31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1642 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_181)—Offset 660h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1643 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_181)—Offset 664h

Access Method

28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1650 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_183)—Offset 680h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1656 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_184)—Offset 698h

Access Method

29.1658 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_185)—Offset 6A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1666 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_188)—Offset 6C0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1672 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_210)—Offset 6D8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1673 Pad Configuration DW3 (PAD_CFG_DW3_GPIO_210)—Offset 6DCh

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1674 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_189)—Offset 6E0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1682 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_191)—Offset 700h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1688 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_192)—Offset 718h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD_0):** Reserved
11	0h RO/V	**Pin-strap value (PINSTRAPVAL):** This bit reflects the pin-strap value.
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1694 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_194)—Offset 730h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1702 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_196)—Offset 750h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1708 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_197)—Offset 768h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

29.1710 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_198)—Offset 770h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1716 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_199)—Offset 788h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1717 Pad Configuration DW3 (PAD_CFG_DW3_GPIO_199)—Offset 78Ch

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1718 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_200)—Offset 790h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1726 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_202)—Offset 7B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1734 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_204)—Offset 7D0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1746 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_207)—Offset 800h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1747 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_207)—Offset 804h

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1752 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_208)—Offset 818h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1753 Pad Configuration DW3 (PAD_CFG_DW3_GPIO_208)—Offset 81Ch

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1754 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_209)—Offset 820h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000500h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1755 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_209)—Offset 824h

Access Method

Type: MSG Register

30 MSR Registers

30.1 IA32_MC5_CTL (P_CR_MC_CTL)—Offset 4620h

PUNIT_MSR: PCU Machine Check Architecture Control MSR.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
63:3	0h RO/V	**RESERVED_0 (RESERVED_0):** Reserved
2	1h RW	**EN_PCU_FW_ERR (EN_PCU_FW_ERR):** Enable Error signaling of PCU Pcode errors. When bit is set PCU HW errors will result in assertion of CATERR. Otherwise CATERR is not asserted. In any case the error is logged in MC4_STATUS MSR.
1	1h RW	**EN_PCU_UC_ERR (EN_PCU_UC_ERR):** Enable Error signaling of PCU uC errors. When bit is set PCU HW errors will result in assertion of CATERR. Otherwise CATERR is not asserted. In any case the error is logged in MC4_STATUS MSR.
0	1h RW	**EN_PCU_HW_ERR (EN_PCU_HW_ERR):** Enable Error signaling of PCU HW errors. When bit is set PCU HW errors will result in assertion of CATERR. Otherwise CATERR is not asserted. In any case the error is logged in MC4_STATUS MSR.

30.2 IA32_MC5_STATUS (P_CR_MC_STATUS)—Offset 4628h

PUNIT_MSR: PCU Machine Check Architecture Status MSR.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/V	**VALID (VALID):** Indicates that this register contains a valid MCA error that was detected.
62	0h RW/V	**OVR (OVR):** Another MCA error was detected when VALID was already set to 1b. In other words a second MCA error was detected while an earlier error was already logged.
61	0h RW/V	**UC (UC):** Indicates when set that the processor did not correct the error condition. 0b Correctable Error 1b Uncorrectable Error
60	0h RW/V	**EN (EN):** Enable bit Whether the logged error was enabled or not. This bit is equal to the appropriate enable bit in IA32_MC4_CTL: For HW errors the value of IA32_MC4_CTL[EN_PCU_HW_ERROR] is writen by HW to this bit. For Microcontroller errors the value of IA32_MC4_CTL[EN_PCU_UC_ERROR] is writen by HW to this bit. For FW errors the value of IA32_MC4_CTL[EN_PCU_FW_ERROR] is writen by HW to this bit.

Bit Range	Default & Access	Field Name (ID): Description
59	0h RW/V	**MISCV (MISCV):** The value held in the MC4_MISC_MSR is valid
58	0h RW/V	**ADDRV (ADDRV):** The address held in the MC4_ADDR_MSR is valid
57	0h RW/V	**PCC (PCC):** Processor Context Corrupt
56:55	0h RW/V	**ENH_MCA_AVAIL1 (ENH_MCA_AVAIL1):** Available when Enhanced MCA is in use
54:53	0h RW/V	**CORRERRORSTATUSIND (CORRERRORSTATUSIND):** These bits are used to indicate when the number of corrected errors has exceeded the safe threshold to the point where an uncorrected error has become more likely to happen. 00 no Tracking No Hardware status tracking is provided for the structure reporting this event. Can I assume that status is 00 when the SBF is disabled 01 Green Status Tracking is provided for the structure reporting this event Current status is Green indicating that the structure is healthy. This is the status when the SBF is not disabled and not full 10 Yellow Status Tracking is provided for the structure reporting this event Current status is Yellow indicating that the structure is operating correctly but with degraded status. This is the status when the SBF is not disabled but the number of HARD errors is above certain threshold defined in CBO_MCA_CONFIG CR 11 Reserved
52:38	0h RW/V	**CORR_ERR_COUNT (CORR_ERR_COUNT):** Correctable error count. Not exposed for PCU
37:32	0h RW/V	**ENH_MCA_AVAIL0 (ENH_MCA_AVAIL0):** Available when Enhanced MCA is in use
31:24	0h RW/V	**MSEC_FW (MSEC_FW):** Model specific error code. This value is written by pcode or vcode from IO_Firmware_MCA_Command. It contains the pcode/vcode specific failure that was logged. Exact encodings found in: machine_check_defs.finc
23:20	0h RW/V	**MSEC_HW (MSEC_HW):** Model specific error code. This logs the type of HW FSM error that has occured. There are 3 errors defined. 1. C7 Save/Restore FSM ECC Error on FSM A 2. C7 Save/Restore FSM ECC Error on FSM B 3. BCLK Mode FSM Failure
19:16	0h RW/V	**MSEC_UC (MSEC_UC):** Model specific error code. This logs the type of HW uC PCU error that has occured. There are 7 errors defined. 1. Instruction address out of valid space 2. Double bit RAM error on Instruction Fetch 3. Invalid OpCode seen Any colored line in the excel sheet 4. Stack Underflow 5. Stack Overflow 6. Data address out of valid space 7. Double bit RAM error on Data Fetch
15:0	0h RW/V	**MCCOD (MCCOD):** Machine Check Error Code. All PCU errors are classified as Internal Unclassified Errors. The value of this field will be 0402h for the PCU . This applies for any logged error

30.7 IA32_MC5_MISC (P_CR_MC_MISC)—Offset 46E8h

PUNIT_MSR: PCU Machine Check Architecture Misc MSR.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW/V	**ENH_MCA_AVAL (ENH_MCA_AVAL):** Available when enhanced MCA is in use
31:24	0h RW/V	**CORRECTED_ERR_CNT (CORRECTED_ERR_CNT):** This field contains the count of correctable errors seen in the PCU. It is updated on a correctable error.
23:17	0h RW/V	**ENH_MCA_AVAL1 (ENH_MCA_AVAL1):** Available when enhanced MCA is in use
16:0	0h RW/V	**ERROR_ADDRESS (ERROR_ADDRESS):** This field contains the address of uncorrected error seen in the PCU. It is updated on an uncorrectable error.

30.8 PLATFORM_ID (P_CR_PLATFORM_ID)—Offset 4710h

Indicates the platform the porcessor is intended for and is also used for selecting the correct patch to apply from among those available in BIOS. Accessible by BIOS as an MSR.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:53	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
52:50	0h RW/V	**PLATFORM_ID (PLATFORM_ID):** This field is loaded from fuses. The field gives information concerning the intended platform for the processor.
49:0	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved

30.9 PLATFORM_INFO (P_CR_PLATFORM_INFO)—Offset 4718h

PUNIT_MSR: This contains information about platforms frequency capabilities that the CPU reports. **MSR_Name**: PLATFORM_INFO **MSR_Addr**: 0x0CE

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 10000F0010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RO	**RESERVED_5 (RESERVED_5):** reserved
55:48	1h RW	**Minimum Supported Clock Multiplier (MIN_OPERATING_RATIO):** Mimumum supported clock multiplier for IA cores, described in units of 100MHz. This is the lower bound on what software may program into its P-state request for IA cores
47:40	0h RW	**Maximum Efficiency Clock Multiplier (MAX_EFFICIENCY_RATIO):** Maximum Efficienty Ratio. This is given in units of 100 MHz.
39:38	0h RO	**RESERVED_4 (RESERVED_4):** reserved
37	0h RW	**Timed MWAIT Enable (TIMED_MWAIT_ENABLE):** If set, this field indicates that the core Timed WAIT feature is supported.
36	0h RO	**RESERVED_3 (RESERVED_3):** reserved
35	0h RW	**PFAT_ENABLE (PFAT_ENABLE):** If set, this field indicates that PFAT is enabled
34:33	0h RW	**CONFIG_TDP_LEVELS (CONFIG_TDP_LEVELS):** Indicates the number of configurable TDP levels are supported. If set to zero, configurable TDP is not supported as a feature
32	0h RW	**Low Power Mode Support (LPM_SUPPORT):** Indicates whether or not P-states below the maximally efficient P-state are allowed. All products support LPM.
31	1h RW	**CPUID Faulting Enable (CPUID_FAULTING_EN):** CPUID Faulting
30	1h RW	**Programmable Tj Offset Enable (PRG_TJ_OFFSET_EN):** If set, enables programmable Tj offset in the TEMPERATURE_TARGET.TJ_MAX_TCC_OFFSET field.
29	1h RW	**Programmable TDP Limit Enable (PRG_TDP_LIMIT_EN):** If set, PL1 power limits are programmable. If clear, the PL1 power limit may not be programmed by software
28	1h RW	**Programmable Turbo Ratio Limits Enable (PRG_TURBO_RATIO_EN):** If set, the FREQ_LIMIT_RATIOS register is programmable by software. If clear, this register is not writable
27	0h RW	**Sample Part (SAMPLE_PART):** Indicates that this part is a non-production / sample part
26	0h RW	**DCU_16K_MODE_AVAIL (DCU_16K_MODE_AVAIL):** If set, indicates the part supports 16K DCU mode
25	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
24	0h RW	**Overclocking Voltage Override Enable (OCVOLT_OVRD_EN):** If set, indicates the part supports voltage overrides as part of general overclocking and voltage control features
23	0h RW	**PPIN_CAP (PPIN_CAP):** When set to 1, indicates that Protected Processor Inventory Number (PPIN) capability can be enabled for privileged system inventory agent to read PPIN from MSR_PPIN. When set to 0, PPIN capability is not supported. An attempt to access MSR_PPIN_CTL or MSR_PPIN will cause #GP.
22:17	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
16	1h RO	**SMM_SAVE_CAP (SMM_SAVE_CAP):** Save/Restore x87 state in SMM Reserved
15:8	0h RW	**Maximum Non-Turbo Clock Multiplier (MAX_NON_TURBO_LIM_RATIO):** The Maximum Non-Turbo clock ratio multiplier describes the highest clock frequency in 100MHz units that IA cores are manufactured to run at without hitting thermal or power constraints. This clock frequency also defines the level that the core timestamp counter runs at

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**RESERVED_0 (RESERVED_0):** Reserved

30.10 DDR_RAPL_LIMIT (P_CR_DDR_RAPL_LIMIT)—Offset 4760h

RAPL power limit for DDR domain. This register is written by platform software and read by pcode once per 1ms. There are actually two instances of this register: one with MSR access and one with MMIO access. There is a separate PECI/PCS command which is also analogous.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**LOCKED (LOCKED):** When set this entire register becomes readonly. This bit will typically be set by BIOS during boot.
62:32	0h RO	Reserved.
31:24	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
23:22	0h RW/L	**LIMIT1_TIME_WINDOW_X (LIMIT1_TIME_WINDOW_X):** The time window for RAPL is expressed in a format called TAU. TAU is specified in a mantissa+exponent format. This format is common across all RAPL interfaces for TAU. The format is specified with a 7 bit number that looks like: XXYYYYY (2 bits of mantissa follwed by 5 exponent) The time window corresponding to this config is calculated as: (1+ XXb / 4) * (2^YYYYYb) The value that results from this math species the time window in units that are defined in PACKAGE_POWER_SKU_UNIT.TIME_UNIT MSR. On every server product we have built, this value has been 976us, which we typically treat as 1ms.
21:17	0h RW/L	**LIMIT1_TIME_WINDOW_Y (LIMIT1_TIME_WINDOW_Y):** The Tau Exponent. See TIME_WINDOW_X for more information.
16	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
15	0h RW/L	**LIMIT1_ENABLE (LIMIT1_ENABLE):** Power Limit[0] enable bit for DDR domain.
14:0	0h RW/L	**LIMIT1_POWER (LIMIT1_POWER):** Power Limit[0] for DDR domain. UnitsWatts Format7.8 Resolution0.125W Range02047.875W.

30.11 FREQ_LIMIT_RATIOS (P_CR_FREQ_LIMIT_RATIOS)—Offset 4768h

PUNIT_MSR: In conjunction with FREQ_LIMIT_CORES, this MSR allows an end-user to limit the number of turbo bins for different numbers of active cores (cores not in C6). Each field in FREQ_LIMIT_RATIOS specifies a frequency limit for the specified number of active cores in the corresponding field in FREQ_LIMIT_CORES.
Example: RATIO_LIMIT_0 is 0x20, CORE_COUNT_0 is 0x3; RATIO_LIMIT_1 is 0x16 and

CORE_COUNT_1 is 0x5; RATIO_LIMIT_3 is 0x10, CORE_COUNT_3 is 0xFF; The frequency limit of <=3 active cores is 32, the limit for 4-5 active cores is 22, and the limit for 6 or more active cores is 16
Ratio limits must monotonically decrease in ascending bin order, core count must monotonically increase in ascending bin order, and the last valid FREQ_LIMIT_CORE field must be >= number of potentially active cores (just set to 0xFF)
Values of '0' are ignored. **MSR_Name**: FREQ_LIMIT_RATIOS **MSR_Addr**: 0x1AD

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**RATIO_LIMIT_7 (RATIO_LIMIT_7):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_7 in FREQ_LIMIT_CORES.
55:48	0h RW	**RATIO_LIMIT_6 (RATIO_LIMIT_6):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_6 in FREQ_LIMIT_CORES.
47:40	0h RW	**RATIO_LIMIT_5 (RATIO_LIMIT_5):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_5 in FREQ_LIMIT_CORES.
39:32	0h RW	**RATIO_LIMIT_4 (RATIO_LIMIT_4):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_4 in FREQ_LIMIT_CORES.
31:24	0h RW	**RATIO_LIMIT_3 (RATIO_LIMIT_3):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_3 in FREQ_LIMIT_CORES.
23:16	0h RW	**RATIO_LIMIT_2 (RATIO_LIMIT_2):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_2 in FREQ_LIMIT_CORES.
15:8	0h RW	**RATIO_LIMIT_1 (RATIO_LIMIT_1):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_1 in FREQ_LIMIT_CORES.
7:0	0h RW	**RATIO_LIMIT_0 (RATIO_LIMIT_0):** The frequency limit corresponding to the maximum number of active cores specified in CORE_COUNT_0 in FREQ_LIMIT_CORES.

30.12 FREQ_LIMIT_CORES (P_CR_FREQ_LIMIT_CORES)—Offset 4770h

PUNIT_MSR: In conjunction with FREQ_LIMIT_RATIOS, this MSR allows an end-user to limit the number of turbo bins for different numbers of active cores (cores not in C6). Each field in FREQ_LIMIT_RATIOS specifies a frequency limit for the specified number of active cores in the corresponding field in FREQ_LIMIT_CORES.
Example: RATIO_LIMIT_0 is 0x20, CORE_COUNT_0 is 0x3; RATIO_LIMIT_1 is 0x16 and CORE_COUNT_1 is 0x5; RATIO_LIMIT_3 is 0x10, CORE_COUNT_3 is 0xFF; The frequency limit of <=3 active cores is 32, the limit for 4-5 active cores is 22, and the limit for 6 or more active cores is 16
Ratio limits must monotonically decrease in ascending bin order, core count must monotonically increase in ascending bin order, and the last valid FREQ_LIMIT_CORE field must be >= number of potentially active cores (just set to 0xFF)
Values of '0' are ignored. **MSR_Name**: FREQ_LIMIT_CORES **MSR_Addr**: 0x1AE

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RW	**CORE_COUNT_7 (CORE_COUNT_7):** The number of maximum active cores corresponding to the frequency limit specified in RATIO_LIMIT_7 in FREQ_LIMIT_RATIOS

15:8	0h RW	**CORE_COUNT_1 (CORE_COUNT_1):** The number of maximum active cores corresponding to the frequency limit specified in RATIO_LIMIT_1 in FREQ_LIMIT_RATIOS
7:0	0h RW	**CORE_COUNT_0 (CORE_COUNT_0):** The number of maximum active cores corresponding to the frequency limit specified in RATIO_LIMIT_0 in FREQ_LIMIT_RATIOS

30.13 Package RAPL Power Limit (P_CR_PACKAGE_RAPL_LIMIT)—Offset 4780h

Package RAPL Power Limit allows a software agent to define power limitation for the package domain. Power limitation is defined in terms of average power usage (Watts) over a time window specified. Two power limits and associated time windows can be specified. These power limits are commonly referred to as PL1 (long time window) and PL2 (short time window). Each power limit provides independent clamping control that would permit the processor cores to go below OS-requested state to meet the power limits. A lock mechanism allow the software agent to enforce power limit settings. Once the lock bit is set, the power limit settings are static and un-modifiable until next RESET.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**Package RAPL Lock (PKG_PWR_LIM_LOCK):** When set all settings in this register are locked and are treated as Read Only. This lock control is persistent until the next reset. This bit will typically set by BIOS during boot time or resume from Sx.
62:56	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
55:49	0h RW/L	**Power Limit 2 (PL2) Time Window (PKG_PWR_LIM_2_TIME):** Time window for Power Limit 1 (PL2). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
48	0h RW/L	**Power Limit 2 (PL2) Clamp (PKG_CLMP_LIM_2):** Clamp mode control for PL2. • 0 = PL2 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL2 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
47	0h RW/L	**Power Limit 2 (PL2) Enable (PKG_PWR_LIM_2_EN):** Enable for Power Limit 2 (PL2). Setting this bit activates the power limit and time window defined for PL2.
46:32	0h RW/L	**Power Limit 2 (PL2) (PKG_PWR_LIM_2):** Sets the average power usage limit of the package domain corresponding to the PL2 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL2 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.
31:24	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
23:17	0h RW/L	**Power Limit 1 (PL1) Time Window (PKG_PWR_LIM_1_TIME):** Time window for Power Limit 1 (PL1). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. Thre is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
16	0h RW/L	**Power Limit 1 (PL1) Clamp (PKG_CLMP_LIM_1):** Clamp mode control for PL1. • 0 = PL1 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL1 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
15	0h RW/L	**Power Limit 1 (PL1) Enable (PKG_PWR_LIM_1_EN):** Enable for Power Limit 1 (PL1). Setting this bit activates the power limit and time window defined for PL1.

Bit Range	Default & Access	Field Name (ID): Description
14:0	0h RW/L	**Power Limit 1 (PL1) (PKG_PWR_LIM_1):** Sets the average power usage limit of the package domain corresponding to the PL1 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL1 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.

30.14 PL3_CONTROL_MSR (P_CR_PL3_CONTROL)—Offset 4790h

PUNIT_MSR: PL3 control MSR

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/L	**LOCK (LOCK):** Lock this MSR until next reset: 0 - unlocked, 1 - locked
62:48	0h RO	Reserved.
47	0h RW/L	**PL4_ENABLE (PL4_ENABLE):** 0 => Algorithm disabled, 1 => Algorithm enabled
46:32	0h RW/L	**PMAX (PMAX):** Power Limit 'PL4' or Pmax power limit in the units as described PACAKGE_POWER_SKU_UNIT MSR
31	0h RO	Reserved.
30:24	0h RW/L	**DUTY_CYCLE (DUTY_CYCLE):** Expressed in percentage(%). Clipped to a max value of 100%.
23:17	0h RW/L	**TIME_WINDOW (TIME_WINDOW):** Duration over which duty cycle control will be maintained. (xxYYYY format)
16	0h RO	Reserved.
15	0h RW/L	**PL3_ENABLE (PL3_ENABLE):** 0 => Algorithm disabled, 1 => Algorithm enabled
14:0	0h RW/L	**POWER_LIMIT (POWER_LIMIT):** PL3 or PAppMax power level. A power reading above this will be interpreted as a violation (in increments of 1/8th Watt)

30.15 VR_CURRENT_CONFIG (P_CR_VR_CURRENT_CONFIG)—Offset 47C0h

PUNIT_MSR: VCCGI rail configuration information, including:

- Limitation on the maximum current consumption of the primary compute power plane.
- Configuration of VR light load management, such as PS0, PS1, etc support

Set power state amp thresholds to 0A in order to disable that power state. **MSR_Name / address**: VR_CURRENT_CONFIG / 0x601

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
62	0h RW	**PS4_ENABLE (PS4_ENABLE):** Enable for PS4 on the VCCGI rail. (current is regulated to ~0A and voltage goes to 0V): • 1 = PSI4 is Enabled • 0 = disable
61:52	0h RW	**VCCGI PS3 Maximum Current (PSI3_THRESHOLD):** Peak current supported by the VR on the VCCGI rail when in single phase mode (PS3). A value of 0 indicates VR support 0A of current in PS3 which will effectively disable PS3 use. This field is defined in 1A units.
51:42	0h RW	**VCCGI PS2 Maximum Current (PSI2_THRESHOLD):** Peak current supported by the VR on the VCCGI rail when in single phase mode (PS2). A value of 0 indicates VR support 0A of current in PS2 which will effectively disable PS2 use. This field is defined in 1A units.
41:32	0h RW	**VCCGI PS1 Maximum Current (PSI1_THRESHOLD):** Peak current supported by the VR on the VCCGI rail when in single phase mode (PS1). A value of 0 indicates VR support 0A of current in PS1 which will effectively disable PS1 use. This field is defined in 1A units.
31	0h RW/L	**LOCK (LOCK):** This bit will lock the CURRENT_LIMIT settings in this register and will also lock this setting. This means that once set to 1b the CURRENT_LIMIT setting and this bit become Read Only until the next Warm Reset.
30:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
12:0	10h RW/L	**VCCGI PS0 Maximum Current (CURRENT_LIMIT):** Peak current supported by the VR on the VCCGI rail when all phases are active. Assumes VR is in the highest power state possible (PS0). Units given in PACKAGE_POWER_SKU_UNIT.CURRENT_UNIT. This field will be locked when the LOCK bit in this register is written to 1b. That lock will be retained until the next reset condition.

30.16 Core Thermal and Power Status (P_CR_THERM_STATUS)—Offset 4828h

PUNIT_MSR: CPU Core thermal and power status register. This register is typically used to inspect the thermal status of a specific core, as well as to discover the sources of core thermal interrupt events. **MSR_Name**: THERM_STATUS **MSR_Addr**: 0x19C

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 8000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Valid (VALID):** Valid flag indicating the validity of the current temperature readout. • 0 = Invalid • 1 = Valid
30:27	1h RO	**Resolution (RESOLUTION):** Supported resolution in degrees Celsius. Hardcoded to 1'C.
26:23	0h RSV	**RESERVED1 (RESERVED1):** reserved
22:16	0h RO/V	**Relative Temperature (TEMPERATURE):** Current temperature of the domain, reported as a negative offset from the reference maximum junction temperature. E.g., a reading of 10 with a reference temperature of 90'C implies this domain is currently operating at 80'C. The reference temperature may be discovered in TEMPERATURE_TARGET.REF_TEMP
15:12	0h RSV	**RESERVED0 (RESERVED0):** reserved
11	0h RW/0C/V	**Power Limitation Log (POWER_LIMITATION_LOG):** Sticky log bit that asserts on a rising edge of the Power Limitation Status indicator. This flag remains asserted until software clears it
10	0h RO/V	**Power Limitation Status (POWER_LIMITATION_STATUS):** The power limit status flag asserts at any time that the domain is performance limited due to power constraints. Performance limitation due to power limits is measured as observing the resolved domain level frequency below the software requested frequency, even within the Turbo operating region. The RAPL PL1 and PL2 power limits are the only sources of this power constraint.
9	0h RW/0C/V	**Thermal Threshold 2 Log (THRESHOLD2_LOG):** Sticky log bit that asserts on a rising or falling edge of the thermal threshold 2 status indicator. This flag remains asserted until software clears it
8	0h RO/V	**Thermal Threshold 2 Status (THRESHOLD2_STATUS):** Indicates whether the actual temperature is currently higher than or equal to the value set in Thermal Threshold 2. • 0 = Current temperature is below threshold 2 • 1 = Current temperature at or above threshold 2
7	0h RW/0C/V	**Thermal Threshold 1 Log (THRESHOLD1_LOG):** Sticky log bit that asserts on a rising or falling edge of the thermal threshold 1 status indicator. This flag remains asserted until software clears it
6	0h RO/V	**Thermal Threshold 1 Status (THRESHOLD1_STATUS):** Indicates whether the actual temperature is currently higher than or equal to the value set in Thermal Threshold 1. • 0 = Current temperature is below threshold 1 • 1 = Current temperature at or above threshold 1
5	0h RW/0C/V	**Critical Thermal Event Log (OUT_OF_SPEC_LOG):** Sticky log bit indicating that a Critical Thermal Event was detected since the last time this bit was cleared by software.
4	0h RO/V	**Critical Thermal Event Status (OUT_OF_SPEC_STATUS):** When set, this event indicates that the processor has observed a critical thermal excursion. It is intended as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RW/0C/V	**PROCHOT# Log (PROCHOT_LOG):** Sticky log bit indicating that the PROCHOT# status bit has asserted or deasserted since the last time this bit was cleared by software.
2	0h RO/V	**PROCHOT# Status (PROCHOT_STATUS):** Status bit indicating that the external PROCHOT# pin is currently being asserted. This will only assert when the processor is configured in Bi-directional PROCHOT# mode (when PROCHOT# is configured as an input)
1	0h RW/0C/V	**Thermal Monitor Log (THERMAL_MONITOR_LOG):** Sticky log bit indicating that the core has seen a rising edge on the Thermal Monitor Status bit since the last time this bit was cleared by software.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**Thermal Monitor Status (THERMAL_MONITOR_STATUS):** This bit indicates that the Thermal Monitor has tripped and is currently thermally throttling this core. If software has programmed a thermal monitor control temperature below the manufacturing default of this processor, this flag will assert when the software programmed constraint has been exceeded.

30.17 Thermal Interrupt Control (P_CR_THERM_INTERRUPT)—Offset 482Ch

PUNIT_MSR: CPU Core thermal interrupt control register. This register is used to configure core or package level notifications of important thermal events. These interrupts may be routed directly to this local core's APIC Thermal LVT or optional modes may be configured that allow the thermal interrupt notification to be routed to a master core for processing (fore more details on locking thermal interrupts, see the MISC_PWR_MGMT MSR definition). **MSR_Name**: THERM_INTERRUPT **MSR_Addr**: 0x19B

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RSV	**RESERVED2 (RESERVED2):** reserved
24	0h RW	**Power Limit Interrupt Enable (SPARE_PWR_LIMIT_ENABLE): NOT USED**. Reserved for Power Limit Notification Enable.
23	0h RW	**Threshold 2 Interrupt Enable (THRESHOLD_2_INT_ENABLE):** Threshold 2 Interrupt Enable is used to enable thermal interrupt notifcation to software upon any rising or falling detection of core temperature crossing the Threshold 2 temperature.
22:16	0h RW	**Thermal Threshold 2 Relative Temperature (THRESHOLD_2_REL_TEMP):** Specifies temperature Threshold 2 value as as a negative offset from the reference maximum junction temperature (defined in TEMPERATURE_TARGET.REF_TEMP). This temperature threshold is compared against the corresponding Thermal Status Relative Temperature reading for this core.
15	0h RW	**Threshold 1 Interrupt Enable (THRESHOLD_1_INT_ENABLE):** Threshold 1 Interrupt Enable is used to enable thermal interrupt notifcation to software upon any rising or falling detection of core temperature crossing the Threshold 1 temperature.
14:8	0h RW	**Thermal Threshold 1 Relative Temperature (THRESHOLD_1_REL_TEMP):** Specifies temperature Threshold 1 value as as a negative offset from the reference maximum junction temperature (defined in TEMPERATURE_TARGET.REF_TEMP). This temperature threshold is compared against the corresponding Thermal Status Relative Temperature reading for this core.
7:5	0h RSV	**RESERVED1 (RESERVED1):** reserved
4	0h RW	**Critical Thermal Event Interrupt Enable (OUT_OF_SPEC_INT_ENABLE):** This bit allows software to enable thermal interrupt delivery upon observation that the processor is operating out of its thermal specification. This interrupt is designed as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RSV	**RESERVED0 (RESERVED0):** reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**PROCHOT# Interrupt Enable (PROCHOT_INT_ENABLE):** This bit allows software to enable a thermal interrupt delivery upon detection of PROCHOT# input assertion or deassertion event.
1	0h RW	**Low Temperature Interrupt Enable (LOW_TEMP_INT_ENABLE):** This bit allows software to enable the generation of an interrupt on the transition from a temperature above or equal to the thermal monitor activation temperature to a temperature below it. This interrupt will be sent on any falling edge of the Thermal Monitor Status bit of this core.
0	0h RW	**High Temperature Interrupt Enable (HIGH_TEMP_INT_ENABLE):** This bit allows software to enable the generation of an interrupt on the transition from a temperature below the thermal monitor activation temperature to a temperature equal to or greater than it. This interrupt will be sent on any rising edge of the Thermal Monitor Status bit of this core.

30.18 C1E Idle Residency (P_CR_PC2_RCNTR)—Offset 4870h

PUNIT_MSR: Time spent in the C1E state. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.
MSR_Name: PC2_RCNTR **MSR_Addr**: 0x60D

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**DATA (DATA):** Time spent in the C1E state. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.19 PC3 Idle Residency Counter (P_CR_PC3_RCNTR)—Offset 4878h

PUNIT_MSR: Currently unused residency counter. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.
MSR_Name: PC3_RCNTR **MSR_Addr**: 0x3F8

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** Currently unused residency counter. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.20 PCS_Idle_Residency (P_CR_PC6_RCNTR)—Offset 4880h

PUNIT_MSR: Primary Compute System (PCS) idle residency counter. This counter increments at any time that the SOC is in the S0i1 state, with cores, graphics and camera processing system all idle. Display, Camera Input System or other south complex IPs may be active at this time. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.
MSR_Name: PC6_RCNTR **MSR_Addr**: 0x3F9

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** Primary Compute System (PCS) idle residency counter. This counter increments at any time that the SOC is in the S0i1 state, with cores, graphics and camera processing system all idle. Display, Camera Input System or other south complex IPs may be active at this time. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.21 PCS S0i3 Residency (P_CR_PC7_RCNTR)—Offset 4888h

PUNIT_MSR: Primary Compute System (PCS) S0i3 residency counter. This counter increments at any time that the PCS is ready for S0i3, which includes all compute domains idle (IA cores, graphics and camera) as well as display and camera input system both off. The SOC may remain in this state for extended periods if south complex IPs are not ready to enter S0i3. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.
MSR_Name: PC7_RCNTR **MSR_Addr**: 0x3FA

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** Primary Compute System (PCS) S0i3 residency counter. This counter increments at any time that the PCS is ready for S0i3, which includes all compute domains idle (IA cores, graphics and camera) as well as display and camera input system both off. The SOC may remain in this state for extended periods if south complex IPs are not ready to enter S0i3. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.22 SOC S0i3 Residency (P_CR_PC10_RCNTR)—Offset 4890h

PUNIT_MSR: SOC S0i3 residency counter. This counter increments at any time that the entire SOC is in an S0i3 state. This register does not distinguish variations on S0i3, it increments for all variations. This residency counter may count some time during entry into and exit from S0i3. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency. **MSR_Name**: PC10_RCNTR **MSR_Addr**: 0x632

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** SOC S0i3 residency counter. This counter increments at any time that the entire SOC is in an S0i3 state. This register does not distinguish variations on S0i3, it increments for all variations. This residency counter may count some time during entry into and exit from S0i3. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.23 LLC_FLUSHED_RCNTR (P_CR_L2_FLUSH_RCNTR)—Offset 4898h

Time spent with LLC flushed. It is given in units compatible to P1 clock frequency (Guaranteed / Maximum Core Non-Turbo Frequency).

