream VC1as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Upstream VC0B In Order (UPSTREAM_VC0B_IN_ORDER):** Configuration bit for upstream VC0bs inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.
0	0h RW	**Upstream VC0A In Order (UPSTREAM_VC0A_IN_ORDER):** Configuration bit for upstream VC0as inorder write handling. • 1 indicates that it is an inorder VC and writes must be handled by the Upstream Ordering Block. • 0 indicates that it is an outoforder VC.

3.545 IDI0 C2U Credit Control (IDI0_C2U_CREDIT_CTRL_MCHBAR) — Offset 7824h

This register will provide the number of credits that IDI C2U channels should be initialized to and other control mechanisms around IDI start/stop flows. A register will be provided per IDI attach to allow for individual IDI tuning. This register will be for the agent attached to IDI0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7824h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved 0 (RESERVED_0):** Reserved
17:12	0h RW	**IDI IA C2U Data Credit Initialization (IDI_IA_C2U_DATA_CREDIT_INIT):** This register is the number of credits to initialize C2U data credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress data queue size in B-Unit. This provides an ability to limit data credits at the next IDI start request change will only take place after the next IDI start request. The default value of this register should work out of reset.
11:6	0h RW	**IDI IA C2U Response Credit Initialization (IDI_IA_C2U_RSP_CREDIT_INIT):** This register is the number of credits to initialize C2U response credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U response shim ingress queue size in T-Unit. This provides an ability to limit response credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.
5:0	0h RW	**IDI IA C2U Request Credit Initialization (IDI_IA_C2U_REQ_CREDIT_INIT):** This register is the number of credits to initialize C2U requests credits for the IDI attach point associated with this register. It is not legal to program this field to a value larger than the C2U ingress queue size in Badmit. This provides an ability to limit request credits at the next IDI start request. Change will only take place after next IDI start request. The default value of this register should work out of reset.

3.546 IDI1 C2U Credit Control (IDI1_C2U_CREDIT_CTRL_MCHBAR) — Offset 7828h

This register will provide the number of credits that IDI C2U channels should be initialized to and other control mechanisms around IDI start/stop flows. A register will be provided per IDI attach to allow for individual IDI tuning. This register will be for the agent attached to IDI1.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:0, F:0] MCHBAR + 7828h	0 h

Bit Range	Default & Access	Field Name (ID): Description

3.563 PMTA_MEE_BIOS_CONFIG (PMTA_MEE_BIOS_CONFIG)—Offset 4C18h

Shadow register for the Slicehash maintained in the MEE; Copy of the B_CR_SLICE_CHANNEL_HASH register (not used) with poison bit added at bit 5.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 3C00000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**LOCK (LOCK):** When set all writes to this register will be dropped
62:52	0h RO	**RESERVED_3 (RESERVED_3):** Reserved
51:38	0h RW/L	**CH_HASH_MASK (CH_HASH_MASK):** When both PMI channels in a slice are enabled this field specifies the Channel Hash Mask to be applied on Addr[19:6] postremap DRAM address of the request to compute which PMI channel a request must be routed to. Relevant only when HVM mode is disabled and only for requests that do not fall under the MOT region. Bunit will override the programmed value to include the Channel Selector bit. Additionally Bunit will remove the Slice Selector bit. See INTERLEAVE_MODE field. Note that HVM mode and MOT regions have special hash requirements and hence they do not use the CH_HASH_MASK.

Bit Range	Default & Access	Field Name (ID): Description
37:36	3h RW/L	**SYM_SLICE1_CHANNEL_ENABLED (SYM_SLICE1_CHANNEL_ENABLED):** Specifies which channels in Slice1 are enabled for hosting the symmetric region of the DRAM address space. If SLICE_1_DISABLED is set to disable mapping of DRAM address space to Slice 1, this field has no effect and symmetric region is considered to be not mapped to Slice1. If CH_1_DISABLED is set, Channel 1 in Slice 1 is not enabled for symmetric DRAM address space regardless of the setting of this register. DRAM address space is divided into a symmetric regions, asymmetric regions that are partially interleaved across a subset of channels (2-way) or asymmetric regions that are non-interleaved and mapped only to a single channel. This field specifies which channels in Slice 1 are enabled for interleaving the symmetric region. SLICE0_CHANNEL_ENABLED defines which channels in Slice 0 are enabled for interleaving the symmetric region. The mapping of partial (2-way) interleaved and non-interleaved regions are specified in other registers. For symmetric region, only selected configurations are supported. Across both slices, only a total of 1 channel, 2 channels or 4 channels must be enabled for interleaving the symmetric region. The total of 1, 2 or 4 channels can be made up of any combination of channel enables across both slices. B-unit does not support a 3-way interleaving of the symmetric region across 3 enabled channels in the two slices combined.
35:34	3h RW/L	**SYM_SLICE0_CHANNEL_ENABLED (SYM_SLICE0_CHANNEL_ENABLED):** Specifies which channels in Slice0 are enabled for hosting the symmetric region of the DRAM address space. If SLICE_0_MEM_DISABLED is set to disable mapping of DRAM address space to Slice 0, this field has no effect and symmetric region is considered to be not mapped to Slice0. If CH_1_DISABLED is set, Channel 1 in Slice 0 is not enabled for symmetric DRAM address space regardless of the setting of this register. DRAM address space is divided into a symmetric regions, asymmetric regions that are partially interleaved across a subset of channels (2-way) or asymmetric regions that are non-interleaved and mapped only to a single channel. This field specifies which channels in Slice 0 are enabled for interleaving the symmetric region. SLICE1_CHANNEL_ENABLED defines which channels in Slice 1 are enabled for interleaving the symmetric region. The mapping of partial (2-way) interleaved and non-interleaved regions are specified in other registers. For symmetric region, only selected configurations are supported. Across both slices, only a total of 1 channel, 2 channels or 4 channels must be enabled for interleaving the symmetric region. The total of 1, 2 or 4 channels can be made up of any combination of channel enables across both slices. B-unit does not support a 3-way interleaving of the symmetric region across 3 enabled channels in the two slices combined.
33	0h RO	**RESERVED_2 (RESERVED_2):** Resesved

Bit Range	Default & Access	Field Name (ID): Description
32	0h RW/L	**CH_1_DISABLED (CH_1_DISABLED):** Channel 1 in both slices are disabled no memory address mapped to ch 1. All requests sent to channel 0.
31	0h RW/L	**ENABLE_PMI_DUAL_DATA_MODE (ENABLE_PMI_DUAL_DATA_MODE):** When set to 1, Single Command Interface and Dual Data Interface for Reads and Writes
30:20	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
19:6	0h RW/L	**SLICE_HASH_MASK (SLICE_HASH_MASK):** When both slices are enabled this field specifies the Slice Hash Mask to be applied on Addr[19:6] physical address of the request to compute which slice a request must be routed to. Relevant only when HVM mode is disabled and only for physical addresses that do not fall under the Asymmetric Memory Region and the MOT region. Bunit will override the programmed value to include the Slice Selector bit. Additionally Bunit will remove the Channel Selector bit. See INTERLEAVE_MODE field. Note that HVM mode nonaddress IDI requests asymmetric memory region and MOT regions have special hash requirements and hence they do not use the SLICE_HASH_MASK.
5	0h RW/L	**POISON (POISON):** Indication that Poison is enabled when set
4	0h RW/L	**SLICE_0_MEM_DISABLED (SLICE_0_MEM_DISABLED):** Slice 0 is disabled for memory accesses; no memory address mapped to Slice 0 and all memory requests sent to Slice 1.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW/L	**INTERLEAVE_MODE (INTERLEAVE_MODE):** Default interleave mode that specifies how the Slice Selector and Channel Selector bits are to be determined. Relevant only when HVM mode is disabled and only for system memory addresses that do not fall under the MOT region or the Asymmetric memory region in the System Address Map. Legal encodings are 0x0 0x1 and 0x2. An encoding of 0x3 is treated as if it was 0x2. When both slices and all four PMI channels are enabled 0x0: Default Slice Selector is Addr[10] and Default Channel Selector is Addr[11] 0x1: Default Slice Selector is Addr[11] and Default Channel Selector is Addr[12] 0x2: Default Slice Selector is Addr[12] and Default Channel Selector is Addr[13] When both slices are enabled but only one channel in each slice enabled: 0x0: Default Slice Selector is Addr[10] 0x1: Default Slice Selector is Addr[11] 0x2: Default Slice Selector is Addr[12] When only SLICE0 is enabled and both channels on that slice are enabled: 0x0: Default Channel Selector is Addr[10] 0x1: Default Channel Selector is Addr[11] 0x2: Default Channel Selector is Addr[12] When SLICE0 and only one channel in that slice is enabled this field is not relevant. Bunit overrides the setting of the SLICE_HASH_MASK to always include the Slice Selector bit. Similarly Bunit overrides the setting of the CH_HASH_MASK to always include the Channel Selector bit.
1	0h RW/L	**HVM_MODE (HVM_MODE):** 0: HVM mode is disabled. 1: HVM mode is enabled. When HVM mode is enabled Slice Hash and Channel Hash is done as follows: Both slices and all four PMI channels enabled: Slice Hash is Request Physical Addr[29] Channel Hash is PostRemap Addr[30] Both slices enabled but only one PMI channel in each slice enabled: Slice Hash is Request Physical Addr[29] Only one SLICE0 enabled but both PMI channels in SLICE0 enabled: Channel Hash is PostRemap Addr[29] When HVM_MODE is enabled TOLUD must be set at 2GB.
0	0h RW/L	**SLICE_1_DISABLED (SLICE_1_DISABLED):** Slice 1 is disabled no memory address mapped to Slice 1. All request sent to Slice 0

§ §

4 Processor Graphics Registers

This chapter documents the registers in Bus: 0, Device 2, Function 0.

NOTE: These registers apply to all processors.

4.1 B-Unit Copy of PCICMD for IGD (B_CR_PCICMD_0_2_0_PCI) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:2, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RESERVED_0):** Reserved
10	0h RW/V	**INTx Disable (INTDIS):** This bit disables the device from asserting INTx. • 0: Enable the assertion of this devices INTx signal. • 1: Disable the assertion of this devices INTx signal. DO_INTx messages will not be sent to DMI.
9	0h RO	**FB2B:** Not Implemented. Hardwired to 0.
8	0h RO	**SEN:** Not Implemented. Hardwired to 0.
7	0h RO	**WCC:** Not Implemented. Hardwired to 0.
6	0h RO	**PER:** Not Implemented. Hardwired to 0. Since the IGD belongs to the category of devices that does not corrupt programs or data in system memory or hard drives the IGD ignores any parity error that it detects and continues with normal operation.
5	0h RO	**VPS:** This bit is hardwired to 0 to disable snooping.
4	0h RO	**MWIE:** Hardwired to 0. The IGD does not support memory write and invalidate commands.
3	0h RO	**SCE:** This bit is hardwired to 0. The IGD ignores Special cycles.
2	0h RW/V	**BME:** • 0: Disable IGD bus mastering. • 1: Enable the IGD to function as a PCI compliant master. .
1	0h RW/V	**MAE:** This bit controls the IGD's response to memory space accesses. • 0: Disable. • 1: Enable. Device 2 Function Level Reset must reset this bit.
0	0h RW/V	**IOAE:** This bit controls the IGD's response to I/O space accesses. • 0: Disable. • 1: Enable. Device 2 Function Level Reset must reset this bit.

4.2 B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_LO_0_2_0_PCI) — Offset 10h

This register contains the lower 32 bits of GTTMMADR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:2, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**Memory Base Address (MBA):** GTTMMADR[38:24] is {GTTMMADR_HI[6:0],GTTMMADR_LO[31:24]}. These bits, which are set by the OS, correspond to address signals [38:24]. 16MB combined for MMIO and Global GTT table aperture. 2MB are for MMIO, 6MB are reserved and 8 MB are for GTT.
23:4	0h RO	**Address Mask (ADM):** Hardwired to 0s to indicate at least 16MB address range.
3	0h RO	**Prefetch Memory Enable (PREFMEM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Base Address Type (MEMTYP):** • 00: To indicate 32 bit base address • 01: Reserved • 10: To indicate 64 bit base address • 11: Reserved
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

4.3 B-Unit Copy of GTTMMADR (B_CR_GTTMMADR_HI_0_2_0_PCI) — Offset 14h

This register contains the upper 32 bits of GTTMMADR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:2, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved
6:0	0h RW/V	**Memory Base Address (MBA):** These bits are set by the OS, and correspond to address signals [38:24]. 16MB combined for MMIO and Global GTT table aperture. 2MB are for MMIO, 6MB are reserved and 8 MB are for GTT.

4.4 B-Unit Copy of GMADR (B_CR_GMADR_LO_0_2_0_PCI) — Offset 18h

This register contains the lower 32 bits of GMADR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:2, F:0] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Memory Base Address or Address Map 4096 (ADMSK4096):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
30	0h RW/V	**Memory Base Address or Address Map 2048 (ADMSK2048):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
29	0h RW/V	**Memory Base Address or Address Map 1024 (ADMSK1024):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
28	0h RW/V	**Memory Base Address or Address Map 512 (ADMSK512):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
27	0h RW/V	**Memory Base Address or Address Map 256 (ADMSK256):** This Bit is either part of the Memory Base Address R/W, or part of the Address Mask RO, depending on the value of MSAC[4:0].
26:4	0h RO	**Address Mask (ADM):** Hardwired to 0s to indicate at least 128MB address range.
3	0h RO	**Prefetch Memory Enable (PREFMEM):** Hardwired to 0 to prevent prefetching.
2:1	2h RO	**Memory Base Address Type (MEMTYP):** • 00: To indicate 32 bit base address • 01: Reserved • 10: To indicate 64 bit base address • 11: Reserved
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

4.5 B-Unit Copy of GMADR (B_CR_GMADR_HI_0_2_0_PCI) — Offset 1Ch

This register contains the upper 32 bits of GMADR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:2, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RESERVED_0):** Reserved
6:0	0h RW/V	**Memory Base Address (MBA):** These bits are set by the OS, and correspond to address signals [38:32].

4.6 B-Unit Copy of the IOBAR (B_CR_IOBAR_0_2_0_PCI) — Offset 20h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:2, F:0] + 20h	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_1):** Reserved
15:6	0h RW/V	**IO Base Address Register Select (IOBASE):** These bits correspond to address signals [15:6]. If there is a match then address hits the IOBAR. Device 2 FLR must reset this field.
5:3	0h RO	**Reserved (RESERVED_0):** Reserved
2:1	0h RO	**Memory Base Address Type (MEMTYPE):** Hardwired to 0s to indicate 32bit address.
0	1h RO	**Memory or IO Space (MIOS):** Hardwired to 1 to indicate IO space.

4.7 B-Unit Copy of Device 2 Control Register (B_CR_DEV2CTL_0_2_0_PCI) — Offset 58h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:2, F:0] + 58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RESERVED_0):** Reserved
0	0h RW/V	**IOBAR Disable (IOBARDIS):** System BIOS can choose to disable and hide the IOBAR for systems that do not require legacy IOBAR access to Gfx MMIO registers. • 0: IOBAR is enabled and exposed at offset 0x20 in Device 2 Configuration space. Default • 1: IOBAR is disabled and not visible in PCI Configuration Space. Behaves as if hardwired to zeros.

4.8 B-Unit Copy of MSAC (B_CR_MSAC_0_2_0_PCI) — Offset 62h

This data is used to determine the size of Aperture GMADR, and affects certain bits of the GMADR register.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:2, F:0] + 62h	1 h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RESERVED_0):** Reserved
4	0h RW/V	**Aperture Size 4 (APSZ4):** Refer to description for APSZ0 [0:0].
3	0h RW/V	**Aperture Size 3 (APSZ3):** Refer to description for APSZ0 [0:0].
2	0h RW/V	**Aperture Size 2 (APSZ2):** Refer to description for APSZ0 [0:0].
1	0h RW/V	**Aperture Size 1 (APSZ1):** Refer to description for APSZ0 [0:0].
0	1h RW/V	**Aperture Size 0 (APSZ0):** This field is used in conjunction with other APSZ fields to determine the size of Aperture GMADR. It affects certain bits of the GMADR register. The description below is for all APSZ fields [4:0]: • 00000b: 128MB GMADR.B[26:4] is hardwired to 0. • 00001b: 256MB GMADR.B[27]=0, RO. • 00010b: illegal hardware will treat this as 00011. • 00011b: 512MB GMADR.B[28:27]=0, RO. • 00100b-00110b: illegal hardware will treat this as 00111. • 00111b: 1024MB GMADR.B[29:27]=0,RO. • 01000b-01110b: illegal hardware will treat this as 01111. • 01111b: 2048MB GMADR.B[30:27]=0,RO. • 10000b-11110b: illegal hardware will treat this as 11111. • 11111b: 4096MB GMADR.B[31:27]=0,RO

4.9 B-Unit Copy of Device 2 Control Register (B_CR_DEVICECTL_0_2_0_PCI) — Offset 78h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:2, F:0] + 78h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/V	**Initiate Function Level Reset (INITIATE_FLR):** A write of 1b initiates Function Level Reset to the Function. The value read by software from this bit is always 0b. B-Unit uses only this bit for Dev2 FLR. The rest of the bits in this register are ignored by the B-Unit.
14:12	0h RO	**Max Read Request Size (MAX_READ_REQUEST_SIZE):** Functions that do not generate Read Requests larger than 128 bytes and Functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only RO with a value of 000b.
11	0h RO	**Enable No Snoop (ENABLE_NO_SNOOP):** This bit is permitted to be hardwired to 0b if a function would never set the No Snoop attribute in transactions it initiates. The graphics device never generates a PCI Express TLP.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**Aux Power PM Enable (AUX_PM_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
9	0h RO	**Phantom Functions Enable (PHANTOM_FUNCTIONS_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
8	0h RO	**Extended Tag Field Enable (EXTENDED_TAG_ENABLE):** Functions that do not implement this capability hardwire this bit to 0b.
7:5	0h RO	**Max Payload Size (MAX_PAYLOAD_SIZE):** Functions that support only the 128byte max payload size are permitted to hardwire this field to 000b.
4	0h RO	**Enable Relaxed Ordering (RO_ENABLE):** A Function is permitted to hardwire this bit to 0b if it never sets the Relaxed Ordering attribute in transactions it initiates as a Requester. The graphics device never generates a PCI Express TLP.
3	0h RO	**Unsupported Request Response Enable (UR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
2	0h RO	**Fatal Error Enable (FATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
1	0h RO	**NonFatal Error Enable (NONFATAL_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.
0	0h RO	**Correctable Error Enable (CORRECTABLE_ERR_ENABLE):** A Root Complex Integrated Endpoint that is not associated with a Root Complex Event Collector is permitted to hardwire this bit to 0b.

4.10 B-Unit Copy of PMCS for IGD (B_CR_PMCS_0_2_0_PCI) — Offset D4h

This is the B-Unit Copy of the Power Management Control/Status Register for the Internal Graphics Device.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:2, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Power Management Event Status (PMESTS):** This bit is 0 to indicate that the Internal Graphics Device does not support Power Management Event generation from D3 (cold).
14:13	0h RO	**Data Scale (DSCALE):** The Internal Graphics Device does not support data register. This bit always returns 00 when read write operations have no effect.
12:9	0h RO	**Data Select (DSEL):** The IGD does not support data register. This bit always returns 0h when read write operations have no effect.
8	0h RO	**Power Management Event Enable (PMEEN):** This bit is 0 to indicate that PME assertion from D3 (cold) is disabled.
7:2	0h RO	**Reserved (RESERVED_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW/V	**Power State (PWRSTAT):** This field indicates the current power state of the IGD, and can be used to set the IGD into a new power state. If software attempts to write an unsupported state to this field, the write operation must complete normally on the bus, but the data is discarded and no state change occurs. On a transition from D3 to D0, the graphics controller is optionally reset to initial values. • 00: D0 Default • 01: D1 Not Supported • 10: D2 Not Supported • 11: D3

§ §

5 System Agent Address Map Registers

This chapter documents the registers in Bus: 0, Device 0, Function 1.

5.1 Device ID and Vendor ID Register (P_CR_DEVICE_ID_VENDOR_ID_0_0_1_PCI) — Offset 0h

This register uniquely identifies any PCI device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 0h	A8C8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	A8Ch RO/V	**Device ID (DEVICE_ID):** Identifier assigned to the Broxton Thermal Management Controller.
15:0	8086h RO	**Vendor ID (VENDOR_ID):** Hardwired to Intel's Vendor ID value.

5.2 PCI_STATUS_COMMAND_0_0_1_PCI (B_CR_PCI_STATUS_COMMAND_0_0_1_PCI) — Offset 4h

PCI Status is used to record status information for PCI bus related events, including the occurrence of a PCI compliant Master Abort (MA) and PCI compliant Target Abort (TA). PCISTS also indicates the DEVSEL# timing that has been set by the thermal device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 4h	900000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** The Thermal device does not implement this bit and it is hardwired to a 0.
30	0h RO	**Signaled System Error (SSE):** This bit is hardwired to zero. The Thermal device never asserts SERR#, and therefore it has no need to implement this bit.
29	0h RO	**Received Master Abort (RURS):** The Thermal device does not implement this bit and it is hardwired to a 0.
28	0h RO	**Received Target Abort (RCAS):** The Thermal device does not implement this bit and it is hardwired to a 0.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Signaled Target Abort (STAS):** his bit is hardwired to 0. The Thermal device will not generate a Target Abort DMI completion packet or Special Cycle, and therefore it has no need to implement this bit.
26:25	0h RO	**DEVSEL Timing (DEVT):** These bits are hardwired to 0. Device 4 does not physically connect to PCI_A.
24	0h RO	**Master Data Parity Error (DPD):** This bit is hardwired to 0. PERR signaling and messaging are not implemented by the Thermal Device, and therefore it has no need to implement this bit.
23	1h RO	**Fast Back to Back Capable (FB2B_CAPABLE):** This bit is hardwired to 1. Device 4 does not physically connect to PCI_A, so this bit is set to 1 (indicating fast back-to-back capability) so that the optimum setting for PCI_A is not limited by the Thermal device.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**66MHz Capable (PCI66M):** The Thermal device does not implement this bit and it is hardwired to a 0.
20	1h RO	**Capabilities List (CLIST):** This bit is set to 1 to indicate that the register at 34h provides an offset into the function. PCI Configuration Space containing a pointer to the location of the first item in the list.
19	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTA# signal at the input of the enable/disable circuit. This bit is set by HW to 1 when the INTA# is asserted and reset by HW to 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the 0.0.1.PCICMD register).
18:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**INTx# Disable (INTDIS):** This bit, when set, disables the device from asserting INTx#, where 'x' is configured in the INTPIN register.
9	0h RO	**Fast Back to Back Enable (FB2B_ENABLE):** The Thermal device does not implement this bit and it is hardwired to a 0.
8	0h RO	**SERR# Enable (SERRE):** The Thermal device does not implement this bit and it is hardwired to a 0.
7	0h RO	**ADSTEP:** The Thermal device does not implement this bit and it is hardwired to a 0.
6	0h RO	**Parity Error Enable (PERRE):** This bit is hardwired to 0. The Thermal device belongs to the category of devices that does not corrupt programs or data in system memory or hard drives. It therefore ignores any parity error that it detects and continues with normal operation.
5	0h RO	**VGA Snoop (VGASNOOP):** The Thermal device does not implement this bit and it is hardwired to a 0.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** This bit is hardwired to 0. The Thermal device will never issue memory write and invalidate commands, and therefore has no need to implement this bit.
3	0h RO	**Special Cycle Enable (SCE):** The Thermal device does not implement this bit and it is hardwired to a 0.
2	0h RW	**Bus Master Enable (BME):** The Thermal device is enabled to function as a PCI-compliant bus master when this bit is set. If it is not set, bus mastering is disabled.
1	0h RW	**Memory Access Enable (MAE):** The Thermal device will allow access to thermal registers when this bit is set. If it is not set, access to memory mapped thermal registers is disabled.
0	0h RO	**I/O Access Enable (IOAE):** The Thermal device does not implement this bit and it is hardwired to a 0.

5.3 PCI Revision ID and PCI Class Code Register (P_CR_REVISION_ID_CLASS_CODE_0_0_1_PCI) — Offset 8h

Revision ID contains the revision number of the device. Class Code identifies the basic function of the device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 8h	11800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	11h RO	**Base Class Code (BASE_CLASS_CODE):** This is an 8-bit value that indicates the base class code for the Thermal Controller. This code has the value 11h, indicating a device that is used for data acquisition and signal processing.
23:16	80h RO	**Sub-class Code (SUB_CLASS_CODE):** The code is 80h which indicates 'Other Data Acquisition and Signal Processing Controllers.'
15:8	0h RO	**Programming Interface (PI):** This is an 8-bit value that indicates the programming interface of this device. This value does not specify a particular register set layout and provides no practical use for this device.
7:0	0h RO/V	**Revision ID (REVISION_ID):** Revision ID.

5.4 Master Latency Timer and Header Type Register (P_CR_MASTER_LATENCY_TIME_0_0_1_PCI) — Offset Ch

This register defines Latency Timer and layout of the device Configuration Space header.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BIST Support (BS):** This bit is hardwired to zero. The Thermal device does not support BIST.
30:24	0h RO	**Reserved (RSVD):** Reserved
23:16	0h RO	**Header Type (HDR):** This field always returns 0 to indicate that the Thermal device is a single function device with standard header layout.
15:8	0h RO	**Master Latency Timer (MLT):** This field is hardwired to 0. The Thermal device does not support perform bursts.
7:0	0h RO	**Cache Line Size (CLS):** This field is hardwired to 0. The Thermal Device as a PCI compliant master does not use the Memory Write and Invalidate command and, in general, does not perform operations based on cache line size.