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** Counter Value

30.24 PC9 Idle Residency Counter (P_CR_PC9_RCNTR)—Offset 48A0h

PUNIT_MSR: Currently unused residency counter. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency. **MSR_Name**: PC9_RCNTR **MSR_Addr**: 0x631

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
59:0	0h RW	**COUNTER (COUNTER):** Currently unused residency counter. When accessed at the core level via RDMSR, time is measured in the same units as the Maximum Non-Turbo clock frequency. When accessed at the P-unit level, the time units are based on the crystal clock frequency.

30.25 C_STATE_LATENCY_CONTROL_0 (P_CR_C_STATE_LATENCY_CONTROL_0)—Offset 48A8h

PUNIT_MSR: This register describes the OS tolerated wake latency for the C3 state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency.
Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_0 **MSR_Addr**: 12'h60A

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved.
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved.
12:10	0h RW	**MULTIPLIER (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.26 C_STATE_LATENCY_CONTROL_1 (P_CR_C_STATE_LATENCY_CONTROL_1)—Offset 48ACh

PUNIT_MSR: This register describes the OS tolerated wake latency for the C6/C7s state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency.
Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_1 **MSR_Addr**: 0x60B

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
12:10	0h RW	**MULTIPLIER (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.27 C_STATE_LATENCY_CONTROL_2 (P_CR_C_STATE_LATENCY_CONTROL_2)—Offset 48B0h

This register describes the OS tolerated wake latency for the C7L state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency. Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_2 **MSR_Addr**: 12'h60C

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved.
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved.
12:10	0h RW	**MULTIPLIER (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.28 C_STATE_LATENCY_CONTROL_3 (P_CR_C_STATE_LATENCY_CONTROL_3)—Offset 48B4h

PUNIT_MSR: This register describes the OS tolerated wake latency for the C8 state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency.
Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_3 **MSR_Addr**: 0x633

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
12:10	0h RW	**MULTIPLIER (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.29 C_STATE_LATENCY_CONTROL_4 (P_CR_C_STATE_LATENCY_CONTROL_4)—Offset 48B8h

PUNIT_MSR: This register describes the OS tolerated wake latency for the C9 state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency.
Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_4 **MSR_Addr**: 0x634

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).

9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.30 C_STATE_LATENCY_CONTROL_5 (P_CR_C_STATE_LATENCY_CONTROL_5)—Offset 48BCh

PUNIT_MSR: This register describes the OS tolerated wake latency for the C10 state. The minimum core C-state is calculated among all IA cores in the die, and power management firmware maps that resolved C-state to the appropriate Interrupt Response Tolerance latency setting. This setting will then affect package level idle state entry decisions such that it is guaranteed that the cores will wake up in less than the tolerated latency.
Registers initialized by Pcode at reset. BIOS cannot update these MSRs prior to PCODE_INIT_DONE, and it is not recommended that BIOS ever overwrite.
MSR_Name: C_STATE_LATENCY_CONTROL_5 **MSR_Addr**: 12'h635

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
12:10	0h RW	**MULTIPLIER (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

30.31 Package Thermal and Power Status (P_CR_PACKAGE_THERM_STATUS)—Offset 49F0h

PUNIT_MSR: Package level thermal and power status register. This register is typically used to inspect the thermal status of the entire package, as well as to discover the sources of package level thermal interrupt events. **MSR_Name**: THERM_STATUS
MSR_Addr: 0x19C

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 8000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Valid (VALID):** Valid flag indicating the validity of the current temperature readout. • 0 = Invalid • 1 = Valid
30:27	1h RO	**Resolution (RESOLUTION):** Supported resolution in degrees Celsius. Hardcoded to 1'C.
26:23	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
22:16	0h RO/V	**Relative Temperature (TEMPERATURE):** Current maximum temperature across all sensors in the package, reported as a negative offset from the reference maximum junction temperature. E.g., a reading of 10 with a reference temperature of 90'C implies this domain is currently operating at 80'C. The reference temperature may be discovered in TEMPERATURE_TARGET.REF_TEMP
15:12	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
11	0h RW/0C/V	**Power Limitation Log (POWER_LIMITATION_LOG):** Sticky log bit that asserts on a rising edge of the Power Limitation Status indicator. This flag remains asserted until software clears it
10	0h RO/V	**Power Limitation Status (POWER_LIMITATION_STATUS):** The power limit status flag asserts at any time that the domain is performance limited due to power constraints. Performance limitation due to power limits is measured as observing the resolved domain level frequency below the software requested frequency, even within the Turbo operating region. The RAPL PL1 and PL2 power limits are the only sources of this power constraint.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW/0C/V	**Thermal Threshold 2 Log (THRESHOLD2_LOG):** Sticky log bit that asserts on a rising or falling edge of the thermal threshold 2 status indicator. This flag remains asserted until software clears it
8	0h RO/V	**Thermal Threshold 2 Status (THRESHOLD2_STATUS):** Indicates whether the actual temperature is currently higher than or equal to the value set in Thermal Threshold 2. • 0 = Current temperature is below threshold 2 • 1 = Current temperature at or above threshold 2
7	0h RW/0C/V	**Thermal Threshold 1 Log (THRESHOLD1_LOG):** Sticky log bit that asserts on a rising or falling edge of the thermal threshold 1 status indicator. This flag remains asserted until software clears it
6	0h RO/V	**Thermal Threshold 1 Status (THRESHOLD1_STATUS):** Indicates whether the actual temperature is currently higher than or equal to the value set in Thermal Threshold 1. • 0 = Current temperature is below threshold 1 • 1 = Current temperature at or above threshold 1
5	0h RW/0C/V	**Critical Thermal Event Log (OUT_OF_SPEC_LOG):** Sticky log bit indicating that a Critical Thermal Event was detected since the last time this bit was cleared by software.
4	0h RO/V	**Critical Thermal Event Status (OUT_OF_SPEC_STATUS):** When set, this event indicates that the processor has observed a critical thermal excursion. It is intended as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RW/0C/V	**PROCHOT# Log (PROCHOT_LOG):** Sticky log bit indicating that the PROCHOT# status bit has asserted or deasserted since the last time this bit was cleared by software.
2	0h RO/V	**PROCHOT# Status (PROCHOT_STATUS):** Status bit indicating that the external PROCHOT# pin is currently being asserted. This will only assert when the processor is configured in Bi-directional PROCHOT# mode (when PROCHOT# is configured as an input)
1	0h RW/0C/V	**Thermal Monitor Log (THERMAL_MONITOR_LOG):** Sticky log bit indicating that the package has seen a rising edge on the Thermal Monitor Status bit since the last time this bit was cleared by software.
0	0h RO/V	**Thermal Monitor Status (THERMAL_MONITOR_STATUS):** This bit indicates that the Thermal Monitor has tripped and is currently thermally throttling at least one domain in the package. If software has programmed a thermal monitor control temperature below the manufacturing default of this processor, this flag will assert when the software programmed constraint has been exceeded.

30.32 Thermal Interrupt Control (P_CR_PACKAGE_THERM_INTERRUPT)—Offset 49F4h

PUNIT_MSR: Package thermal interrupt control register. This register is used to configure package level notifications of important thermal events. These interrupts are routed directly to core APIC Thermal LVT's and are handled locally by the core that has unmasked the LVT. **MSR_Name**: THERM_INTERRUPT **MSR_Addr**: 0x19B THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RSV	**RESERVED_2 (RESERVED_2):** Reserved
24	0h RW	**Power Limit Interrupt Enable (POWER_INT_ENABLE):** When this bit is set a thermal interrupt will be sent upon detection of a rising edge assertion of the Power Limit Status bit in the Package Thermal and Power Status register.
23	0h RW	**Threshold 2 Interrupt Enable (THRESHOLD_2_INT_ENABLE):** Threshold 2 Interrupt Enable is used to enable thermal interrupt notifcation to software upon any rising or falling detection of the virtual package max temperature crossing the Threshold 2 temperature.
22:16	0h RW	**Thermal Threshold 2 Relative Temperature (THRESHOLD_2_REL_TEMP):** Specifies temperature Threshold 2 value as as a negative offset from the reference maximum junction temperature (defined in TEMPERATURE_TARGET.REF_TEMP). This temperature threshold is compared against the corresponding Thermal Status Relative Temperature reading for the virtual maximum package temperature.
15	0h RW	**Threshold 1 Interrupt Enable (THRESHOLD_1_INT_ENABLE):** Threshold 1 Interrupt Enable is used to enable thermal interrupt notifcation to software upon any rising or falling detection of the virtual package max temperature crossing the Threshold 1 temperature.
14:8	0h RW	**Thermal Threshold 1 Relative Temperature (THRESHOLD_1_REL_TEMP):** Specifies temperature Threshold 1 value as as a negative offset from the reference maximum junction temperature (defined in TEMPERATURE_TARGET.REF_TEMP). This temperature threshold is compared against the corresponding Thermal Status Relative Temperature reading for the virtual maximum package temperature.
7:5	0h RSV	**RESERVED_1 (RESERVED_1):** Reserved
4	0h RW	**Critical Thermal Event Interrupt Enable (OUT_OF_SPEC_INT_ENABLE):** This bit allows software to enable thermal interrupt delivery upon observation that the processor is operating out of its thermal specification. This interrupt is designed as an early warning of thermal runaway in the silicon and shutdown is recommended.
3	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
2	0h RW	**PROCHOT# Interrupt Enable (PROCHOT_INT_ENABLE):** This bit allows software to enable a thermal interrupt delivery upon detection of PROCHOT# input assertion or deassertion event.
1	0h RW	**Low Temperature Interrupt Enable (LOW_TEMP_INT_ENABLE):** This bit allows software to enable the generation of an interrupt on the transition from a temperature above or equal to the thermal monitor activation temperature to a temperature below it. This interrupt will be sent on any falling edge of the Thermal Monitor Status bit of the virtual maximum package temperature.
0	0h RW	**High Temperature Interrupt Enable (HIGH_TEMP_INT_ENABLE):** This bit allows software to enable the generation of an interrupt on the transition from a temperature below the thermal monitor activation temperature to a temperature equal to or greater than it. This interrupt will be sent on any rising edge of the Thermal Monitor Status bit of this virtual maximum temperature.

30.33 IA32_MC6_STATUS (A_CR_MCI_STATUS)—Offset 4F80h

Machine check control.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/V	**Valid (VALID):** MCI_Status Valid (VAL): When set, indicates the information on the IA32_MCI_Status register is valid. Software is responsible for clearing the VAL flag.
62	0h RW/V	**Overflow (OVFLW):** Error Overflow (OVER): Indicates a second error was received while the MCI_Status Valid bit as set.
61	0h RW/V	**Uncorrected Error (UC):** Indicates that an uncorrected error was received by the A-Unit.
60	0h RW/V	**Error Report Enabled (EN):** Error reporting has been enabled by the MCI_CTL register.
59	0h RW/V	**MISC Valid (MISCV):** MISCV (mci_misc is valid).
58	0h RW/V	**Address Valid (ADDRV):** ADDRV (mci_addr is valid).
57	0h RW/V	**Process Context Corrupted (PCC):** When set, indicates the state of the processor might have been corrupted. When clear, indicates the error did not affect the processor state.
56	0h RW/V	**Signal (S):** S (signaling an uncorr recoverable (UCR) error).
55	0h RW/V	**Recovery Action Required (AR):** AR (recovery action required for UCR error).
54:53	0h RW/V	**Threshold Status (THRSH):** Threshold-based error status.
52:38	0h RW/V	**Corectable Error Count (CERR_CNT)**
37:32	0h RW/V	**Other (OTHER)**
31:16	0h RW/V	**Model Specific Error Code (MODEL_SPECIFIC_ERR_CODE)**
15:0	0h RW/V	**MCA Error Code (MCA_ERR_CODE)**

30.34 MCA Control Register (A_CR_MCI_CTL)—Offset 4F88h

Controls which errors will signal an MCA. 0 - do not signal. 1 - signal.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RO	Reserved.
31	0h RO	**reserved (undefined31):** reserved for future use
30	0h RO	**reserved (undefined30):** reserved for future use

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**reserved (undefined29):** reserved for future use
28	0h RO	**reserved (undefined28):** reserved for future use
27	0h RO	**reserved (undefined27):** reserved for future use
26	0h RO	**reserved (undefined26):** reserved for future use
25	0h RO	**reserved (undefined25):** reserved for future use
24	0h RO	**reserved (undefined24):** reserved for future use
23	0h RO	**reserved (undefined23):** reserved for future use
22	0h RO	**reserved (undefined22):** reserved for future use
21	0h RO	**reserved (undefined21):** reserved for future use
20	0h RO	**reserved (undefined20):** reserved for future use
19	0h RO	**reserved (undefined19):** reserved for future use
18	0h RO	**reserved (undefined18):** reserved for future use
17	0h RO	**reserved (undefined17):** reserved for future use
16	0h RO	**reserved (undefined16):** reserved for future use
15	0h RO	**reserved (undefined15):** reserved for future use
14	0h RO	**reserved (undefined14):** reserved for future use
13	0h RO	**reserved (undefined13):** reserved for future use
12	0h RO	**reserved (undefined12):** reserved for future use
11	0h RO	**reserved (undefined11):** reserved for future use
10	0h RW	**msi rsvd set (msi_rsvd_set):** An MSI was received with reserved bits set
9	0h RW	**gpa overflow (gpa_overflow):** A transaction was received with a guest physical address that was too large
8	0h RW	**illegal msi (illegal_msi):** A malformed/illegal MSI was received in the upstream direction
7	0h RW	**at translated illegal device (at_translated_illegal_device):** A device that is not support to set the AT bit set it to an illegal value
6	0h RO	**reserved (undefined5):** reserved for future use

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**bad sai cmpl (bad_sai_cmpl):** An incorrect/illegal sai was received with an upstream completion transaction.
4	0h RW	**received lk cmpl (received_lk_cmpl):** Received a CmplLck completion from iosf.
3	0h RW	**bad sai nonposted (bad_sai_nonposted):** An incorrect/illegal sai was received with an upstream non-posted transaction.
2	0h RW	**illegal nonposted opcode (illegal_nonposted_opcode):** Illegal/Unsupported non-posted opcode received from iosf.
1	0h RW	**bad sai posted (bad_sai_posted):** An incorrect/illegal sai was received with an upstream posted transaction.
0	0h RW	**illegal posted opcode (illegal_posted_opcode):** Illegal/Unsupported posted opcode received from iosf.

30.35 IA32_MC6_CTL2 (A_CR_MCI_CTL2)—Offset 4F90h

Machine Check Control 2.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:31	0h RO	Reserved.
30	0h RW	**Enable (ENABLE):** MCI_CTL2 enable for CMCI.
29:15	0h RO	Reserved.
14:0	0h RW	**Threshold (THRESHOLD):** MCI_CTL2 threshold value for CMCI.

30.36 IA32_MC6_ADDR (A_CR_MCI_ADDR)—Offset 4F98h

Machine check address.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RW/V	**Address (ADDRESS):** MCI_ADDR: Address associated with the MCI_STS register if addrv==1. This is the GPA.

30.37 IA32_MC6_MISC (A_CR_MCI_MISC)—Offset 4FC0h

The MCi Misc MSR contains additional microarchitecture specific information describing the machine check error if the MISCV flag in the MCi_STATUS register is set.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:48	0h RW/V	**BDF (BDF):** IOSF rqid of request
47:40	0h RW/V	**SAI (SAI):** IOSF SAI (8-bit) of request
39:9	0h RO	Reserved.
8:6	0h RW/V	**Address Mode (ADDR_MODE):** Address Mode
5:0	0h RO	Reserved.

30.38 IA32_MC4_CTL (B_CR_MCI_CTL)—Offset 4B20h

This register specifies which errors are enabled for reporting. When set to 0, error is still logged but not signalled. When set to 1, error is logged and signalled.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:10	0h RO	**Reserved (RESERVED_0):** Reserved.
9	0h RW	**MC Uncorrected Read Data Error (MC_RD_DATA_UNC):** CRC error on DRAM read data
8	0h RW	**BRAM Read Parity Error (BRAM_RD_PAR):** Userver only feature.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BRAM Write Parity Error (BRAM_WR_PAR):** Userver only feature.
6	0h RW	**XUCode Software Initiated Error (XUCODE_ERR)**
5	0h RW	**IA Hit to Graphics Stolen Memory (IA_HIT_GSM)**
4	0h RW	**ClFlush to MMIO (MMIO_CLFLUSH)**
3	0h RW	**WBMTo Access to MMIO (MMIO_WBMTOIE)**
2	0h RW	**MMIO Access HITM (MMIO_HITM):** MMIO Access for HIT Modified Snoop Response.
1	0h RW	**Pondicherry Internal Interface Access to MMIO (PII_2_MMIO):** NonIDI access to MMIO.
0	0h RW	**Unsupported IDI Opcode (UNS_IDI_OP)**

30.39 IA32_MC4_STATUS (B_CR_MCI_STATUS)—Offset 4B28h

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/V	**MCI Status Valid (MCI_STATUS_VALID):** VAL: When set, indicates the information in the rest of this register is valid. Software is responsible for clearing the VAL flag.
62	0h RW/V	**Error Overflow (ERR_OVERFLOW):** Indicates a second error was received while the MCI Status Valid bit was set. The B-Unit supports the Machine Check Overwrite rules for a Machine Check Overflow. For the purpose of B-Unit error reporting, corrected errors or SERRORs sent from the Dunit will be overwritten by any new errors received. The first uncorrected error received will not be overwritten by any new errors received.
61	0h RW/V	**Uncorrected Error (UNCORRECTED_ERR):** UC: Indicates that an uncorrected error was received by the B-Unit. The source of the uncorrected error can be any of those as indicated in the MCI_CTL register.
60	0h RW/V	**Error Reporting Enabled (ERR_ENABLED):** Error reporting has been enabled by the MCI_CTL register.
59	0h RW/V	**MCI_MISC Register Valid (MCI_STATUS_MISCV):** This field will be 0, except for XuCode written errors, which set this field to 1.
58	0h RW/V	**MCI_ADDR Register Valid (MCI_STATUS_ADDRV):** ADDRV: When set, indicates that the value stored in the MCI_ADDR register is valid.
57	0h RW/V	**Processor Context Corrupted (PROCESSOR_CONTEXT_CORRUPTED):** PCC: When set, indicates the state of the processor might have been corrupted. When clear, indicates the error did not affect the processor state.
56:53	0h RO	**Reserved (RESERVED_0):** Reserved. These bits correspond to S AR and Corrected Error Status indicator. They are all readonly and always return 0s

Bit Range	Default & Access	Field Name (ID): Description
52	0h RW/V	**Corrected Error Count Overflow (CORRECTED_ERR_COUNT_OVERFLOW):** Sets if the corrected error count is saturated to 3FFh and another corrected error occurs.
51:38	0h RW/V	**Corrected Error Count (CORRECTED_ERR_COUNT):** The number of corrected errors that have been received from the D-Unit.
37	0h RO	**Reserved (RESERVED_1):** This bit is RO and will always return 0
36:32	0h RW/V	**Agent ID (AGENT_ID):** Agent ID of request that had an ECC or BRAM error.
31:16	0h RW/V	**Model Specific Error Code (MODEL_SPECIFIC_ERR_CODE):** Model Specific Error Code. 0x0000 - Unsupported IDI opcode, 0x0001 - NonIDI access to MMIO, 0x0002 - MMIO Access HITM, 0x0003 - WBMTo* access to MMIO, 0x0004 - ClFlush to MMIO, 0x0005 - IA hit to graphics stolen memory, 0x0006 - XUCode Software initiated error, 0x0007 - BRAM write parity error, 0x0008 - BRAM read parity error, 0x0009 - DRAM uncorrectable ecrc error, 0x000A - DRAM correctable ecrc error
15:0	0h RW/V	**MCA Error Code (MCA_ERR_CODE):** • 0x0005: Parity Error. • 0x009X: Memory read error (where X is channel ID). • 0x408: All other errors.

30.40 IA32_MC4_ADDR (B_CR_MCI_ADDR)—Offset 4B30h

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0h RO	**Reserved (RESERVED_0):** Reserved.
39:0	0h RW/V	**Address MCI_ADDR (MCA_ADDRESS):** When ADDRV is set in the MCI_STATUS register, the memory or system address is stored in this register.

30.41 IA32_MC4_MISC (B_CR_MCI_MISC)—Offset 4B38h

The MCi Misc MSR contains additional microarchitecture specific information describing the machine check error if the MISCV flag in the MCi_STATUS register is set.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:9	0h RW/V	**Misc Info (MISC):** Miscellaneous information. See register description.

Bit Range	Default & Access	Field Name (ID): Description
8:6	0h RW/V	**Address Mode (ADDR_MODE):** • 000: Segment Offset • 001: Linear Address • 010: Physical Address • 011: Memory Address • 100-110: Reserved • 111: Generic
5:0	0h RW/V	**Recoverable Address LSB (RECOV_ADDR_LSB)**

30.42 IA32_MC4_CTL2 (B_CR_MCI_CTL2)—Offset 4B40h

This register is responsible for enabling and controlling the CMCI mechanism.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:31	0h RO	**Reserved (RESERVED_1):** Reserved.
30	0h RW	**Corrected Error Interrupt Enable (CORRECTED_ERROR_INTERRUPT_ENABLE):** This bit is set by software to enable the generation of corrected error interrupts.
29:15	0h RO	**Reserved (RESERVED_0):** Reserved.
14:0	0h RW	**Corrected Error Count Threshold (CORRECTED_ERROR_COUNT_THRESHOLD):** Specifies the value to use for the corrected error threshold.

30.43 B-Unit Slice and Channel Hash Function (B_CR_SLICE_CHANNEL_HASH)—Offset 4C58h

A-Unit also has a copy of this register in A_CR_SLICE_CHANNEL_HASH. BIOS MUST explicitly program each register separately and to identical values.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 3C00000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW	**Lock WRMSR (LOCK):** When set, microcode will disallow writes to the this register via the WRMSR path. Intended usage is for BIOS to set the LOCK when it updates the CR, and Ucode to check the LOCK bit to decide whether the WRMSR to this CR must be allowed. B-Unit implements only storage for this bit. No hardware exists to implement hardware locking.
62:52	0h RO	**Reserved (RESERVED_3):** Reserved.
51:38	0h RW	**Channel Hash Mask (CH_HASH_MASK):** When both PMI channels in a slice are enabled, this field specifies the Channel Hash Mask to be applied on Addr[19:6] postremap DRAM address of the request to compute which PMI channel a request must be routed to. Relevant only when HVM mode is disabled, and only for requests that do not fall under the MOT region. B-Unit will override the programmed value to include the Channel Selector bit. Additionally, B-Unit will remove the Slice Selector bit. See INTERLEAVE_MODE field. Note that HVM mode and MOT regions have special hash requirements and hence they do not use the CH_HASH_MASK.
37:36	3h RW	**Channel Enabled for Slice 1 (SYM_SLICE1_CHANNEL_ENABLED):** Specifies which channels in Slice1 are enabled for hosting the symmetric region of the DRAM address space. If SLICE_1_DISABLED is set to disable mapping of DRAM address space to Slice 1, this field has no effect and symmetric region is considered to be not mapped to Slice1. If CH_1_DISABLED is set, Channel 1 in Slice 1 is not enabled for symmetric DRAM address space regardless of the setting of this register. DRAM address space is divided into a symmetric regions, asymmetric regions that are partially interleaved across a subset of channels (2-way) or asymmetric regions that are non-interleaved and mapped only to a single channel. This field specifies which channels in Slice 1 are enabled for interleaving the symmetric region. SYM_SLICE0_CHANNEL_ENABLED defines which channels in Slice 0 are enabled for interleaving the symmetric region. The mapping of partial (2-way) interleaved and non-interleaved regions are specified in other registers. For symmetric region, only selected configurations are supported. Across both slices, only a total of 1 channel, 2 channels or 4 channels must be enabled for interleaving the symmetric region. The total of 1, 2 or 4 channels can be made up of any combination of channel enables across both slices. B-unit does not support a 3-way interleaving of the symmetric region across 3 enabled channels in the two slices combined.
35:34	3h RW	**Channel Enabled for Slice 0 (SYM_SLICE0_CHANNEL_ENABLED):** Specifies which channels in Slice0 are enabled for hosting the symmetric region of the DRAM address space. If SLICE_0_MEM_DISABLED is set to disable mapping of DRAM address space to Slice 0, this field has no effect and symmetric region is considered to be not mapped to Slice0. If CH_1_DISABLED is set, Channel 1 in Slice 0 is not enabled for symmetric DRAM address space regardless of the setting of this register. DRAM address space is divided into a symmetric regions, asymmetric regions that are partially interleaved across a subset of channels (2-way) or asymmetric regions that are non-interleaved and mapped only to a single channel. This field specifies which channels in Slice 0 are enabled for interleaving the symmetric region. SYM_SLICE1_CHANNEL_ENABLED defines which channels in Slice 1 are enabled for interleaving the symmetric region. The mapping of partial (2-way) interleaved and non-interleaved regions are specified in other registers. For symmetric region, only selected configurations are supported. Across both slices, only a total of 1 channel, 2 channels or 4 channels must be enabled for interleaving the symmetric region. The total of 1, 2 or 4 channels can be made up of any combination of channel enables across both slices. B-unit does not support a 3-way interleaving of the symmetric region across 3 enabled channels in the two slices combined.
33	0h RO	**Reserved (RESERVED_2):** Reserved.
32	0h RO	**Channel 1 Disabled (CH_1_DISABLED):** B-Unit is divided into two slices, and each slice has two PMI channels to the internal memory subsystem -- for a total of four channels. With this bit asserted, channel 1 in both slices is disabled. Thus, no memory addresses are mapped to the slice's ch 1. All requests are sent to the slice's channel 0. This bit can be set for SoC Usage of this bit is depricated, Hardware assumes this bit to be always cleared
31	0h RW	**Enable PMI Dual Data Mode (ENABLE_PMI_DUAL_DATA_MODE):** When set to 1, Single Command Interface and Dual Data Interface for Reads and Writes
30:20	0h RO	**Reserved (RESERVED_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
19:6	0h RW	**Slice Hash Mask (SLICE_HASH_MASK):** When both slices are enabled, this field specifies that the Slice Hash Mask is to be applied on Addr[19:6] physical address of the request, to compute which slice a request must be routed to. Relevant only when HVM mode is disabled, and only for physical addresses that do not fall under the Asymmetric Memory Region and the MOT region. B-Unit will override the programmed value to include the Slice Selector bit. Additionally, B-Unit will remove the Channel Selector bit. See INTERLEAVE_MODE field. Note that HVM mode non-address IDI requests asymmetric memory region and MOT regions have special hash requirements and hence they do not use the SLICE_HASH_MASK.
5	0h RO	**Reserved (RESERVED_0):** Reserved.
4	0h RW	**Slice 0 Memory Disabled (SLICE_0_MEM_DISABLED):** Slice 0 is disabled for memory accesses; no memory address mapped to Slice 0 and all memory requests sent to Slice 1.
3:2	0h RW	**Interleave Mode (INTERLEAVE_MODE):** Default interleave mode that specifies how the Slice Selector and Channel Selector bits are to be determined. Relevant only when HVM mode is disabled, and only for system memory addresses that do not fall under the MOT region or the Asymmetric memory region in the System Address Map. Legal encodings are 0h, 1h and 2h. An encoding of 3h is treated as if it was 2h. When both slices and all four PMI channels are enabled: • 0h: Default Slice Selector is Addr[10] and Default Channel Selector is Addr[11] • 1h: Default Slice Selector is Addr[11] and Default Channel Selector is Addr[12] • 2h: Default Slice Selector is Addr[12] and Default Channel Selector is Addr[13] When both slices are enabled, but only one channel in each slice is enabled: • 0h: Default Slice Selector is Addr[10] • 1h: Default Slice Selector is Addr[11] • 2h: Default Slice Selector is Addr[12] When only SLICE0 is enabled, and both channels on that slice are enabled: • 0h: Default Channel Selector is Addr[10] • 1h: Default Channel Selector is Addr[11] • 2h: Default Channel Selector is Addr[12] When SLICE0 and only one channel in that slice is enabled this field is not relevant. B-Unit overrides the setting of the SLICE_HASH_MASK to always include the Slice Selector bit. Similarly, B-Unit overrides the setting of the CH_HASH_MASK to always include the Channel Selector bit.
1	0h RW	**HVM Mode Enable (HVM_MODE):** • 0: HVM mode is disabled. • 1: HVM mode is enabled. When HVM mode is enabled, Slice Hash and Channel Hash are done as follows: Both slices and all four PMI channels enabled: Slice Hash is Request Physical Addr[29] and Channel Hash is PostRemap Addr[30]. Both slices enabled, but only one PMI channel in each slice enabled: Slice Hash is Request Physical Addr[29]. Only one SLICE0 enabled, but both PMI channels in SLICE0 enabled: Channel Hash is PostRemap Addr[29]. When HVM_MODE is enabled, TOLUD must be set at 2GB.
0	0h RW	**Slice 1 Disabled (SLICE_1_DISABLED):** Slice 1 is disabled -- no memory address is mapped to Slice 1. All requests are sent to Slice 0.

30.44 SMM_BLOCKED (T_CR_SMM_BLOCKED)—Offset 5100h

This CSR contains bit per logical processor indicating whether the logical processor is in state where SMIs are blocked and hence will not be able to service SMI. SMI can be serviced after the logical processor exits the state in which SMIs are blocked

Access Method

Type: MSG Register
(Size: 64 bits)

Default: FFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
15:0	FFFFh RW/V	**LOG_PROC (LOG_PROC):** This bit will be set when the logical processor is in the following states Wait For SIPI SENTER Sleep VMX Abort Error Shutdown Machine check in WFS state This bit will only exist for logical processors that exist tied to number of logical processors in the system. It is undefined for processors that dont exist.

30.45 SMM_DELAYED (T_CR_SMM_DELAYED)—Offset 5108h

This CSR contains bit per logical processor indicating whether the logical processor is in the middle of long flow and hence will delay servicing of SMI. SMI will be serviced after the long flow completes execution.

Access Method

Type: MSG Register
(Size: 64 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RSV	**RESERVED_0 (RESERVED_0):** Reserved
15:0	0h RW/V	**LOG_PROC (LOG_PROC):** This bit will be set at the start of the flows listed below and cleared at the end of the flows Patch load C6 entry C6 exit WBINVD Ratio Change/ Throttle/S1 This bit will only exist for logical processors that exist tied to number of logical processors in the system. It is undefined for processors that dont exist.

§ §

31 MODPHY Registers

31.1 CLK_SRC_SELECT Register (CLK_SRC_SELECT)—Offset 0h

Clock Source Select Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**RESERVED3:** Reserved
5	0h RW	**TX_TIMING_CFG_SRC:** Selects the source for timing parameter configuration for DFE 0-Controller, 1-Local Register
4	0h RW	**RESERVED2:** TXDDR_CLK_SRC, Reserved MUST BE 1'b0.
3	0h RW	**TXBYTE_CLK_SRC:** txByte clock source 0=txbyteclock external 1= derived from TxddrclkIhs For Functional mode this bit MUST be set to 1'b0
2:1	0h RW	**RESERVED1**
0	0h RW	**RESERVED0:** Reserved

31.2 TXESC_CLK_DIV1 Register (TXESC_CLK_DIV1)—Offset 4h

txesc div1 register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**RESERVED0:** Reserved
9:0	80h RW	**TXESC_CLKDIV1:** txesc clock divider 1 ratio(one hot encoding)

31.3 TXESC_CLK_DIV2 Register (TXESC_CLK_DIV2)—Offset 8h

txesc div2 register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**RESERVED0:** Reserved
9:0	10h RW	**TXESC_CLKDIV2:** txesc clock divider 2 ratio(one hot encoding)

31.4 RCOMP_CLK_DIV1 Register (RCOMP_CLK_DIV1)—Offset Ch

rcomp div1 register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**RESERVED0:** Reserved
9:0	10h RW	**RCOMP_CLKDIV1:** rcomp clock divider 1 ratio(one hot encoding). By default this is based on i_phyclk (100MHz)

31.5 RCOMP_CLK_DIV2 Register (RCOMP_CLK_DIV2)—Offset 10h

rcomp div2 register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**RESERVED0:** Reserved
9:0	1h RW	**RCOMP_CLKDIV2:** rcomp clock divider 1 ratio(one hot encoding). By default this is based on i_phyclk (100MHz)

31.6 TOP_CFG_REG Register (TOP_CFG_REG)—Offset 14h

Top Config Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RESERVED1**
30:3	0h RW	**RESERVED0:** Reserved
2	0h RW	**IP_BI_MODE:** IP_BI_Mode will be used to isolate IP burn-in mode (i.e. near-end analog loopback for MPHY) from SOC full-chip scan mode. IP_BI_Mode = 1'b0 (default); 1'b1 (set when enabling local IP burn-in test mode, e.g. near-end analog loopback) This signal is used to gate all the scan controls from SOC, thus full-chip scan can be run concurrently with IP burn-in mode.
1	0h RW	**BSCAN_EXCLUDE:** BSCAN exclude
0	0h RW	**SIDEBAND_OR_STAP_SELECT:** This bit selects IOSF SB or STAP access 1 - STAP 0 - IOSF SB. Default selection IOSF SB.

31.7 REF_CTL_REG Register (REF_CTL_REG)—Offset 18h

Reference Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RW	**RESERVED1:** Reserved
8	0h RW	**TX_8XCLKBYPASS:** Bypass 8x clock path and send the data for 4x path
7:6	0h RW	**RESERVED0:** Reserved
5:1	0h RW	**VREG_REFSEL:** RegulatorReference select between 1/4 to 3/4 of reference voltage
0	1h RW	**VREG_REFEN:** Regulator Reference Enable

31.8 DLY_ADJ_REG Register (DLY_ADJ_REG)—Offset 1Ch

Delay Adjustment Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**RESERVED0:** Reserved
19:16	0h RW	**ADJ_DLY_4XQ_DFE:** Delay adjustment for 4x Quad-Phase clock going to DFE
15:12	0h RW	**ADJ_DLY_4XI_DFE:** Delay adjustment for 4x In-Phase clock going to DFE
11:8	0h RW	**ADJ_DLY_8X:** Delay adjustment for 8x lock
7:4	0h RW	**ADJ_DLY_4XQ:** Delay adjustment for 4x qual -phase clock
3:0	0h RW	**ADJ_DLY_4XI:** Delay adjustment for 4x in -phase clock

31.9 HS_RCOMP_READOUT Register (HS_RCOMP_READOUT)—Offset 20h

HS RCOMP Readout Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**RESERVED2:** Reserved
15	0h RO/V	**HS_CALIB_EXIT_TYPE:** HS_CALIB_EXIT_TYPE
14:13	0h RO/V	**RESERVED1:** Reserved
12:8	0h RO/V	**FINAL_HS_RCOMP_CODE_OUT:** Final HS RCOMP updated value: final_hs_rcomp_code_out[4:0]. This final code going into the AFE.
7	0h RO/V	**HS_CALIB_EXIT_STATUS:** CALIB_EXIT_STATUS: 0=)Normal exit; 1=)Error condition

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**HS_RCOMP_DONE_STICKY:** HS RCOMP Calibration and update complete
5	0h RO/V	**RESERVED0:** Reserved
4:0	0h RO/V	**FINAL_HS_RCOMP_CODE_INT:** Final HS RCOMP updated value: final_hs_rcomp_code_out[4:0]. This field is expected to hold calibrated value before update. Need to fix the RTL.

31.10 LP_P_RCOMP_READOUT Register (LP_P_RCOMP_READOUT)—Offset 24h

LP P RCOMP Readout Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO/V	**RESERVED2:** Reserved
24:21	0h RO/V	**FINAL_LP_P_RCOMP_SLEW:** Final LP P RCOMP slew rate updated value: final_lp_p_rcomp_slew[3:0]
20:12	0h RO/V	**RESERVED1:** Reserved
11:8	0h RO/V	**FINAL_LP_P_RCOMP_CODE_OUT:** Final LP P RCOMP updated value: final_lp_p_rcomp_code_out[3:0]. This final code going into the AFE.
7	0h RO/V	**LP_P_RCOMP_DONE_STICKY:** LP_P_RCOMP_DONE_STICKY
6	0h RO/V	**LP_P_CALIB_EXIT_TYPE:** LP_P_CALIB_EXIT_TYPE
5	0h RO/V	**LP_P_CALIB_EXIT_STATUS:** CALIB_EXIT_STATUS: 0=)Normal exit; 1=)Error condition
4	0h RO/V	**RESERVED0:** Reserved
3:0	0h RO/V	**FINAL_LP_P_RCOMP_CODE_INT:** Final LP P RCOMP calibrated value. This field is expected to hold calibrated value before update. Need to fix the RTL.

31.11 LP_N_RCOMP_READOUT Register (LP_N_RCOMP_READOUT)—Offset 28h

LP N RCOMP Readout Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO/V	**RESERVED2:** Reserved
24:21	0h RO/V	**FINAL_LP_N_RCOMP_SLEW:** Final LP N RCOMP slew rate updated value: final_lp_n_rcomp_slew[3:0]
20:12	0h RO/V	**RESERVED1:** Reserved
11:8	0h RO/V	**FINAL_LP_N_RCOMP_CODE_OUT:** Final LP N RCOMP updated value: final_lp_n_rcomp_code_out[3:0]. This final code going into the AFE.
7	0h RO/V	**LP_N_RCOMP_DONE_STICKY:** LP_N_RCOMP_DONE_STICKY
6	0h RO/V	**LP_N_CALIB_EXIT_TYPE:** LP_N_CALIB_EXIT_TYPE
5	0h RO/V	**LP_N_CALIB_EXIT_STATUS:** CALIB_EXIT_STATUS: 0=)Normal exit; 1=)Error condition
4	0h RO/V	**RESERVED0:** Reserved
3:0	0h RO/V	**FINAL_LP_N_RCOMP_CODE_INT:** Final LP N RCOMP calibrated value. This field is expected to hold calibrated value before update. Need to fix the RTL.

31.12 RCOMP_LP_SLEW_CFG Register (RCOMP_LP_SLEW_CFG)—Offset 2Ch

RCOMP LP Slew Configuration Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**RESERVED1:** Reserved
13:10	0h RW	**LP_DRV_STRG_SEL:** LP Driver Strength Select btw 150, 200, 300, 600 ohm
9:6	0h RW	**LP_P_RCOMP_SLEW_OVR_PUP:** LP RCOMP Override code for Pull-UP slew
5	0h RW	**RESERVED0:** Reserved
4:1	0h RW	**LP_N_RCOMP_SLEW_OVR_PDN:** LP RCOMP Override code for Pull-down slew

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**LP_RCOMP_SLEW_OVR_ENABLE:** LP RCOMP slew Override valid

31.13 CLK_MONITOR_PORT_CONTROL Register (CLK_MONITOR_PORT_CONTROL)—Offset 30h

CLOCK MONITOR PORT CONTROL

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**CLK_MONITOR_PORT_EN:** Enable the Clock Monitor debug port. 0 = Disable Clock Monitor port. Tie it to '0', so that there is no toggle 1 = Enable the Clock Monitor debug port and route the appropriate clock
1:0	0h RW	**CLK_MONITOR_PORT_CLK_SEL:** Clock Monitor Clock Select to route the required clock to Debug port 00 : DDRCLK = CLK_8x select 01 : DDR_CLK_I = CLK4x_i Select 10 : DDR_CLK_Q = CLK4x_q Select 11: Byte Clock select

31.14 HS_RCOMP_CFG Register (HS_RCOMP_CFG)—Offset 34h

HS RCOMP Configuration Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**RESERVED5:** Reserved
22	0h RW	**RESERVED4:** Was used for HS_NO_WAIT_UPDATE : Forced update mode for HS ; Does not wait for any device state;
21	0h RW	**RESERVED3:** Was used for HS_RCOMP_UPDATE: 0b = RCOMP is updated if the clock lane is in LP11 or ULPS state; 1b = RCOMP is updated if all the data lanes are in LP11 or ULPS state.
20:19	0h RW	**HS_TOGGLE_LIMIT_CREG_ENC:** HS_TOGGLE_LIMIT_CREG_ENC: HS state machine toggle limit. Number of times RCOMP state machine will toggle before exiting. 2'b00: 6 toggles; 2'b01: 4 toggles; 2'b10: 8 toggles; 2'b11: 10 toggles
18:16	0h RW	**RESERVED2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RW	**RESERVED1:** Reserved
8	0h RW	**HS_RCOMP_OVERRIDE_VALID:** HS override enable
7:6	0h RW	**RESERVED0:** Reserved
5:1	0h RW	**HS_RCOMP_OVERRIDE_CODE:** HS override values
0	1h RW	**HS_RCOMP_ENABLE:** Enable HS calibration

31.15 LP_RCOMP_CFG Register (LP_RCOMP_CFG)—Offset 38h

LP RCOMP Configuration Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**RESERVED5:** Reserved
22	0h RW	**RESERVED4:** Was used for LP_NO_WAIT_UPDATE : Forced update mode for LP ; Does not wait for any device state;
21	0h RW	**RESERVED3:** Was used for LP_RCOMP_UPDATE: 0b = RCOMP is updated if the clock lane is in LP11 or ULPS state; 1b = RCOMP is updated if all the data lanes are in LP11 or ULPS state.
20:19	0h RW	**LP_TOGGLE_LIMIT_CREG_ENC:** LP_TOGGLE_LIMIT_CREG_ENC: HS state machine toggle limit. Number of times RCOMP state machine will toggle before exiting. 2'b00: 6 toggles; 2'b01: 4 toggles; 2'b10: 8 toggles; 2'b11: 10 toggles
18:16	0h RW	**RESERVED2:** Reserved
15:11	0h RW	**RESERVED1:** Reserved
10:7	0h RW	**LP_P_RCOMP_OVERRIDE_CODE:** LP RCOMP Overide code for Pull-UP strength
6	0h RW	**RESERVED0:** Reserved
5:2	0h RW	**LP_N_RCOMP_OVERRIDE_CODE:** LP RCOMP Overide code for Pull-down strength
1	0h RW	**LP_RCOMP_OVERRIDE_VALID:** LP override enable
0	1h RW	**LP_RCOMP_ENABLE:** Enable LP calibration

31.16 RCOMP_STAT Register (RCOMP_STAT)—Offset 3Ch

RCOMP Status register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**RESERVED3:** Reserved
15	0h RO/V	**LP_TXP_RCOMP_COUNTUP:** afe_dfx_lptxpcountup_ff
14	0h RO/V	**LP_TXN_RCOMP_COUNTUP:** afe_dfx_lptxncountup_ff
13	0h RO/V	**HS_RCOMP_COUNTUP:** afe_dfx_hsrcompcountup_ff
12:9	0h RO/V	**RESERVED2:** Was used for LP_P_RCOMP_CODE_MUX : lp_n_rcomp_code_out_mux. Make this reserved.
8:5	0h RO/V	**RESERVED1:** Was used for LP_N_RCOMP_CODE_MUX : lp_p_rcomp_code_out_mux. Make this reserved.
4:0	0h RO/V	**RESERVED0:** Was used for HS_RCOMP_CODE_OUT_MUX : hs_rcomp_code_out_mux. Make this reserved.

31.17 RCCRCOMP Register (RCCRCOMP)—Offset 40h

Rcomp Leg Control

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**RESERVED_3:** Reserved
3	0h RW	**RESERVED2:** Was used for HS_RCOMP_CLK_EN : mdf_dphy_rcompclken. Now Reserved
2	0h RW	**RESERVED1:** Was used for HS_RCOMP_FLIS_OVRD : mdf_dphy_rcompflisovrd
1:0	0h RW	**RESERVED0:** RESERVED

31.18 RCOMPCTL Register (RCOMPCTL)—Offset 44h

RCOMP Control

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RESERVED_3:** Reserved
30	0h RW	**TXDPHY_TESTHSTXSTATICLEG_DISABLE:** DFX signal to disable HS static leg
29	0h RW	**TXDPHY_TESTLPPDSTATICLEG_DISABLE:** DFX signal to disable PD static leg
28	0h RW	**TXDPHY_TESTLPPUSTATICLEG_DISABLE:** DFX signal to disable PU static leg
27	0h RW	**LP_RCOMP_CONTROL_SELECT:** This signal is used to select between functional LP rcomp control and dfx LP rcomp control (enable RCOMP lane manual RCOMP cal test)
26	0h RW	**HS_RCOMP_CONTROL_SELECT:** This signal is used to select between functional HS rcomp control and dfx HS rcomp control
25	0h RW	**RESEREVED:** Reserved
24:21	0h RW	**LPTXNSTRCAL:** DFX override for LP N-strength calibration bits
20	0h RW	**RESERVED0:** Reserved
19:16	0h RW	**LPTXPSTRCAL:** DFX override for LP P-strength calibration bits (override lp_p_next_code to RCOMP lane)
15	0h RW	**LPTXNCOMPEN:** DFX override value for LP N Analog rcomp enable
14	0h RW	**LPTXPCOMPEN:** DFX override value for LP P Analog rcomp enable
13:11	0h RW	**RCOMPTARGET:** DFX override for RCOMP Target level
10:6	0h RW	**HSRCOMPCAL:** DFX override for HS rcomp calibration bits
5	0h RW	**HSRCOMPEN:** DFX override for HS rcomp enable
4	0h RW	**RCOMPSTART:** Customer Trigger/DFX HS start signal to trigger RCOMP FSM. By default this bit is auto cleared when RCOMPSTART_AUTO_CLR_DIS = 0 else auto clear is disabled
3	0h RW	**RCOMPSTART_AUTO_CLR_DIS:** This bit is used to disable the RCOMPSTART auto clear feature. By default RCOMPSTART_AUTO_CLR_DIS = 0 : auto-clear is enabled RCOMPSTART_AUTO_CLR_DIS = 1 : auto clear disabled NOTE : This is valid only via APB registers. The RCOMPSTART Auto-Clear feature is not available in the mirror STAP register

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**LP_RCOMP_OVERRIDE_SELECT:** This bit is used to select between functional LP Rcomp code and DFX LP rcomp code
1	0h RW	**HSREGENRCOMP:** DFX override to enable HS regulator for Rcomp lane
0	0h RW	**HS_RCOMP_OVERRIDE_SELECT:** This signal is used to select between functional HS rcomp control and dfx rcomp controls

31.19 PWRMNG_OVR_CTL Register (PWRMNG_OVR_CTL)—Offset 48h

Power Management Override Control Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**RESERVED0:** Reserved
29	0h RW	**PHY_RST_B_OVR:** PHY RESET RESET BAR VALUE
28	0h RW	**RCOMP_RESET_OVR:** RCOMP RESET VALUE: (ACTIVE HIGH) This field is only used if 0: RCOMP is not IN RESET 1: RCOMP is FORCED to RESET
27	0h RW	**BITRATECLK_ACK_OVR:** BITRATE Clock ACK OVERRIDE VALUE
26	0h RW	**INDUCE_LP00_OVR:** Induce LP00 VALUE
25	0h RW	**PHYREADY_B_OVR:** PHY Ready Override VALUE
24	0h RW	**PWRSTABLE_OVR:** Power Stable Override VALUE
23	0h RW	**AFE_FWEN_B_OVR:** AFE Frirewall Enable OVERRIDE VALUE
22	0h RW	**LPLATCHENB_OVR:** LPLATCHENB OVERRIDE VALUE
21	0h RW	**LP00_LPWRMODE_OVR:** LP00_LPWRMODE OVERRIDE VALUE (UNUSED)
20	0h RW	**LP11_LPWRMODE_OVR:** LP11_LPWRMODE OVERRIDE VALUE (UNUSED)
19	0h RW	**LPWAKE_OVR:** Low power Wake OVERRIDE VALUE
18	0h RW	**MIPI_MODE_OVR:** MIPI MODE OVERRIDE VALUE

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**BITRATECLK_REQ_OVR:** BITRATE Clock OVERRIDE REQ VALUE
16	0h RW	**PHYCLK_REQ_OVR:** PHY Clock OVERRIDE REQ VALUE
15	0h RW	**PHY_RST_B_OVR_EN:** PHY RESET OVERRIDE ENABLE: 0: phy_rst_b reset is an input to the DPHY IP 1: phy_rst_b reset is overriden by PHY_RST_B_OVR
14	0h RW	**RCOMP_RESET_OVR_EN:** RCOMP RESET OVERRIDE ENABLE: 0: Rcomp Reset genmerated out of FSM is not overriden 1: Rcomp Reset genmerated out of FSM is overriden by RCOMP_RESET_OVR
13	0h RW	**BITRATECLK_ACK_OVR_EN:** BITRATE Clock ACK OVERRIDE ENABLE: 0: Input bitrateclk_ack is not overriden 1: Input bitrateclk_ack is overriden, value specified by BITRATECLK_ACK_OVR
12	0h RW	**S0I3_ENTRY_DISABLE:** s0i3 Entry disable 0: s0i3 entry will ocurr every time ulps state is detected while in normal run mode 1: s0i3 entry is disabled
11	0h RW	**INDUCE_LP00_OVR_EN:** Iduce LP 00 (Warm reset) Override Enable 0: Induce LP00 from conroller is not overriden 1: induce_lp00 is overriden, value specified by INDUCE_LP00_OVR
10	0h RW	**SW_SEQ_EN_OVR_EN:** Software Sequence Enable Override Enable 0: Power Sequence is handled by Power Hardwared FSM within MIPIO 1: Controller Software Power Sequence is Enable
9	0h RW	**PHYREADY_B_OVR_EN:** PHY Ready Override Enable 0: phyready_b is not overriden 1: phyready_b is overriden, value specified by PHYREADY_B_OVR
8	0h RW	**PWRSTABLE_OVR_EN:** Power Stable Override Enable 0: pwrstable is not overriden 1: pwrstable is overriden, value specified by PWRSTABLE_OVR
7	0h RW	**AFE_FWEN_B_OVR_EN:** AFE Frirewall Enable OVERRIDE ENABLE: 0: afe_fwen_b is not overriden 1: afe_fwen_b is overriden, value specified by AFE_FWEN_B_OVR
6	0h RW	**LPLATCHENB_OVR_EN:** LPLATCHENB OVERRIDE ENABLE: 0: lplatchenb is not overriden 1: lplatchenb is overriden, value specified by LPLATCHENB_OVR
5	0h RW	**LP00_LPWRMODE_OVR_EN:** LP00_LPWRMODE OVERRIDE ENABLE: (UNUSED) 0: lp00_lpwrmode is not overriden 1: lp00_lpwrmode is overriden, value specified by LP00_LPWRMODE_OVR
4	0h RW	**LP11_LPWRMODE_OVR_EN:** LP11_LPWRMODE OVERRIDE ENABLE: (UNUSED) 0: lp11_lpwrmode is not overriden 1: lp11_lpwrmode is overriden, value specified by LP11_LPWRMODE_OVR
3	0h RW	**LPWAKE_OVR_EN:** Low power Wake OVERRIDE ENABLE: 0: lpwake is not overriden 1: lpwake is overriden, value specified by LPWAKE_OVR
2	0h RW	**MIPI_MODE_OVR_EN:** MIPI MODE OVERRIDE ENABLE: 0: mipi_mode is not overriden 1: mipi_mode is overriden, value specified by MIPI_MODE_OVR
1	0h RW	**BITRATECLK_REQ_OVR_EN:** BITRATE Clock REQUEST OVERRIDE ENABLE: 0: bitrateclk_req is not overriden 1: bitrateclk_req is overriden, value specified by BITRATECLK_REQ_OVR
0	0h RW	**PHYCLK_REQ_OVR_EN:** PHY Clock REQUEST OVERRIDE ENABLE: 0: phyclk_req is not overriden 1: phyclk_req is overriden, value specified by PHYCLK_REQ_OVR

31.20 PWRMNG_STATUS Register (PWRMNG_STATUS)—Offset 4Ch

Power Management STATUS Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RESERVED0:** Reserved
6	0h RO	**BITRATECLK_CLKACK:** CLOCK ACK for BITRATE CLOCK
5	0h RO	**PHYCLK_CLKACK:** CLOCK ACK for PHY CLOCK
4	0h RO	**PORT1_LATCHOUTCP_STAT:** Port1 LATCHOUTCP STATUS: Reflects current Value of latcnoutcp from Port0 AFE From Controller
3	0h RO	**PORT0_LATCHOUTCP_STAT:** Port0 LATCHOUTCP STATUS: Reflects current Value of latcnoutcp from Port0 AFE From Controller
2	0h RO	**LATCHENB_STAT:** LATCHENB STATUS: Reflects current Value of LATCHENB After Override MUX
1	0h RO	**AFE_FWEN_B_STAT:** AFE Firewall Enable STATUS: Reflects current Value of AFE_FWEN_B After Override MUX
0	0h RO	**MIPI_MODE_STAT:** MIPI_MODE STATUS: Reflects current Value of MIPI_MODE After Override MUX

31.21 GLOBAL_GLK_RESERVED3 Register (GLOBAL_GLK_RESERVED3)—Offset 50h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RESERVED0**

31.22 GLOBAL_RESERVED1 Register (GLOBAL_RESERVED1)—Offset 54h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.23 TX_DFX_TOP_CFG_REG Register (TX_DFX_TOP_CFG_REG)—Offset 58h

TX DFX Top Config Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**RESERVED0:** Reserved
5	0h RW	**DFX_DPHY_LATCH_EN:** DFX_DPHY_LATCH EN. Enable latch in AFE to allow data to pass through
4	0h RW	**TXDPHY_TESTLPCDDISABLE_N:** Disable contention detection, Goes to AFE. Used to disable LPCD in debug mode
3	0h RW	**BSCAN_LATCH_RESETB:** In bscan mode, this signal will override the itx_latchresetb
2	0h RW	**BSCAN_LATCH_SELECT:** In bscan mode, use this signal to enable bscan_latchresetb override
1	0h RW	**ALL_1:** All 1. Only required for Tx Path
0	0h RW	**ALL_0:** All 0. Only required for Tx Path

31.24 TX_DFX_TOP_RESERVED1 Register (TX_DFX_TOP_RESERVED1)—Offset 5Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.25 TX_DFX_TOP_RESERVED2 Register (TX_DFX_TOP_RESERVED2)—Offset 60h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.26 TX_DFX_TOP_RESERVED3 Register (TX_DFX_TOP_RESERVED3)—Offset 64h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.27 TX_DFX_TOP_RESERVED4 Register (TX_DFX_TOP_RESERVED4)—Offset 68h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.28 TX_DFX_TOP_RESERVED5 Register (TX_DFX_TOP_RESERVED5)—Offset 6Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.29 TX_DFX_TOP_RESERVED6 Register (TX_DFX_TOP_RESERVED6)—Offset 70h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.30 TX_DFX_TOP_RESERVED7 Register (TX_DFX_TOP_RESERVED7)—Offset 74h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.31 TX_DFX_TOP_RESERVED8 Register (TX_DFX_TOP_RESERVED8)—Offset 78h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.32 TX_DFX_TOP_RESERVED9 Register (TX_DFX_TOP_RESERVED9)—Offset 7Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.33 TX_DFX_PORT0_CTL_REG Register (TX_DFX_PORT0_CTL_REG)—Offset 80h

TX DFX Port-0 Level Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**CONTENTION_DETECTION_DATAN:** CD DATA DN: Drive Contention data on LP DN pin from FLIS DFX

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**CONTENTION_DETECTION_DATAP:** CD DATA DP: Drive Contention data on LP DP pin from FLIS DFX
15	0h RW	**CONTENTION_DETECTION_MODE:** CD MODE. Enable Contention Detect Mode in testing
14:11	0h RW	**RESERVED0:** Reserved
10:9	0h RW	**HS_CLK_SEL:** High speed clock select for DFX mode
8:7	0h RW	**HS_DATA_SEL:** High speed data select for DFX mode
6:5	0h RW	**LP_CLK_SEL:** Low power clock select for DFX mode
4:2	0h RW	**LP_DATA_SEL:** Low power data select for DFX mode
1	0h RW	**LP_IO_CONTROL_SELECT:** DFX override for LP TX DATA
0	0h RW	**HS_IO_CONTROL_SELECT:** DFX override for HS TX DATA

31.34 TX_DFX_PORT0_CD_COUNTUP_STATUS Register (TX_DFX_PORT0_CD_COUNTUP_STATUS)—Offset 84h

CD Countup Status

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RESERVED0:** RESERVED
11	0h RO	**LP_CD_D1_0_META_FLOP_CORE:** LPCD High Test Mode Meta flop output This is the LPCD High signal sync'ed with Tx Escape Clock
10	0h RO	**LP_CD_D0_0_META_FLOP_CORE:** LPCD Low Test Mode Meta flop output This is the LPCD Low signal sync'ed with Tx Escape Clock
9:6	0h RO	**ALPCDHIGH_TEST:** LPCD High Test Mode output
5:2	0h RO	**ALPCDLOW_TEST:** LPCD Low Test Mode output
1	0h RO	**ALPCDHIGH_0:** LPCD contention high
0	0h RO	**ALPCDLOW_0:** LPCD contention low

31.35 TX_DFX_PORT0_RCC_CFG_REG Register (TX_DFX_PORT0_RCC_CFG_REG)—Offset 88h

RCC Config Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED3:** Reserved
17	0h RW	**HS_RCC_TX_START:** HS_RCC_TX_Start
16	0h RW	**HS_RCC_TX_ENABLE:** HS_RCC_TX_Enable
15:12	0h RW	**TEST_DATA_PATTERN:** Test_Data_Pattern
11	0h RW	**RESERVED2:** Reserved
10	0h RW	**RESERVED1:** Reserved
9	0h RW	**RESERVED0:** Reserved
8	0h RW	**FINITE_TEST:** Finite_Test
7:0	0h RW	**MAX_COUNT:** 8-bit max count for test IO TEST ENGINE RCC

31.36 TX_DFX_PORT0_ACIO_CFG_REG Register (TX_DFX_PORT0_ACIO_CFG_REG)—Offset 8Ch

ACIO Loopback Config Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**DATA_MASK:** Data Mask IO TEST ENGINE
27:12	0h RW	**TEST_DATA_PATTERN:** Test Data Pattern IO TEST ENGINE

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**RESERVED2:** Reserved
10	0h RW	**RESERVED1:** Reserved
9	0h RW	**RESERVED0:** Reserved
8	0h RW	**FINITE_TEST:** Finite_Test
7:0	0h RW	**MAX_COUNT:** 8-bit max count for test IO TEST ENGINE

31.37 TX_DFX_PORT0_ACIOSS_REG Register (TX_DFX_PORT0_ACIOSS_REG)—Offset 90h

ACIO Loopback Start and Status Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**RESERVED2:** Reserved
19	0h RW	**LB_FIFO_RST_B:** Resets the loopback FIFO read and write pointers.
18	0h RW	**LP_CDFELB_SEL:** select between low and high contention
17	0h RW	**LP_FELB_SEL:** select between contention and rxpath
16	0h RW	**LP_RXFELB_SEL:** Rx Far End loopback select. At portlevel selects between toggle detector and rx path for lane0
15	0h RW	**RESERVED1:** Reserved
14	0h RW	**PRG_DEL:** prg_del
13	0h RW	**CAL_IOTE_DELA:** cal_iote_dela
12	0h RW	**SYNCFLOPBYPASSMODEEN_N:** Enable to bypass DSI sync flop stage
11	0h RW	**SYNCFLOPBYPASSMODE_CTRL:** Control to allow bypass sync flop enable to pass to AFE and override DSI controller bypass flop muxing enable bit=dpa_mio_portctrl_a[8]
10	0h RW	**SERIALIZER_ENABLE:** This will enable rd_en on TXPORT sync FIFO and will also reset TX sync FIFO

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**RESERVED0:** TXPORT_LOOPBACK, Reserved, MUST be 1'b0 always
8:5	0h RW	**DELAY1:** These bits delay comparison if the received data takes more than the default number of cycles to reach the comparator
4	0h RW	**ACIO_START_A:** Start ACIO Loopback test using IOTE : 0-Stop test, 1-Start test
3	0h RW	**ACIOLB_A_RST:** Reset for cal_iote_del_a
2	0h RW	**LB_FIFO_PTR_SEP:** Loopback FIFO pointer separation between write and read pointers. 0 - read pointer delayed 1 cycle, 1 - read pointer delayed 2 cycles
1	0h RW	**ACIO_MODE_CLN_HSREQ_OVR:** ACIO Mode Clock Lane High Speed Request Override Control. This bit must be set first before setting the Start bits When 1'b0: Functional MODE is selected for CLN_HSREQ When 1'b1: CLN_HSREQ is forced to 1'b1 for ACIO LB operation
0	0h RW	**ACIOLBEN:** AC IO loopback enable --> Connect to Internal ACIO Loopback Enable (sent to AFE to enable loopback circuitry)

31.38 TX_DFX_PORT0_ACIOERR_REG Register (TX_DFX_PORT0_ACIOERR_REG)—Offset 94h

ACIO Loopback Error Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**RESERVED_2:** Reserved
28	0h RO	**IOTE_START_FF:** This bit indicates IOTES ENGINE A has started
27:20	0h RO	**TRANSMIT_DATA:** Generated data from IO Test Engine to check if the IOTE A did indeed start
19:16	0h RO	**DATA_ERROR_RESULT:** Data0_Error_Result from IOTE ENGINE A
15	0h RO	**ACIO_COMPLETE:** This indicates that ACIO loopback test using IOTE Engine A is complete
14:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**MAX_COUNT:** 8-bit max count number when the test is done for IOTE ENGINE A

31.39 TX_DFX_PORT0_DELAY_CALIB_REG Register (TX_DFX_PORT0_DELAY_CALIB_REG)—Offset 98h

Delay Calibration Register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**RESERVED0:** Reserved
4	0h RO	**COMP_STATA:** comp_stata
3:0	0h RO	**CAL_DELAY1:** cal_delay1

31.40 TX_DFX_PORT0_RXLPBK_DATA Register (TX_DFX_PORT0_RXLPBK_DATA)—Offset 9Ch

RX Loopback Data Register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RX_LPBK_DATA1:** rx_lpbk_data1 (CLK A) --> Use SIPO instead of Receiver data

31.41 TX_DFX_PORT0_CLANE_CTL_REG Register (TX_DFX_PORT0_CLANE_CTL_REG)—Offset A0h

TX DFX Clock Lane Control Reg

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**RESERVED0:** Reserved
6:3	0h RW	**TIME_SKEW_ADJUST_CLK:** Lane Timing Skew adjustability between CLK/DATA for DSI with 4-bit control for each lane: ~25ps resolution
2	0h RW	**HS_TX_REGEN_CLK:** DFX override for HS TX REG enable
1	0h RW	**HS_TX_EN_CLK:** DFX override for HS TX enable
0	0h RW	**LP_TX_EN_CLK:** DFX override for LP TX enable

31.42 TX_DFX_PORT0_RESERVED1 Register (TX_DFX_PORT0_RESERVED1)—Offset A4h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.43 TX_DFX_PORT0_RESERVED2 Register (TX_DFX_PORT0_RESERVED2)—Offset A8h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.44 TX_DFX_PORT0_RESERVED3 Register (TX_DFX_PORT0_RESERVED3)—Offset ACh

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.45 TX_DFX_PORT0_DLANE0_CTL_REG Register (TX_DFX_PORT0_DLANE0_CTL_REG)—Offset B0h

TX DFX Data Lane-0 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED0:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-0 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**TIME_SKEW_ADJUST_DATA:** Lane 0-3 Timing Skew adjustability between CLK/ DATA for DSI with 4-bit control for each lane: ~25ps resolution
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA0 REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA0 enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA0 enable

31.46 TX_DFX_PORT0_DLANE0_STAT_REG Register (TX_DFX_PORT0_DLANE0_STAT_REG)—Offset B4h

TX DFX Data Lane-0 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO0 - Pipe A

31.47 TX_DFX_PORT0_DLANE1_CTL_REG Register (TX_DFX_PORT0_DLANE1_CTL_REG)—Offset B8h

TX DFX Data Lane-1 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-1 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA1 REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA1 enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA1 enable

31.48 TX_DFX_PORT0_DLANE1_STAT_REG Register (TX_DFX_PORT0_DLANE1_STAT_REG)—Offset BCh

TX DFX Data Lane-1 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO1 - Pipe A

31.49 TX_DFX_PORT0_DLANE2_CTL_REG Register (TX_DFX_PORT0_DLANE2_CTL_REG)—Offset C0h

TX DFX Data Lane-2 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-2 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA2REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA2enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA2enable