5.5 Thermal Management Base Address Register (B_CR_TMBAR_LO_0_0_1_PCI) — Offset 10h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**TMMBA:** This field corresponds to bits 31 to 15 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.'
14:4	0h RO	**Address Map (ADM):** Hardwired to 11'h000 to indicate at least 32KB address range.
3	0h RO	**Prefetch Memory (PM):** Hardwired to 1'b0 to prevent prefetching.
2:1	2h RO	**Memory Type (MT):** Hardwired to 2'b10 to indicate 64-bit address.
0	0h RO	**Memory or IO Space (MIOS):** Hardwired to 0 to indicate memory space.

5.6 Thermal Management Base Address Register (B_CR_TMBAR_HI_0_0_1_PCI) — Offset 14h

This is the base address for the Thermal Controller Memory Mapped space. There is no physical memory within this 32KB window that can be addressed. The 32KB reserved by this register does not alias to any PCI 2.2 compliant memory mapped space. All TMBAR space maps the access to this memory space towards MCHBAR space. For details of this BAR, refer to the MCHBAR specifications.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Reserved RW (RSVDRW):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RW	**TMMBA:** This field corresponds to bits 38 to 32 of the base address TMBAR address space. BIOS will program this register resulting in a base address for a 32KB block of contiguous memory address space. This register ensures that a naturally aligned 32KB space is allocated within total addressable memory space. The DPTF driver uses this base address to program all Thermal and Throttling control register set.

5.7 PCI Subsystem Vendor ID and PCI Subsystem ID (P_CR_SVID_SID_0_0_1_PCI) — Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Subsystem ID (SUBSYSTEM_ID):** PCI Subsystem ID: This field should be programmed during BIOS initialization.
15:0	0h RW	**Subsystem Vendor ID (SUBSYSTEM_VENDOR_ID):** PCI Subsystem Vendor ID: This field should be programmed by BIOS during bootup to indicate the vendor of the system board.

5.8 CAPPTR_0_0_1_PCI (P_CR_CAPPTR_0_0_1_PCI) — Offset 34h

CAPPOINT provides the offset that is the pointer to the location of the first device capability in the capability list.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 34h	D0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	D0h RO	**Base Address of First Capability Register (BASE_ADDR):** This pointer is an 8-bit address to an offset within this device's Configuration Space that holds the first Capability Register (CAPID0_CAPCTRL).

5.9 Interrupt and Latency Configuration (P_CR_INTR_LAT_0_0_1_PCI) — Offset 3Ch

This register is used for specifying how often the device needs to gain access to the PCI bus.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Maximum Latency Value (MLV):** These bits are hardwired to zero. The Thermal device has no specific requirements for how often it needs to access the PCI bus.
23:16	0h RO	**Minimum Grant Value (MGV):** These bits are hardwired to zero. The Thermal device does not burst as a PCI compliant master.
15:8	1h RW/L	**Interrupt Pin (INTPIN):** As a single function device, the Thermal device specifies INTA as its interrupt pin. 01h = INTA by default. BIOS may need to reconfigure this in order allow software to disambiguate multiple functions within MCHBAR. Recommended setting is 02h = INTB. This field is locked from future writes when the THERMAL_DEVICE_IRQ.LOCK
7:0	0h RW	**Interrupt Line (INTCON):** Used to communicate interrupt line routing information. BIOS Requirement: POST software writes the routing information into this register as it initializes and configures the system. The value indicates to which input of the system interrupt controller this device's interrupt pin is connected.

5.10 Device Enable Register (P_CR_DEVEN_0_0_1_PCI) — Offset 54h

The Device Enable register allows for enabling/disabling of PCI devices and functions that are within the CPU package.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 54h	33 h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RESERVED_1:** Reserved
5	1h RW/V	**Device 3 Function 0 Enable (Imaging) (D3F0EN):** • 0 = Imaging Device 0/3/0 is disabled and hidden • 1 = Imaging Device 0/3/0 is enabled and visible Software may write a 0b to this register to disable the imaging device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
4	1h RW/V	**Device 2 Function 0 Enable (Graphics/Display) (D2F0EN):** • 0 = Graphics/Display Device 0/2/0 is disabled and hidden • 1 = Graphics/Display Device 0/2/0 is enabled and visible Software may write a 0b to this register to disable the graphics / display device. Writes to 1b are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
3	0h RO	**Reserved (RSVD):** Reserved
2	0h RO	**RESERVED_0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW/V	**Device 0 Function 1 Enable (Thermal) (D0F1EN):** • 0 = Thermal Device 0/0/1 is disabled and hidden • 1 = Thermal Device 0/0/1 is enabled and visible Software may write a '0 to this register to disable the thermal device. Writes to '1 are not allowed (i.e., the device may not be software enabled if hardware natively disables it)
0	1h RO	**Device 0 Function 0 Enable (Memory / System Agent) (D0F0EN):** Device enable for MCHBAR device. This device not be disabled and is therefore hardwired to 1.

5.11 SCISTS_0_0_1_PCI (P_CR_SCISTS_0_0_1_PCI) — Offset 88h

This register is used to report various error conditions via the SCI messaging mechanism. An SCI message is generated on a zero to one transition of any of these flags (if enabled by the SCICMD and PCICMD registers). This bit is set regardless of whether or not the SCI event is enabled and generated. After the event processing is complete, the error logging mechanism can be unlocked by clearing the appropriate status bit by software writing a 1 to it.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/1C/V	**CTED:** If set, indicates a thermal event was detected and SCI has optionally been generated. If this bit is already set, then an interrupt message will not be sent on a new event. ACPI software will write this bit to 1b to clear the event.

5.12 SCI Command (P_CR_SCICMD_0_0_1_PCI) — Offset CCh

This register enables various event conditions to generate an SCI event message. When an event log is observed, it will generate an SCI message when enabled by the SCICMD register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + CCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**SCI Event Enable (SCICE):** • 0 = SCI messaging in response to thermal events is disabled. • 1 = Generate an SCI event message on detection of a hardware thermal event, as configured by software.
15:0	0h RO	**Reserved (RSVD):** Reserved

5.13 Power Management Capabilities (P_CR_PMCAPID_0_0_1_PCI) — Offset D0h

The Power Management Capabilities register is a 16-bit read-only register which provides information on the capabilities of the function related to power management. The information in this register is generally static and known at design time.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + D0h	3E001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** This field indicates the power states in which the thermal device may assert PME#. It is hardwired to 0 to indicate that the Thermal device does not support nor assert the PME# signal.
26	0h RO	**D2:** Hardwired to 0 to indicate that the D2 power management state is not supported.
25	0h RO	**D1:** Hardwired to 0 to indicate that the D1 power management state is not supported.
24:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Device Specific Initialization (DSI):** Indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. This bit is not used by some operating systems. Microsoft Windows* and Windows NT, for instance, do not use this bit to determine whether to use D3. Instead, they use the driver's capabilities to determine this. 1b indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.
20	0h RO	**APS:** The Thermal device does not implement this bit and it is hardwired to a 0.
19	0h RO	**PME# Capbility (PMEC):** Hardwired to 0 to indicate the thermal device does not support PME# generation.
18:16	3h RO	**VER:** This device complies with revision 1.2 of the PCI Power Management Interface Specification.
15:8	E0h RO	**Next Capability Pointer (NCP):** This contains a pointer to next item in capabilities list. The next capability is E0h which is device 0 / func 0 capability mirror.
7:0	1h RO	**Capability ID (CID):** 01h indicates that this is a power management capability

5.14 Power Management Control and Status (P_CR_PMCS_0_0_1_PCI) — Offset D4h

The Data register is an optional, 8-bit read-only register that provides a mechanism for the function to report state dependent operating data such as power consumed or heat dissipation. Typically the data returned through the Data register is a static copy (look up table, for example) of the function's worst case 'DC characteristics' data sheet. This data, when made available to system software, could then be used to intelligently make decisions about power budgeting, cooling requirements, etc.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + D4h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**DATA:** The data register, data scale and data select registers are not supported. Hardwired to zero.
23:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME# Status (PMES):** This bit is set when the function would normally assert the PME# signal independent of the state of the PME_En bit. This bit is hardwired to 0b to indicate that PME# assertion from D3 (cold) is not supported.
14:13	0h RO	**Data Scale (DS):** The data register, data scale and data select registers are not supported
12:9	0h RO	**Data Select (DSEL):** The data register, data scale and data select registers are not supported
8	0h RO	**PME# Enable (PMEEN):** This bit is hardwired to 0b to indicate that PME# assertion from D3 (cold) is disabled.
7:4	0h RO	**Reserved (RSVD):** Reserved
3	1h RO	**No Soft Reset (NSR):** • 1 = Devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 initialized state, no additional operating system intervention is required to preserve configuration Context beyond writing the PowerState bits. • 0 = Devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full initialization sequence is needed to return the device to D0 initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW/V	**Power State (PS):** This field indicates the current power state of the thermal device and can be used to set the thermal device into a new power state. If software attempts to write an unsupported state to this field, the write operation must complete normally on the bus, but the data is discarded and no state change occurs. • 00b = D0 Default • 01b = D1 Not Supported • 10b = D2 Not Supported • 11b = D3

5.15 Interrupt Status (P_CR_INTSTS_0_0_1_PCI) — Offset DCh

This register is used to report interrupt pending event status. Upon event detection, if enabled, an interrupt message will be delivered to the IOAPIC. Upon processing that event, software may clear the event to enable future event signaling by writing a 1 to the INTSTAT bit in this register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/1C/V	**Interrupt Status (INTSTAT):** If set, indicates a thermal event was detected. If this bit is already set, then an interrupt message will not be sent upon detection of a new event.

5.16 Capability ID0 Capability Control (P_CR_CAPID0_CAPCTRL0_0_0_1_PCI) — Offset E0h

Control bits in this register describe the attributes of CAPID0_A and CAPID0_B capability registers.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + E0h	10C0009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27:24	1h RO	**Capability ID Version (CAPID_VER):** This field has the value 0001b to identify the first revision of the CAPID register definition.
23:16	Ch RO	**Capability ID0 Structure Length (CAPIDLEN):** This field has the value 0Ch to indicate the structure length 12 bytes. This is the total size of this CAPCTRL and the CAPID0_A and CAPID0_B registers in the following bytes.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Capability Register Pointer (NCP):** This field is hardwired to 00h, indicating the end of the capabilities linked list.
7:0	9h RO	**Capability ID (CAP_ID):** This field has the value 1001b to identify the CAP_ID assigned by the PCI SIG for vendor dependent capability pointers.

5.17 Capability ID0 A (P_CR_CAPID0_A_0_0_1_PCI) — Offset E4h

Control of bits in this register is only required for SKU differentiation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + E4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**SPARE31_24:** Reserved for future capabilities.
23	0h RW/V	**VTd Disable (VTDD):** • 0 = Enable VTd • 1 = Disable VTd
22	0h RW/V	**FUSE_SPARE22:** Fuse backed spare.
21	0h RW/V	**FUSE_SPARE21:** Fuse backed spare.
20	0h RW/V	**FUSE_SPARE20:** Fuse backed spare.
19	0h RW/V	**FUSE_SPARE19:** Fuse backed spare.
18	0h RW/V	**FUSE_SPARE18:** Fuse backed spare.
17	0h RW/V	**FUSE_SPARE17:** Fuse backed spare.
16	0h RW/V	**FUSE_SPARE16:** Fuse backed spare.
15	0h RW/V	**Thermal Device Disable (CDD):** • 0 = Thermal associated memory spaces are accessible. • 1 = Thermal associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for DPTF cannot be set.
14	0h RW/V	**FUSE_SPARE14:** Fuse backed spare.
13	0h RW/V	**FUSE_SPARE13:** Fuse backed spare.
12	0h RW/V	**FUSE_SPARE12:** Fuse backed spare.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/V	**Internal Graphics and Display Disable (IGD):** • 0 = There is a graphics engine within this CPU. Internal Graphics Device 2 is enabled, and all of its memory and I/O spaces are accessible. Configuration cycles to Device 2 will be completed within the CPU. All nonSMM memory and IO accesses to VGA will be handled based on Memory and IO enables of Device 2, IO registers within Device 2, and VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6, if PCI Express GFX attach is supported. A selected amount of Graphics Memory space is preallocated from the main memory, based on Graphics Mode Select GMS in the GGC Register. Graphics Memory is preallocated above TSEG Memory. • 1 = There is no graphics engine within this CPU. Internal Graphics Device 2 and all of its memory and I/O functions are disabled. Configuration cycles targeted to Device 2 will be passed on to DMI. In addition, all clocks to internal graphics logic are turned off. All nonSMM memory and IO accesses to VGA will be handled based on VGA Enable of the PCI to PCI bridge control register in Devices 1 and 6. DEVEN [4:3] Device 0 offset 54h have no meaning. Device 2 Functions 0 and 1 are disabled and hidden.
10	0h RO	**DIDOE:** Controls if there is an override of Dev2 (GFX) device ID. Hardwired to 1'b0. • 0 = Disable ability to override DID - For production • 1 = Enable ability to override DID - For debug and samples only
9:8	0h RO	**CDID:** Controls the value of Dev2 (GFX) device ID. Hardwired to 2'b00. Identifier assigned to the core/primary PCI device.The corresponding two bit capability ID programming is: • 00b = Desktop • 01b = Mobile • 10b = Server • 11b = Marketing Spare
7:0	0h RW	**SPARE7_0:** Reserved for future capabilities