31.50 TX_DFX_PORT0_DLANE2_STAT_REG Register (TX_DFX_PORT0_DLANE2_STAT_REG)—Offset C4h

TX DFX Data Lane-2 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO2 - Pipe A

31.51 TX_DFX_PORT0_DLANE3_CTL_REG Register (TX_DFX_PORT0_DLANE3_CTL_REG)—Offset C8h

TX DFX Data Lane-3 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-3 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA3REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA3enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA3enable

31.52 TX_DFX_PORT0_DLANE3_STAT_REG Register (TX_DFX_PORT0_DLANE3_STAT_REG)—Offset CCh

TX DFX Data Lane-3 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO3 - Pipe A

31.53 TX_DFX_PORT0_LANE_RESERVED5 Register (TX_DFX_PORT0_LANE_RESERVED5)—Offset D0h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.54 TX_DFX_PORT0_LANE_RESERVED6 Register (TX_DFX_PORT0_LANE_RESERVED6)—Offset D4h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.55 TX_DFX_PORT0_LANE_RESERVED7 Register (TX_DFX_PORT0_LANE_RESERVED7)—Offset D8h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.56 TX_DFX_PORT0_LANE_RESERVED8 Register (TX_DFX_PORT0_LANE_RESERVED8)—Offset DCh

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.57 TX_DFE_PORT0_DLN_CNT_LPX Register (TX_DFE_PORT0_DLN_CNT_LPX)—Offset E0h

lpx count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Ah

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Ah RW	**DLN_CNT_LPX:** period for which a LP state should be driven

31.58 TX_DFE_PORT0_DLN_CNT_HS_PREP Register (TX_DFE_PORT0_DLN_CNT_HS_PREP)—Offset E4h

hs prepare count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	9h RW	**DLN_CNT_HS_PREP:** Period for which HS Prepare time should be accomodated

31.59 TX_DFE_PORT0_DLN_CNT_HS_ZERO Register (TX_DFE_PORT0_DLN_CNT_HS_ZERO)—Offset E8h

hs zero count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 15h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	15h RW	**DLN_CNT_HS_ZERO:** Period for which HS Zero should be driven before sync

31.60 TX_DFE_PORT0_DLN_CNT_HS_TRAIL Register (TX_DFE_PORT0_DLN_CNT_HS_TRAIL)—Offset ECh

hs trail count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Bh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Bh RW	**DLN_CNT_HS_TRAIL:** Period for which HS trailing should be driven

31.61 TX_DFE_PORT0_DLN_CNT_HS_EXIT Register (TX_DFE_PORT0_DLN_CNT_HS_EXIT)—Offset F0h

hs exit count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**DLN_CNT_HS_EXIT:** Period for which HS exit state should be maintained

31.62 TX_DFE_PORT0_DLN_CNT_RX Register (TX_DFE_PORT0_DLN_CNT_RX)—Offset F4h

rx count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	1h RW	**DLN_CNT_RX:** Counter that controls the assertion of enable on the DPHY

31.63 TX_DFE_PORT0_DLN_SYNC_CNT Register (TX_DFE_PORT0_DLN_SYNC_CNT)—Offset F8h

sync count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	1h RW	**DLN_SYNC_COUNT:** A timeout value used for Sync error detector logic

31.64 TX_DFE_PORT0_CLN_CNT_HS_TRAIL Register (TX_DFE_PORT0_CLN_CNT_HS_TRAIL)—Offset FCh

clane trail count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Bh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Bh RW	**CLN_HS_TRAIL:** Wait time in byte clock for the trailing bits

31.65 TX_DFE_PORT0_CLN_CNT_HS_EXIT Register (TX_DFE_PORT0_CLN_CNT_HS_EXIT)—Offset 100h

clane exit count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**CLN_HS_EXIT:** Wait time in byte clock for the exit state

31.66 TX_DFE_PORT0_CLN_CNT_LPX Register (TX_DFE_PORT0_CLN_CNT_LPX)—Offset 104h

clane lpx count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	9h RW	**CLN_CNT_LPX:** Wait time in byte clock for the LPX

31.67 TX_DFE_PORT0_CLN_CNT_PREP Register (TX_DFE_PORT0_CLN_CNT_PREP)—Offset 108h

clane prepare count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Eh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Eh RW	**CLN_CNT_PREP:** Wait time in byte clock for the prepare time

31.68 TX_DFE_PORT0_CLN_CNT_ZERO Register (TX_DFE_PORT0_CLN_CNT_ZERO)—Offset 10Ch

clane zero count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 32h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	32h RW	**CLN_CNT_ZERO:** Wait time in byte clock for the zero state

31.69 TX_DFE_PORT0_CLN_CNT_PLL Register (TX_DFE_PORT0_CLN_CNT_PLL)—Offset 110h

clane PLL count

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RESERVED0:** Reserved
15:0	0h RW	**CLN_CNT_PLL:** Count value used for the PLL lock time

31.70 TX_DFE_PORT0_CLN_CNT_POST Register (TX_DFE_PORT0_CLN_CNT_POST)—Offset 114h

clane cnt post

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**CLN_CNT_POST:** Wait time in byte clock for the zero state

31.71 TX_DFE_PORT0_CLN_DLN_ENABLE_OVR Register (TX_DFE_PORT0_CLN_DLN_ENABLE_OVR)—Offset 118h

Clock Lane and Data Lane Enable Override

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** RESERVED
7	0h RW	**AFE_LPRX_EN_CNTRL_SEL:** AFE Low Power Receiver Enable Control Select on the functional Path (i.e before the DFX override) 1 : LP Receiver Enable for Lane 0 is always Enable 0 : Use Data Lane Enables to qualify LP Receiver Enable Control
6	0h RW	**CLN_ENABLE_OVR_SEL:** TX-DFE Clock Lane Enable Override Select Control 1 : Override the Clock Lane Enable from this reg (CLN_ENABL_OVR) 0 : Select the Clock Lane Enable from ORing Data Lane Enable Controls After Override Mux
5:2	0h RW	**DLN_ENABLE_OVR:** TX-DFE Data Lane Enable Control Override Signal DLN_ENABLE_OVR[3:0] DLN_ENABLE_OVR[3] : 1 = Enable the Data Lane-3 ; 0 = Disable Data Lane-3 DLN_ENABLE_OVR[2] : 1 = Enable the Data Lane-2 ; 0 = Disable Data Lane-2 DLN_ENABLE_OVR[1] : 1 = Enable the Data Lane-1 ; 0 = Disable Data Lane-1 DLN_ENABLE_OVR[0] : 1 = Enable the Data Lane-0 ; 0 = Disable Data Lane-0
1	0h RW	**CLN_ENABLE_OVR:** TX-DFE Clock Lane Enable Control Override Signal 1 : Enable the Clock Lane 0 : Disable the Clock Lane [Reset Default]
0	0h RW	**DLN_ENABLE_OVR_SEL:** TX-DFE Data Lane Enable Override Select Control 1 : Override the Data Lane Enable from this reg 0 : Select the Data Lane Enable from PPI or normal TX-DFE control [reset Default]

31.72 TX_DFE_PORT0_RESERVED1 Register (TX_DFE_PORT0_RESERVED1)—Offset 11Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.73 TX_DFX_PORT1_CTL_REG Register (TX_DFX_PORT1_CTL_REG)—Offset 120h

TX DFX Port-1 Level Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**CONTENTION_DETECTION_DATAN:** CD DATA DN: Drive Contention data on LP DN pin from FLIS DFX
16	0h RW	**CONTENTION_DETECTION_DATAP:** CD DATA DP: Drive Contention data on LP DP pin from FLIS DFX
15	0h RW	**CONTENTION_DETECTION_MODE:** CD MODE. Enable Contention Detect Mode in testing
14:11	0h RW	**RESERVED0:** Reserved
10:9	0h RW	**HS_CLK_SEL:** High speed clock select for DFX mode
8:7	0h RW	**HS_DATA_SEL:** High speed data select for DFX mode
6:5	0h RW	**LP_CLK_SEL:** Low power clock select for DFX mode
4:2	0h RW	**LP_DATA_SEL:** Low power data select for DFX mode
1	0h RW	**LP_IO_CONTROL_SELECT:** DFX override for LP TX DATA
0	0h RW	**HS_IO_CONTROL_SELECT:** DFX override for HS TX DATA

31.74 TX_DFX_PORT1_CD_COUNTUP_STATUS Register (TX_DFX_PORT1_CD_COUNTUP_STATUS)—Offset 124h

CD Countup Status

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RESERVED0:** RESERVED
11	0h RO	**LP_CD_D1_0_META_FLOP_CORE:** LPCD High Test Mode Meta flop output This is the LPCD High signal sync'ed with Tx Escape Clock
10	0h RO	**LP_CD_D0_0_META_FLOP_CORE:** LPCD Low Test Mode Meta flop output This is the LPCD Low signal sync'ed with Tx Escape Clock
9:6	0h RO	**ALPCDHIGH_TEST:** LPCD High Test Mode output
5:2	0h RO	**ALPCDLOW_TEST:** LPCD Low Test Mode output

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	**ALPCDHIGH_0:** LPCD contention high
0	0h RO	**ALPCDLOW_0:** LPCD contention low

31.75 TX_DFX_PORT1_RCC_CFG_REG Register (TX_DFX_PORT1_RCC_CFG_REG)—Offset 128h

RCC Config Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED3:** Reserved
17	0h RW	**HS_RCC_TX_START:** HS_RCC_TX_Start
16	0h RW	**HS_RCC_TX_ENABLE:** HS_RCC_TX_Enable
15:12	0h RW	**TEST_DATA_PATTERN:** Test_Data_Pattern
11	0h RW	**RESERVED2:** Reserved
10	0h RW	**RESERVED1:** Reserved
9	0h RW	**RESERVED0:** Reserved
8	0h RW	**FINITE_TEST:** Finite_Test
7:0	0h RW	**MAX_COUNT:** 8-bit max count for test IO TEST ENGINE RCC

31.76 TX_DFX_PORT1_ACIO_CFG_REG Register (TX_DFX_PORT1_ACIO_CFG_REG)—Offset 12Ch

ACIO Loopback Config Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**DATA_MASK:** Data Mask IO TEST ENGINE
27:12	0h RW	**TEST_DATA_PATTERN:** Test Data Pattern IO TEST ENGINE
11	0h RW	**RESERVED2:** Reserved
10	0h RW	**RESERVED1:** Reserved
9	0h RW	**RESERVED0:** Reserved
8	0h RW	**FINITE_TEST:** Finite_Test
7:0	0h RW	**MAX_COUNT:** 8-bit max count for test IO TEST ENGINE

31.77 TX_DFX_PORT1_ACIOSS_REG Register (TX_DFX_PORT1_ACIOSS_REG)—Offset 130h

ACIO Loopback Start and Status Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**RESERVED2:** Reserved
19	0h RW	**LB_FIFO_RST_B:** Resets the loopback FIFO read and write pointers.
18	0h RW	**LP_CDFELB_SEL:** select between low and high contention
17	0h RW	**LP_FELB_SEL:** select between contention and rxpath
16	0h RW	**LP_RXFELB_SEL:** Rx Far End loopback select. At portlevel selects between toggle detector and rx path for lane0
15	0h RW	**RESERVED1:** Reserved
14	0h RW	**PRG_DEL:** prg_del
13	0h RW	**CAL_IOTE_DELA:** cal_iote_dela
12	0h RW	**SYNCFLOPBYPASSMODEEN_N:** Enable to bypass DSI sync flop stage

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**SYNCFLOPBYPASSMODE_CTRL:** Control to allow bypass sync flop enable to pass to AFE and override DSI controller bypass flop muxing enable bit=dpa_mio_portctrl_a[8]
10	0h RW	**SERIALIZER_ENABLE:** This will enable rd_en on TXPORT sync FIFO and will also reset TX sync FIFO
9	0h RW	**RESERVED0:** TXPORT_LOOPBACK, Reserved, MUST be 1'b0 always
8:5	0h RW	**DELAY1:** These bits delay comparison if the received data takes more than the default number of cycles to reach the comparator
4	0h RW	**ACIO_START_A:** Start ACIO Loopback test using IOTE : 0-Stop test, 1-Start test
3	0h RW	**ACIOLB_A_RST:** Reset for cal_iote_del_a
2	0h RW	**LB_FIFO_PTR_SEP:** Loopback FIFO pointer separation between write and read pointers. 0 - read pointer delayed 1 cycle, 1 - read pointer delayed 2 cycles
1	0h RW	**ACIO_MODE_CLN_HSREQ_OVR:** ACIO Mode Clock Lane High Speed Request Override Control. This bit must be set first before setting the Start bits When 1'b0: Functional MODE is selected for CLN_HSREQ When 1'b1: CLN_HSREQ is forced to 1'b1 for ACIO LB operation
0	0h RW	**ACIOLBEN:** AC IO loopback enable --> Connect to Internal ACIO Loopback Enable (sent to AFE to enable loopback circuitry)

31.78 TX_DFX_PORT1_ACIOERR_REG Register (TX_DFX_PORT1_ACIOERR_REG)—Offset 134h

ACIO Loopback Error Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**RESERVED_2:** Reserved
28	0h RO	**IOTE_START_FF:** This bit indicates IOTES ENGINE A has started
27:20	0h RO	**TRANSMIT_DATA:** Generated data from IO Test Engine to check if the IOTE A did indeed start
19:16	0h RO	**DATA_ERROR_RESULT:** Data0_Error_Result from IOTE ENGINE A
15	0h RO	**ACIO_COMPLETE:** This indicates that ACIO loopback test using IOTE Engine A is complete
14:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**MAX_COUNT:** 8-bit max count number when the test is done for IOTE ENGINE A

31.79 TX_DFX_PORT1_DELAY_CALIB_REG Register (TX_DFX_PORT1_DELAY_CALIB_REG)—Offset 138h

Delay Calibration Register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**RESERVED0:** Reserved
4	0h RO	**COMP_STATA:** comp_stata
3:0	0h RO	**CAL_DELAY1:** cal_delay1

31.80 TX_DFX_PORT1_RXLPBK_DATA Register (TX_DFX_PORT1_RXLPBK_DATA)—Offset 13Ch

RX Loopback Data Register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RX_LPBK_DATA1:** rx_lpbk_data1 (CLK A) --> Use SIPO instead of Receiver data

31.81 TX_DFX_PORT1_CLANE_CTL_REG Register (TX_DFX_PORT1_CLANE_CTL_REG)—Offset 140h

TX DFX Clock Lane Control Reg

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**RESERVED0:** Reserved
6:3	0h RW	**TIME_SKEW_ADJUST_CLK:** Lane Timing Skew adjustability between CLK/DATA for DSI with 4-bit control for each lane: ~25ps resolution
2	0h RW	**HS_TX_REGEN_CLK:** DFX override for HS TX REG enable
1	0h RW	**HS_TX_EN_CLK:** DFX override for HS TX enable
0	0h RW	**LP_TX_EN_CLK:** DFX override for LP TX enable

31.82 TX_DFX_PORT1_RESERVED1 Register (TX_DFX_PORT1_RESERVED1)—Offset 144h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.83 TX_DFX_PORT1_RESERVED2 Register (TX_DFX_PORT1_RESERVED2)—Offset 148h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.84 TX_DFX_PORT1_RESERVED3 Register (TX_DFX_PORT1_RESERVED3)—Offset 14Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.85 TX_DFX_PORT1_DLANE0_CTL_REG Register (TX_DFX_PORT1_DLANE0_CTL_REG)—Offset 150h

TX DFX Data Lane-0 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED0:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-0 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**TIME_SKEW_ADJUST_DATA:** Lane 0-3 Timing Skew adjustability between CLK/DATA for DSI with 4-bit control for each lane: ~25ps resolution
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA0 REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA0 enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA0 enable

31.86 TX_DFX_PORT1_DLANE0_STAT_REG Register (TX_DFX_PORT1_DLANE0_STAT_REG)—Offset 154h

TX DFX Data Lane-0 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO0 - Pipe A

31.87 TX_DFX_PORT1_DLANE1_CTL_REG Register (TX_DFX_PORT1_DLANE1_CTL_REG)—Offset 158h

TX DFX Data Lane-1 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-1 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA1 REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA1 enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA1 enable

31.88 TX_DFX_PORT1_DLANE1_STAT_REG Register (TX_DFX_PORT1_DLANE1_STAT_REG)—Offset 15Ch

TX DFX Data Lane-1 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO1 - Pipe A

31.89 TX_DFX_PORT1_DLANE2_CTL_REG Register (TX_DFX_PORT1_DLANE2_CTL_REG)—Offset 160h

TX DFX Data Lane-2 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-2 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA2REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA2enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA2enable

31.90 TX_DFX_PORT1_DLANE2_STAT_REG Register (TX_DFX_PORT1_DLANE2_STAT_REG)—Offset 164h

TX DFX Data Lane-2 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO2 - Pipe A

31.91 TX_DFX_PORT1_DLANE3_CTL_REG Register (TX_DFX_PORT1_DLANE3_CTL_REG)—Offset 168h

TX DFX Data Lane-3 Control Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RW	**RESERVED1:** Reserved
17	0h RW	**LP_RX_EN:** LP RX DATA Lane-3 CNTL TESTMODE. DFX override for LP RX CNTL
16:9	0h RW	**COMP_SEL_OVRD:** (DSI_PIPEA_SIPO0) compare_sel_ovrd: Overriden value for symbol
8	0h RW	**CP_STAT:** (DSI_PIPEA_SIPO0) cp_stat: Enable symbol value from sync_align logic output
7	0h RW	**CP_STAT_OVRD:** (DSI_PIPEA_SIPO0) cp_stat_ovrd: 1 - select overriden value, 0 - select value from sync_align logic
6:3	0h RW	**RESERVED0:** RESERVED
2	0h RW	**HS_TX_REGEN:** DFX override for HS TX DATA3REG enable
1	0h RW	**HS_TX_EN:** DFX override for HS TX DATA3enable
0	0h RW	**LP_TX_EN:** DFX override for LP TX DATA3enable

31.92 TX_DFX_PORT1_DLANE3_STAT_REG Register (TX_DFX_PORT1_DLANE3_STAT_REG)—Offset 16Ch

TX DFX Data Lane-3 Status Reg

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	0h RO	**INTLPBK_COMP_STAT:** Compare status from SIPO3 - Pipe A

31.93 TX_DFX_PORT1_LANE_RESERVED5 Register (TX_DFX_PORT1_LANE_RESERVED5)—Offset 170h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.94 TX_DFX_PORT1_LANE_RESERVED6 Register (TX_DFX_PORT1_LANE_RESERVED6)—Offset 174h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.95 TX_DFX_PORT1_LANE_RESERVED7 Register (TX_DFX_PORT1_LANE_RESERVED7)—Offset 178h

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.96 TX_DFX_PORT1_LANE_RESERVED8 Register (TX_DFX_PORT1_LANE_RESERVED8)—Offset 17Ch

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.97 TX_DFE_PORT1_DLN_CNT_LPX Register (TX_DFE_PORT1_DLN_CNT_LPX)—Offset 180h

lpx count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Ah

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Ah RW	**DLN_CNT_LPX:** period for which a LP state should be driven

31.98 TX_DFE_PORT1_DLN_CNT_HS_PREP Register (TX_DFE_PORT1_DLN_CNT_HS_PREP)—Offset 184h

hs prepare count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	9h RW	**DLN_CNT_HS_PREP:** Period for which HS Prepare time should be accomodated

31.99 TX_DFE_PORT1_DLN_CNT_HS_ZERO Register (TX_DFE_PORT1_DLN_CNT_HS_ZERO)—Offset 188h

hs zero count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 15h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	15h RW	**DLN_CNT_HS_ZERO:** Period for which HS Zero should be driven before sync

31.100 TX_DFE_PORT1_DLN_CNT_HS_TRAIL Register (TX_DFE_PORT1_DLN_CNT_HS_TRAIL)—Offset 18Ch

hs trail count register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Bh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Bh RW	**DLN_CNT_HS_TRAIL:** Period for which HS trailing should be driven

31.101 TX_DFE_PORT1_DLN_CNT_HS_EXIT Register (TX_DFE_PORT1_DLN_CNT_HS_EXIT)—Offset 190h

hs exit count register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**DLN_CNT_HS_EXIT:** Period for which HS exit state should be maintained

31.102 TX_DFE_PORT1_DLN_CNT_RX Register (TX_DFE_PORT1_DLN_CNT_RX)—Offset 194h

rx count register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	1h RW	**DLN_CNT_RX:** Counter that controls the assertion of enable on the DPHY

31.103 TX_DFE_PORT1_DLN_SYNC_CNT Register (TX_DFE_PORT1_DLN_SYNC_CNT)—Offset 198h

sync count register

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	1h RW	**DLN_SYNC_COUNT:** A timeout value used for Sync error detector logic

31.104 TX_DFE_PORT1_CLN_CNT_HS_TRAIL Register (TX_DFE_PORT1_CLN_CNT_HS_TRAIL)—Offset 19Ch

clane trail count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Bh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Bh RW	**CLN_HS_TRAIL:** Wait time in byte clock for the trailing bits

31.105 TX_DFE_PORT1_CLN_CNT_HS_EXIT Register (TX_DFE_PORT1_CLN_CNT_HS_EXIT)—Offset 1A0h

clane exit count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**CLN_HS_EXIT:** Wait time in byte clock for the exit state

31.106 TX_DFE_PORT1_CLN_CNT_LPX Register (TX_DFE_PORT1_CLN_CNT_LPX)—Offset 1A4h

clane lpx count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 9h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	9h RW	**CLN_CNT_LPX:** Wait time in byte clock for the LPX

31.107 TX_DFE_PORT1_CLN_CNT_PREP Register (TX_DFE_PORT1_CLN_CNT_PREP)—Offset 1A8h

clane prepare count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: Eh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	Eh RW	**CLN_CNT_PREP:** Wait time in byte clock for the prepare time

31.108 TX_DFE_PORT1_CLN_CNT_ZERO Register (TX_DFE_PORT1_CLN_CNT_ZERO)—Offset 1ACh

clane zero count

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 32h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	32h RW	**CLN_CNT_ZERO:** Wait time in byte clock for the zero state

31.109 TX_DFE_PORT1_CLN_CNT_PLL Register (TX_DFE_PORT1_CLN_CNT_PLL)—Offset 1B0h

clane PLL count

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RESERVED0:** Reserved
15:0	0h RW	**CLN_CNT_PLL:** Count value used for the PLL lock time

31.110 TX_DFE_PORT1_CLN_CNT_POST Register (TX_DFE_PORT1_CLN_CNT_POST)—Offset 1B4h

clane cnt post

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 12h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** Reserved
7:0	12h RW	**CLN_CNT_POST:** Wait time in byte clock for the zero state

31.111 TX_DFE_PORT1_CLN_DLN_ENABLE_OVR Register (TX_DFE_PORT1_CLN_DLN_ENABLE_OVR)—Offset 1B8h

Clock Lane and Data Lane Enable Override

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**RESERVED0:** RESERVED
7	0h RW	**AFE_LPRX_EN_CNTRL_SEL:** AFE Low Power Receiver Enable Control Select on the functional Path (i.e before the DFX override) 1 : LP Receiver Enable for Lane 0 is always Enable 0 : Use Data Lane Enables to qualify LP Receiver Enable Control
6	0h RW	**CLN_ENABLE_OVR_SEL:** TX-DFE Clock Lane Enable Override Select Control 1 : Override the Clock Lane Enable from this reg (CLN_ENABL_OVR) 0 : Select the Clock Lane Enable from ORing Data Lane Enable Controls After Override Mux
5:2	0h RW	**DLN_ENABLE_OVR:** TX-DFE Data Lane Enable Control Override Signal DLN_ENABLE_OVR[3:0] DLN_ENABLE_OVR[3] : 1 = Enable the Data Lane-3 ; 0 = Disable Data Lane-3 DLN_ENABLE_OVR[2] : 1 = Enable the Data Lane-2 ; 0 = Disable Data Lane-2 DLN_ENABLE_OVR[1] : 1 = Enable the Data Lane-1 ; 0 = Disable Data Lane-1 DLN_ENABLE_OVR[0] : 1 = Enable the Data Lane-0 ; 0 = Disable Data Lane-0
1	0h RW	**CLN_ENABLE_OVR:** TX-DFE Clock Lane Enable Control Override Signal 1 : Enable the Clock Lane 0 : Disable the Clock Lane [Reset Default]
0	0h RW	**DLN_ENABLE_OVR_SEL:** TX-DFE Data Lane Enable Override Select Control 1 : Override the Data Lane Enable from this reg 0 : Select the Data Lane Enable from PPI or normal TX-DFE control [reset Default]

31.112 TX_DFE_PORT1_RESERVED1 Register (TX_DFE_PORT1_RESERVED1)—Offset 1BCh

RESERVED

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RESERVED0:** Reserved for future enhancement

31.113 RX_DWORD5 (rx_dword5)—Offset 4214h/4614h/1A14h/1614h/1214h/614h/614h/1E14h/4E14h/4A14h

RX_DWORD5

Access Method

Type: IO Register

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RW	**RESERVED_0**
25	0h RW	**SKIP_FUSE_PULL:** If set Don t repull fuses on side_rst deassertion
24:18	0h RW	**LJPLL_OUTPUT_RATIO:** Set the output clk ratio
17:16	0h RW	**LJPLL_PVD_RATIO:** Set the post VCO clk divider ratio 001 012 104 118
15:14	0h RW	**LJPLL_REF_RATIO:** Set the refclk ratio 00 refclk 01 refclk/2 10 refclk/4 11refclk/8 set this to 2 b10 for Iunit PLL
13	0h RW	**LJPLL_FORCE_ON:** Force The PLL Enable ON 0NoForce 1 FORCE_ON
12	0h RW	**LJPLL_FORCE_OFF:** Force The PLL Enable OFF 0 NoForce 1 FORCE_OFF
11:10	0h RW	**SEL_MIPICLK_C:** Select DSI Clk 00 default 018x 1016x/3 114x don t care for other PLLs
9:8	0h RW	**SEL_MIPICLK_A:** Select DSI Clk 00default 018x 1016x/3 114x don t care for other PLLs
7:0	41h RW	**LJPLL_FB_RATIO:** Set the feedback ratio

32.2 LJPLL_RW_CONTROL_1 (LJPLL_CR_RW_CONTROL_1)—Offset 10h

LJPLL CR

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**PLL_RATIO_FRAC:** Clock Bending: fractional frequency multiplier; shift PLL clock frequency by (value/2^24)*refclk frequency. eg 0x200000 = (2097152/2^24) * refclk freq = 0.125*19.2 = 2.4MHz
7:2	0h RW	**SPARE:** Spare CR
1	0h RW	**SSC_EN_OVRD:** Override the fuse/tap value for SSC enable
0	0h RW	**SSC_EN:** Spread Spectrum Clocking: spread enable; 0x0=no frequency spreading; 0x1=enable frequency spreading on PLL output clock; This enable is not default and needs to be set along with SSC_EN_OVRD to take effect

32.3 LJPLL_RW_CONTROL_2 (LJPLL_CR_RW_CONTROL_2)—Offset 14h

LJPLL CR

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**SSC_FRAC_STEP:** Spread Spectrum Clocking: fractional step configuration; fraction of PLL ratio at which to take frequency modulation steps. eg 0x200000 = (2097152/2^20) * refclk freq = 0.125*19.2 = 2.4MHz steps. Spread magnitude is determined by the step size multiplied by the number of steps in the modulation period (see ssc_cyc_to_peak_m1 for steps per modulation period).
11	0h RW	**SPARE:** Spare CR
10:9	0h RW	**SSC_MODE:** Spread Spectrum Clocking: spread direction select; 0x0 = down-spread only; 0x1 = up-spread only; 0x2 = center spread, start with down-spread; 0x3 = center spread, start with up-spread
8:0	0h RW	**SSC_CYC_TO_PEAK_M1:** Spread Spectrum Clocking: spread period configuration; half the number of steps in the modulation period minus 1. Period of modulation is 2*(value+1) multiplied by the step duration (PLL refclk period). eg 0x12B = 2*(299+1) * (1/19.2MHz) = 600 * 52.083ns = 31.25us. Spread magnitude is determined by the step size (integer + fractional) multiplied by the number of steps in the modulation period (see ssc_frac_step and ssc_ratio_step for step

32.4 depll_cp (depll_cp)—Offset 20h

Policy DEPLL_POLICY_GROUP CP Register

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 40001200215h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200215h RW	**sai**

32.5 depll_rac (depll_rac)—Offset 28h

Policy DEPLL_POLICY_GROUP RAC Register

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 40001200215h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200215h RW	**sai**

32.6 depll_wac (depll_wac)—Offset 30h

Policy DEPLL_POLICY_GROUP WAC Register

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 40001200215h

Bit Range	Default & Access	Field Name (ID): Description
63:0	40001200215h RW	**sai**

32.7 MCHBAR_LSB (GFXVTDBAR_LSB)—Offset 6C88h

This is the base address for the Graphics VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset, the GFX-VT configuration space is disabled and must be enabled by writing a 1 to GFX-VTBAREN. All the bits in this register are locked in Intel TXT mode. BIOS programs this register after which the register cannot be altered. This register is only written via an SAI protected IOSF SB shadow access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**GFXVTBAR (GFXVTBAR):** This field corresponds to bits 38 to 12 of the base address GFX-VT configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFX-VT register set. All the Bits in this register are locked in Intel TXT mode.
11:2	0h RSV	**RESERVED (RSVD_0):** Reserved
1	0h RW	**SPARE (SPARE):** Was lock bit prior to Gen10
0	0h RW/V	**GFXVTBAREN (GFXVTBAREN):** 0: GFX-VTBAR is disabled and does not claim any memory. 1: GFX-VTBAR memory mapped accesses are claimed and decoded appropriately This bit will remain 0 if VTd capability is disabled.

32.8 MCHBAR_MSB (GFXVTDBAR_MSB)—Offset 6C8Ch

This is the base address for the Graphics VT configuration space. There is no physical memory within this 4KB window that can be addressed. The 4KB reserved by this register does not alias to any PCI 2.3 compliant memory mapped space. On reset, the GFX-VT configuration space is disabled and must be enabled by writing a 1 to GFX-VTBAREN. All the bits in this register are locked in Intel TXT mode. BIOS programs this register after which the register cannot be altered. This register is only written via an SAI protected IOSF SB shadow access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GFXVTBAR (GFXVTBAR):** This field corresponds to bits63 to 12 of the base address GFX-VT configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the GFX-VT register set. All the Bits in this register are locked in Intel TXT mode.

32.9 Fuse Status (FUSE_STATUS)—Offset 42000h

This register is on the ungated clock and the chip reset, not the FLR or display debug reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**FUSE DOWNLOAD STATUS (Fuse_Download_Status):** This field indicates the status of fuse and strap download to the Display Engine. After fuse and strap download, fuses will be distributed within the Display Engine.
30:28	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Fuse Status' does not have a description in the BXML
27	0h RO	**FUSE PG0 DISTRIBUTION STATUS (Fuse_PG0_Distribution_Status):** This field indicates the status of fuse distribution to power well #0.
26	0h RO	**FUSE PG1 DISTRIBUTION STATUS (Fuse_PG1_Distribution_Status):** This field indicates the status of fuse distribution to power well #1.
25	0h RO	**FUSE PG2 DISTRIBUTION STATUS (Fuse_PG2_Distribution_Status):** This field indicates the status of fuse distribution to power well #2.
24:0	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Fuse Status' does not have a description in the BXML

32.10 Display Engine Power 1 (DE_POWER1)—Offset 42400h

The register 'Display Engine Power 1' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**POWER WELL 2 STATE (Power_Well_2_State):** This field indicates the status of display power well 2.
30	0h RO	**DISPLAY PIPES ENABLED (Display_Pipes_Enabled):** This field indicates if any display pipes are enabled.
29	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Display Engine Power 1' does not have a description in the BXML
28	0h RO	**POWER WELL 1 STATE (Power_Well_1_State):** This field indicates the status of display power well 1.
27:26	0h RO	**SRD STATUS (SRD_Status):** This field indicates the live status of the SRD link on eDP DDI-A.
25	0h RO	**KVM SESSION STATUS (KVM_Session_Status):** This field indicates the status of KVM session.
24:13	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Display Engine Power 1' does not have a description in the BXML
12:10	0h RO	**ENABLED PIPE SCALERS (Enabled_Pipe_Scalers):** Indicates total usage of the EBBs.