5.18 Capability ID0 B (P_CR_CAPID0_B_0_0_1_PCI) — Offset E8h

Control of bits in this register is only required for SKU differentiation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:1] + E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**IMGU_DIS:** 0: Imaging Unit associated memory spaces are accessible. 1: Imaging Unit associated memory and IO spaces are disabled. DEVEN_0_0_0_PCI field for I-unit can not be set.
30	0h RW/V	**FUSE_SPARE30:** Fuse backed spare.
29	0h RW/V	**FUSE_SPARE29:** Fuse backed spares, potentially to be used for PKGTYP encoding.
28	0h RW/V	**FUSE_SPARE28:** Fuse backed spares potentially to be used for PKGTYP encoding.
27	0h RW/V	**FUSE_SPARE27:** Fuse backed spares potentially to be used for PKGTYP encoding.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/V	**FUSE_SPARE26:** Fuse backed spares potentially to be used for PKGTYP encoding.
25	0h RW/V	**FUSE_SPARE25:** Fuse backed spares potentially to be used for PKGTYP encoding.
24	0h RW/V	**Shared Virtual Memory Disable (SVMDIS):** • 0 = Enable Shared Virtual Memory mode • 1 = Disable Shared Virtual Memory mode
23:0	0h RW	**Spare (SPARE23_0):** Reserved for future capabilities.

5.19 B-Unit Copy of Default VTd BAR PMEN (B_CR_PMEN_REG_0_0_0_DEFVTDBAR)—Offset 64h

B-Unit copy of the Default VTd BAR PMEN register. Bit 31 is the only bit used for B-Unit.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**EPM (EPM):** This field controls DMA accesses to the protected lowmemory and protected highmemory regions. • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled. Access control is implemented. IA accesses are always allowed access. NonIA accesses are allowed if request SAI matches the SAI of the Default VTd Engine. Requests blocked due to protected memory region violation are not recorded or reported as remapping faults. Hardware reports the status of the protected memory enable/disable operation through the PRS field in this register. Hardware implementations supporting DMA draining must drain any inflight translated DMA requests queued within the RootComplex before indicating the protected memory region as enabled through the PRS field.
30:1	0h RO	**Reserved (RESERVED_0):** Reserved.
0	0h RO	**PRS Unused (PRS):** Unused by the B-Unit. This field indicates the status of protected memory regions: • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled.

5.20 B-Unit Copy of Default VTd BAR PLM Base Register (B_CR_PLMBASE_REG_0_0_0_DEFVTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most

significant bit position with 0 in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software must setup the protected low memory region below 4GB. Section 10.4.18 of the Intel Virtualization Technology for Directed I/O: Spec describes the Protected Low-Memory Limit register and hardware decoding of these registers. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/V	**Protected Low Memory Base (PLMB):** This register specifies the base of the protected low-memory region in system memory.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.21 B-Unit Copy of Default VTd BAR PLM Limit Register (B_CR_PLMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 6Ch

This register sets up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and it must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and then finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s. The Protected low-memory base and limit registers function as follows: Programming the protected low-memory base and limit registers with the same value in bits 31:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/V	**Protected Low Memory Limit (PLML):** This register specifies the last host physical address of the DMAprotected lowmemory region in system memory.

Bit Range	Default & Access	Field Name (ID): Description
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.22 B-Unit Copy of Default VTd BAR PHM Base Register (B_CR_PHMBASE_REG_0_0_0_DEFVTDBAR)—Offset 70h

This is the register to set up the base address of the DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 64 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:20	0h RW/V	**Protected High Memory Base (PHMB):** This register specifies the base of protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

5.23 B-Unit Copy of Default VTd BAR PHM Limit Register (B_CR_PHMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all ones to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all ones. The protected high-memory base and limit registers function as

follows: Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0h RO	**Reserved (RESERVED_1):** Reserved.
38:20	0h RW/V	**Protected High Memory Limit (PHML):** This register specifies the last host physical address of the DMA protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW where HAW is the host address width.
19:0	0h RO	**Reserved (RESERVED_0):** Reserved.

§ §

6 Gaussian Mixture Model (GMM) Registers

This chapter documents the registers in Bus: 0, Device 0, Function 3.

6.1 ID — Offset 0h

Device ID assigned to GNA and Vendor ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification Number (DID):** Indicates the device ID assigned to the GNA [6:0] set by straps [15:7] This field is set to the module via IOSF SB message received during device reset.
15:0	0h RO	**Vendor Identification Number (VID):** Intels identification

6.2 Device Control (DCTRL) — Offset 4h

The Command register provides coarse control over GMM's abilities like Unsupported Request Error Reporting Enable, Poisoned TLP Error Reporting Enable, Interrupt Disable, Max Aligned Payload Size, Max Aligned Read Request Size, Special Cycle Enable, Bus Master Enable, Memory Space Enable

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD):** Reserved
14	0h RO	**Unsupported Request Error Reporting Enable (UNSPREQERREN):** Unsupported Request Error Reporting Enable
13	0h RO	**Poisoned TLP Error Reporting Enable (PTLPERREN):** Poisoned TLP Error Reporting Enable
12:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Interrupt Disable (INTDIS):** Interrupt Disable: Controls the ability of the function to generate INTx interrupts. 0: INTx allowed 1: INTx disabled

Bit Range	Default & Access	Field Name (ID): Description
9:6	0h RO	**Reserved (RSVD_2):** Reserved
5	0h RO	**Max Aligned Payload Size (MXAPAYLDSZ):** Max Aligned Payload Size - Reserved
4	0h RO	**Max Aligned Read Request Size (MXARDREQSZ):** Max Aligned Read Request Size - Reserved
3	0h RO	**Special Cycle Enable (SCEN):** Special Cycle Enable - Reserved
2	0h RW	**Bus Master Enable (BME):** Bus Master Enable: 0: Disable (default) 1: Enabled. Device may generate bus master transactions depending on its mode of operation.
1	0h RW	**Memory Space Enable (MSE):** Memory Space Enable Controls the GMM devices response to memory space accesses 0: Disabled (default) 1: Enabled. Device will respond to memory space accesses.
0	0h RO	**IO Space Enable (IOSE):** IO Space Enable. Not implemented.

6.3 Device Status (DSTS) — Offset 6h

The Status register to record status information for PCI/IOSF related events

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** This bit is Set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. On a Function with a Type 1 Configuration header, the bit is Set when the Poisoned TLP is received by its Primary Side. Note : some implementations use this error type as non-fatal error indication This bit is typically RWC. Change to RO as this bit is not in use
14	0h RO	**Signaled System Error (SSE):** This bit is Set when a Function sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR# Enable bit in the Command register is 1. Note: some implementations use this error for fatal. When received all operations are aborted. This bit is typically RWC. Change to RO as this bit is not in use
13	0h RW/1C/V	**Received Master Abort (RMA):** This bit is Set when a Requester receives a Completion with Unsupported Request Completion Status. On a Function with a Type 1 Configuration header, the bit is Set when the Unsupported Request is received by its Primary Side.
12	0h RW/1C/V	**Received Target Abort (RTA):** This bit is set when a transaction abort is received to a GMM initiated transaction
11	0h RW/1C/V	**Signaled Target Abort (STA):** This bit is Set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side.
10:8	0h RO	**Reserved (RSVD):** Reserved
7	0h RO	**Fast Back-to-Back (FB2B):** Fast Back-to_Back (ignored by SW)
6:5	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Capability List (CLIST):** Capability List 0 : no capability list 1 : the GMM contains a linked list of capabilities which is accessed via the CAPPTR register at offset 34h
3	0h RO/V	**Interrupt Status (INTSTS):** Interrupt Status Reflects the state of the interrupt in the device. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will this device send a virtual INTA. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit is controlled by HW. 0 : No interrupt pending 1 : Interrupt pending
2:0	0h RO	**Reserved (RSVD_2):** Reserved

6.4 RID: Revision ID DLCO: Class Code (RID_DLCO) — Offset 8h

RID: DLCO: This register identify the type of device. The values are as defined in PCI 3.0 bus specification in Appendix D. The GMM is identified as an Other system Peripheral

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Base Class Code (BCC):** Base Class (Generic system Peripherals)
23:16	0h RO	**Sub Class Code (SCC):** Sub Class
15:8	0h RO	**Peripheral Interface (PROGINTERFACE):** Interface (other system peripheral)
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of this device. This register is set by side-band. All RID registers are sourced from a fuse/settings incremented for each stepping.

6.5 Cache Line Size (CLS) — Offset Ch

The system cacheline size in units of DWORDS

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Cache Line Size (CLS):** Implemented by PCI Express devices as a read-write field for legacy compatibility purposes but has no impact on any PCI Express device functionality

6.6 Header Type (HTYPE) — Offset Eh

This byte identifies the layout of the second part of the predefined header and whether or not the device contains multiple functions (GMM is a single-function device of basic configuration space format, so this register is Read-Only and hardwired to 0)

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi Function Device (MFD):** Hardwired to 0 indicating this device is not a multi-function device.
6:0	0h RO	**Header Type (HT):** The value 00h, indicates a basic (i.e., single function) configuration space format.

6.7 Built-in Self Test (BIST) — Offset Fh

This register describes the BIST capability of GMM and since GMM doesnt support BIST, the register is configured as Read Only

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BISTCAP):** BIST Capable. Hardwired to 0 since this device does not implement BIST.
6	0h RO	**Start BIST (BISTST):** Start BIST. Hardwired to 0 since this device does not implement BIST
5:4	0h RO	**Reserved (RSVD):** Reserved
3:0	0h RO	**BIST Completion Code (BISTCC):** Hardwired to 0 since this device does not implement BIST.

6.8 GNA Base Address Low (GNABAL) — Offset 10h

GNA Base Address Low: Lower 32-bits of the GNA Base Address register. The GMM Base Address register may be accessed with Double Word (32bit) read/write operations. In 32-bit OS, the address specified may be limited by 32-bit of space, and the renaming bits must stay with their default values

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Memory Base Address Low (BAL):** Memory Base Address Low Base address of this device's memory mapped IO space. A page of 4KB of address is used
11:4	0h RO	**Address Mask (ADDRMSK):** Address Mask Hardwired to 0s to indicate at least 4KB address range
3	0h RO	**PREF:** Hardwired to 0 indicating that this range is not prefetchable
2:1	0h RO	**Memory Type (MEMTY):** Memory Type: 00: 32 bit base address 01: reserved 10: 64-bit base address 11: reserved
0	0h RO	**Space Type (SPTY):** Space Type: Memory/IO Space Hardwired to 0 indicating that this is a Memory BAR

6.9 GNA Base Address High (GNABAH) — Offset 14h

GNA Base Address High: Upper 32-bits of the GNA Base Address register. The GNA Base Address register may be accessed with Double Word (32bit) read/write operations. In 32-bit OS, the address specified may be limited by 32-bit of space, and the renaming bits must stay with their default values

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**Memory Base Address High (Reserved) (BAR):** These bits must be loaded with zeros
6:0	0h RW	**Memory Base Address High (BAH):** Memory Base Address High - bits Includes the high bits of the base address used by 64-bit OS. Must hold zero for 32-bit OS

6.10 Sub System Vendor Identifiers (SSVI) — Offset 2Ch

This register is initialized to logic 0 by the assertion of reset. This register can be written only once after reset de-assertion it is locked for writes after that.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Subsystem Vendor ID (SSVID): This is written by BIOS. No hardware action taken on this value.

6.11 Sub System Identifiers (SSI) — Offset 2Eh

This register is initialized to logic 0 by the assertion of reset. This register can be written only once after reset de-assertion it is locked for writes after that.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 2Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**Subsystem ID (SSID):** Subsystem ID (SSID): This is written by BIOS. No hardware action taken on this value.

6.12 Capabilities Pointers (CAPP) — Offset 34h

This register gives MSI capability pointer offset

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RO	**Capability Pointer (CAPP):** Indicates that the MSI capability pointer offset is offset 90h

6.13 Interrupt Line (INTL) — Offset 3Ch

This register contains interrupt line routing information. The device itself does not use this value, rather it is used by device drivers and operating systems to determine priority and vector information.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Connection (INTCON):** Interrupt Connection Communicate interrupt line routing information. BIOS Requirement: POST software writes the routing information into this register as it initializes and configures the system. The value indicates to which input of the system interrupt controller this device's interrupt pin is connected

6.14 Interrupt Pin Register (INTP) — Offset 3Dh

tells which PCI legacy interrupt pin a device will use (GMM uses only IntA).

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + 3Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD):** Reserved
2:0	0h RO	**Legacy Interrupt (LEGINT):** When Legacy interrupts are used, function use legacy interrupt INTA.

6.15 Min Grant And Min Latency Register (MINGNTLAT) — Offset 3Eh

specifies a device's desired settings for Latency Timer values

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 3Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Min Latency (MINLAT):** Reserved: Min Latency
7:0	0h RO	**Min Grant (MINGNT):** Reserved: Min Grant

6.16 Override Configuration Control (OVRCFGCTL) — Offset 40h

This register holds bits that may be used internal mechanisms in the GMM during debug operations. Special notes will be made to BIOS writers, if any 5 of these bits will need to be set to value other than default.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**RSVD (RSVD1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Scoring Underrun/Overrun Error Check Disable (SUOECD):** Disable the consistency checks in GMM setup (sw calculated values GMMSCRLEN & GMMTELST) that are based on too-few or too-many elements in the DMA setup. Scoring Under-run is a scenario where DMA is out of data for scoring to proceed. 0 : Error Check is enabled,. 1 : Error Check is disabled.
15	0h RW	**PM_REQ (Package C state transition) NACK before Drain Enable (CXNBDEN):** 0: NACK PM_REQ is sent only after all outstanding completion is returned, and after master cycles are blocked. 1: NACK PM_REQ is sent before waiting for return of any outstanding completion
14	0h RW	**FLR_NP_Disable (FLRNPDIS):** 0: FLR operates normally.
13	0h RW	**FLR_Disable (FLRDIS):** 0: FLR operates normally. 1: FLR is disabled. Writes to start FLR will be ignored. FLR data structure is reported as usual.
12:10	0h RW	**RSVDCTL:** Reserved
9	0h RW	**PGCB Clock Trunk Clock Gating Enable (PGCBCGEN):** This bit, when set, allows the PGCB interface clock for GMM from SoC (pgcb_clk) to be gated when conditions are met by de-asserting GMMs clock request (pgcb_clkreq). When clear, GMM will always assert its clock request.
8	0h RW	**Sideband Clock Gating Enable (SBDCGEN):** This bit, when set, enables the sideband interface clock used for GMM bus interface operations (gated_side_clk) to be gated when conditions are met. When clear, clock gating is disabled.
7	0h RW	**Sideband Clock Trunk Clock Gating Enable (SBTCGEN):** This bit, when set, allows the sideband interface clock for GMM from SoC (iosfsf_clk) to be gated when conditions are met by deasserting GMMs clock request (iosfst_side_clkreq). When clear, GMM will always assert its clock request.
6	0h RW	**Sideband Clock Partition Clock Gating Enable (SBPCGEN):** This bit, when set, enables the IOSF sideband interface clock for GMM (side_clk) to be gated when conditions are met. When clear, clock gating is disabled
5	0h RW	**GMM Core Clock Gating Enable (GM_BB_GMMC_DCGEN):** This bit, when set, enables the primary interface clock used for GMM core operations (ggm_core_clk) to be gated when conditions are met. When clear, clock gating is disabled.
4	0h RW	**DMA engine Clock Gating Enable (GM_BB_DMA_DCGEN):** This bit, when set, enables the primary interface clock used for GMM DMA and MMU operations (ggm_bb_clk_ra) to be gated when conditions are met. When clear, clock gating is disabled.
3	0h RW	**Register Access Clock Gating Enable (GM_BB_RA_DCGEN):** This bit, when set, enables the primary interface clock used for GMM register access operations (ggm_bb_clk_ra) to be gated when conditions are met. When clear, clock gating is disabled.
2	0h RW	**Host interface Clock Gating Enable (GM_BB_HOST_DCGEN):** This bit, when set, enables the primary interface clock used for GMM bus interface operations (ggm_bb_clk_host) to be gated when conditions are met. When clear, clock gating is disabled
1	0h RW	**Partition Clock Gating Enable (PCGEN):** This bit, when set, enables the primary interface clock for GMM (gm_bb_clk) to be gated when conditions are met. When clear, clock gating is disabled.
0	0h RW	**Trunk Clock Gating Enable (TCGEN):** This bit, when set, allows the primary interface clock for GMM from SoC (iosfpf_clk) to be gated when conditions are met by deasserting GMMs clock request (iosfpt_prim_clkreq). When clear, GMM will always assert its clock request.

6.17 Message Signaled Interrupt Capability ID (MSICAPID) — Offset 90h

This register contains a pointer to the next item in the capabilities list which is the Power Management Capability and also helps to identify linked list item (capability structure) as being for MSI registers.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Pointer to Next Capability (NXTPTR):** Pointer to Next Capability This contains a pointer to the next item in the capabilities list which is the Power Management Capability
7:0	0h RO	**Capability ID (CAPID):** Capability ID Value of 05h identifies this linked list item (capability structure) as being for MSI registers.

6.18 Message Signaled Interrupt Message Control (MC) — Offset 92h

This register is defined to meet PCI Local Bus Specification 3.0 definition of MSI messages.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + 92h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**Per-Vector Masking Capable (PVMCAP):** Per-Vector Masking Capable. 0- not supported by GMM
7	0h RO	**64-bit Address Capable (ADDR64CAP):** 64-bit Address Capable Hardwired to 0 to indicate that the function does not implement the upper 32 bits of the Message Address register and is incapable of generating a 64-bit memory address. This may need to change in future implementations when addressable system memory exceeds the 32bit/4GB limit.
6:4	0h RW	**Multiple Message Enable (MMEN):** Multiple Message Enable System software program this field to indicate the number of vectors allocated to the GMM. At least one vector must be allocated when the MSI interrupts are enabled. This value is ignored by HW as only a single vector is in use by GMM.
3:1	0h RO	**Multiple Message Capable (MMCAP):** Indicates to SW the number of vectors that the GMM module is requesting for use Value Number of Messages requested 000 1 001 2 (reserved) 010 4 (reserved) 011 8 (reserved) 100 16(reserved) 101 32(reserved) Other reserved
0	0h RW	**MSI Enable (MSIEN):** MSI Enable Controls the ability of GMM to generate MSI Messages. A device driver is prohibited from writing this bit to mask a functions service request. 0: MSI will not be generated 1: MSI will be generated. INTA will not be generated and INTA status is not set.

6.19 Message Signaled Interrupt Message Address (MA) — Offset 94h

This register is defined to meet PCI Local Bus Specification 3.0 definition of MSI messages

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MADDR):** Message Address Used by system software to assign an MSI address to the device. The device handles an MSI by writing the padded contents of the MD register to this address
1:0	0h RO	**Reserved (RSVD):** Reserved

6.20 Message Signaled Interrupt Message Data (MD) — Offset 98h

This register is defined to meet PCI Local Bus Specification 3.0 definition of MSI messages

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Message Data (MDAT):** Message Data Base message data pattern assigned by system software and used to handle an MSI from the device. When the device must generate an interrupt request, it writes a 32-bit value to the memory address specified in the MA register. The upper 16 bits are always set to 0. The lower 16 bits are supplied by this register.

6.21 D0i3 Capability ID (D0I3CAPID) — Offset A0h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Pointer to Next Capability (NXTPTR):** This contains a pointer to the next item in the capabilities list which is the Power Management Capability
7:0	0h RO	**Capability ID (CAPID):** Value of 09h identifies this linked list item (capability structure) is a vendor specific capability.

6.22 D0i3 Capability (D0I3CAP) — Offset A2h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + A2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**Vendor-Specific Capability ID (VSID):** Indicates that this Vendor Specific Capability is an Extended Capability, which use a VSEC 16-bit Externded VCapaiblity in the subsequent 4B., differentiating this from other vendor specific capabilities.
11:8	0h RO	**Vendor Specific Capability Revision (VSREV):** Reserved for VSID of Fh
7:0	0h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes in this capability including the CapID and Cap registers.

6.23 D0i3 Vendor Extended Capability Register (D0I3VSEC) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Vendor Specific Extended Capability Length (VSECLEN):** Indicates that this Vendor Specific Capability is an Extended Capability, which use a VSEC 16-bit Externded VCapaiblity in the subsequent 4B., differentiating this from other vendor specific capabilities.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSREV):** For this revision of DevIdle, this field is 0h
15:0	0h RO	**Vendor Specific Extended Capability ID (VSECID):** DevIdle has been assigned the Intel VSEC ID of 10h

6.24 D0i3 SW LTR Pointer Register (D0I3SWLTRPTR) — Offset A8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** The value in this field is ignored as GMM does not support SW LTR
3:1	0h RO	**Base Address Register Number (BARNUM):** The value in this field is ignored as GMM does not support SW LTR
0	0h RO	**VALID:** Indicates the use of SW LTR by the function.GMM does not use SW LTR

6.25 D0i3 DevIdle Pointer Register (D0I3DEVIDLEPTR) — Offset ACh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:0, F:3] + ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DevIdle MMIO Offset Location (DEVIDLELOC):** This location pointer to the DevIdle register in MMIO space, as an offset from the BAR base.
3:1	0h RO	**Base Address Register Number (BARNUM):** The DevIdle is located in BAR0
0	0h RO	**VALID:** GMM has a DevIdle register

6.26 D0i3 DevIdle Power On Latency (D0I3DEVIDLEPOL) — Offset B0h

D0idle_5 Max_Power_On_Latency is set by BIOS at boot and read by device driver SW to calculate approximate cost of a D0idle entry + exit cycle. This allows driver to avoid idle entry in cases where device duty cycle is larger than D0idle entry + exit cycle.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD):** Reserved
12:10	0h RO	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. This field is a RO as there is no need for BIOS programing of it.
9:0	0h RO	**Power On Latency Value (POLV):** A value of 0 indicates a power on latency of less than 1us. This field is a RO as there is no need for BIOS programing of it.

6.27 D0i3 Power Control Enables Register (PCE) — Offset B2h

This register controls the D0i3 features like Hardware Autonomous Enable,sleep enable, D3-Hot Enable, I3 Enable and PMC Request Enable

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + B2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD):** Reserved
5	0h RW	**Hardware Autonomous Enable (HAE):** If set, then the IP may request a PG whenever it is idle. NOTE: If this bit is set, then bits[2:0] must be 000.
4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RO	**Sleep Enable (SE):** if clear, then IP will never asset Sleep to the retention flops. If set, then IP may assert Sleep during PGing. Note that some platforms may default this bit to 0, others to 1.
2	0h RW	**D3-Hot Enable (D3HE):** If set, then IP will PG when idle and the PMCSR[1:0] register in the IP =11.
1	0h RW	**I3 Enable (I3E):** If set, then IP will PG when idle and the D0i3 register (D0i3C[2] = 1) is set. NOTE: If bits [2:1] = 11, then the IP would PG whenever either PMCSR = 11 or the D0i3C.i3 bit is set.
0	0h RW	**PMC Request Enable (PMCRE):** If set, then IP will PG when idle and the PMC requests power gating by asserting the pmc_*_sw_pg_req_b signal.

6.28 Power Management Capability ID (PMCAPID) — Offset DCh

This register contains a pointer to next item in capabilities list and also helps to identify linked list item as being for PCI Power Management registers

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Pointer (NXTPTR):** Next Pointer This contains a pointer to next item in capabilities list. This is the final capability in the list and must be set to 00h.
7:0	0h RO	**Capability Identifier (CAPID):** Capability Identifier Identifies this linked list item as being for PCI Power Management registers. This is compliant with the PCI Power Management Interface Specification.

6.29 Power Management Capability (PMCAP) — Offset DEh

This register describes the Power Management Capability of GMM

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + DEh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**PME Support (PMES):** PME Support This device does not support PMEB signal
10	0h RO	**D2 Support (D2S):** D2 This device does not support D2
9	0h RO	**D1 Support (D1S):** D1 This device does not support D1
8:6	0h RO	**Auxiliary Current (AUXC):** Auxiliary Current Reserved. Not applicable for GNA
5	0h RO	**Device Specific Initialization (DSI):** Device specific Initialization Indicates that this device requires device specific initialization before generic class device driver is to use it
4	0h RO	**Auxiliary Power (AUXP):** Aux Power This device does not use Aux power
3	0h RO	**PME Clock (PMEC):** PME Clock indicate this device does NOT support PMEB generation
2:0	0h RO	**VER:** Version Hardwired to 010b to indicate there are 4 bytes of power management registers implemented and that this device complies with revision 1.1 of the PCI Power Management Interface Specification.