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'Display Engine Power 1' does not have a description in the BXML
7:4	0h RO	**TRANSMIT LANES ENABLED (Transmit_Lanes_Enabled):** The total number of DDI lanes enabled.
3	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'Display Engine Power 1' does not have a description in the BXML
2:0	0h RO	**ENABLED DPLLS (Enabled_DPLLs):** The total number of Display PLLs enabled.

32.11 Display Engine Power 2 (DE_POWER2)—Offset 42404h

The register 'Display Engine Power 2' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DE BANDWIDTH COUNTER (DE_bandwidth_counter):** This counter increments on every cache line put arriving at the DE. The bandwidth is estimated by taking the difference between two reads at a known interval. Access is actually a read/write variant. Writes to this register will load the write data into the counter. The GDR_DFT register Hold_DE_POWER2 bit can be set to stop the count from incrementing.

32.12 Master Interrupt Control (MASTER_INT_CTL)—Offset 44200h

This register has the master enable for graphics interrupts and gives an overview of what interrupts are pending. An interrupt pending bit will read 1b while one or more interrupts of that category are set (IIR) and enabled (IER). All Pending Interrupts are ORed together to generate the combined interrupt. The combined interrupt is ANDed with the Master Interrupt enable to create the master enabled interrupt. The master enabled interrupt goes to PCI device 2 interrupt processing. The master interrupt enable must be set before any of these interrupts will propagate to PCI device 2 interrupt processing.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MASTER INTERRUPT ENABLE (Master_Interrupt_Enable):** This is the master control for graphics interrupts. This must be enabled for any of these interrupts to propagate to PCI device 2 interrupt processing.
30	0h RO	**PCU INTERRUPTS PENDING (PCU_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
29:25	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Master Interrupt Control' does not have a description in the BXML
24	0h RO	**AUDIO CODEC INTERRUPTS PENDING (Audio_Codec_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
23	0h RO	**DE PCH INTERRUPTS PENDING (DE_PCH_Interrupts_Pending):** This field indicates if interrupts of this category are pending. The PCH Display interrupt is configured through the SDE interrupt registers.
22	0h RO	**DE MISC INTERRUPTS PENDING (DE_Misc_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
21	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Master Interrupt Control' does not have a description in the BXML
20	0h RO	**DE PORT INTERRUPTS PENDING (DE_Port_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
19	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'Master Interrupt Control' does not have a description in the BXML
18	0h RO	**DE PIPE C INTERRUPTS PENDING (DE_Pipe_C_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
17	0h RO	**DE PIPE B INTERRUPTS PENDING (DE_Pipe_B_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
16	0h RO	**DE PIPE A INTERRUPTS PENDING (DE_Pipe_A_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'Master Interrupt Control' does not have a description in the BXML
7	0h RO	**WDBOX OR OACS INTERRUPTS PENDING (WDBox_or_OACS_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
6	0h RO	**VEBOX INTERRUPTS PENDING (VEBox_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
5	0h RO	Reserved.
4	0h RO	**GTPM INTERRUPTS PENDING (GTPM_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
3	0h RO	**VCS2 INTERRUPTS PENDING (VCS2_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
2	0h RO	**VCS1 INTERRUPTS PENDING (VCS1_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
1	0h RO	**BLITTER INTERRUPTS PENDING (Blitter_Interrupts_Pending):** This field indicates if interrupts of this category are pending.
0	0h RO	**RENDER INTERRUPTS PENDING (Render_Interrupts_Pending):** This field indicates if interrupts of this category are pending.

32.13 GT 0 Interrupts 0 (GT_0_INTERRUPT_0)—Offset 44300h

This table indicates which events are mapped to each bit of the GT Interrupt 0 registers. Bits 15:0 are used for Render CS. Bits 31:16 are used for Blitter CS. The IER enabled Render Interrupt IIR (sticky) bits are ORed together to generate the Render Interrupts Pending bit in the Master Interrupt Control register. The IER enabled Blitter Interrupt IIR (sticky) bits are ORed together to generate the Blitter Interrupts Pending bit in the Master Interrupt Control register. 0x44300 = ISR 0x44304 = IMR 0x44308 = IIR 0x4430C = IER

24	0h RO	**MIPI C TE (MIPI_C_TE):** The ISR is an active high level indicating a TE interrupt is set in MIPIC_STATUS.
23	0h RO	**MIPI A TE (MIPI_A_TE):** The ISR is an active high level indicating a TE interrupt is set in MIPIA_STATUS.
22:12	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Display Engine Port Interrupts 0' does not have a description in the BXML
11:10	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'Display Engine Port Interrupts 0' does not have a description in the BXML
9	0h RO	**SCDC READ REQUEST INTERRUPT - PORT C (SCDC_Read_Request_Interrupt__Port_C):** The IIR is set when a HDMI 2.0 SCDC read request event is detected and is cleared by writing a '1' to this bit. The ISR is active high level signal that will indicate if the read request (RR) is still active.
8	0h RO	**SCDC READ REQUEST INTERRUPT - PORT B (SCDC_Read_Request_Interrupt__Port_B):** The IIR is set when a HDMI 2.0 SCDC read request event is detected and is cleared by writing a '1' to this bit. The ISR is active high level signal that will indicate if the read request (RR) is still active.
7:6	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'Display Engine Port Interrupts 0' does not have a description in the BXML
5	0h RO	**DDI C HOTPLUG (DDI_C_Hotplug):** The ISR gives the live state of the DDI HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled. This field is unused in projects that have a PCH.
4	0h RO	**DDI B HOTPLUG (DDI_B_Hotplug):** The ISR gives the live state of the DDI HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled. This field is unused in projects that have a PCH.
3	0h RO	**DDI A HOTPLUG (DDI_A_Hotplug):** The ISR gives the live state of the DDI HPD pin when the HPD input is enabled. The IIR is set if a short or long pulse is detected when HPD input is enabled. This field is unused in projects that have a PCH.
2	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'Display Engine Port Interrupts 0' does not have a description in the BXML
1	0h RO	**GMBUS (GMbus):** The ISR is an active high pulse when any of the unmasked events in GMBUS4 Interrupt Mask register occur. This field is only used on projects that have GMBUS integrated into the north display. Projects that have GMBUS in the south display have the GMBUS interrupt in the south display interrupts.
0	0h RO	**AUX_CHANNEL_A (AUX_Channel_A):** The ISR is an active high pulse on the AUX DDI A done event. This event will not occur for SRD AUX done.

32.30 Display Engine Port Interrupts 1 (DE_PORT_INTERRUPT_1)—Offset 44444h

This table indicates which events are mapped to each bit of the Display Engine Port Interrupt registers. 0x44440 = ISR 0x44444 = IMR 0x44448 = IIR 0x4444C = IER

Access Method

32.36 PCU Interrupts 3 (PCU_INTERRUPT_3)—Offset 444ECh

This table indicates which events are mapped to each bit of the PCU Interrupt registers. 0x444E0 = ISR 0x444E4 = IMR 0x444E8 = IIR 0x444EC = IER

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDIA DC9 HPD (DDIA_DC9_HPD):** This field indicates DDIA hotplug activity was detected during DC9.
30	0h RW	**DDIB DC9 HPD (DDIB_DC9_HPD):** This field indicates DDIB hotplug activity was detected during DC9.
29	0h RW	**DDIC DC9 HPD (DDIC_DC9_HPD):** This field indicates DDIC hotplug activity was detected during DC9.
28:26	0h RW	**UNUSED_INT_28_26 (Unused_Int_28_26):** These interrupts are currently unused.
25	0h RW	**PCU_PCODE2DRIVER_MAILBOX_EVENT (PCU_Pcode2driver_Mailbox_Event):** The field 'PCU_Pcode2driver_Mailbox_Event' in register 'PCU Interrupts 3' does not have a description in the BXML
24	0h RW	**PCU_THERMAL_EVENT (PCU_Thermal_Event):** The field 'PCU_Thermal_Event' in register 'PCU Interrupts 3' does not have a description in the BXML
23:0	0h RW	**UNUSED_INT_23_0 (Unused_Int_23_0):** These interrupts are currently unused.

32.37 Display C State Enable (DC_STATE_EN)—Offset 45504h

The register 'Display C State Enable' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MODE SET IN PROGRESS (MODE_SET_in_Progress):** This bit indicates that Mode set is in progress and DCPR will not generate any CSR_Start to DMC when set. Software needs to program this bit when mode set is started and software should reset it when mode set is done.
30:10	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Display C State Enable' does not have a description in the BXML
9	0h RW	**IN CSR FLOW (In_CSR_Flow):** Restriction : This field is used for hardware communication. Software must not change this field.
8	0h RW	**BLOCK OUTBOUND TRAFFIC (Block_Outbound_Traffic):** Access is read/write, but hardware can also clear the value based on the PM Request. Restriction : This field is used for hardware communication. Software must not change this field.
7:5	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Display C State Enable' does not have a description in the BXML
4	0h RW	**MASK POKE (Mask_Poke):** This field masks the poke signal that would otherwise be generated by a write to the DC_STATE_SEL register. Restriction : This field is used for hardware communication. Software must not change this field.
3	0h RW	**DC9 ALLOW (DC9_Allow):** This field indicates software allows Display C9. When allowed, the PCU can save the display PCI Config context and power down display
2	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'Display C State Enable' does not have a description in the BXML
1:0	0h RW	**DYNAMIC DC STATE ENABLE (Dynamic_DC_State_Enable):** This field enables hardware to dynamically enter and exit Display C states. Restriction : The Display CSR code must be loaded before this field is enabled.

32.38 CD Clock Control (CDCLK_CTL)—Offset 46000h

This register is not reset by the device 2 FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 13Bh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'CD Clock Control' does not have a description in the BXML
23:22	0h RW	**DE CD2X DIVIDER SELECT (DE_CD2X_Divider_Select):** This field selects how the DE PLL CD2X clock output is divided before driving the display CD2X clock. This field is double buffered to align with the pipe from DE CD2X Pipe Select. It will update at the start of vertical blank of the selected pipe, or immediately if the selected pipe is disabled or no pipe is selected. Restriction : DE CD2X Divider Select must not be changed while more than one pipe is enabled. When one pipe is enabled, the DE CD2X Pipe Select must be set to that pipe before changing DE CD2X Divider Select.

Bit Range	Default & Access	Field Name (ID): Description
21:20	0h RW	**DE CD2X PIPE SELECT (DE_CD2X_Pipe_Select):** This field selects the pipe enable and vertical blank to be used for double buffering the DE CD2X Divider Select and SSA Precharge Enable.
19:18	0h RO	Reserved.
17	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'CD Clock Control' does not have a description in the BXML
16	0h RW	**SSA PRECHARGE ENABLE (SSA_Precharge_Enable):** This field enables the Low Speed Small Signal Array Pre-charge. This field is double buffered to align with the pipe from DE CD2X Pipe Select. It will update at the start of vertical blank of the selected pipe, or immediately if the selected pipe is disabled or no pipe is selected. Restriction : This field must be disabled when CD clock frequency is < 500 MHz and enabled when CD clock frequency is >= 500 MHz. This field must not be changed while more than one pipe is enabled. When one pipe is enabled, the DE CD2X Pipe Select must be set to that pipe before changing DE CD2X Divider Select.
15	0h RO	Reserved.
14:11	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'CD Clock Control' does not have a description in the BXML
10:0	13Bh RW	**CD FREQUENCY DECIMAL (CD_Frequency_Decimal):** This field selects the decimal value of the frequency for CD clock, which is used to generate divided down clocks for some display engine timers. This value is represented in a 10.1 format with 10 integer bits and 1 fractional bit. Program this field to match the CD frequency chosen by the DE PLL and CD2X Divider, minus one. Used for Aux channel and GMBUS.

32.39 North Display Reset Warn Options (NDE_RSTWRN_OPT)—Offset 46408h

This register is used to control the display behavior on receiving a Reset Warning.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'North Display Reset Warn Options' does not have a description in the BXML
6	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'North Display Reset Warn Options' does not have a description in the BXML
5	0h RO	Reserved.
4	0h RW	**RST PCH HANDSHAKE EN (RST_PCH_Handshake_En):** This field enables the handshake with PCH display when processing the reset. This applies to all types of DE resets. By default it is disabled and the north display will not wait for south display to acknowledge the reset. This must be set to 1b as part of the display initialization sequence.
3:0	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'North Display Reset Warn Options' does not have a description in the BXML

32.40 Software Flags 0 (SWF_0)—Offset 4F000h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.41 Software Flags 1 (SWF_1)—Offset 4F004h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.42 Software Flags 2 (SWF_2)—Offset 4F008h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.43 Software Flags 3 (SWF_3)—Offset 4F00Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.44 Software Flags 4 (SWF_4)—Offset 4F010h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.45 Software Flags 5 (SWF_5)—Offset 4F014h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.46 Software Flags 6 (SWF_6)—Offset 4F018h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.47 Software Flags 7 (SWF_7)—Offset 4F01Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.48 Software Flags 8 (SWF_8)—Offset 4F020h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.49 Software Flags 9 (SWF_9)—Offset 4F024h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.50 Software Flags 10 (SWF_10)—Offset 4F028h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.51 Software Flags 11 (SWF_11)—Offset 4F02Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.52 Software Flags 12 (SWF_12)—Offset 4F030h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.53 Software Flags 13 (SWF_13)—Offset 4F034h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.54 Software Flags 14 (SWF_14)—Offset 4F038h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.55 Software Flags 15 (SWF_15)—Offset 4F03Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.56 Software Flags 16 (SWF_16)—Offset 4F040h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.57 Software Flags 17 (SWF_17)—Offset 4F044h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.58 Software Flags 18 (SWF_18)—Offset 4F048h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.59 Software Flags 19 (SWF_19)—Offset 4F04Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.60 Software Flags 20 (SWF_20)—Offset 4F050h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.61 Software Flags 21 (SWF_21)—Offset 4F054h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.62 Software Flags 22 (SWF_22)—Offset 4F058h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.63 Software Flags 23 (SWF_23)—Offset 4F05Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.64 Software Flags 24 (SWF_24)—Offset 4F060h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.65 Software Flags 25 (SWF_25)—Offset 4F064h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.66 Software Flags 26 (SWF_26)—Offset 4F068h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.67 Software Flags 27 (SWF_27)—Offset 4F06Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.68 Software Flags 28 (SWF_28)—Offset 4F070h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.69 Software Flags 29 (SWF_29)—Offset 4F074h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.70 Software Flags 30 (SWF_30)—Offset 4F078h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.71 Software Flags 31 (SWF_31)—Offset 4F07Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.72 Software Flags 32 (SWF_32)—Offset 4F080h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.73 Software Flags 33 (SWF_33)—Offset 4F084h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.74 Software Flags 34 (SWF_34)—Offset 4F088h

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.75 Software Flags 35 (SWF_35)—Offset 4F08Ch

These registers are used as scratch pad data storage space and have no direct effect on hardware operation. There are 36 instances of this register format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SOFTWARE FLAGS (Software_Flags):** Software flags

32.76 Display Fuse (DFSM)—Offset 51000h

This register contains fuse and strap settings for display. This register is not reset by a debug reset or FLR. Access is RO_FW. Only writes from the correct source will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: B00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**SPARE 31 (Spare_31):** The field 'Spare 31' in register 'Display Fuse' does not have a description in the BXML
30	0h RW	**DISPLAY PIPEA DISABLE (Display_PipeA_Disable):** This bit indicates whether the display pipe A (first pipe) capability is disabled. When the fuse is set, display hardware will override the pipe A output to a solid color.
29	0h RO	Reserved.
28	0h RW	**DISPLAY PIPEC DISABLE (Display_PipeC_Disable):** This bit indicates whether the display pipe C (third pipe) capability is disabled. When the fuse is set, display hardware will override the pipe C output to a solid color.
27	0h RW	**DISPLAY PM DISABLE (Display_PM_Disable):** This bit indicates whether the display power management FBC and DPST capabilities are disabled. When disabled, display hardware will prevent the FBC enable and DPST image enhancement enable register bits from being set to 1b.
26	0h RW	**DISPLAY EDP DISABLE (Display_eDP_Disable):** This bit indicates whether the display embedded DisplayPort eDP DDIA capability is disabled. When disabled, display hardware will prevent the eDP DDIA enable register bit from being set to 1b and mask the eDP DDIA present strap.
25	0h RO	Reserved.
24	0h RW	**SPARE 24 (Spare_24):** The field 'Spare 24' in register 'Display Fuse' does not have a description in the BXML
23	0h RW	**SPARE 23 (Spare_23):** The field 'Spare 23' in register 'Display Fuse' does not have a description in the BXML
22	0h RW	**SPARE 22 (Spare_22):** The field 'Spare 22' in register 'Display Fuse' does not have a description in the BXML
21	0h RW	**DISPLAY PIPEB DISABLE (Display_PipeB_Disable):** This bit indicates whether the display pipe B (second pipe) capability is disabled. When the fuse is set, display hardware will override the pipe B output to a solid color.
20	0h RW	**DISPLAY WD DISABLE (Display_WD_Disable):** This bit indicates whether the display WD Video capability is disabled. When disabled, display hardware will prevent the pipe WD Video function enable register bit from being set to 1b. WD audio is not impacted by this fuse.
19	0h RW	**SPARE 19 (Spare_19)**
18	0h RW	**SPARE 18 (Spare_18):** The field 'Spare 18' in register 'Display Fuse' does not have a description in the BXML
17	0h RW	**SPARE 17 (Spare_17):** The field 'Spare 17' in register 'Display Fuse' does not have a description in the BXML

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**ISOLATED DECODE DISABLE (Isolated_Decode_Disable):** This field indicates whether the Isolated Decode feature is disabled.
15:8	Bh RW	**AUDIO CODEC ID (Audio_Codec_ID):** This field indicates the lower 8 bits of the audio codec device ID.
7	0h RW	**DISPLAY DSC DISABLE (Display_DSC_Disable):** This field indicates whether the DSC (MIPI DSI and eDP compression) feature is disabled.
6	0h RW	**DISPLAY RSB ENABLE (Display_RSB_Enable):** This bit indicates whether the remote screen blanking feature is enabled in the display engine. When disabled, display hardware will prevent the remote screen blanking from being enabled.
5	0h RW	**SPARE 5 (Spare_5):** The field 'Spare 5' in register 'Display Fuse' does not have a description in the BXML
4	0h RW	**SPARE 4 (Spare_4):** The field 'Spare 4' in register 'Display Fuse' does not have a description in the BXML
3	0h RW	**SPARE 3 (Spare_3):** The field 'Spare 3' in register 'Display Fuse' does not have a description in the BXML
2	0h RW	**SPARE 2 (Spare_2):** The field 'Spare 2' in register 'Display Fuse' does not have a description in the BXML
1	0h RO	Reserved.
0	0h RW	**DISPLAY AUDIO CODEC DISABLE (Display_Audio_Codec_Disable):** This bit indicates whether the display audio codec capability is disabled. When disabled, display hardware will prevent the audio codec enable register bit from being set to 1b.

32.77 Display Strap State (DSSM)—Offset 51004h

This register contains fuse and strap settings for display. This register is not reset by a debug reset or FLR. Access is RO_FW. Only writes from cfgspace 0x11111 and srcID 0x10 will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**REFERENCE FREQUENCY (Reference_Frequency):** This bit indicates the reference clock frequency. Software should use this value when programming the display clocks.
30	0h RW	**SPARE 30 (Spare_30):** The field 'Spare 30' in register 'Display Strap State' does not have a description in the BXML
29	0h RW	**SPARE 29 (Spare_29):** The field 'Spare 29' in register 'Display Strap State' does not have a description in the BXML
28	0h RW	**SPARE 28 (Spare_28):** The field 'Spare 28' in register 'Display Strap State' does not have a description in the BXML
27	0h RW	**SPARE 27 (Spare_27):** The field 'Spare 27' in register 'Display Strap State' does not have a description in the BXML

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**SPARE 26 (Spare_26):** The field 'Spare 26' in register 'Display Strap State' does not have a description in the BXML
25	0h RW	**SPARE 25 (Spare_25):** The field 'Spare 25' in register 'Display Strap State' does not have a description in the BXML
24	0h RW	**SPARE 24 (Spare_24):** The field 'Spare 24' in register 'Display Strap State' does not have a description in the BXML
23	0h RW	**SPARE 23 (Spare_23):** The field 'Spare 23' in register 'Display Strap State' does not have a description in the BXML
22	0h RW	**SPARE 22 (Spare_22):** The field 'Spare 22' in register 'Display Strap State' does not have a description in the BXML
21	0h RW	**SPARE 21 (Spare_21):** The field 'Spare 21' in register 'Display Strap State' does not have a description in the BXML
20	0h RW	**SPARE 20 (Spare_20):** The field 'Spare 20' in register 'Display Strap State' does not have a description in the BXML
19	0h RW	**SPARE 19 (Spare_19):** The field 'Spare 19' in register 'Display Strap State' does not have a description in the BXML
18	0h RW	**SPARE 18 (Spare_18):** The field 'Spare 18' in register 'Display Strap State' does not have a description in the BXML
17	0h RW	**SPARE 17 (Spare_17):** The field 'Spare 17' in register 'Display Strap State' does not have a description in the BXML
16	0h RW	**SPARE 16 (Spare_16):** The field 'Spare 16' in register 'Display Strap State' does not have a description in the BXML
15	0h RW	**SPARE 15 (Spare_15):** The field 'Spare 15' in register 'Display Strap State' does not have a description in the BXML
14	0h RW	**SPARE 14 (Spare_14):** The field 'Spare 14' in register 'Display Strap State' does not have a description in the BXML
13	0h RW	**SPARE 13 (Spare_13):** The field 'Spare 13' in register 'Display Strap State' does not have a description in the BXML
12	0h RW	**SPARE 12 (Spare_12):** The field 'Spare 12' in register 'Display Strap State' does not have a description in the BXML
11	0h RW	**SPARE 11 (Spare_11):** The field 'Spare 11' in register 'Display Strap State' does not have a description in the BXML
10	0h RW	**SPARE 10 (Spare_10):** The field 'Spare 10' in register 'Display Strap State' does not have a description in the BXML
9	0h RW	**SPARE 9 (Spare_9):** The field 'Spare 9' in register 'Display Strap State' does not have a description in the BXML
8	0h RW	**SPARE 8 (Spare_8):** The field 'Spare 8' in register 'Display Strap State' does not have a description in the BXML
7	0h RW	**SPARE 7 (Spare_7):** The field 'Spare 7' in register 'Display Strap State' does not have a description in the BXML
6	0h RW	**SPARE 6 (Spare_6):** The field 'Spare 6' in register 'Display Strap State' does not have a description in the BXML
5	0h RW	**SPARE 5 (Spare_5):** The field 'Spare 5' in register 'Display Strap State' does not have a description in the BXML
4	0h RW	**SPARE 4 (Spare_4):** The field 'Spare 4' in register 'Display Strap State' does not have a description in the BXML
3	0h RW	**SPARE 3 (Spare_3):** The field 'Spare 3' in register 'Display Strap State' does not have a description in the BXML

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SPARE 2 (Spare_2):** The field 'Spare 2' in register 'Display Strap State' does not have a description in the BXML
1	0h RW	**PART IS SOC (Part_Is_SOC):** This field specifies whether this part is a SoC or not.
0	0h RW	**DISPLAYPORT A PRESENT (DisplayPort_A_Present):** This bit specifies whether the port was present during initalization. This strap state can also be read in the DDI_BUF_CTL_A 0x64000 register bit 0. There are no port presence straps on Broxton. Software should use alternate means to determine port presence. Workaround : The strap is not connected on the A steppings.

32.78 Display Fuse Done (DFSDONE)—Offset 51080h

This register is not reset by a debug reset or FLR. Access is RO_FW. Only writes from PCU (cfgspace 0x11111 and srcID 0x10) to Display on the message channel will update the register value. Writes from other sources will complete normally without updating the value. Any source can read the register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Display Fuse Done' does not have a description in the BXML
0	0h RW	**DOWNLOAD DONE (Download_Done):** This field indicates when fuse download is complete.

32.79 DDI A Buffer Control (DDI_BUF_CTL_A)—Offset 64000h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI A Buffer Control' does not have a description in the BXML

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside lnik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI A Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI A Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI A Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI A Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.80 DDI B Buffer Control (DDI_BUF_CTL_B)—Offset 64100h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI B Buffer Control' does not have a description in the BXML
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside lnik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI B Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI B Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI B Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI B Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.81 DDI C Buffer Control (DDI_BUF_CTL_C)—Offset 64200h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI C Buffer Control' does not have a description in the BXML
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside lnik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI C Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI C Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI C Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI C Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.82 DDI D Buffer Control (DDI_BUF_CTL_D)—Offset 64300h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI D Buffer Control' does not have a description in the BXML
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside lnik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI D Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI D Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI D Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI D Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.83 DDI E Buffer Control (DDI_BUF_CTL_E)—Offset 64400h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI E Buffer Control' does not have a description in the BXML
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside Inik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI E Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI E Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI E Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI E Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.

Bit Range	Default & Access	Field Name (ID): Description
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.84 DDI F Buffer Control (DDI_BUF_CTL_F)—Offset 64500h

There is one DDI Buffer Control per each DDI A/B/C/D/E/F. Do not read or write the register when the associated power well is disabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DDI BUFFER ENABLE (DDI_Buffer_Enable):** This bit enables the DDI buffer.
30	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'DDI F Buffer Control' does not have a description in the BXML
29	0h RW	**OVERRIDE TRAINING ENABLE (Override_Training_Enable):** This field enables the override on the training enable signal that tells the DDI I/O to pick up any DDI voltage swing and pre-emphasis changes.
28	0h RW	**PHY PARAM ADJUST (Phy_Param_Adjust):** Enables adjustment of Phy parameters such as voltage swing and pre emphasis outside lnik training process. This field is conditioned on 'override training enable' (DDI_BUF_CTL[29]).
27:24	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'DDI F Buffer Control' does not have a description in the BXML
23:17	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'DDI F Buffer Control' does not have a description in the BXML
16	0h RW	**PORT REVERSAL (Port_Reversal):** This field enables lane reversal within the port. Lane reversal swaps the data on the lanes as they are output from the port. DDI B, C, D, and F reversal always swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. If DDIA Lane Capability Control selects DDIA x2, then DDI A reversal swaps the two lanes, so lane 0 is swapped with lane 1. If DDIA Lane Capability Control selects DDIA x4, then DDI A reversal swaps the four lanes, so lane 0 is swapped with lane 3, and lane 1 is swapped with lane 2. Restriction : This field must not be changed while the DDI is enabled. DDI E does not support reversal.
15:8	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'DDI F Buffer Control' does not have a description in the BXML
7	0h RO	**DDI IDLE STATUS (DDI_Idle_Status):** This bit indicates when the DDI buffer is idle.

Bit Range	Default & Access	Field Name (ID): Description
6:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'DDI F Buffer Control' does not have a description in the BXML
4	0h RW	**DDIA LANE CAPABILITY CONTROL (DDIA_Lane_Capability_Control):** This bit selects how lanes are shared between DDI A and DDI E. This field is only used in the DDI A instance of this register. See the DDI A and DDI E lane mapping table in the Introduction section. Restriction : This field must be programmed at system boot based on board configuration and may not be changed afterwards. Restriction : DDI A x2 (DDI A x2 + DDI E x2) selection is not valid on boards that use DDI F.
3:1	0h RW	**DP PORT WIDTH SELECTION (DP_Port_Width_Selection):** This bit selects the number of lanes to be enabled on the DDI link for DisplayPort. This field is ignored for HDMI and DVI which always use all 4 lanes. Restriction : When in DisplayPort mode the value selected here must match the value selected in the DDI Buffer Control register for the DDI attached to this pipe. Restriction : This field must not be changed while the DDI is enabled. DDI E only supports x1 and x2 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x2, otherwise DDI E is not supported. DDI A (EDP) supports x1, x2, and x4 when DDI_BUF_CTL_A DDIA Lane Capability Control is set to DDIA x4, otherwise DDI A only supports x1 and x2.
0	0h RO	**INIT DISPLAY DETECTED (Init_Display_Detected):** Strap indicating whether a display was detected on this port during initialization. It signifies the level of the port detect pin at boot. This bit is only informative. It does not prevent this port from being enabled in hardware. This field only indicates the DDIA detection. Detection for other ports is read from SFUSE_STRAP.

32.85 Hot Plug Control (HOTPLUG_CTL)—Offset C4030h

Hot plug detect (HPD) is used for notification of plug, unplug, and other sink events. The short pulse durations are programmed in HPD_PULSE_CNT. The hotplug ISR gives the live states of the HPD pins.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
28	0h RW	**DDI A HPD INPUT ENABLE (DDI_A_HPD_Input_Enable):** This field enables the HPD buffer for digital port A.
27	0h RW	**DDI A HPD INVERT (DDI_A_HPD_Invert):** This field inverts the HPD sense for digital port A.
26	0h RSV	**RESERVED (Reserved_1):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
25:24	0h RW/C	**DDI A HPD STATUS (DDI_A_HPD_Status):** This field indicates the hot plug detect status on port A. When HPD input is enabled and either a long or short pulse is detected, one of these bits will set and the hotplug IIR will be set (if unmasked in the IMR). These are sticky bits, cleared by writing 1s to both of them.
23:13	0h RSV	**RESERVED (Reserved_2):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
12	0h RW	**DDI C HPD INPUT ENABLE (DDI_C_HPD_Input_Enable):** This field enables the HPD buffer for digital port C.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**DDI C HPD INVERT (DDI_C_HPD_Invert):** This field inverts the HPD sense for digital port C.
10	0h RSV	**RESERVED (Reserved_3):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
9:8	0h RW/C	**DDI C HPD STATUS (DDI_C_HPD_Status):** This field indicates the hot plug detect status on port C. When HPD input is enabled and either a long or short pulse is detected, one of these bits will set and the hotplug IIR will be set (if unmasked in the IMR). These are sticky bits, cleared by writing 1s to both of them.
7:5	0h RSV	**RESERVED (Reserved_4):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
4	0h RW	**DDI B HPD INPUT ENABLE (DDI_B_HPD_Input_Enable):** This field enables the HPD buffer for digital port B.
3	0h RW	**DDI B HPD INVERT (DDI_B_HPD_Invert):** This field inverts the HPD sense for digital port B.
2	0h RSV	**RESERVED (Reserved_5):** The field 'Reserved' in register 'Hot Plug Control' does not have a description in the BXML
1:0	0h RW/C	**DDI B HPD STATUS (DDI_B_HPD_Status):** This field indicates the hot plug detect status on port B. When HPD input is enabled and either a long or short pulse is detected, one of these bits will set and the hotplug IIR will be set (if unmasked in the IMR). These are sticky bits, cleared by writing 1s to both of them.

32.86 HPD Pulse Count DDI B (HPD_PULSE_CNT_B)—Offset C4034h

There is one instance of this register per DDI. This register is on the chip reset, not the FLR or display debug reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7CEh

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'HPD Pulse Count DDI B' does not have a description in the BXML
16:0	7CEh RW	**SHORTPULSE COUNT (ShortPulse_Count):** These bits define the duration of the pulse defined as a short pulse for DDI HPD. The value is the number of microseconds minus 2.

32.87 HPD Filter Count (HPD_FILTER_CNT)—Offset C4038h

This register is on the chip reset, not the FLR or display debug reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1F2h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'HPD Filter Count' does not have a description in the BXML
16:0	1F2h RW	**HPD FILTER COUNT (HPD_Filter_Count):** These bits define the duration of the filter for DDI HPD. The value is the number of microseconds minus 2.

32.88 HPD Pulse Count DDI C (HPD_PULSE_CNT_C)—Offset C4044h

There is one instance of this register per DDI. This register is on the chip reset, not the FLR or display debug reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7CEh

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'HPD Pulse Count DDI C' does not have a description in the BXML
16:0	7CEh RW	**SHORTPULSE COUNT (ShortPulse_Count):** These bits define the duration of the pulse defined as a short pulse for DDI HPD. The value is the number of microseconds minus 2.

32.89 HPD Pulse Count DDI A (HPD_PULSE_CNT_A)—Offset C404Ch

There is one instance of this register per DDI. This register is on the chip reset, not the FLR or display debug reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7CEh

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RSV	**RESERVED (Reserved_0):** The field 'Reserved' in register 'HPD Pulse Count DDI A' does not have a description in the BXML
16:0	7CEh RW	**SHORTPULSE COUNT (ShortPulse_Count):** These bits define the duration of the pulse defined as a short pulse for DDI HPD. The value is the number of microseconds minus 2.

32.90 FENCE0_LSB (FENCE0_LSB)—Offset 100000h

Fence Registers LSBs

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**FENCELO (FENCELO):** Bits 31:12 of the ending Graphics Address of the fence region. Fence regions must be aligned to a 4KB page. This address represents the last 4KB page of the fence region (Lower Bound is included in the fence region). Graphics Address is the offset within GMADR space.
11:2	0h RSV	**RESERVED (RSVD_0):** Reserved
1	0h RW	**TILE (TILE):** This field specifies the spatial ordering of QW within tiles. 0b - Consecutive SWords (32B) sequenced in the X direction 1b - Consecutive OWords (16B) sequenced in the Y direction
0	0h RW/V	**FENCEVAL (FENCEVAL):** This field specifies whether or not this fence register defines a fence region. 0b - FENCE INVALID 1b - FENCE VALID

32.91 FENCE0_MSB (FENCE0_MSB)—Offset 100004h

Fence Registers MSBs

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**FENCEUP (FENCEUP):** Bits 31:12 of the ending Graphics Address of the fence region. Fence regions must be aligned to a 4KB page. This address represents the last 4KB page of the fence region (Upper Bound is included in the fence region). Graphics Address is the offset within GMADR space.
11	0h RSV	**RESERVED (RSVD_0):** Reserved
10:0	0h RW	**PITCH (Pitch):** This field specifies the width (pitch) of the fence region in multiple of tile widths. For Tile X this field must be programmed to a multiple of 512B (003 is the minimum value) and for Tile Y this field must be programmed to a multiple of 128B (000 is the minimum value). 000h = 128B 001h = 256B 002h = 384B 003h = 512B 004h = 640B 005h = 768B 006h = 896B 007h = 1024B ... 3FFh = 128KB 4FFh = 160KB 5FFh = 192KB 6FFh = 224KB 7FFh = 256KB

32.92 FENCE1_LSB (FENCE1_LSB)—Offset 100008h

Fence Registers LSBs

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**FENCELO (FENCELO):** Bits 31:12 of the ending Graphics Address of the fence region. Fence regions must be aligned to a 4KB page. This address represents the last 4KB page of the fence region (Lower Bound is included in the fence region). Graphics Address is the offset within GMADR space.
11:2	0h RSV	**RESERVED (RSVD_0):** Reserved
1	0h RW	**TILE (TILE):** This field specifies the spatial ordering of QW within tiles. 0b - Consecutive SWords (32B) sequenced in the X direction 1b - Consecutive OWords (16B) sequenced in the Y direction
0	0h RW/V	**FENCEVAL (FENCEVAL):** This field specifies whether or not this fence register defines a fence region. 0b - FENCE INVALID 1b - FENCE VALID

32.93 FENCE1_MSB (FENCE1_MSB)—Offset 10000Ch

Fence Registers MSBs

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**FENCEUP (FENCEUP):** Bits 31:12 of the ending Graphics Address of the fence region. Fence regions must be aligned to a 4KB page. This address represents the last 4KB page of the fence region (Upper Bound is included in the fence region). Graphics Address is the offset within GMADR space.
11	0h RSV	**RESERVED (RSVD_0):** Reserved
10:0	0h RW	**PITCH (Pitch):** This field specifies the width (pitch) of the fence region in multiple of tile widths. 1	0h RW/V	**TLBPF (TLBPF):** Store multiple PTE enable. 0: Only one Page Table Entry is stored in the Translation Lookaside Buffer cache. 1: Multiple Page Table Entries (8) are stored in the Translation Lookaside Buffer cache.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**SWZCTL (SWZCTL):** In order to spread DRAM accesses between multiple channels in the most efficient way, address bits can be used as a channel select. The Driver needs to obtain the need for memory address swizzling via DRAM configuration registers and set the following bits. x0b - No Address Swizzling x1b - Address bit [6] needs to be swizzled for tiled surfaces SWZCTL background (Display has an associated bit) : In order to spread DRAM accesses between multiple channels in the most efficient way, address bits can be used as a channel select. The most common DRAM configuration is 2-channels with 64B interleaving where address bit[6] is used as a channel select. Tiled surface topologies can lead to back-to-back accesses to the same memory channel. In order to minimize these accesses and therefore more efficiently utilize memory bandwidth, we manipulate (or 'swizzle') the tiled address bit[6]. For X-tiled surfaces: A'6 = A6 xor A9 xor A10. Where A represents the tiled address before swizzling and A' represents the address after swizzling.

32.157 GFX_FLSH_CNT (GFX_FLSH_CNT)—Offset 101008h

Used to flush Gunit TLB

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RSV	**RESERVED (RSVD_0):** Reserved
0	0h WO	**GFXFLSHCNTL (GfxFlshCntl):** Access type of this register is WO. A write to this bit flushes the Gfx TLB in GUNIT. The data associated with the write is discarded and a read return all 0s.

32.158 DISPLAY_DEADLINE_CONTROL (DISPLAY_DEADLINE_CONTROL)—Offset 10102Ch

Deadline latency override control

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RSV	**RESERVED (RSVD_0):** Reserved
10:1	0h RW/V	**LATENCY_OVERRIDE_OFFSET (Latency_Override_Offset):** When enable, provides a fixed latency offset override for display VC1 requests. For example, value of 0 would sent every VC1 request with the current global time value .. effectively making every VC1 request access 'urgent'.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**LATENCY_OVERRIDE_ENABLE (Latency_Override_Enable):** 0 (default) : Hardware determined deadlines. 1 : Latency override enabled. Deadline latency offsets are no longer hardware determined. Instead, deadline latency offsets are taken from the 'latency_override_offset' bits

32.159 DG_CLKREQ_POLICY (DG_CLKREQ_POLICY)—Offset 101038h

Various bits that control clock req functionality in DG. This register should be programmed as part of graphics initialization.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V	**SPARE2 (SPARE2):** Reserved
23:16	0h RW/V	**CLKREQ_HYST_CNTR (CLKREQ_HYST_CNTR):** Register to store the parameter used to counting IDLE cycles during Hysteris state. Deassert clkreq when DG is idle for the number of cycles this register is programmed to.
15:2	0h RW/V	**SPARE1 (SPARE1):** Reserved
1	0h RW/V	**MEM_UP_OVRD (MEM_UP_OVRD)**
0	0h RW/V	**CLKREQ_OVRD (CLKREQ_OVRD)**

32.160 VDMBDFBARKVM (VDMBDFBARKVM)—Offset 101070h

Allows indirection of KVM traffic for manageability.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 700B0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RSV	**RESERVED (RSVD_0):** Reserved
18:16	7h RW	**BARNUM (BARNUM):** Indicates to which base address register VDM packets should be addressed.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**BUSNUM (BUSNUM):** Indicates to which bus number VDM packets should be addressed.
7:3	16h RW	**DEVNUM (DEVNUM):** Indicates to which Device number VDM packets should be addressed.
2:0	0h RW	**FUNNUM (FUNNUM):** Indicates to which Function number VDM packets should be addressed.

32.161 WDBDF (WDBDF)—Offset 101074h

Its the BDF used for wireless display to talk to WNIC. BIOS must program this register with the PCI Bus, Device, and Function.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**BUS (BUS):** This field specifies the PCI bus number used for wireless display to talk to WNIC.
23:19	2h RW	**DEVICE (DEVICE):** This field specifies the PCI device number used for wireless display to talk to WNIC.
18:16	0h RW	**FUNCTION (FUNC):** This field specifies the PCI function number used for wireless display to talk to WNIC.
15:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.162 TOUCHBDF (TOUCHBDF)—Offset 101078h

BIOS must program this register with the PCI Bus, Device, and Function that the Display Engine should use for communication with the PCH Touch Device.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**BUS (BUS):** This field specifies the PCI bus number of the PCH Touch device.
23:19	2h RW	**DEVICE (DEVICE):** This field specifies the PCI device number of the PCH Touch device.

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RW	**FUNCTION (FUNC):** This field specifies the PCI function number of the PCH Touch device.
15:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.163 MTOLUD (MTOLUD)—Offset 108000h

This 32 bit register defines the Top of Low Usable DRAM. TSEG, GTT Graphics memory and Graphics Stolen Memory are within the DRAM space defined. From the top, the Host optionally claims 1 to 64MBs of DRAM for internal graphics if enabled, 1or 2MB of DRAM for GTT Graphics Stolen Memory (if enabled) and 1, 2, or 8 MB of DRAM for TSEG if enabled. Programming Example: C1DRB3 is set to 4GB TSEG is enabled and TSEG size is set to 1MB Internal Graphics is enabled, and Graphics Mode Select is set to 32MB GTT Graphics Stolen Memory Size set to 2MB BIOS knows the OS requires 1G of PCI space. BIOS also knows the range from 0_FEC0_0000h to 0_FFFF_FFFFh is not usable by the system. This 20MB range at the very top of addressable memory space is lost to APIC and LT. According to the above equation, TOLUD is originally calculated to: 4GB = 1_0000_0000h The system memory requirements are: 4GB (max addressable space) - 1GB (pci space) - 35MB (lost memory) = 3GB - 35MB (minimum granularity) = 0_ECB0_0000h Since 0_ECB0_0000h (PCI and other system requirements) is less than 1_0000_0000h, TOLUD should be programmed to ECBh. These bits are Intel TXT lockable.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	1h RO/V	**TOLUD (TOLUD):** This register contains bits 31 to 20 of an address one byte above the maximum DRAM memory below 4G that is usable by the operating system. Address bits 31 down to 20 programmed to 01h implies a minimum memory size of 1MB. Configuration software must set this value to the smaller of the following 2 choices: maximum amount memory in the system minus ME stolen memory plus one byte or the minimum address allocated for PCI memory. Address bits 19:0 are assumed to be 0_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register. The Top of Low Usable DRAM is the lowest address above both Graphics Stolen memory and Tseg. BIOS determines the base of Graphics Stolen Memory by subtracting the Graphics Stolen Memory Size from TOLUD and further decrements by Tseg size to determine base of Tseg. All the Bits in this register are locked in LT mode. This register must be 1MB aligned when reclaim is enabled.
19:1	0h RSV	**RESERVED (RSVD_0):** Reserved
0	0h RO/V	**SPARE (SPARE):** Was lock bit prior to Gen10

32.164 MMIO Mirror of GMCH Graphics Control Register (MGGC)—Offset 108040h

All the bits in this register are Intel TXT lockable.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 500h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RSV	**RESERVED (RSVD_0):** Reserved
15:8	5h RO/V	**GMS (GMS):** This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. It corresponds to DSM (Data Stolen Memory region) region. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0. BIOS Requirement: Given new sizes allow down to 8MB allocation, BIOS has to ensure there is sufficient space for WOPCM and basic GFX Stolen functions. 00h:0MB 01h:32MB 02h:64MB 03h:96MB 04h:128MB 05h:160MB 06h:192MB 07h:224MB 08h:256MB 09h:288MB 0Ah:320MB 0Bh:352MB 0Ch:384MB 0Dh:416MB 0Eh:448MB 0Fh:480MB 10h:512MB 11h - 1Fh: Reserved 20h:1024MB 21h - 2Fh: Reserved 30h:1536MB 31h - 3Fh: Reserved 40h: 2048MB 41h - EFh: Reserved F0h: 4MB F1h: 8MB F2h: 12MB F3h: 16MB F4h: 20MB F5h: 24MB F6h: 28MB F7h: 32MB F8h: 36MB F9h: 40MB FAh: 44MB FBh: 48MB FCh: 52MB FDh: 56MB FEh: 60MB FFh: Reserved Hardware functionality in case of programming this value to Reserved is not guaranteed.
7:6	0h RO/V	**GGMS (GGMS):** This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware will derive the base of GSM from DSM only using the GSM size programmed in the register. Hardware functionality in case of programming this value to Reserved is not guaranteed. 0x0:No Preallocated Memory 0x1:2MB of Preallocated Memory 0x2:4MB of Preallocated Memory 0x3:8MB of Preallocated Memory
5:3	0h RSV	**RESERVED (RSVD_1):** Enables the use of the iGFX enbines for Versatile Acceleration. 1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. 0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
2	0h RO/V	**VAMEN (VAMEN):** Reserved
1	0h RO/V	**IVD (IVD):** 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field (bits 7:3 of this register) pre-allocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override (CAPID0_A[IGD] = 1) or via a register (DEVEN[3] = 0). This register is locked by Intel TXT lock. 0:Enable 1:Disable
0	0h RO/V	**SPARE (SPARE):** Was lock bit prior to Gen10

32.165 MTOUUD_LSB (MTOUUD_LSB)—Offset 108080h

This 64 bit register defines the Top of Upper Usable DRAM. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled, this value must be set to reclaim limit + 1byte, 1MB aligned, since reclaim limit is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than or equal to 4GB. BIOS Restriction: Minimum value for TOUUD is 4GB. These bits are Intel TXT lockable.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	1h RO/V	**TOUUD (TOUUD):** This register contains bits 38 to 20 of an address one byte above the maximum DRAM memory above 4G that is usable by the operating system. Configuration software must set this value to TOM minus all ME stolen memory if reclaim is disabled. If reclaim is enabled, this value must be set to reclaim limit 1MB aligned since reclaim limit + 1byte is 1MB aligned. Address bits 19:0 are assumed to be 000_0000h for the purposes of address comparison. The Host interface positively decodes an address towards DRAM if the incoming address is less than the value programmed in this register and greater than 4GB. 0	0h RO/V	**SPARE (SPARE):** Was lock bit prior to Gen10

32.169 Base of DMA Protected Range (BDPR)—Offset 108140h

This register indicates the Base of DMA Protected Range.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO/V	**BDPR (BDPR):** 1MB aligned base of DMA Protected Memory Range.
19:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.170 MPMEN (MPMEN)—Offset 108180h

Register to enable the DMA-protected memory regions setup through the PLMBASE, PLMLIMT, PHMBASE, PHMLIMIT registers. This register is always treated as RO for implementations not supporting protected memory regions (PLMR and PHMR fields reported as Clear in the Capability register). Protected memory regions may be used by software to securely initialize remapping structures in memory. To avoid impact to legacy BIOS usage of memory, software is recommended to not overlap protected memory regions with any reserved memory regions of the platform reported through the Reserved Memory Region Reporting (RMRR) structures.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**EPM (EPM):** This field controls DMA accesses to the protected low-memory and protected high-memory regions. 0: Protected memory regions are disabled. 1: Protected memory regions are enabled. DMA requests accessing protected memory regions are handled as follows: - When DMA remapping is not enabled, all DMA requests accessing protected memory regions are blocked. - When DMA remapping is enabled: -- DMA requests processed as pass-through (Translation Type value of 10b in Context-Entry) and accessing the protected memory regions are blocked. -- DMA requests with translated address (AT=10b) and accessing the protected memory regions are blocked. -- DMA requests that are subject to address remapping, and accessing the protected memory regions may or may not be blocked by hardware. For such requests, software must not depend on hardware protection of the protected memory regions, and instead program the DMA-remapping page-tables to not allow DMA to protected memory regions. Remapping hardware access to the remapping structures are not subject to protected memory region checks. DMA requests blocked due to protected memory region violation are not recorded or reported as remapping faults. Hardware reports the status of the protected memory enable/disable operation through the PRS field in this register. Hardware implementations supporting DMA draining must drain any in-flight translated DMA requests queued within the Root-Complex before indicating the protected memory region as enabled through the PRS field.
30:1	0h RSV	**RESERVED (RSVD_0):** Reserved
0	0h RW	**PRS (PRS):** This field indicates the status of protected memory region(s): 0: Protected memory region(s) disabled. 1: Protected memory region(s) enabled.

32.171 MPLMBASE (MPLMBASE)—Offset 1081C0h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant zero bit position with 0 in the value read back from the register. Bits N:0 of this register is decoded by hardware as all 0s. Software must setup the protected low memory region below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**PLMB (PLMB):** This register specifies the last host physical address of the DMA-protected low-memory region in system memory.
19:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.172 MPLMLIMIT (MPLMLIMIT)—Offset 108200h

Register to set up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s. The Protected low-memory base and limit registers functions as follows: - Programming the protected low-memory base and limit registers with the same value in bits 31:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. - Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**PLML (PLML):** This register specifies the last host physical address of the DMA-protected low-memory region in system memory.
19:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.173 MPHMBASE_LSB (MPHMBASE_LSB)—Offset 108240h

Register to set up the base address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**PHMB (PHMB):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.174 MPHMBASE_MSB (MPHMBASE_MSB)—Offset 108244h

Register to set up the base address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PHMB (PHMB):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.

32.175 MPHMLIMIT_LSB (MPHMLIMIT_LSB)—Offset 108280h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s. The protected high-memory base and limit registers functions as follows. - Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. - Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**PHML (PHML):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.176 MPHMLIMIT_MSB (MPHMLIMIT_MSB)—Offset 108284h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s. The protected high-memory base and limit registers functions as follows. - Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. - Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PHML (PHML):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.

32.177 MGCMD (MGCMD)—Offset 108300h

Mirror GT hardware uses for Vtd state.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**TE (TE):** 0: Disable Vtd DMA remapping 1: Enable Vtd DMA remapping
30:26	0h RSV	**RESERVED (RSVD_0):** Reserved
25	0h RO/V	**IRE (IRE):** Used for Debug only. No HW usage model. 0: Disable interrupt-remapping hardware 1: Enable interrupt-remapping hardware
24:0	0h RSV	**RESERVED (RSVD_1):** Reserved

32.178 MEMRR_BASE_LSB (MEMRR_BASE_LSB)—Offset 108340h

The EMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the EMRR range by indicating its starting address. It functions in tandem with the EMRR mask register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO/V	**RANGE_BASE (RANGE_BASE):** This field corresponds to bits 38:12 of the base address memory range which is allocated to EMRR memory.
11:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.179 MEMRR_BASE_MSB (MEMRR_BASE_MSB)—Offset 108344h

The EMRR range is used to protect Xucode memory from unauthorized reads and writes. Any IO access to this range is aborted. This register controls the location of the EMRR range by indicating its starting address. It functions in tandem with the EMRR mask register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RSV	**RESERVED (RSVD_0):** Reserved
6:0	0h RO/V	**RANGE_BASE (RANGE_BASE):** This field corresponds to bits 38:12 of the base address memory range which is allocated to EMRR memory.

32.180 MEMRR_MASK_LSB (MEMRR_MASK_LSB)—Offset 108380h

This register controls the size of the EMRR range by indicating which address bits must match the EMRR base register value.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO/V	**RANGE_BASE (RANGE_MASK):** This field indicates which address bits must match EMRR base in order to qualify as an EMRR access.
11	0h RO/V	**RANGE_EN (RANGE_EN):** Indicates whether the EMRR range is enabled and valid.
10	0h RO/V	**LOCK (LOCK):** Setting this bit locks all writeable settings in this register, including itself.
9:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.181 MEMRR_MASK_MSB (MEMRR_MASK_MSB)—Offset 108384h

This register controls the size of the EMRR range by indicating which address bits must match the EMRR base register value.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RSV	**RESERVED (RSVD_0):** Reserved
6:0	0h RO/V	**RANGE_MASK (RANGE_MASK):** This field indicates which address bits must match EMRR base in order to qualify as an EMRR access.

32.182 GTACK (GTACK)—Offset 120004h

This register is written to by GT for various device 2 sequencer flows.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RSV	**RESERVED (RSVD_0):** Reserved
4	0h RW/V	**RTPACK (RTPACK):** GT indicates that the set root table pointer flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
3	0h RW/V	**DESCRACK (DESCRACK):** GT indicates that the generic descriptor flow is complete from its point of view by writing a 1b to this field Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
2	0h RW/V	**VTDACK (VTDACK):** GT indicates that the Translation Enable/Disable or IOTLB Invalidation flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
1	0h RW/V	**DPRACK (DPRACK):** GT indicates that DPR Update flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.
0	0h RW/V	**PMRACK (PMRACK):** GT indicates that PMR Enable/Disable flow is complete from its point of view by writing a 1b to this field. Once SW is notified with the appropriate status bit, this bit is cleared by the HW.

32.183 EDRAMCAP (EDRAMCAP)—Offset 120010h

Describes the presence and capabilities of the eDRAM cache.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EDRAMCAP_VALUE (EDRAMCAP_VALUE):** Bit[31] - Reserved Bits[30:26] - EDRAM Frequency, Default Value: 01000b eDRAM frequency: 200MHz* encode. 0x08 = 1600MHz 0x09 = 1800MHz 0x0A = 2000MHz Bits[25:24] - EDRAM_CHANNELS, Default Value: 00b If FUSE_EDRAM_ENABLE=0, this field is NA. 00 = one channel, 01 = two channels. 1x = Reserved. Bits[23:22] - Reserved Bits[21:16] - CURRENT_ETAG_WAYS, Default Value: 11b The total number of ways in each ETAG slice. This field is updated by PCODE after every ETAG shrink or ETAG expand. 0 if 4 ways 1 if 8 ways 2 if 12 ways 3 if 16 ways. Bits[15:10] - Reserved Bits[9:8] - SETS_CONFIGURATION, Default Value: 10b 1K or 2K sets, to support 64MB and 128MB EDRAM size configurations accordingly. 00 = Reserved. 01 if 1K sets 10 if 2K sets 11 reserved. Bits[7:5] - WAYS_CONFIGURATION, Default Value: 011b This field defines the total number of ETAG ways. 000 if 4 ways 001 if 8 ways 010 if 12 ways 011 if 16 ways 1xx reserved. Bits[4:1] - Super Queue Internal Register Count, Bit[0] - FUSE_EDRAM_ENABLE, Default Value: 0b PCODE will update this field based on FUSE_EDRAM_ENABLE.

32.184 MAILBOX0 (MAILBOX0)—Offset 120800h

This register contains bits 31:0 of the generic descriptor, fetched from the invalidate queue for GT.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains bits 31:0 of the generic descriptor, fetched from the invalidate queue for GT.

32.185 MAILBOX1 (MAILBOX1)—Offset 120804h

This register contains bits 63:32 of the generic descriptor, fetched from the invalidate queue for GT.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains bits 63:32 of the generic descriptor, fetched from the invalidate queue for GT.

32.186 MAILBOX2 (MAILBOX2)—Offset 120808h

This register contains bits 95:64 of the generic descriptor, fetched from the invalidate queue for GT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains bits 95:64 of the generic descriptor, fetched from the invalidate queue for GT.

32.187 MAILBOX3 (MAILBOX3)—Offset 12080Ch

This register contains bits 127:96 of the generic descriptor, fetched from the invalidate queue for GT.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains bits 127:96 of the generic descriptor, fetched from the invalidate queue for GT.

32.188 FLT_RPT0 (FLT_RPT0)—Offset 124810h

GT uses this register to post VT-d faults

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**FI (FI):** Fault Info.
11:0	0h RSV	**RESERVED (RSVD_0):** The field 'RESERVED' in register 'FLT_RPT0' does not have a description in the BXML

32.189 FLT_RPT1 (FLT_RPT1)—Offset 124814h

GT uses this register to post VT-d faults

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**FI (FI):** Fault Info.

32.190 FLT_RPT2 (FLT_RPT2)—Offset 124818h

GT uses this register to post VT-d faults

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PP (PP):** PASID Present.
30	0h RW	**EXE (EXE):** Execute Permission Requested.
29	0h RW	**PRIV (PRIV):** Privilege Mode Requested .
28:16	0h RSV	**RESERVED (RSVD_0):** Reserved
15:0	10h RO	**SOURCE ID (SID):** Source ID.

32.191 FLT_RPT3 (FLT_RPT3)—Offset 12481Ch

GT uses this register to post VT-d faults

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**F (F):** Fault
30	0h RW	**T (T):** Type

Bit Range	Default & Access	Field Name (ID): Description
29:28	0h RW	**AT (AT):** Address Type
27:8	0h RW	**PN (PN):** PASID Number
7:0	0h RW	**FR (FR):** Fault Reason

32.192 PPRO (PPRO)—Offset 124820h

GT uses this register to post Page Request Queue overflow faults

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RSV	**RESERVED (RSVD_0):** Reserved
0	0h WO	**POST PAGE REQUEST OVERFLOW FAULT (PPRO):** Post Page Request overflow fault

32.193 PPPR (PPPR)—Offset 124824h

GT uses this register to post pending page requests to software, such as x86 page faults. A write to this register triggers an MSI per the registers PRESTS, PRECTL, PREDATA, PREADR, and PREUADR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RSV	**RESERVED (RSVD_0):** Reserved
0	0h WO	**POST PENDING PAGE REQUEST (PPPR):** Post Pending Page Request

32.194 RTADDR_LSB (RTADDR_LSB)—Offset 124830h

Register providing the base address of root-entry table.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**RTA (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.
11	0h RW	**RTT (RTT):** This field specifies the type of root-table referenced by the Root Table Address (RTA) field; 0: Root Table 1: Extended Root Table
10:0	0h RSV	**RESERVED (RSVD_0):** Reserved

32.195 RTADDR_MSB (RTADDR_MSB)—Offset 124834h

Register providing the base address of root-entry table.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RSV	**RESERVED (RSVD_0):** Reserved
6:0	0h RW	**RTA (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.

32.196 GT Scratchpad 0 (GTSP0)—Offset 130040h

The register 'GT Scratchpad 0' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 0' does not have a description in the BXML

32.197 GT Scratchpad 1 (GTSP1)—Offset 130044h

The register 'GT Scratchpad 1' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 1' does not have a description in the BXML
15:0	0h RW	**MULTIPLE FORCE WAKE (Multiple_Force_Wake):** GT programs this field with the multiple force wake status. Software reads this field to find the status. Refer to MULTIFORCEWAKE 0xA188 register description for the usage.

32.198 GT Scratchpad 2 (GTSP2)—Offset 130048h

The register 'GT Scratchpad 2' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 2' does not have a description in the BXML

32.199 GT Scratchpad 3 (GTSP3)—Offset 13004Ch

The register 'GT Scratchpad 3' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 3' does not have a description in the BXML

32.200 GT Scratchpad 4 (GTSP4)—Offset 130050h

The register 'GT Scratchpad 4' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 4' does not have a description in the BXML

32.201 GT Scratchpad 5 (GTSP5)—Offset 130054h

The register 'GT Scratchpad 5' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 5' does not have a description in the BXML

32.202 GT Scratchpad 6 (GTSP6)—Offset 130058h

The register 'GT Scratchpad 6' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 6' does not have a description in the BXML

32.203 GT Scratchpad 7 (GTSP7)—Offset 13005Ch

The register 'GT Scratchpad 7' does not have a description in the BXML source

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**GT SCRATCH PAD (GT_scratch_pad):** The field 'GT scratch pad' in register 'GT Scratchpad 7' does not have a description in the BXML
0	0h RO	Reserved.

32.204 Version Register (VER_REG_0_0_0_VTDBAR)—Offset 0h

Register to report the architecture version supported. Backward compatibility for the architecture is maintained with new revision numbers, allowing software to load remapping hardware drivers written for prior architecture versions.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:4	1h RO	**Major Version Number (MAJOR):** Indicates supported architecture version.
3:0	0h RO	**Minor Version Number (MINOR):** Indicates supported architecture minor version.

32.205 Capability Register (CAP_REG_0_0_0_VTDBAR)—Offset 8h

Register to report general remapping hardware capabilities. Note: These values can change based on defeature bits.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 1C0000C40660462h

Bit Range	Default & Access	Field Name (ID): Description
63:57	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
56	1h RO	**First Level 64-KByte Page SupportP (FL1GP):** A value of 1 in this field indicates 1-GByte page size is supported for first-level translation. Note: These values can change based on defeature bits.
55	1h RO	**Read Draining (DRD):** • 0 = Hardware does not support draining of DMA read requests. • 1 = Hardware supports draining of DMA read requests. Note: These values can change based on defeature bits.
54	1h RO	**Write Draining (DWD):** • 0 = Hardware does not support draining of DMA write requests. • 1 = Hardware supports draining of DMA write requests. Note: These values can change based on defeature bits.
53:48	0h RO	**Maximum Address Mask Value (MAMV):** The value in this field indicates the maximum supported value for the Address Mask (AM) field in the Invalidation Address register (IVA_REG) and IOTLB Invalidation Descriptor (iotlb_inv_dsc) used for invalidations of second-level translation. This field is valid only when the PSI field in Capability register is reported as Set. Note: These values can change based on defeature bits.
47:40	0h RO	**Number of Fault-Recording Registers (NFR):** Number of fault recording registers is computed as N+1, where N is the value reported in this field. Implementations must support at least one fault recording register (NFR = 0) for each remapping hardware unit in the platform. The maximum number of fault recording registers per remapping hardware unit is 256. Note: These values can change based on defeature bits.
39	0h RO	**Page Selective Invalidation (PSI):** • 0 = Hardware supports only domain and global invalidates for IOTLB.{*}1 = Hardware supports page selective, domain and global invalidates for IOTLB. Hardware implementations reporting this field as set are recommended to support a Maximum Address Mask Value (MAMV) value of at least 9 (or 18 if supporting 1GB pages with second level translation). Note: These values can change based on defeature bits.
38	0h RO	Reserved.
37:34	3h RO	**Second Level Large Page Support (SLLPS):** This field indicates the super page sizes supported by hardware. A value of 1 in any of these bits indicates the corresponding super-page size is supported. The super-page sizes corresponding to various bit positions within this field are: • 0 = 21-bit offset to page frame (2MB) • 1 = 30-bit offset to page frame (1GB) • 2 = 39-bit offset to page frame (512GB) • 3 = 48-bit offset to page frame (1TB) Hardware implementations supporting a specific super-page size must support all smaller super-page sizes, i.e. only valid values for this field are 0000b, 0001b, 0011b, 0111b, 1111b. Note: These values can change based on defeature bits.
33:24	40h RO	**Fault-Recording Register Offset (FRO):** This field specifies the location to the first fault recording register relative to the register base address of this remapping hardware unit. If the register base address is X, and the value reported in this field is Y, the address for the first fault recording register is calculated as X+(16*Y). Note: These values can change based on defeature bits.
23	0h RO	Reserved.
22	1h RO	**Zero Length Read (ZLR):** • 0 = Indicates the remapping hardware unit blocks (and treats as fault) zero length DMA read requests to write-only pages. • 1 = Indicates the remapping hardware unit supports zero length DMA read requests to write-only pages. DMA remapping hardware implementations are recommended to report ZLR field as Set. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
21:16	26h RO	**Maximum Guest Address Width (MGAW):** This field indicates the maximum DMA virtual addressability supported by remapping hardware. The Maximum Guest Address Width (MGAW) is computed as (N+1), where N is the value reported in this field. For example, a hardware implementation supporting 48-bit MGAW reports a value of 47 (101111b) in this field. If the value in this field is X, untranslated and translated DMA requests to addresses above 2(x+1)-1 are always blocked by hardware. Translations requests to address above 2(x+1)-1 from allowed devices return a null Translation Completion Data Entry with R=W=0. Guest addressability for a given DMA request is limited to the minimum of the value reported through this field and the adjusted guest address width of the corresponding page-table structure. (Adjusted guest address widths supported by hardware are reported through the SAGAW field). Implementations are recommended to support MGAW at least equal to the physical addressability (host address width) of the platform. Note: These values can change based on defeature bits.
15:13	0h RO	Reserved.
12:8	4h RO	**Supported Adjusted Guest Address Widths (SAGAW):** This 5-bit field indicates the supported adjusted guest address widths (which in turn represents the levels of page-table walks for the 4KB base page size) supported by the hardware implementation. A value of 1 in any of these bits indicates the corresponding adjusted guest address width is supported. The adjusted guest address widths corresponding to various bit positions within this field are: • 0 = 30-bit AGAW (2-level page table) • 1 = 39-bit AGAW (3-level page table) • 2 = 48-bit AGAW (4-level page table) • 3 = 57-bit AGAW (5-level page table) • 4 = 64-bit AGAW (6-level page table) Software must ensure that the adjusted guest address width used to setup the page tables is one of the supported guest address widths reported in this field. Note: These values can change based on defeature bits.
7	0h RO	**Caching Mode (CM):** • 0 = Not-present and erroneous entries are not cached in any of the renmapping caches. Invalidations are not required for modifications to individual not present or invalid entries. However, any modifications that result in decreasing the effective permissions or partial permission increases require invalidations for them to be effective. • 1 = Not-present and erroneous mappings may be cached in the remapping caches. Any software updates to the remapping structures (including updates to not-present or erroneous entries) require explicit invalidation. Hardware implementations of this architecture must support a value of 0 in this field. Note: These values can change based on defeature bits.
6	1h RO	**Protected High-Memory Region (PHMR):** • 0 = Indicates protected high-memory region is not supported. • 1 = Indicates protected high-memory region is supported. Note: These values can change based on defeature bits.
5	1h RO	**Protected Low-Memory Region (PLMR):** • 0 = Indicates protected low-memory region is not supported. • 1 = Indicates protected low-memory region is supported. Note: These values can change based on defeature bits.
4	0h RO	**Required Write-Buffer Flushing (RWBF):** • 0 = Indicates no write-buffer flushing is needed to ensure changes to memory-resident structures are visible to hardware. • 1 = Indicates software must explicitly flush the write buffers to ensure updates made to memory-resident remapping structures are visible to hardware. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Advanced Fault Logging (AFL):** • 0 = Indicates advanced fault logging is not supported. Only primary fault logging is supported. • 1 = Indicates advanced fault logging is supported. Note: These values can change based on defeature bits.
2:0	2h RO	**Number of Domains Supported (ND):** • 000b = Hardware supports 4-bit domain-ids with support for up to 16 domains. • 001b = Hardware supports 6-bit domain-ids with support for up to 64 domains. • 010b = Hardware supports 8-bit domain-ids with support for up to 256 domains. • 011b = Hardware supports 10-bit domain-ids with support for up to 1024 domains. • 100b = Hardware supports 12-bit domain-ids with support for up to 4K domains. • 100b = Hardware supports 14-bit domain-ids with support for up to 16K domains. • 110b = Hardware supports 16-bit domain-ids with support for up to 64K domains. • 111b = Reserved. Note: These values can change based on defeature bits.