6.30 Power Management Control Status (PMCS) — Offset E0h

This register has the status of PME Generation from D3(cold), Data Scale, Data Select, PME Enable and Power State

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + E0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**PME Generation from D3 (cold) (PMEGD3):** PME Generation from D3 (cold) Not supported
14:13	0h RO	**Data Scale (DATSC):** Data Scale No support for Power Management Data register
12:9	0h RO	**Data Select (DATSEL):** Data Select No support for Power Management Data register
8	0h RO	**PME Enable (PMEE):** PME Enable PMEB is not supported
7:2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**Power State (PS):** Indicates the current power state of this device and can be used to set the device into a new power state. If software attempts to write an unsupported state to this field, write operation must complete normally on the bus, but the data is discarded and no state change occurs. 00: D0 01: D1 (Not supported in this device.) 10: D2 (Not supported in this device.) 11: D3 Write of reserved values is ignored and state will not change. Support of D3cold does not require any special action. While in the D3hot state, this device can only act as the target of PCI configuration transactions (for power management control). This device also cannot generate interrupts or respond to MMR cycles in the D3 state. The device must return to the D0 state in order to be fully-functional.

6.31 FLR Capability ID (FLRCAPID) — Offset F0h

This register contains a pointer to next item in capabilities list and capablity of Advanced Features

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + F0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Next Pointer (NXTPTR):** Next Pointer This contains a pointer to next item in capabilities list. This is the final capability in the list and must be set to 00h.
7:0	0h RO	**Capability Identifier (CAPID):** Capability Identifier A value that indicates FLR (Vendor specific value) 0 : 09h (FLR in use) A value of 09h in this register indicates that this is a FLR capabilities field.

6.32 FLR Capability Length And Version (FLRMISC) — Offset F2h

This register descibest the FLR Capability, TXP Capability and Capability Length

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:0, F:3] + F2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved (RSVD):** Reserved
9	0h RO	**FLR Capability (FLRCAP):** Indicates support for Function Level Reset (FLR).
8	0h RO	**TXP Capability (TXPCAP):** Indicates that TP bit is supported
7:0	0h RO	**Capability Length (CAPLEN):** Capability Length This bit indicates the number of bytes this vendor specified capability requires. it has a value of 06h for the FLR capability

6.33 FLR Control Register (FLRCTL) — Offset F4h

This register controls the Functional Level reset operation of gmm

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RSVD):** Reserved
0	0h WO	**Initiate FLR (INITFLR):** Writing 1 to this field starts the Functional Level Reset.This will act similar to the Abort + will bring all non-CFG registers to their reset value. The FLR is completed when the FLR status bit is cleared

6.34 FLR Status Register (FLRSTS) — Offset F5h

This register helps to identify whether FLR is in progress

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:0, F:3] + F5h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RO/V	**Transaction Pending (XPEND):** Transaction Pending 0 : FLR not in progress 1 : FLR is in progress (due to internal operation or waiting for the completion of a non-posted transaction)

6.35 GMM Status Register (GNASTS)—Offset 80h

This register contains a quick status of the state of the GMM Scoring Accelerator.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved Always returns zero when read
23:18	0h RW/1C/V	**Reserved (RSVDSTS):** Reserved for future use
17	0h RW/1C/V	**Score has reached the saturation point (SAT):** Score has reached the saturation Internal math in score calculation has reached saturation (all 1 s) and thus is not accurate. Read 0 - Saturation didn t occurred 1 - Saturation occurred. Write : 0 - ignored 1 - clear the bit
16	0h RW/1C/V	**GMM output buffer is currently full. (FULL):** GMM output buffer is currently full. GMM scoring stall due to score output buffer being full and previous score-store DMA operation not completed yet. This is a backpressure situation that should not occur, the status flag is used to catch this condition. Read 0 - no back pressure occurred 1 - back pressure occurred Write : 0 - ignored 1 - clear the bit
15:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO/V	**GMM Parameter out of Range (PARAMOORNG):** GMM Parameter out of Range 1 indicates an error casued by one of the GMM parameters being out of the operational range of the GMM Module. This bit is clear by the GMM Abort..
7	0h RO/V	**VA Out of Range Error (VAOORNG):** VA Out of Range Error 000 : no error n : DMA Channel n (1..5) has reached a VA out of range error. This field is clear by the GMM Abort..
6	0h RO/V	**PCIe Error Unexpected Completion (PCIEERRUNEXPCPL):** PCIe Error un Expected Completion 1 indicates an error that is related to the PCIe operation. The error is due to unexpected completion. This bit is clear by the GMM Abort..
5	0h RO/V	**PCIe Error DMA Req (PCIEERRDMA):** PCIe Error DMA Req 1 indicates an error that is related to the PCIe operation. The error is due to DMA. This bit is clear by the GMM Abort..
4	0h RO/V	**PCIe Error MMU Req (PCIEERRMMU):** PCIe Error MMU Req 1 indicates an error that is related to the PCIe operation. The error is due to MMU req. This bit is clear by the GMM Abort..
3	0h RO/V	**Compute Statistics Valid (COMPVALID):** Compute Statistics Valid 1 indicates the GMM collected performance statistics and that the value of stall and total compute cycles are valid. This bit is clear by the GMM Abort..

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	**Suspended due to Pause (SUSPPAUSE):** Suspended due to Pause 1 indicates that a GMM Scoring operation was suspended due to a SW write of 1 to the Pause bit. GMM execution is now suspended to allow software observation of current state. The bit is cleared when the operation is resumed or aborted.
1	0h RO/V	**Suspended Break Point Match (SUSPBREAKPT):** Suspended Break Point Match 1 indicates that a breakpoint match was reached and that GMM execution is now suspended to allow software observation of current state. The bit is cleared when the operation is resumed or aborted.
0	0h RO/V	**Scoring completed. (SCRCPL):** Scoring completed. Indicate that the scoring of the frame is completed but data may still be DMAed to memory. The bit is cleared when the GMM Abort is set.

6.36 GMM Control Register (GNACTRL)—Offset 84h

This register is used to initiation GMM Scoring Accelerator calculations.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved Always returns zero when read
23:19	0h RW	**Reserved (RSVDCTL):** Reserved for future use
18	0h RW	**Power Management Quiet-Idle Disable (PMQID):** Power Management Quiet-Idle Disable 0 : module return to Idle immediately (by clearing Start bit) when Completion status bit is set. 1 : module remains in GMM scoring mode when until SW writes to the GMM Abort/clear bit a 1
17	0h RW	**PM Override Force Clock On (PMCLKON):** PM Override Force Clock On 1 : force the clocks to all GMM modules to be always on. Setting this bit impact the global power management of the device
16	0h RW	**PM Override Power On (PMPWRON):** PM Override Power On 1 : force power to the module to be always on. Setting this bit impact the global power management of the device

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**Compute Statistics Enable (COMPSTATEN):** Compute Statistics Enable This fields control the enabling of the GMM Scoring Acceleration performance counters. When performance counting is enabled, the total scoring cycles counter is always on. In addition one of several reasons for stall may be measured to allow identifying the bottlenecks in the scoring operation. Bits Encoding 000 Performance counting is disabled 001 Count Total stall cycle 010 Wait for DMA Completion 011 Wait for MMU Transaltion Others reserved
11	0h RO	**Reserved (RSVD_1):** Reserved Always returns zero when read
10	0h RW	**Error Interrupt Enable (ERRINTEN):** Error Interrupt Enable 0 : Interrupt is not sent when the GMM execution is stopped due to an error. 1 : Interrupt is sent when execution is stopped due to an error as indicated by the setting of one of the Error status bits
9	0h RW	**Break Point Pause Interrupt Enable (BRKPTINTEN):** Break Point Pause Interrupt Enable : 0 : No interrupt sent on execution Pause due to break point. 1 : Interrupt is sent when execution is paused due to a reaching a break point.
8	0h RW	**Completion Interrupt Enable (CPLINTEN):** Completion Interrupt Enable 0 : Interrupt is not sent when the GMM execution is completed. 1 : Interrupt is sent when execution is completed and the Completion Status is set.
7	0h RO	**Reserved (RSVD_2):** Reserved
6:5	0h RW	**GNA Operation Mode (MODE):** 00: GMM; 01: XNN; Other: Reserved
4	0h RW/1S	**Resume Execution (RESUME):** Resume Execution 0 : ignored 1 : Resume execution when in the Pause states (status bit is set), due to Break point or a write to the Suspend bit. Pause status is cleared when execution resumes.
3	0h RW/1S	**Pause Execution (PAUSE):** Pause Execution Write behavior : 0 - ignored 1 - halts the execution of the GMM module at the next stop point. Once stopped the appropriate status bit indicates the reason of the pause.
2	0h RW/1S	**Abort Accelerator (ABORT):** Abort Accelerator Write behavior : 0 - ignored 1 - performs an abort operation. When written a 1, when the GMM is running or when halted due to an error or a break point. It will reset the GMM to its Idle condition and will clear any pending error bit in the MMIO registers. When the reset is completed the Start bit and all status bits are cleared. This bit retunes returns a zero when read.
1	0h RW	**Active List Enable (ALE):** Enables the use of the active state list. "1"- once enabled, the value in the active state list parameter registers are valid "0"-disabled

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1S	**Start GMM Accelerator (START):** Start GMM Accelerator Write behavior : 0 - ignored 1 - start execution of the GMM hardware based on the parameters set in the various register. When read the bit indicates the current status of the GMM execution. 0 - GMM is Idle 1 - GMM is executing. The Start bit is cleared by HW when GMM execution is completed (note that data might be in flight to memory, and pushed by status read completion or MSI). In case execution is halted due to error conditions, or due to a break point, the bit stay set, and only the halt status is flagged. The bit is also cleared when GMM operations is Aborted by a write of 1 to the respective control bit. .

6.37 GMM Management And Control Register (GNAMCTL)—Offset 88h

This register specifies the System Agent Frequency requirement and max number of allowed outstanding memory transactions in gmm

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: Fh

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**System Agent High Frequency Required (SAHFREQ):** System Agent High Frequency Required 0 - GMM can operate at SA low frequency or high freq. 1 - GMM is scoring a large model and a SA high freq. is required during GMM active mode. This bit must be by SW while the GMM is Idle to guarantee proper operation.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3:0	Fh RW	**Max Outstanding Transaction Control (MAXOTC):** Max Outstanding Transaction Control -1 The number of outstanding transactions that may be pending to memory at any given time. Smaller numbers may be enforced due to lack of system resources or override by uArch control.

6.38 GMM Performance Total Cycle (GNAPTC)—Offset 8Ch

Indicates the number of cycles that the GMM was in Score in Progress state since the last score enable was started

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**GMM Performance Total Cycle (GNAPTC):** Indicates the number of cycles that the GMM was in Score in Progress state since the last score enable was started. A value of all 1 indicates saturation of the counter.

6.39 GMM Performance Stall Cycles (GNAPSC)—Offset 90h

Indicates the number of stall cycles that the GMM had since the last Score in Progress state since the last score enable was started

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**GMM Performance Stall Cycles (GNAPSC):** Indicates the number of stall cycles that the GMM had since the last Score in Progress state since the last score enable was started. The type of stall is defined in the A value of all 1 indicates saturation of the counter.

6.40 GMM Internal State Index (GNAISI)—Offset 94h

For debug assistance, the GNAISI register identifies the internal signal states by indexing to a list of pre-defined observation points. The actual internal signal state values are routed to the GNAPISVL and GNAPISVH registers

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD):** Reserved
10:0	0h RW	**Index (IND):** Index that select the proper internal status for the GMM module. Signal list is defined in Table 1-3

6.41 GMM Internal State Value Low (GNAPISVL)—Offset 98h

The lower 32 bits of the GMM internal signal states as identified by the GNAISI register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Low Status Bits (GNAPISVL):** Low Status bits Low Status bits. Meaning of field depends on status register selected in the Index field.

6.42 GMM Internal State Value High (GNAPISVH)—Offset 9Ch

The higher 32 bits of the GMM internal signal states as identified by the GNAISI register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**High Status bits (GNAPISVH):** High Status bits High Status bits applicable for some data elements. Meaning of field depends on status register selected in the Index field.

6.43 GMM Break Point Setup Low (GNABPL)—Offset A0h

This register may be read and written as a 32 bit register when the GMM scoring is off or suspended. The operation of the break point will use either Active list or GMM state index or both (in which case match occurs when either match is reached).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RW	**GMM States (GMMST):** The index of GMM state at which the break point match. 1 to 262144: are valid and indicate GMM state at which to stop (counting starts at 1). 0 : ignore the GMM state index (stop will use active list index and mixture component).
12:0	0h RW	**Mixture Components Number (MCNUM):** Mixture Components Number The index of the break point mixture component index. 1 to 4096 : are valid and indicate stop after the mixture component of that number (counting starts at 1). 0 : means stopping before the first mixture component.

6.44 GMM Break Point Setup High (GNABPH)—Offset A4h

This register may be read and written as a 32 bit register when the GMM scoring is off or suspended. The operation of the break point will use either Active list or GMM state index or both (in which case match occurs when either match is reached).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Reserved1 (RSVD1):** Reserved
30:19	0h RO	**Reserved (RSVD):** Reserved
18:0	0h RW	**Active Index (ACTIND):** Active Index The index of Active List state at which the break point match. 1 to 262144: are valid and indicate GMM Active List index at which to stop (counting starts at 1). 0 : ignore the Active List state index (stop will use GMM state index and mixture component).

6.45 GMM Internal State Value (GNAD0i3C)—Offset A8h

This register is used as part of the D0i3 enter flow only. When that mode is not enabled this register is ignored by HW and its bits behavior is not guranteed.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD1):** Reserved
7:4	0h RO	**Reserved (RSVD):** Reserved
3	1h RW/1C/V	**Restore Required (RESTREQ):** Indicates the validity of the MMIO space registers and the need to restore them. The state may have been lost due to a reset or A MDfull power lost. SW clears the bit by writing a 1. This bit will be set on initial power up. Read : 0 no restore is require 1 : set by HW to indicate that a restore of state is required due to power loss. Write : 0 : ignored 1 : clear the bit When set (by HW), SW must restore state to the IP.
2	0h RW	**D0i3_SW (D0i3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Request (INTREQ):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. 0 : interrupt will not be generated 1 : interrupt will be generated on the transition of 1-> 0 of the Command In Progress bit.
0	0h RO/V	**Command-In-Progress (CMDIP):** This bit is set by HW when a transition into or out of D0i3 command is received (a change 0->1 or 1 ->0 on D0i3 bit). The bit is changed to 0 when the enter/exit of D0i3 is completed. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

6.46 GNA Descriptor Base Address Register (GNADESBASE)—Offset B0h

GNA Descriptor Base Address Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RW	**Base Physical Offset (GNADESBASE):** The upper 32-bit of he directory page address. The directory structure is always at the beginning of a 4KB aligned block that starts at this address

6.47 GNA Information Register (GNAIBUFFS)—Offset B4h

GNA Information Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 18h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	18h RO	**GNA Input buffer size (GNAIBUFFS):** GNA Input Buffer Size. The size of the input buffer in KB.

6.48 GNASAI1L (GNASAI1L)—Offset 100h

GNA access Policy for MMIO Group (RW access).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FFF0FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFF0FFFFh RO	**GNASAI1 (GNASAI1L):** Lower 32 bits of GNA access Policy for MMIO Group (RW access). This is a RO register

6.49 GNASAI1H (GNASAI1H)—Offset 104h

GNA access Policy for MMIO Group (RW access).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FFF0FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFF0FFFFh RO	**GNASAI1H (GNASAI1H):** Upper 32 bits of GNA access Policy for MMIO Group (RW access). This is a RO register

6.50 GNASAI2 (GNASAI2L)—Offset 108h

GNA access Policy for Private registers Group (RW access).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FFF0FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFF0FFFFh RO	**GNASAI2 (GNASAI2L):** Lower 32 bits of GNA access Policy for Private registers Group (RW access). This is a RO register

6.51 GNASAI2 (GNASAI2H)—Offset 10Ch

GNA access Policy for Private registers Group (RW access).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FFF0FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFF0FFFFh RO	**Base Physical Offset (GNASAI2H):** Upper 32 bits of GNA access Policy for Private registers Group (RW access). This is a RO register

6.52 GNASAI2 (GNASAIV)—Offset 110h

GNA access Policy for Private registers Group (RW access).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RO	**GNA SAIV Setup (GNASAIV):** Outgoing SAI of GNA

§ §

7 SMBus Registers

This chapter documents the registers in Bus: 0, Device 31, Function 1.

7.1 Vendor ID (VID) — Offset 0h

Value 8086h indicates Intel as the vendor

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Vendor ID (VID):** Value indicates Intel as the vendor

7.2 Device ID (DID) — Offset 2h

Indicates the Device Number assigned for SMBus Host Controller Device ID.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG.

7.3 Command (CMD) — Offset 4h

Contains various bits such as IO Space Enable, Memory Space Enable, Bus Master Enable etc.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Interrupt Disable (INTD):** 1 = Disables SMBus to assert its PIRQB# signal. Defaults to 0.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0. Read Only.
8	0h RW	**SERR# Enable (SERRE):** 1 = Enables SERR# generation
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0. Read Only.
6	0h RW	**Parity Error Response (PER):** 1 = Sets Detected Parity Error bit when parity error is detected
5	0h RO	**VGA Palette Snoop (VGAPS):** Reserved as 0. Read Only.
4	0h RO	**Postable Memory Write Enable (PMWE):** Reserved as 0. Read Only.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0. Read Only.
2	0h RO	**Bus Master Enable (BME):** Reserved as 0. Read Only.
1	0h RW	**Memory Space Enable (MSE):** 1= Enables memory mapped config space.
0	0h RW	**I/O Space Enable (IOSE):** 1= enables access to the SM Bus I/O space registers as defined by the Base Address Register.

7.4 Device Status (DS) — Offset 6h

Contains various bits such as Interrupt Status, Capabilities List Indicator, Signaled System Error, Detected Parity Error etc.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
14	0h RW/1C	**Signaled System Error (SSE):** Set when the SMBus signals a system error to the internal SERR# logic.
13	0h RO	**Received Master Abort (RMA):** Reserved as 0.
12	0h RO	**Received Target Abort (RTA):** Reserved as '0'.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** Reserved as 0.

Bit Range	Default & Access	Field Name (ID): Description
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. These read only bits indicate the SoC's DEVSEL# timing when performing a positive decode. Note: SoC generates DEVSEL# with medium time. Note: It is not clear if a PCI master can write to SMBus controller.
8	0h RO	**Data Parity Error Detected (DPED):** Reserved as 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Reserved as '1'.
6	0h RO	**User Definable Features (UDF):** Reserved as 0.
5	0h RO	**66 MHz Capable (C_66M):** Reserved as 0.
4	0h RO	**Capabilities List Indicator (CLI):** Hardwired to 0 because there are no capability list structures in this function.
3	0h RO	**Interrupt Status (INTS):** This bit indicates that an interrupt is pending. It is independent from the state of the Interrupt Enable bit in the command register.
2:0	0h RO	**Reserved (RSVD):** Reserved

7.5 Revision ID (RID) — Offset 8h

Indicates the part revision. This will reset to 0 but is expected to be overridden by the SetID IOSF-SB message.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** The value reported in this register depends on theglobal revision ID for the PCH.

7.6 Programming Interface (PI) — Offset 9h

SMBus Controller has no programming interface.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 9h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Programming Interface (PI):** No programming interface defined.

7.7 Sub Class Code (SCC) — Offset Ah

Indicates this device is a SMBus serial controller.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + Ah	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Sub Class Code (SCC):** A value of 05h indicates that this device is a SM Bus serial controller.

7.8 Base Class Code (BCC) — Offset Bh

Indicates this device is a serial controller.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + Bh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Base Class Code (BCC):** A value of 0Ch indicates that this device is a serial controller

7.9 SMBus Memory Base Address_31_0 (SMBMBAR_31_0) — Offset 10h

Provides the 32 byte system memory base address for the SoC SMB logic.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**BA:** Provides the 32 byte system memory base address for the SoC SMB logic.
7:4	0h RO	**HARDWIRED_0:** Hardwired to 0.
3	0h RO	**PREF:** Hardwired to 0. Indicated that SMBMBAR is not pre- fetchable
2:1	0h RO	**Address Range (ADDRNG):** Indicates that this SMBMBAR can be located anywhere in 64 bit address space

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Memory Space Indicator (MSI):** Indicates that the SMB logic is memory mapped.

7.10 SMBus Memory Base Address_63_32 (SMBMBAR_63_32) — Offset 14h

Bits 63-32 of SMbus Memory Base Address

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BA:** Bits 63-32 of SMbus Memory Base Address

7.11 SMB Base Address (SBA) — Offset 20h

Provides the 32 byte system I/O base address for the SMB logic.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:5	0h RW	**BA:** Provides the 32 byte t system I/O base address for the SMB logic.
4:1	0h RO	**Reserved (RSVD_1):** Reserved
0	0h RO	**IO Space Indicator (IOSI):** This read-only bit always is 1, indicating that the SMB logic is I/O mapped.

7.12 SVID — Offset 2Ch

BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**SVID:** BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

7.13 SID — Offset 2Eh

BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s).

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:1] + 2Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**SID:** BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s). Note: The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.

7.14 Interrupt Line (INTLN) — Offset 3Ch

This data is not used by the hardware. It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (INTLN):** This data is not used by the hardware. It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#.

7.15 Interrupt Pin (INTPN) — Offset 3Dh

Defines the interrupt pin to be used by the SMBus controller.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 3Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/O	**Interrupt Pin (INTPN):** This defines the interrupt pin to be used by the SMBus controller. Bits : Pins 0h : No Interrupt 1h : INTA# 2h : INTB# 3h : INTC# 4h : INTD# 5h-Fh : Reserved.

7.16 Host Configuration (HCFG) — Offset 40h

Contains the HST_EN, SMB_SMI_EN, I2C_EN, SSRESET and SPD Write Disable bit.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:1] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD):** Reserved
4	0h RW/1L	**SPD Write Disable (SPDWD):** This bit is must be set to '1' to disable writes to SPD which are on Host SMB address ranges A0h - AEh. The SMBus range is unwriteable until next platform reset. HW Default is '0.' Note: This bit is RW O and will be reset on PLTRST# reset. This should be set by BIOS memory reference code to '1'. SW can only program this bit when both HCTL(6) = 0 (START) and HSTS(0) = 0 (HBSY), else it may result in an undefined behavior. [Noted in HSTS.HBSY that states "No SMB registers should be accessed while HSTS.HBSY bit is set, the same will apply to SPD write disable. 3 RW 0 SSRESET : Soft SMBUS Reset: When this bit is 1,
3	0h RW	**SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMbus state machine and logic in PCH is reset. The HW will reset this bit to 0 when reset operation is completed.
2	0h RW	**I2C_EN (I2CEN):** When this bit is 1, the SoC is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus.
1	0h RW	**SMB_SMI_EN (SSEN):** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#.
0	0h RW	**HST_EN (HSTEN):** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared.

7.17 B-Unit Copy of the TCO Base Address Register for Legacy SMBUS (B_CR_TCOBASE_SMBUS) — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:5	0h RW/V	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, mappable anywhere in the 64k I/O space on 32-byte boundaries.
4:0	0h RO	**Reserved (RSVD):** Reserved

7.18 B-Unit Copy of the TCO Control Register for Legacy SMBUS (B_CR_TCOCTL_SMBUS) — Offset 54h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + 54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW/V	**TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled.
7:0	0h RO	**Reserved (RSVD):** Reserved

7.19 Manufacturer's ID (MANID) — Offset F8h

This reflects the value of the Manufacturers ID which provides information on the details of the chip revision. Implementation Note: A single Manufacturers ID is implemented based on information in the Fuse block and distributed to the devices via a message. This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:1] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27:24	0h RO/V	**Dot Portion of Process ID (DPID):** Indicates the dot process as x.8
23:16	0h RO/V	**Stepping ID (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO/V	**Manufacturer (MAFA):** 0Fh = Intel
7:0	0h RO/V	**Process/Dot (PD):** Indicates that the process base is 1271.

7.20 Host Status Register Address (HSTS)—Offset 0h

Contains the Host Status bits i.e. Host Busy, Interrupt, Device Error, Bus Error, Failed, SMBALERT_STS, In Use Status and Byte Done Status. All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C	**BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit is not set when transmission is due to the D110 interface heartbeat. This bit has no meaning for block transfers when the 32- byte buffer is enabled. Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SoCSoC will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.
6	0h RW/1C	**In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SoCs SMBus logic.
5	0h RW/1C	**SMBALERT_STS (SMSTS):** SoC sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal. Software resets this bit by writing a 1 to this location. This bit should also be cleared by RSMRST# (but not PLTRST#).

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1C	**Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.
3	0h RW/1C	**Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision.
2	0h RW/1C	**Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following: Illegal Command Field Unclaimed Cycle (host initiated) Host Device Time-out Error. CRC Error
1	0h RW/1C	**Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command.
0	0h RW/1C	**Host Busy (HBSY):** A 1 indicates that the SoC is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.

7.21 Host Control Register (HCTL)—Offset 2h

Contains the interrupt generation bit, KILL, SMB CMD, Last Byte, Start and Packet Error Checking bits. Note: A read to this register will clear the pointer in the 32-byte buffer.

Access Method

Type: MEM Register (Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**PEC_EN (PEC_EN):** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to 0, the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.
6	0h RW	**START (START):** This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a 1 to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SoC has finished the command.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**LAST_BYTE (LAST_BYTE):** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the LAST BYTE bit. The software will then clear the BYTE_DONE_STS bit. D. The SoC will then receive the last byte of the message (byte n). However, the SoC state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).