32.206 Extended Capability Register (ECAP_REG_0_0_0_VTDBAR)—Offset 10h

Register to report remapping hardware extended capabilities. Note: These values can change based on defeature bits.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 19E2FF0505Eh

Bit Range	Default & Access	Field Name (ID): Description
63:41	0h RO	Reserved.
40	1h RO	**Process Address Space ID Support (PASID):** • 0 = Hardware does not support requests tagged with Process Address Space IDs. • 1 = Hardware supports requests tagged with Process Address Space IDs. Note: These values can change based on defeature bits.
39:35	13h RO	**PASID Size Supported (PSS):** This field reports the PASID size supported by the remapping hardware for requests-with-PASID. A value of N in this field indicates hardware supports PASID field of N+1 bits (For example, value of 7 in this field, indicates 8-bit PASIDs are supported). Requests-with-PASID with PASID value beyond the limit specified by this field are treated as error by the remapping hardware. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
34	1h RO	**Extended Accessed Flag Support (EAFS):** • 0 = Hardware does not support the extended-accessed (EA) bit in first-level paging-structure entries. • 1 = Hardware supports the extended accessed (EA) bit in first-level paging-structure entries. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
33	1h RO	**No Write Flag Support (NWFS):** • 0 = Hardware ignores the No Write (NW) flag in Device-TLB translationrequests, and behaves as if NW is always 0. • 1 = Hardware supports the No Write (NW) flag in Device-TLB translationrequests. This field is valid only when Device-TLB support (DT) field is reported as Set. Note: These values can change based on defeature bits.
32	0h RO	**PASID-Only Translations (POT):** • 0 = Hardware does not support PASID-only Translation Type in extended-context-entries. • 1 = Hardware supports PASID-only Translation Type in extended-context-entries. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
31	0h RO	**Supervisor Request Support (SRS):** • 0 = H/W does not support requests-with-PASID seeking supervisor privilege. • 1 = H/W supports requests-with-PASID seeking supervisor privilege. The field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
30	0h RO	**Execute Request Support (ERS):** • 0 = H/W does not support requests-with-PASID seeking execute permission. • 1 = H/W supports requests-with-PASID seeking execute permission. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
29	1h RO	**Page Request Support (PRS):** • 0 = Hardware does not support Page Requests. • 1 = Hardware supports Page Requests This field is valid only when Device-TLB (DT) field is reported as Set. Note: These values can change based on defeature bits.
28	0h RO	**Ignore (IGN):** Ignore this field
27	1h RO	**Deferred Invalidate Support (DIS):** • 0 = Hardware does not support deferred invalidations of IOTLB and Device-TLB. • 1 = Hardware supports deferred invalidations of IOTLB and Device-TLB. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
26	1h RO	**Nested Translation Support (NEST):** • 0 = Hardware does not support nested translations. • 1 = Hardware supports nested translations. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
25	1h RO	**Memory Type Support (MTS):** • 0 = Hardware does not support Memory Type in first-level translation and Extended Memory type in second-level translation. • 1 = Hardware supports Memory Type in first-level translation and Extended Memory type in second-level translation. This field is valid only when PASID and ECS fields are reported as Set. Remapping hardware units with, one or more devices that operate in processor coherency domain, under its scope must report this field as Set. Note: These values can change based on defeature bits.
24	1h RO	**Extended Context Support (ECS):** • 0 = Hardware does not support extended-root-entries and extended-context-entries. • 1 = Hardware supports extended-root-entries and extended-context-entries. Implementations reporting PASID or PRS fields as Set, must report this field as Set. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
23:20	Fh RO	**Maximum Handle Mask Value (MHMV):** The value in this field indicates the maximum supported value for the Handle Mask (HM) field in the interrupt entry cache invalidation descriptor (iec_inv_dsc). This field is valid only when the IR field in Extended Capability register is reported as Set. Note: These values can change based on defeature bits.
19:18	0h RO	Reserved.
17:8	50h RO	**IOTLB Register Offset (IRO):** This field specifies the offset to the IOTLB registers relative to the register base address of this remapping hardware unit. If the register base address is X, and the value reported in this field is Y, the address for the first IOTLB invalidation register is calculated as X+(16*Y). Note: These values can change based on defeature bits.
7	0h RO	**Snoop Control (SC):** • 0 = Hardware does not support 1-setting of the SNP field in the page-table entries. • 1 = Hardware supports the 1-setting of the SNP field in the page-table entries. Note: These values can change based on defeature bits.
6	1h RO	**Pass Through (PT):** • 0 = Hardware does not support pass-through translation type in context entries and extended-context-entries. • 1 = Hardware supports pass-through translation type in context entries and extended-context-entries. Pass-through translation is specified through Translation-Type (T) field value of 10b in context-entries, or T field value of 010b in extended-context-entries. Hardware implementations supporting PASID must report a value of 1b in this field. Note: These values can change based on defeature bits.
5	0h RO	Reserved.
4	1h RO	**Extended Interrupt Mode (EIM):** • 0 = On Intel64 platforms, hardware supports only 8-bit APIC-IDs (xAPIC mode). • 1 = On Intel64 platforms, hardware supports 32-bit APIC-IDs (x2APIC mode). This field is valid only on Intel64 platforms reporting Interrupt Remapping support (IR field Set). Note: These values can change based on defeature bits.
3	1h RO	**Interrupt Remapping Suport (IR):** • 0 = Hardware does not support interrupt remapping. • 1 = Hardware supports interrupt remapping. Implementations reporting this field as Set must also support Queued Invalidation (QI). Note: These values can change based on defeature bits.
2	1h RO	**Device-TLB Support (DT):** • 0 = Hardware does not support device-IOTLBs. • 1 = Hardware supports Device-IOTLBs. Implementations reporting this field as Set must also support Queued Invalidation (QI). Hardware implementations supporting I/O Page Requests (PRS field Set in Extended Capability register) must report a value of 1b in this field. Note: These values can change based on defeature bits.
1	1h RO	**Queued Invalidation Support (QI):** • 0 = Hardware does not support queued invalidations. • 1 = Hardware supports queued invalidations. Note: These values can change based on defeature bits.
0	0h RO	**Page-Walk Coherency (C):** This field indicates if hardware access to the root, context, extended-context and interrupt-remap tables, and second-level paging structures for requests-without-PASID, are coherent (snooped) or not. • 0 = Indicates hardware accesses to remapping structures are non-coherent. • 1 = Indicates hardware accesses to remapping structures are coherent. Hardware access to advanced fault log, invalidation queue, invalidation semaphore, page-request queue, PASID-table, PASID-state table, and first-level page-tables are always coherent. Note: These values can change based on defeature bits.

32.207 Global Command Register (GCMD_REG_0_0_0_VTDBAR)—Offset 18h

Register to control remapping hardware. If multiple control fields in this register need to be modified, software must serialize the modifications through multiple writes to this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Translation Enable (TE):** Software writes to this field to request hardware to enable/disable DMA-remapping: • 0 = Disable DMA remapping. • 1 = Enable DMA remapping. Hardware reports the status of the translation enable operation through the TES field in the Global Status register. There may be active DMA requests in the platform when software updates this field. Hardware must enable or disable remapping logic only at determinstic transaction boundaries, so that any in-flight transaction is either subject to remapping or not at all. Hardware implementations supporting DMA draining must drain any in-flight DMA read/write requests queued within the Root-Complex before completing the translation enable command and reflecting the status of the command through the TES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
30	0h WO	**Set Root Table Pointer (SRTP):** Software sets this field to set/update the root-entry table pointer used by hardware. The root-entry table pointer is specified through the Root-entry Table Address (RTA_REG) register. Hardware reports the status of the Set Root Table Pointer operation through the RTPS field in the Global Status register. The Set Root Table Pointer operation must be performed before enabling or re-enabling (after disabling) DMA remapping through the TE field. .After a Set Root Table Pointer operation, software must globally invalidate the context cache and then globally invalidate of IOTLB. This is required to ensure hardware uses only the remapping structures referenced by the new root table pointer, and not stale cached entries. While DMA remapping hardware is active, software may update the root table pointer through this field. However, to ensure valid in-flight DMA requests are deterministically remapped, software must ensure that the structures referenced by the new root table pointer are programmed to provide the same remapping results as the structures referenced by the previous root-table pointer. Clearing this bit has no effect. The value returned on read of this field is undefined. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
29	0h RO	**Set Fault Log (SFL):** This field is valid only for implementations supporting advanced fault logging. Software sets this field to request hardware to set/update the fault-log pointer used by hardware. The fault-log pointer is specified through Advanced Fault Log register. Hardware reports the status of the Set Fault Log operation through the FLS field in the Global Status register. The fault log pointer must be set before enabling advanced fault logging (through EAFL field). Once advanced fault logging is enabled, the fault log pointer may be updated through this field while DMA remapping is active. Clearing this bit has no effect. The value returned on read of this field is undefined.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RO	**Enable Advanced Fault Logging (EAFL):** This field is valid only for implementations supporting advanced fault logging. Software writes to this field to request hardware to enable or disable advanced fault logging: • 0 = Disable advanced fault logging. In this case, translation faults are reported through the Fault Recording registers. • 1 = Enable use of memory-resident fault log. When enabled, translation faults are recorded in the memory-resident log. The fault log pointer must be set in hardware (through the SFL field) before enabling advaned fault logging. Hardware reports the status of the advaned fault logging enable operation through the AFLS field in the Global Status register. The value returned on read of this field is undefined.
27	0h RO	**Write Buffer Flush (WBF):** This bit is valid only for implementations requiring write buffer flushing. Software sets this field to request that hardware flush the Root-Complex internal write buffers. This is done to ensure any updates to the memory-resident remapping structures are not held in any internal write posting buffers. Hardware reports the status of the write buffer flushing operation through the WBFS field in the Global Status register. Clearing this bit has no effect. The value returned on a read of this field is undefined.
26	0h RW	**Queued Invalidation Enable (QIE):** This field is valid only for implementations supporting queued invalidations. Software writes to this field to enable or disable queued invalidations. • 0 = Disable queued invalidations. • 1 = Enable use of queued invalidations. Hardware reports the status of queued invalidation enable operation through QIES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
25	0h RW	**Interrupt Remapping Enable (IRE):** This field is valid only for implementations supporting interrupt remapping. • 0 = Disable interrupt-remapping hardware. • 1 = Enable interrupt-remapping hardware. Hardware reports the status of the interrupt remapping enable operation through the IRES field in the Global Status register. There may be active interrupt requests in the platform when software updates this field. Hardware must enable or disable interrupt-remapping logic only at deterministic transaction boundaries, so that any in-flight interrupts are either subject to remapping or not at all. Hardware implementations must drain any in-flight interrupts requests queued in the Root-Complex before completing the interrupt-remapping enable command and reflecting the status of the command through the IRES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
24	0h WO	**Set Interrupt Remap Table Pointer (SIRTP):** This field is valid only for implementations supporting interrupt-remapping. Software sets this field to set/update the interrupt remapping table pointer used by hardware. The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address (IRTA_REG) register. Hardware reports the status of the Set Interrupt Remap Table Pointer operation through the IRTPS field in the Global Status register. The Set Interrupt Remap Table Pointer operation must be performed before enabling or re-enabling (after disabling) interrupt-remapping hardware through the IRE field. After a Set Interrupt Remap Table Pointer operation, software must globally invalidate the interrupt entry cache. This is required to ensure hardware uses only the interrupt-remapping entries referenced by the new interrupt remap table pointer, and not any stale cached entries. While interrupt remapping is active, software may update the interrupt remapping table pointer through this field. However, to ensure valid in-flight interrupt requests are deterministically remapped, software must ensure that the structures referenced by the new interrupt remap table pointer are programmed to provide the same remapping results as the structures referenced by the previous interrupt remap table pointer. Clearing this bit has no effect. The value returned on a read of this field is undefined. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Compatibility Format Interrupt (CFI):** This field is valid only for Intel64 implementations supporting interrupt-remapping. Software writes to this field to enable or disable Compatibility Format interrupts on Intel64 platforms. The value in this field is effective only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Block Compatibility format interrupts. • 1 = Process Compatibility format interrupts as pass-through (bypass interrupt remapping). Hardware reports the status of updating this field through the CFIS field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
22:0	0h RO	Reserved.

32.208 Global Status Register (GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch

Register to report general remapping hardware status.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Translation Enable Status (TES):** This field indicates the status of DMA-remapping hardware. • 0 = DMA-remapping hardware is not enabled. • 1 = DMA-remapping hardware is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
30	0h RO/V	**Root Table Pointer Status (RTPS):** This field indicates the status of the root- table pointer in hardware. This field is cleared by hardware when software sets the SRTP field in the Global Command register. This field is set by hardware when hardware completes the Set Root Table Pointer operation using the value provided in the Root-Entry Table Address register. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
29	0h RO	**Fault Log Status (FLS):** This field: • Is cleared by hardware when software Sets the SFL field in the Global Command register. • Is Set by hardware whn hardware completes the Set Fault Log Pointer operation using the value provided in the Advanced Fault Log register.
28	0h RO	**Adavanced Fault Logging Status (AFLS):** This field is valid only for implementations supporting advanced fault logging. It indicates the advanced fault logging status: • 0 = Advanced Fault Logging is not enabled. • 1 = Advanced Fault Logging is enabled.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Write Buffer Flush Status (WBFS):** This field is valid only for implementations requiring write buffer flushing. This field indicates the status of the write buffer flush command. It is: • Set by hardware when software sets the WBF field in the Global Command register. • Cleared by hardware when hardware completes the write buffer flushing operation.
26	0h RO/V	**Queued Invalidation Enable Status (QIES):** This field indicates queued invalidation enable status. • 0 = queued invalidation is not enabled. • 1 = queued invalidation is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
25	0h RO/V	**Interrupt Remapping Enable Status (IRES):** This field indicates the status of Interrupt-remapping hardware. • 0 = Interrupt-remapping hardware is not enabled. • 1 = Interrupt-remapping hardware is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
24	0h RO/V	**Interrupt Remapping Pointer Status (IRTPS):** This field indicates the status of the interrupt remapping table pointer in hardware. This field is cleared by hardware when software sets the SIRTP field in the Global Command register. This field is Set by hardware when hardware completes the set interrupt remap table pointer operation using the value provided in the Interrupt Remapping Table Address register. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
23	0h RO/V	**Compatibility Format Interrupt Status (CFIS):** This field indicates the status of Compatibility format interrupts on Intel64 implementations supporting interrupt-remapping. The value reported in this field is applicable only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Compatibility format interrupts are blocked. • 1 = Compatibility format interrupts are processed as pass-through (bypassing interrupt remapping). Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
22:0	0h RO	Reserved.

32.209 Root Table Address Register (RTADDR_REG_0_0_0_VTDBAR)—Offset 20h

Register providing the base address of root-entry table.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0h RW	**Root Table Address (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Root Table Type (RTT):** This field specifies the type of root-table referenced by the Root Table Address (RTA) field: • 0 = Root Table. • 1 = Extended Root Table
10:0	0h RO	Reserved.

32.210 Context Command Register (CCMD_REG_0_0_0_VTDBAR)—Offset 28h

Register to manage context cache. The act of writing the uppermost byte of the CCMD_REG with the ICC field Set causes the hardware to perform the context-cache invalidation.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 8000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/V	**Invalidate Context Cache (ICC):** Software requests invalidation of context-cache by setting this field. Software must also set the requested invalidation granularity by programming the CIRG field. Software must read back and check the ICC field is Clear to confirm the invalidation is complete. Software must not update this register when this field is set. Hardware clears the ICC field to indicate the invalidation request is complete. Hardware also indicates the granularity at which the invalidation operation was performed through the CAIG field. Software must submit a context-cache invalidation request through this field only when there are no invalidation requests pending at this remapping hardware unit. Since information from the context-cache may be used by hardware to tag IOTLB entries, software must perform domain-selective (or global) invalidation of IOTLB after the context cache invalidation has completed. Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flush before invalidating the context cache.
62:61	0h RW	**Context Invalidation Request Granularity (CIRG):** Software provides the requested invalidation granularity through this field when setting the ICC field: • 00: Reserved. • 01: Global Invalidation request. • 10: Domain-selective invalidation request. The target domain-id must be specified in the DID field. • 11: Device-selective invalidation request. The target source-id(s) must be specified through the SID and FM fields, and the domain-id (that was programmed in the context-entry for these device(s)) must be provided in the DID field. Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested. Hardware indicates completion of the invalidation request by clearing the ICC field. At this time, hardware also indicates the granularity at which the actual invalidation was performed through the CAIG field.

Bit Range	Default & Access	Field Name (ID): Description
60:59	1h RO/V	**Context Actual Invalidation Granularity (CAIG):** Hardware reports the granularity at which an invalidation request was processed through the CAIG field at the time of reporting invalidation completion (by clearing the ICC field). The following are the encodings for this field: • 00: Reserved. • 01: Global Invalidation performed. This could be in response to a global, domain-selective or device-selective invalidation request. • 10: Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or device-selective invalidation request. • 11: Device-selective invalidation performed using the source-id and domain-id specified by software in the SID and FM fields. This can only be in response to a device-selective invalidation request. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
58:34	0h RO	Reserved.
33:32	0h RW	**Function Mask (FM):** Software may use the Function Mask to perform device-selective invalidations on behalf of devices supporting PCI Express Phantom Functions...This field specifies which bits of the function number portion (least significant three bits) of the SID field to mask when performing device-selective invalidations. The following encodings are defined for this field: • 00: No bits in the SID field masked. • 01: Mask most significant bit of function number in the SID field. • 10: Mask two most significant bit of function number in the SID field. • 11: Mask all three bits of function number in the SID field. The context-entries corresponding to all the source-ids specified through the FM and SID fields must have to the domain-id specified in the DID field. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
31:16	0h RW	**Source-ID (SID):** Indicates the source-id of the device whose corresponding context-entry needs to be selectively invalidated. This field along with the FM field must be programmed by software for device-selective invalidation requests. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
15:0	0h RW	**Domain-ID (DID):** Indicates the id of the domain whose context-entries need to be selectively invalidated. This field must be programmed by software for both domain-selective and device-selective invalidation requests. The Capability register reports the domain-id width supported by hardware. Software must ensure that the value written to this field is within this limit. Hardware may ignore and not implement bits15:N, where N is the supported domain-id width reported in the Capability register.

32.211 Fault Status Register (FSTS_REG_0_0_0_VTDBAR)—Offset 34h

Register indicating the various error status.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO	**Fault Record Index (FRI):** This field is valid only when the PPF field is Set. The FRI field indicates the index (from base) of the fault recording register to which the first pending fault was recorded when the PPF field was Set by hardware. The value read from this field is undefined when the PPF field is clear.
7	0h RW/1C	**Page Request Overflow (PRO):** Hardware detected a Page Request Overflow error. Hardware implementations not supporting the Page Request Queue implement this bit as RsvdZ. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
6	0h RO	**Invalidation Time-out Error (ITE):** Hardware detected a Device-IOTLB invalidation completion time-out. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting device Device-IOTLBs implement this bit as RsvdZ.
5	0h RO	**Invalidation Completion Error (ICE):** Hardware received an unexpected or invalid Device-IOTLB invalidation completion. This could be due to either an invalid ITag or invalid source-id in an invalidation completion response. At this time, a fault event may be generated based on the programming of hte Fault Event Control register. Hardware implementations not supporting Device-IOTLBs implement this bit as RsvdZ.
4	0h RW/1C	**Invalidation Queue Error (IQE):** Hardware detected an error associated with the invalidation queue. This could be due to either a hardware error while fetching a descriptor from the invalidation queue, or hardware detecting an erroneous or invalid descriptor in the invalidation queue. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting queued invalidations implement this bit as RsvdZ. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
3	0h RO	**Advanced Pending Fault (APF):** When this field is Clear, hardware sets this field when the first fault record (at index 0) is written to a fault log. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
2	0h RO	**Advanced Fault Overflow (AFO):** Hardware sets this field to indicate advanced fault log overflow condition. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
1	0h RO/V	**Primary Pending Fault (PPF):** This field indicates if there are one or more pending faults logged in the fault recording registers. Hardware computes this field as the logical OR of Fault (F) fields across all the fault recording registers of this remapping hardware unit. • 0 = No pending faults in any of the fault recording registers. • 1 = One or more fault recording registers has pending faults. The FRI field is updated by hardware whenever the PPF field is set by hardware. Also, depending on the programming of Fault Event Control register, a fault event is generated when hardware sets this field. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
0	0h RW/1C	**Primary Fault Overflow (PFO):** Hardware sets this field to indicate overflow of fault recording registers. Software writing 1 clears this field. When this field is Set, hardware does not record any new faults until software clears this field. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

32.212 Fault Event Control Register (FECTL_REG_0_0_0_VTDBAR)—Offset 38h

Register specifying the fault event interrupt message control bits.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Interrupt Mask (IM):** • 0 = No masking of interrupt. When an interrupt condition is detected, hardware issues an interrupt message (using the Fault Event Data and Fault Event Address register values). • 1 = This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is set.

30	0h
	RO/V
		Interrupt Pending (IP): Hardware sets the IP field whenever it detects an interrupt condition, which is defined as:
		• When primary fault logging is active, an interrupt condition occurs when hardware records a fault through one of the Fault Recording registers and sets the PPF field in Fault Status register.
		• When advanced fault logging is active, an interrupt condition occurs when hardware records a fault in the first fault record (at index 0) of the current fault log and sets the APF field in the Fault Status register.
		• Hardware detected error associated with the Invalidation Queue, setting the IQE field in the Fault Status register.
		• Hardware detected invalid Device-IOTLB invalidation completion, setting the ICE field in the Fault Status register.
		• Hardware detected Device-IOTLB invalidation completion time-out, setting the ITE field in the Fault Status register.
		If any of the status fields in the Fault Status register was already Set at the time of setting any of these fields, it is not treated as a new interrupt condition. The IP field is kept set by hardware while the interrupt message is held pending. The interrupt message could be held pending due to interrupt mask (IM field) being Set or other transient hardware conditions. The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either:
		• Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending, or due to software clearing the IM field.
		• Software servicing all the pending interrupt status fields in the Fault Status register as follows:
		  • When primary fault logging is active, software clearing the Fault (F) field in all the Fault Recording registers with faults, causing the PPF field in Fault Status register to be evaluated as clear.
		  • Software clearing other status fields in the Fault Status register by writing back the value read from the respective fields.
		Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

Version Register (VER_REG_0_0_0_VTDBAR)—Offset 0h

Register to report the architecture version supported. Backward compatibility for the architecture is maintained with new revision numbers, allowing software to load remapping hardware drivers written for prior architecture versions.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:4	1h RO	**Major Version Number (MAJOR):** Indicates supported architecture version.
3:0	0h RO	**Minor Version Number (MINOR):** Indicates supported architecture minor version.

32.222 Capability Register (CAP_REG_0_0_0_VTDBAR)—Offset 8h

Register to report general remapping hardware capabilities. Note: These values can change based on defeature bits.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: D2008C40660462h

Bit Range	Default & Access	Field Name (ID): Description
63:57	0h RO	Reserved.
56	0h RO	**First Level 64-KByte Page SupportP (FL1GP):** A value of 1 in this field indicates 1-GByte page size is supported for first-level translation. Note: These values can change based on defeature bits.
55	1h RO	**Read Draining (DRD):** • 0 = Hardware does not support draining of DMA read requests. • 1 = Hardware supports draining of DMA read requests. Note: These values can change based on defeature bits.
54	1h RO	**Write Draining (DWD):** • 0 = Hardware does not support draining of DMA write requests. • 1 = Hardware supports draining of DMA write requests. Note: These values can change based on defeature bits.
53:48	12h RO	**Maximum Address Mask Value (MAMV):** The value in this field indicates the maximum supported value for the Address Mask (AM) field in the Invalidation Address register (IVA_REG) and IOTLB Invalidation Descriptor (iotlb_inv_dsc) used for invalidations of second-level translation. This field is valid only when the PSI field in Capability register is reported as Set. Note: These values can change based on defeature bits.
47:40	0h RO	**Number of Fault-Recording Registers (NFR):** Number of fault recording registers is computed as N+1, where N is the value reported in this field. Implementations must support at least one fault recording register (NFR = 0) for each remapping hardware unit in the platform. The maximum number of fault recording registers per remapping hardware unit is 256. Note: These values can change based on defeature bits.
39	1h RO	**Page Selective Invalidation (PSI):** • 0 = Hardware supports only domain and global invalidates for IOTLB.{*}1 = Hardware supports page selective, domain and global invalidates for IOTLB. Hardware implementations reporting this field as set are recommended to support a Maximum Address Mask Value (MAMV) value of at least 9 (or 18 if supporting 1GB pages with second level translation). Note: These values can change based on defeature bits.
38	0h RO	Reserved.
37:34	3h RO	**Second Level Large Page Support (SLLPS):** This field indicates the super page sizes supported by hardware. A value of 1 in any of these bits indicates the corresponding super-page size is supported. The super-page sizes corresponding to various bit positions within this field are: • 0 = 21-bit offset to page frame (2MB) • 1 = 30-bit offset to page frame (1GB) • 2 = 39-bit offset to page frame (512GB) • 3 = 48-bit offset to page frame (1TB) Hardware implementations supporting a specific super-page size must support all smaller super-page sizes, i.e. only valid values for this field are 0000b, 0001b, 0011b, 0111b, 1111b. Note: These values can change based on defeature bits.
33:24	40h RO	**Fault-Recording Register Offset (FRO):** This field specifies the location to the first fault recording register relative to the register base address of this remapping hardware unit. If the register base address is X, and the value reported in this field is Y, the address for the first fault recording register is calculated as X+(16*Y). Note: These values can change based on defeature bits.
23	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
22	1h RO	**Zero Length Read (ZLR):** • 0 = Indicates the remapping hardware unit blocks (and treats as fault) zero length DMA read requests to write-only pages. • 1 = Indicates the remapping hardware unit supports zero length DMA read requests to write-only pages. DMA remapping hardware implementations are recommended to report ZLR field as Set. Note: These values can change based on defeature bits.
21:16	26h RO	**Maximum Guest Address Width (MGAW):** This field indicates the maximum DMA virtual addressability supported by remapping hardware. The Maximum Guest Address Width (MGAW) is computed as (N+1), where N is the value reported in this field. For example, a hardware implementation supporting 48-bit MGAW reports a value of 47 (101111b) in this field. If the value in this field is X, untranslated and translated DMA requests to addresses above 2(x+1)-1 are always blocked by hardware. Translations requests to address above 2(x+1)-1 from allowed devices return a null Translation Completion Data Entry with R=W=0. Guest addressability for a given DMA request is limited to the minimum of the value reported through this field and the adjusted guest address width of the corresponding page-table structure. (Adjusted guest address widths supported by hardware are reported through the SAGAW field). Implementations are recommended to support MGAW at least equal to the physical addressability (host address width) of the platform. Note: These values can change based on defeature bits.
15:13	0h RO	Reserved.
12:8	4h RO	**Supported Adjusted Guest Address Widths (SAGAW):** This 5-bit field indicates the supported adjusted guest address widths (which in turn represents the levels of page-table walks for the 4KB base page size) supported by the hardware implementation. A value of 1 in any of these bits indicates the corresponding adjusted guest address width is supported. The adjusted guest address widths corresponding to various bit positions within this field are: • 0 = 30-bit AGAW (2-level page table) • 1 = 39-bit AGAW (3-level page table) • 2 = 48-bit AGAW (4-level page table) • 3 = 57-bit AGAW (5-level page table) • 4 = 64-bit AGAW (6-level page table) Software must ensure that the adjusted guest address width used to setup the page tables is one of the supported guest address widths reported in this field. Note: These values can change based on defeature bits.
7	0h RO	**Caching Mode (CM):** • 0 = Not-present and erroneous entries are not cached in any of the renmapping caches. Invalidations are not required for modifications to individual not present or invalid entries. However, any modifications that result in decreasing the effective permissions or partial permission increases require invalidations for them to be effective. • 1 = Not-present and erroneous mappings may be cached in the remapping caches. Any software updates to the remapping structures (including updates to not-present or erroneous entries) require explicit invalidation. Hardware implementations of this architecture must support a value of 0 in this field. Note: These values can change based on defeature bits.
6	1h RO	**Protected High-Memory Region (PHMR):** • 0 = Indicates protected high-memory region is not supported. • 1 = Indicates protected high-memory region is supported. Note: These values can change based on defeature bits.
5	1h RO	**Protected Low-Memory Region (PLMR):** • 0 = Indicates protected low-memory region is not supported. • 1 = Indicates protected low-memory region is supported. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Required Write-Buffer Flushing (RWBF):** • 0 = Indicates no write-buffer flushing is needed to ensure changes to memory-resident structures are visible to hardware. • 1 = Indicates software must explicitly flush the write buffers to ensure updates made to memory-resident remapping structures are visible to hardware. Note: These values can change based on defeature bits.
3	0h RO	**Advanced Fault Logging (AFL):** • 0 = Indicates advanced fault logging is not supported. Only primary fault logging is supported. • 1 = Indicates advanced fault logging is supported. Note: These values can change based on defeature bits.
2:0	2h RO	**Number of Domains Supported (ND):** • 000b = Hardware supports 4-bit domain-ids with support for up to 16 domains. • 001b = Hardware supports 6-bit domain-ids with support for up to 64 domains. • 010b = Hardware supports 8-bit domain-ids with support for up to 256 domains. • 011b = Hardware supports 10-bit domain-ids with support for up to 1024 domains. • 100b = Hardware supports 12-bit domain-ids with support for up to 4K domains. • 100b = Hardware supports 14-bit domain-ids with support for up to 16K domains. • 110b = Hardware supports 16-bit domain-ids with support for up to 64K domains. • 111b = Reserved. Note: These values can change based on defeature bits.