Bit Range	Default & Access	Field Name (ID): Description
4:2	0h RW	**SMB_CMD (SMB_CMD):** As shown by the bit encoding below, indicates which command the SoC is to perform. If enabled, the SoC will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the SoC will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SoC will perform no command, and will not operate until DEV_ERR is cleared. Val - Command Description: 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register. 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data. 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. 101 - Block: This command uses the transmit slave address,command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The SoC will continue reading data until the NAK is received. 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. Note: E32B bit in the Auxiliary Control Register must be set for this command to work.
1	0h RW	**KILL (KILL):** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**INTREN (INTREN):** Enable the generation of an interrupt or SMI# upon the completion of the command.

7.22 Host Command Register (HCMD)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

7.23 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RW	**ADDRESS (ADDR):** 7-bit address of the targeted slave. Note: Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration.
0	0h RW	**RW (RW):** Direction of the host transfer. 1 = read, 0 = write

7.24 Data 0 Register (HD0)—Offset 5h

This register contains the eight bit data sent in the DATA0 field of the SMB protocol.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts.

7.25 Data 1 Register (HD1)—Offset 6h

This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**DATA1 (DATA1):** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.

7.26 Host Block Data (HBD)—Offset 7h

This is a register containing a byte of data to be sent on a block write or read . Or a pointer into a 32- byte block array.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the SoC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert waitstates on the interface.

7.27 Packet Error Check Data Register (PEC)—Offset 8h

Note: This register may reside in either the core well or the suspend well. To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B). This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

Access Method

Type: MEM Register (Size: 8 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**PEC_DATA (PEC_DATA):** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.

7.28 Receive Slave Address Register (RSA)—Offset 9h

Contains the slave address that the SoC decodes for read and write cycles.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 44h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD)**
6:0	44h RW	**SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the SoC decodes for read and write cycles. The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead). This register is reset by RSMRST#, but not by PLTRST#.

7.29 Slave Data Register (SD)—Offset Ah

The 16-bit data value written by the external SMBus master.

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master. The CPU can then read the value from this register. This register is reset by RSMRST#, but not by PLTRST#. SLAVE_DATA[7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table. SLAVE_[15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table.

7.30 Auxiliary Status (AUXS)—Offset Ch

Contains the CRC Error, the SMT1EN, SMT2EN and SMT3EN bits. All bits in this register are in the core well.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved (RSVD)**
4	0h RO/V	**SMT3EN (SMT3EN):** Register value determines if SMT3 is enabled and connected on SMLink1. Disabled means the device is not connected to the pins 0: Disable 1: Enable
3	0h RO/V	**SMT2EN (SMT2EN):** Register value determines if SMT2 is enabled and connected on SMLink0. Disabled means the device is not connected to the pins 0: Disable 1: Enable
2	0h RO/V	**SMT1EN (SMT1EN):** Register value determines if SMT1 is enabled and connected on SMBus. Disabled means the device is not connected to the pins 0: Disables 1: Enable
1	0h RO	**Reserved (RSVD_1)**
0	0h RW/1C	**CRC Error (CRCE):** This bit is set if a received message contained a CRC error. When this bit is set, the DERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SoC has received the final data bit transmitted by external slave.

7.31 Auxiliary Control (AUXC)—Offset Dh

Contains the Automatically Append CRC and Enable 32-byte buffer bits. All bits in this register are in the resume well.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the SoC generates an interrupt.
0	0h RW	**Automatically Append CRC (AAC):** When set, the SoC will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function.

7.32 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

Contains the SMLINK[0]_CUR_STS, SMLINK[1]_CUR_STS and SMLINK_CLK_CTL bits. Note: This register is in the resume well and is reset by RSMRST#

Access Method

Type: MEM Register (Size: 8 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD)**
2	1h RW	**SMLINK_CLK_CTL (SMLINK_CLK_CTL):** 0 = SoC will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin. 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin.
1	0h RO/V	**SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[1] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO/V	**SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[0] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

7.33 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

Contains the SMBCLK_CUR_STS, SMBDATA_CUR_STS and SMBCLK_CTL bits. Note: This register is in the resume well and is reset by RSMRST#

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD)**
2	1h RW	**SMBCLK_CTL (SMBCLK_CTL):** 0 = SoC will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin. 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.
1	0h RO/V	**SMBDATA_CUR_STS (SMBDATA_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBDATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.
0	0h RO/V	**SMBCLK_CUR_STS (SMBCLK_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBCLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin.

7.34 Slave Status Register (SSTS)—Offset 10h

This bit is set to 1 when it has completely received a successful Host Notify Command on the SMBus pins. All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1C	**HOST_NOTIFY_STS (HNS):** The SoC sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SoC will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SoC will NACK the first byte (host address) of any new Host Notify commands on the SMBus. Writing a 0 to this bit has no effect.

7.35 Slave Command Register (SCMD)—Offset 11h

Contains the HOST_NOTIFY_INTREN, HOST_NOTIFY_WKEN and SMBALERT_DIS bits. All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD)**
2	0h RW	**SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source. This bit is logically inverted and ANDed with the SMBALERT_STS bit. The resulting signal is distributed to the SMI# and/or interrupt generation logic. This bit does not effect the wake logic.
1	0h RW	**HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event. When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register.
0	0h RW	**HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated. The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits.

7.36 Notify Device Address Register (NDA)—Offset 14h

Contains the 7-bit device address received during the Host Notify protocol of the SMBUS 2.0 specification.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0h RO/V	**DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.
0	0h RO	**Reserved (RSVD)**

7.37 Notify Data Low Byte Register (NDLB)—Offset 16h

Contains the low byte of data received during the Host Notify protocol of the SMBUS 2.0 specification.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

7.38 Notify Data High Byte Register (NDHB)—Offset 17h

Contains the high byte of data received during the Host Notify protocol of the SMBUS 2.0 specification.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.

7.39 TCO_RLD Register (TRLD)—Offset 0h

The values in this register have no effects on the TCO Timer hardware.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved (RSVD)**
9:0	4h RW	**TCORLD (TCORLD):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

7.40 TCO_DAT_IN Register (TDI)—Offset 2h

Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

7.41 TCO_DAT_OUT Register (TDO)—Offset 3h

Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

7.42 TCO1_STS Register (TSTS1)—Offset 4h

Contains the TCO status bits such as NMI2SMI, OS_TCO_SMI, TCO_INT_STS, CPUSCI_STS, CPUSMI_STS etc. Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD)**
13	0h RO	**TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap.
12	0h RW/1C	**CPUSERR_STS (CPUSERR_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SERR#. The software must read the MCH to find out why it wanted the SERR#. Software must write a 1 back to this bit to clear it.
11	0h RO	**Reserved (RSVD_1)**
10	0h RW/1C	**CPUSMI_STS (CPUSMI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SMI. The software must read the CPU to find out why it wanted the SMI. Software must write a 1 back to this bit to clear it.
9	0h RW/1C	**CPUSCI_STS (CPUSCI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SCI. The software must read the CPU to find out why it wanted the SCI. Software must write a 1 back to this bit to clear it.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C	**BIOSWR_STS (BIOSWR_STS):** SoC sets this bit to 1 and generates and SMI# to indicate an illegal attempt to write to the BIOS. (The BIOS write could be either to FirmwareHUB (FWH) or SPI Flash). This occurs when either: a) The WP bit (10.1.7.4 bit 0) is changed from 0 to 1 and the LE bit (10.1.7.4 bit 1) is also set, or b) any write is attempted to the BIOS and the WP bit is also set. Note: On write cycles attempted to the 4MB lower alias to the BIOS space, the BIOSWR_STS bit will not be set.
7	0h RW/1C	**NEWCENTURY_STS (NEWCENTURY_STS):** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTEST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event (i.e. if the system is in a sleeping state when the NEWCENTURY_STS bit is set, the system will not wake up). Note: This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). Software can determine that the RTC well was not maintained by checking the RTC_PWR_STS bit (GEN_PMCON_3 register in the Power Management Controller, D31:F2:A4, bit 2) or by other means (such as doing a checksum on the RTC RAM array). If the RTC well is determined to not have been maintained, the BIOS should set the time to a legal value and then clear the NEWCENTURY_STS bit. Note: This bit may take up to 3 RTCCLKs for the bit to be cleared when a 1 is written to the bit to clear it. After writing a 1 to the NEWCENTURY_STS bit, software should also not exit the SMI handler until after the bit has been cleared. This is to make sure the SMI is not re-entered. BIOS Assumption: When booting, the BIOS checks the NEWCENTURY_STS bit. If set, the BIOS should increment the value in the RTC RAM register associated with the century. The BIOS should then clear the NEWCENTURY_STS bit. This scenario would occur if the system was asleep when the century rolls over. If the system is in an S0 state (not sleeping) and the SMI# occurs with the NEWCENTURY_STS bit sets, the SMI handler should increment the value in the RTC RAM register and clear the NEWCENTURY_STS bit.
6:4	0h RO	**Reserved (RSVD_2)**
3	0h RW/1C	**TIMEOUT (TIMEOUT):** Bit set to 1 by SoC to indicate that the SMI was caused by TCO timer reaching 0. Note: The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.
2	0h RW/1C	**TCO_INT_STS (TCO_INT_STS):** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.
1	0h RW/1C	**OS_TCO_SMI (OS_TCO_SMI):** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**NMI2SMI_STS (NMI2SMI_STS):** The SoC sets read-only this bit when an SMI# occurs because an event occurred that would otherwise have caused an NMI. The NMI2SMI_STS bit should not be sticky bit. It should be a simple OR gate to indicate that one of the NMI sources has caused the SMI#. Each of the NMI sources already has its own sticky bit feeding the OR gate. Writes to this bit have no effect.

7.43 TCO2_STS Register (TSTS2)—Offset 6h

Contains the INTRD_DET, SECOND_TO_STS and SMLINK_SLAVE_SMI_STS bits.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0h RO	**Reserved (RSVD)**
4	0h RW/1C	**SMLINK_SLAVE_SMI_STS (SMLINK_SLAVE_SMI_STS):** SoC will set this bit to 1 when it receives the SMI message (encoding 08h in the command type) on the SMLinks Slave Interface. Software clears the bit by writing a 1 to this bit position. This bit is in the resume well. It is reset by RSMRST#, but not by the PCI Reset associated with exit from S3-S5 states. This allows the software (presumably BIOS) to get the interrupt, see this new bit set, and decidedly go into the pre-determined (by local policy) sleep state. The advantage here is that race conditions are eliminated if the bit is only meant for power-down instead of potentially being meant for power-up or power-down depending on the current state (like the real power button).
3:2	0h RO	**Reserved (RSVD_1)**
1	0h RW/1C	**SECOND_TO_STS (SECOND_TO_STS):** SoC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the SoC will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1C	**INTRD_DET (INTRD_DET):** Intruder Detect. Bit set to 1 by the SoC to indicate that an intrusion was detected. This is latched. This bit is cleared by writing a 1 to this bit or by RTEST#. This bit is backed in the RTC Well. Note: This bit has a recovery time. After writing a 1 to this bit position (to clear it), the bit may be read back as a 1 for up 65 microseconds before it is read as a 0. Software must be aware of this recovery time when reading this bit after clearing it. Note: If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signals goes inactive and then active again, there will not be further SMIs (because the INTRD_SEL bits would select that no SMI# be generated). If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET signal will go to a 0 when INTRUDER# input signal goes inactive. Note that this is slightly different than a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

7.44 TCO1_CNT Register (TCTL1)—Offset 8h

Contains the NMI_NOW, NMI2SMI_EN, TCO_TMR_HALT bits.

Access Method

Type: IO Register (Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD)**
12	0h RW	**TCO_LOCK (TCO_LOCK):** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0h RW	**TCO_TMR_HALT (TCO_TMR_HALT):** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.
10	0h RW	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**NMI2SMI_EN (NMI2SMI_EN):** Setting this bit 1 forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. NMI2SMI_EN bit is set AND the NMI_EN# bit is set to 0, the NMI# will be routed to cause an SMI#. No NMI will be caused. However, if the GBL_SMI_EN bit is not set, then no SMI# will be generated, either. If NMI2SMI_EN is set but the NMI_EN# bit is set to 1, then no NMI or SMI# will be generated. The following table shows the possible combinations: NMI_EN#, GBL_SMI_EN 00 No SMI# based on NMI events (since no SMI# at all because SMI_EN = 0) 01 SMI# will be caused based on NMI events 10 No SMI# at all because SMI_EN is 0 11 No SMI# based on NMI events because NMI_EN#=1
8	0h RW	**NMI_NOW (NMI_NOW):** Writing a 1 to this bit causes an NMI. This allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.
7:0	0h RO	**Reserved (RSVD_1)**

7.45 TCO2_CNT Register (TCTL2)—Offset Ah

Contains the INTRD_SEL andf SMBALERT_DISABLE bits.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD)**
5:4	0h RW	**OS_POLICY (OS_POLICY):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Dont load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved Implementation note: These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.