32.223 Extended Capability Register (ECAP_REG_0_0_0_VTDBAR)—Offset 10h

Register to report remapping hardware extended capabilities. Note: These values can change based on defeature bits.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: F050DAh

Bit Range	Default & Access	Field Name (ID): Description
63:41	0h RO	Reserved.
40	0h RO	**Process Address Space ID Support (PASID):** • 0 = Hardware does not support requests tagged with Process Address Space IDs. • 1 = Hardware supports requests tagged with Process Address Space IDs. Note: These values can change based on defeature bits.
39:35	0h RO	**PASID Size Supported (PSS):** This field reports the PASID size supported by the remapping hardware for requests-with-PASID. A value of N in this field indicates hardware supports PASID field of N+1 bits (For example, value of 7 in this field, indicates 8-bit PASIDs are supported). Requests-with-PASID with PASID value beyond the limit specified by this field are treated as error by the remapping hardware. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
34	0h RO	**Extended Accessed Flag Support (EAFS):** • 0 = Hardware does not support the extended-accessed (EA) bit in first-level paging-structure entries. • 1 = Hardware supports the extended accessed (EA) bit in first-level paging-structure entries. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
33	0h RO	**No Write Flag Support (NWFS):** • 0 = Hardware ignores the No Write (NW) flag in Device-TLB translationrequests, and behaves as if NW is always 0. • 1 = Hardware supports the No Write (NW) flag in Device-TLB translationrequests. This field is valid only when Device-TLB support (DT) field is reported as Set. Note: These values can change based on defeature bits.
32	0h RO	**PASID-Only Translations (POT):** • 0 = Hardware does not support PASID-only Translation Type in extended-context-entries. • 1 = Hardware supports PASID-only Translation Type in extended-context-entries. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
31	0h RO	**Supervisor Request Support (SRS):** • 0 = H/W does not support requests-with-PASID seeking supervisor privilege. • 1 = H/W supports requests-with-PASID seeking supervisor privilege. The field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
30	0h RO	**Execute Request Support (ERS):** • 0 = H/W does not support requests-with-PASID seeking execute permission. • 1 = H/W supports requests-with-PASID seeking execute permission. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
29	0h RO	**Page Request Support (PRS):** • 0 = Hardware does not support Page Requests. • 1 = Hardware supports Page Requests This field is valid only when Device-TLB (DT) field is reported as Set. Note: These values can change based on defeature bits.
28	0h RO	**Ignore (IGN):** Ignore this field
27	0h RO	**Deferred Invalidate Support (DIS):** • 0 = Hardware does not support deferred invalidations of IOTLB and Device-TLB. • 1 = Hardware supports deferred invalidations of IOTLB and Device-TLB. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
26	0h RO	**Nested Translation Support (NEST):** • 0 = Hardware does not support nested translations. • 1 = Hardware supports nested translations. This field is valid only when PASID field is reported as Set. Note: These values can change based on defeature bits.
25	0h RO	**Memory Type Support (MTS):** • 0 = Hardware does not support Memory Type in first-level translation and Extended Memory type in second-level translation. • 1 = Hardware supports Memory Type in first-level translation and Extended Memory type in second-level translation. This field is valid only when PASID and ECS fields are reported as Set. Remapping hardware units with, one or more devices that operate in processor coherency domain, under its scope must report this field as Set. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RO	**Extended Context Support (ECS):** • 0 = Hardware does not support extended-root-entries and extended-context-entries. • 1 = Hardware supports extended-root-entries and extended-context-entries. Implementations reporting PASID or PRS fields as Set, must report this field as Set. Note: These values can change based on defeature bits.
23:20	Fh RO	**Maximum Handle Mask Value (MHMV):** The value in this field indicates the maximum supported value for the Handle Mask (HM) field in the interrupt entry cache invalidation descriptor (iec_inv_dsc). This field is valid only when the IR field in Extended Capability register is reported as Set. Note: These values can change based on defeature bits.
19:18	0h RO	Reserved.
17:8	50h RO	**IOTLB Register Offset (IRO):** This field specifies the offset to the IOTLB registers relative to the register base address of this remapping hardware unit. If the register base address is X, and the value reported in this field is Y, the address for the first IOTLB invalidation register is calculated as X+(16*Y). Note: These values can change based on defeature bits.
7	1h RO	**Snoop Control (SC):** • 0 = Hardware does not support 1-setting of the SNP field in the page-table entries. • 1 = Hardware supports the 1-setting of the SNP field in the page-table entries. Note: These values can change based on defeature bits.
6	1h RO	**Pass Through (PT):** • 0 = Hardware does not support pass-through translation type in context entries and extended-context-entries. • 1 = Hardware supports pass-through translation type in context entries and extended-context-entries. Pass-through translation is specified through Translation-Type (T) field value of 10b in context-entries, or T field value of 010b in extended-context-entries. Hardware implementations supporting PASID must report a value of 1b in this field. Note: These values can change based on defeature bits.
5	0h RO	Reserved.
4	1h RO	**Extended Interrupt Mode (EIM):** • 0 = On Intel64 platforms, hardware supports only 8-bit APIC-IDs (xAPIC mode). • 1 = On Intel64 platforms, hardware supports 32-bit APIC-IDs (x2APIC mode). This field is valid only on Intel64 platforms reporting Interrupt Remapping support (IR field Set). Note: These values can change based on defeature bits.
3	1h RO	**Interrupt Remapping Suport (IR):** • 0 = Hardware does not support interrupt remapping. • 1 = Hardware supports interrupt remapping. Implementations reporting this field as Set must also support Queued Invalidation (QI). Note: These values can change based on defeature bits.
2	0h RO	**Device-TLB Support (DT):** • 0 = Hardware does not support device-IOTLBs. • 1 = Hardware supports Device-IOTLBs. Implementations reporting this field as Set must also support Queued Invalidation (QI). Hardware implementations supporting I/O Page Requests (PRS field Set in Extended Capability register) must report a value of 1b in this field. Note: These values can change based on defeature bits.
1	1h RO	**Queued Invalidation Support (QI):** • 0 = Hardware does not support queued invalidations. • 1 = Hardware supports queued invalidations. Note: These values can change based on defeature bits.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Page-Walk Coherency (C):** This field indicates if hardware access to the root, context, extended-context and interrupt-remap tables, and second-level paging structures for requests-without-PASID, are coherent (snooped) or not. • 0 = Indicates hardware accesses to remapping structures are non-coherent. • 1 = Indicates hardware accesses to remapping structures are coherent. Hardware access to advanced fault log, invalidation queue, invalidation semaphore, page-request queue, PASID-table, PASID-state table, and first-level page-tables are always coherent. Note: These values can change based on defeature bits.

32.224 Global Command Register (GCMD_REG_0_0_0_VTDBAR)—Offset 18h

Register to control remapping hardware. If multiple control fields in this register need to be modified, software must serialize the modifications through multiple writes to this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Translation Enable (TE):** Software writes to this field to request hardware to enable/disable DMA-remapping: • 0 = Disable DMA remapping. • 1 = Enable DMA remapping. Hardware reports the status of the translation enable operation through the TES field in the Global Status register. There may be active DMA requests in the platform when software updates this field. Hardware must enable or disable remapping logic only at determinstic transaction boundaries, so that any in-flight transaction is either subject to remapping or not at all. Hardware implementations supporting DMA draining must drain any in-flight DMA read/write requests queued within the Root-Complex before completing the translation enable command and reflecting the status of the command through the TES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
30	0h WO	**Set Root Table Pointer (SRTP):** Software sets this field to set/update the root-entry table pointer used by hardware. The root-entry table pointer is specified through the Root-entry Table Address (RTA_REG) register. Hardware reports the status of the Set Root Table Pointer operation through the RTPS field in the Global Status register. The Set Root Table Pointer operation must be performed before enabling or re-enabling (after disabling) DMA remapping through the TE field. .After a Set Root Table Pointer operation, software must globally invalidate the context cache and then globally invalidate of IOTLB. This is required to ensure hardware uses only the remapping structures referenced by the new root table pointer, and not stale cached entries. While DMA remapping hardware is active, software may update the root table pointer through this field. However, to ensure valid in-flight DMA requests are deterministically remapped, software must ensure that the structures referenced by the new root table pointer are programmed to provide the same remapping results as the structures referenced by the previous root-table pointer. Clearing this bit has no effect. The value returned on read of this field is undefined. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RO	**Set Fault Log (SFL):** This field is valid only for implementations supporting advanced fault logging. Software sets this field to request hardware to set/update the fault-log pointer used by hardware. The fault-log pointer is specified through Advanced Fault Log register. Hardware reports the status of the Set Fault Log operation through the FLS field in the Global Status register. The fault log pointer must be set before enabling advanced fault logging (through EAFL field). Once advanced fault logging is enabled, the fault log pointer may be updated through this field while DMA remapping is active. Clearing this bit has no effect. The value returned on read of this field is undefined.
28	0h RO	**Enable Advanced Fault Logging (EAFL):** This field is valid only for implementations supporting advanced fault logging. Software writes to this field to request hardware to enable or disable advanced fault logging: • 0 = Disable advanced fault logging. In this case, translation faults are reported through the Fault Recording registers. • 1 = Enable use of memory-resident fault log. When enabled, translation faults are recorded in the memory-resident log. The fault log pointer must be set in hardware (through the SFL field) before enabling advaned fault logging. Hardware reports the status of the advaned fault logging enable operation through the AFLS field in the Global Status register. The value returned on read of this field is undefined.
27	0h RO	**Write Buffer Flush (WBF):** This bit is valid only for implementations requiring write buffer flushing. Software sets this field to request that hardware flush the Root-Complex internal write buffers. This is done to ensure any updates to the memory-resident remapping structures are not held in any internal write posting buffers. Hardware reports the status of the write buffer flushing operation through the WBFS field in the Global Status register. Clearing this bit has no effect. The value returned on a read of this field is undefined.
26	0h RW	**Queued Invalidation Enable (QIE):** This field is valid only for implementations supporting queued invalidations. Software writes to this field to enable or disable queued invalidations. • 0 = Disable queued invalidations. • 1 = Enable use of queued invalidations. Hardware reports the status of queued invalidation enable operation through QIES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
25	0h RW	**Interrupt Remapping Enable (IRE):** This field is valid only for implementations supporting interrupt remapping. • 0 = Disable interrupt-remapping hardware. • 1 = Enable interrupt-remapping hardware. Hardware reports the status of the interrupt remapping enable operation through the IRES field in the Global Status register. There may be active interrupt requests in the platform when software updates this field. Hardware must enable or disable interrupt-remapping logic only at deterministic transaction boundaries, so that any in-flight interrupts are either subject to remapping or not at all. Hardware implementations must drain any in-flight interrupts requests queued in the Root-Complex before completing the interrupt-remapping enable command and reflecting the status of the command through the IRES field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
24	0h WO	**Set Interrupt Remap Table Pointer (SIRTP):** This field is valid only for implementations supporting interrupt-remapping. Software sets this field to set/update the interrupt remapping table pointer used by hardware. The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address (IRTA_REG) register. Hardware reports the status of the Set Interrupt Remap Table Pointer operation through the IRTPS field in the Global Status register. The Set Interrupt Remap Table Pointer operation must be performed before enabling or re-enabling (after disabling) interrupt-remapping hardware through the IRE field. After a Set Interrupt Remap Table Pointer operation, software must globally invalidate the interrupt entry cache. This is required to ensure hardware uses only the interrupt-remapping entries referenced by the new interrupt remap table pointer, and not any stale cached entries. While interrupt remapping is active, software may update the interrupt remapping table pointer through this field. However, to ensure valid in-flight interrupt requests are deterministically remapped, software must ensure that the structures referenced by the new interrupt remap table pointer are programmed to provide the same remapping results as the structures referenced by the previous interrupt remap table pointer. Clearing this bit has no effect. The value returned on a read of this field is undefined. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
23	0h RW	**Compatibility Format Interrupt (CFI):** This field is valid only for Intel64 implementations supporting interrupt-remapping. Software writes to this field to enable or disable Compatibility Format interrupts on Intel64 platforms. The value in this field is effective only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Block Compatibility format interrupts. • 1 = Process Compatibility format interrupts as pass-through (bypass interrupt remapping). Hardware reports the status of updating this field through the CFIS field in the Global Status register. The value returned on a read of this field is undefined. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
22:0	0h RO	Reserved.

32.225 Global Status Register (GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch

Register to report general remapping hardware status.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Translation Enable Status (TES):** This field indicates the status of DMA-remapping hardware. • 0 = DMA-remapping hardware is not enabled. • 1 = DMA-remapping hardware is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RO/V	**Root Table Pointer Status (RTPS):** This field indicates the status of the root- table pointer in hardware. This field is cleared by hardware when software sets the SRTP field in the Global Command register. This field is set by hardware when hardware completes the Set Root Table Pointer operation using the value provided in the Root-Entry Table Address register. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
29	0h RO	**Fault Log Status (FLS):** This field: • Is cleared by hardware when software Sets the SFL field in the Global Command register. • Is Set by hardware whn hardware completes the Set Fault Log Pointer operation using the value provided in the Advanced Fault Log register.
28	0h RO	**Adavanced Fault Logging Status (AFLS):** This field is valid only for implementations supporting advanced fault logging. It indicates the advanced fault logging status: • 0 = Advanced Fault Logging is not enabled. • 1 = Advanced Fault Logging is enabled.
27	0h RO	**Write Buffer Flush Status (WBFS):** This field is valid only for implementations requiring write buffer flushing. This field indicates the status of the write buffer flush command. It is: • Set by hardware when software sets the WBF field in the Global Command register. • Cleared by hardware when hardware completes the write buffer flushing operation.
26	0h RO/V	**Queued Invalidation Enable Status (QIES):** This field indicates queued invalidation enable status. • 0 = queued invalidation is not enabled. • 1 = queued invalidation is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
25	0h RO/V	**Interrupt Remapping Enable Status (IRES):** This field indicates the status of Interrupt-remapping hardware. • 0 = Interrupt-remapping hardware is not enabled. • 1 = Interrupt-remapping hardware is enabled Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
24	0h RO/V	**Interrupt Remapping Pointer Status (IRTPS):** This field indicates the status of the interrupt remapping table pointer in hardware. This field is cleared by hardware when software sets the SIRTP field in the Global Command register. This field is Set by hardware when hardware completes the set interrupt remap table pointer operation using the value provided in the Interrupt Remapping Table Address register. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
23	0h RO/V	**Compatibility Format Interrupt Status (CFIS):** This field indicates the status of Compatibility format interrupts on Intel64 implementations supporting interrupt-remapping. The value reported in this field is applicable only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Compatibility format interrupts are blocked. • 1 = Compatibility format interrupts are processed as pass-through (bypassing interrupt remapping). Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
22:0	0h RO	Reserved.

32.226 Root Table Address Register (RTADDR_REG_0_0_0_VTDBAR)—Offset 20h

Register providing the base address of root-entry table.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0h RW	**Root Table Address (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory. Hardware ignores and not implements bits 63:HAW, where HAW is the host address width. Software specifies the base address of the root-entry table through this register, and programs it in hardware through the SRTP field in the Global Command register. Reads of this register returns value that was last programmed to it.
11	0h RW	**Root Table Type (RTT):** This field specifies the type of root-table referenced by the Root Table Address (RTA) field: • 0 = Root Table. • 1 = Extended Root Table
10:0	0h RO	Reserved.

32.227 Context Command Register (CCMD_REG_0_0_0_VTDBAR)—Offset 28h

Register to manage context cache. The act of writing the uppermost byte of the CCMD_REG with the ICC field Set causes the hardware to perform the context-cache invalidation.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 8000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RW/V	**Invalidate Context Cache (ICC):** Software requests invalidation of context-cache by setting this field. Software must also set the requested invalidation granularity by programming the CIRG field. Software must read back and check the ICC field is Clear to confirm the invalidation is complete. Software must not update this register when this field is set. Hardware clears the ICC field to indicate the invalidation request is complete. Hardware also indicates the granularity at which the invalidation operation was performed through the CAIG field. Software must submit a context-cache invalidation request through this field only when there are no invalidation requests pending at this remapping hardware unit. Since information from the context-cache may be used by hardware to tag IOTLB entries, software must perform domain-selective (or global) invalidation of IOTLB after the context cache invalidation has completed. Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flush before invalidating the context cache.
62:61	0h RW	**Context Invalidation Request Granularity (CIRG):** Software provides the requested invalidation granularity through this field when setting the ICC field: • 00: Reserved. • 01: Global Invalidation request. • 10: Domain-selective invalidation request. The target domain-id must be specified in the DID field. • 11: Device-selective invalidation request. The target source-id(s) must be specified through the SID and FM fields, and the domain-id (that was programmed in the context-entry for these device(s)) must be provided in the DID field. Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested. Hardware indicates completion of the invalidation request by clearing the ICC field. At this time, hardware also indicates the granularity at which the actual invalidation was performed through the CAIG field.
60:59	1h RO/V	**Context Actual Invalidation Granularity (CAIG):** Hardware reports the granularity at which an invalidation request was processed through the CAIG field at the time of reporting invalidation completion (by clearing the ICC field). The following are the encodings for this field: • 00: Reserved. • 01: Global Invalidation performed. This could be in response to a global, domain-selective or device-selective invalidation request. • 10: Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or device-selective invalidation request. • 11: Device-selective invalidation performed using the source-id and domain-id specified by software in the SID and FM fields. This can only be in response to a device-selective invalidation request. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
58:34	0h RO	Reserved.
33:32	0h RW	**Function Mask (FM):** Software may use the Function Mask to perform device-selective invalidations on behalf of devices supporting PCI Express Phantom Functions...This field specifies which bits of the function number portion (least significant three bits) of the SID field to mask when performing device-selective invalidations. The following encodings are defined for this field: • 00: No bits in the SID field masked. • 01: Mask most significant bit of function number in the SID field. • 10: Mask two most significant bit of function number in the SID field. • 11: Mask all three bits of function number in the SID field. The context-entries corresponding to all the source-ids specified through the FM and SID fields must have to the domain-id specified in the DID field. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Source-ID (SID):** Indicates the source-id of the device whose corresponding context-entry needs to be selectively invalidated. This field along with the FM field must be programmed by software for device-selective invalidation requests. Note: This field behaves like a WO field except for requests with certain SAIs: Power Management, DFX Red2, and DFX Red4.
15:0	0h RW	**Domain-ID (DID):** Indicates the id of the domain whose context-entries need to be selectively invalidated. This field must be programmed by software for both domain-selective and device-selective invalidation requests. The Capability register reports the domain-id width supported by hardware. Software must ensure that the value written to this field is within this limit. Hardware may ignore and not implement bits15:N, where N is the supported domain-id width reported in the Capability register.

32.228 Fault Status Register (FSTS_REG_0_0_0_VTDBAR)—Offset 34h

Register indicating the various error status.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO	**Fault Record Index (FRI):** This field is valid only when the PPF field is Set. The FRI field indicates the index (from base) of the fault recording register to which the first pending fault was recorded when the PPF field was Set by hardware. The value read from this field is undefined when the PPF field is clear.
7	0h RW/1C	**Page Request Overflow (PRO):** Hardware detected a Page Request Overflow error. Hardware implementations not supporting the Page Request Queue implement this bit as RsvdZ. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
6	0h RO	**Invalidation Time-out Error (ITE):** Hardware detected a Device-IOTLB invalidation completion time-out. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting device Device-IOTLBs implement this bit as RsvdZ.
5	0h RO	**Invalidation Completion Error (ICE):** Hardware received an unexpected or invalid Device-IOTLB invalidation completion. This could be due to either an invalid ITag or invalid source-id in an invalidation completion response. At this time, a fault event may be generated based on the programming of hte Fault Event Control register. Hardware implementations not supporting Device-IOTLBs implement this bit as RsvdZ.
4	0h RW/1C	**Invalidation Queue Error (IQE):** Hardware detected an error associated with the invalidation queue. This could be due to either a hardware error while fetching a descriptor from the invalidation queue, or hardware detecting an erroneous or invalid descriptor in the invalidation queue. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting queued invalidations implement this bit as RsvdZ. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Advanced Pending Fault (APF):** When this field is Clear, hardware sets this field when the first fault record (at index 0) is written to a fault log. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
2	0h RO	**Advanced Fault Overflow (AFO):** Hardware sets this field to indicate advanced fault log overflow condition. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
1	0h RO/V	**Primary Pending Fault (PPF):** This field indicates if there are one or more pending faults logged in the fault recording registers. Hardware computes this field as the logical OR of Fault (F) fields across all the fault recording registers of this remapping hardware unit. • 0 = No pending faults in any of the fault recording registers. • 1 = One or more fault recording registers has pending faults. The FRI field is updated by hardware whenever the PPF field is set by hardware. Also, depending on the programming of Fault Event Control register, a fault event is generated when hardware sets this field. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.
0	0h RW/1C	**Primary Fault Overflow (PFO):** Hardware sets this field to indicate overflow of fault recording registers. Software writing 1 clears this field. When this field is Set, hardware does not record any new faults until software clears this field. Note: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

32.229 Fault Event Control Register (FECTL_REG_0_0_0_VTDBAR)—Offset 38h

Register specifying the fault event interrupt message control bits.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Interrupt Mask (IM):** • 0 = No masking of interrupt. When an interrupt condition is detected, hardware issues an interrupt message (using the Fault Event Data and Fault Event Address register values). • 1 = This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is set.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RO/V	**Interrupt Pending (IP):** Hardware sets the IP field whenever it detects an interrupt condition, which is defined as: • When primary fault logging is active, an interrupt condition occurs when hardware records a fault through one of the Fault Recording registers and sets the PPF field in Fault Status register. • When advanced fault logging is active, an interrupt condition occurs when hardware records a fault in the first fault record (at index 0) of the current fault log and sets the APF field in the Fault Status register. • Hardware detected error associated with the Invalidation Queue, setting the IQE field in the Fault Status register. • Hardware detected invalid Device-IOTLB invalidation completion, setting the ICE field in the Fault Status register. • Hardware detected Device-IOTLB invalidation completion time-out, setting the ITE field in the Fault Status register. If any of the status fields in the Fault Status register was already Set at the time of setting any of these fields, it is not treated as a new interrupt condition. The IP field is kept set by hardware while the interrupt message is held pending. The interrupt message could be held pending due to interrupt mask (IM field) being Set or other transient hardware conditions. The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either: • Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending, or due to software clearing the IM field. • Software servicing all the pending interrupt status fields in the Fault Status register as follows: — When primary fault logging is active, software clearing the Fault (F) field in all the Fault Recording registers with faults, causing the PPF field in Fault Status register to be evaluated as clear. — Software clearing other status fields in the Fault Status register by writing back the value read from the respective fields. **Note**: This field becomes a RW field based on request SAIs: Power Managment, DFX Red2, and DFX Red4.

§ §

33 USB 2 Tuning Registers

33.1 c73usb280_USB2 PER PORT (USB2_PER_PORT_PP0)—Offset 4100h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 5DA81h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Per-Port UTMI_CLK Output Clock Gating Enable (PPUOCGE):** 1: Dynamic Clock Gating is enabled based on L1/L2 suspend indicator. This is the recommended setting for SYNOPSYS based controllers. 0: Output UTMI_CLK is running unless USB PLL is shutdown. This is the recommended setting for FRESCO based controllers.
30	0h RW	**RX EN AFE Control (RXENAC):** 1: Enables the dynamic RX EN behavior. This allows compensation code updates at various boundaries. 0: Disables the dynamic RX EN behavior (function of TXVALID only). RXENAC, RXBIASAC: 00: Legacy mode 01: Illegal 10: Allows additional code update window 11: Allows additional code update window with power saving
29	0h RW	**RX BIAS AFE Control (RXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal RXBIAS policy is selected (SELSBRXBIASEN = 0b).
28	0h RW	**TX BIAS AFE Control (TXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal TXBIAS policy is selected (SELSBTXBIASEN = 0b).
27	0h RW	**RX CLKEN AFE Clock Gating (RXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal RXCLKEN policy is selected (SELRXCLKEN = 0b).
26	0h RW	**TX CLKEN AFE Clock Gating (TXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal TXCLKEN policy is selected (SELTXCLKEN = 0b).
25	0h RW	**ENHSCLK2PORT (ENHSCLK2PORT):** This per-port pin will generate HS clock data pattern for testing purposes for that port and ignore the core data during Tx: 1: The port will transmit 10101..clock data pattern when txen=1. 0: The port will resume to c73usb280_normal operation where data is generated by the controller.
24	0h RW	**SELSBRXBIASEN (SELSBRXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE RX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**SELSBTXBIASEN (SELSBTXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE TX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
22	0h WO	**RSVD (RSVD):** RSVD
21	0h RW	**SELTXCLKEN (SELTXCLKEN):** This is to select between internal mode vs. side-band control on the TX clock enable signal. 0 - override for TXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
20	0h RW	**SELRXCLKEN (SELRXCLKEN):** This is to select between internal mode vs. side-band control on the RX clock enable signal. 0 - override for RXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
19:17	2h RW	**PerPort HS Receiver Bias (PERPORTRXISET):** Config bit (per port) HS Receiver Bias current offset bit (2:0) 000 - 80uA 001 - 90uA 010 (default) - 100uA 011 - 110uA 100 - 120uA 101 - 130uA 110 - 140uA 111 - 150uA
16	1h RW	**PerPort Common Mode Pre-charge (PERPORTTXPRECHARGEEN):** Config bit (per port) To select whether to enable or disable the common mode pre-charge during SOP and EOP. Pre-charge hold for 4 cycles before first data transmission. This is to allow common choke ring back to settle down before driving first data bit to meet eye opening spec. 1 - pre-charge ON 0 - pre-charge OFF
15	1h RW	**RX ERROR FIX ENABLE (RXERROR_FIXEN):** When reg_utmi_rxerror_fixen = 1'b1, Rxerror fix is enabled When reg_utmi_rxerror_fixen = 1'b0, Rxerror fix is disabled
14	1h RW	**PerPort Half Bit Pre-emphasis (PERPORTTXPEHALF):** Config bit (per port) to select between half-bit or full-bit implementation 1 - select half-bit pre-emphasis 0 - select full-bit pre-emphasis
13:11	3h RW	**PerPort HS Pre-emphasis Bias (PERPORTPETXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV

Bit Range	Default & Access	Field Name (ID): Description
10:8	2h RW	**PerPort HS Transmitter Bias (PERPORTTXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
7:4	8h RW	**PORTRESERVED_0123 (PORTRESERVED):** PORTRESERVED (PORTRESERVED): Reserved pin for future functionality of the respective ports iusbportreserved[0] is used for differential disconnect purpose. 0 - Differential disconnect and HS squelch uses the same voltage reference (sqref-sqrefb = diffdiscref - diffdiscrefb) 1 - Differential disconnect and HS squelch uses different voltage reference (sqref-sqrefb != diffdiscref - diffdiscrefb) iusbportreserved[1] - iusbafedaten_h_dfxoveride 0 - functional mode. iusbafedaten will be controlled functionally by PCS logic 1 - test mode. The iusbafedaten will be forced to 1 to ensure CL TX is never blocked. iusbportreserved[3:2] - reserved for future functionality.
3	0h RW	**CL TX EMI Reduction Circuit Bypass (CLTXEMIREDCCTBYPASS)** Assert 1 to bypass the EMI reduction circuit. Default is 0b. AFE pin remains as PORTRESERVED for this project.
2	0h RW	**PERPORT ALLPORTZ (PERPORTALLPORTZ):** Legacy pin. No longer carries any functionality as the pull-down enable is now controlled by ilane5:0usbpdnen_h
1	0h RW	**PERPORT PPDPDMBSEL (PERPORTPPDPDMBSEL):** Config bit to select comparator 2:1 mux input either dp or dm for HS TX per port current calibration 1 - select dp (for debug purpose only) 0 - select dm (without 1.5K pullup)
0	1h RW	**PERPORT TX EOS protection enable (PERPORTTXEOS):** Set to 1b enables the TX EOS protection. To protect high speed driver passgate.

33.2 c73usb280_USB2 PER PORT 2 (USB2_PER_PORT_2_PP0)—Offset 4126h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Device:
Function:

Default: 5DA81h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Per-Port UTMI_CLK Output Clock Gating Enable (PPUOCGE):** 1: Dynamic Clock Gating is enabled based on L1/L2 suspend indicator. This is the recommended setting for SYNOPSYS based controllers. 0: Output UTMI_CLK is running unless USB PLL is shutdown. This is the recommended setting for FRESCO based controllers.
30	0h RW	**RX EN AFE Control (RXENAC):** 1: Enables the dynamic RX EN behavior. This allows compensation code updates at various boundaries. 0: Disables the dynamic RX EN behavior (function of TXVALID only). RXENAC, RXBIASAC: 00: Legacy mode 01: Illegal 10: Allows additional code update window 11: Allows additional code update window with power saving
29	0h RW	**RX BIAS AFE Control (RXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal RXBIAS policy is selected (SELSBRXBIASEN = 0b).

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**TX BIAS AFE Control (TXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal TXBIAS policy is selected (SELSBTXBIASEN = 0b).
27	0h RW	**RX CLKEN AFE Clock Gating (RXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal RXCLKEN policy is selected (SELRXCLKEN = 0b).
26	0h RW	**TX CLKEN AFE Clock Gating (TXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal TXCLKEN policy is selected (SELTXCLKEN = 0b).
25	0h RW	**ENHSCLK2PORT (ENHSCLK2PORT):** This per-port pin will generate HS clock data pattern for testing purposes for that port and ignore the core data during Tx: 1: The port will transmit 10101..clock data pattern when txen=1. 0: The port will resume to c73usb280_normal operation where data is generated by the controller.
24	0h RW	**SELSBRXBIASEN (SELSBRXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE RX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
23	0h RW	**SELSBTXBIASEN (SELSBTXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE TX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
22	0h WO	**RSVD (RSVD):** RSVD
21	0h RW	**SELTXCLKEN (SELTXCLKEN):** This is to select between internal mode vs. side-band control on the TX clock enable signal. 0 - override for TXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
20	0h RW	**SELRXCLKEN (SELRXCLKEN):** This is to select between internal mode vs. side-band control on the RX clock enable signal. 0 - override for RXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
19:17	2h RW	**PerPort HS Receiver Bias (PERPORTRXISET):** Config bit (per port) HS Receiver Bias current offset bit (2:0) 000 - 80uA 001 - 90uA 010 (default) - 100uA 011 - 110uA 100 - 120uA 101 - 130uA 110 - 140uA 111 - 150uA
16	1h RW	**PerPort Common Mode Pre-charge (PERPORTTXPRECHARGEEN):** Config bit (per port) To select whether to enable or disable the common mode pre-charge during SOP and EOP. Pre-charge hold for 4 cycles before first data transmission. This is to allow common choke ring back to settle down before driving first data bit to meet eye opening spec. 1 - pre-charge ON 0 - pre-charge OFF
15	1h RW	**RX ERROR FIX ENABLE (RXERROR_FIXEN):** When reg_utmi_rxerror_fixen = 1'b1, Rxerror fix is enabled When reg_utmi_rxerror_fixen = 1'b0, Rxerror fix is disabled

Bit Range	Default & Access	Field Name (ID): Description
14	1h RW	**PerPort Half Bit Pre-emphasis (PERPORTTXPEHALF):** Config bit (per port) to select between half-bit or full-bit implementation 1 - select half-bit pre-emphasis 0 - select full-bit pre-emphasis
13:11	3h RW	**PerPort HS Pre-emphasis Bias (PERPORTPETXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
10:8	2h RW	**PerPort HS Transmitter Bias (PERPORTTXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
7:4	8h RW	**PORTRESERVED_0123 (PORTRESERVED):** PORTRESERVED (PORTRESERVED): Reserved pin for future functionality of the respective ports iusbportreserved[0] is used for differential disconnect purpose. 0 - Differential disconnect and HS squelch uses the same voltage reference (sqref-sqrefb = diffdiscref - diffdiscrefb) 1 - Differential disconnect and HS squelch uses different voltage reference (sqref-sqrefb != diffdiscref - diffdiscrefb) iusbportreserved[1] - iusbafedaten_h_dfxoveride 0 - functional mode. iusbafedaten will be controlled functionally by PCS logic 1 - test mode. The iusbafedaten will be forced to 1 to ensure CL TX is never blocked. iusbportreserved[3:2] - reserved for future functionality.
3	0h RW	**CL TX EMI Reduction Circuit Bypass (CLTXEMIREDCCTBYPASS):** Assert 1 to bypass the EMI reduction circuit. Default is 0b. AFE pin remains as PORTRESERVED for this project.
2	0h RW	**PERPORT ALLPORTZ (PERPORTALLPORTZ):** Legacy pin. No longer carries any functionality as the pull-down enable is now controlled by ilane5:0usbpdnen_h
1	0h RW	**PERPORT PPDPDMBSEL (PERPORTPPDPDMBSEL):** Config bit to select comparator 2:1 mux input either dp or dm for HS TX per port current calibration 1 - select dp (for debug purpose only) 0 - select dm (without 1.5K pullup)
0	1h RW	**PERPORT TX EOS protection enable (PERPORTTXEOS):** Set to 1b enables the TX EOS protection. To protect high speed driver passgate.

RXENAC, RXBIASAC: 00: Legacy mode 01: Illegal 10: Allows additional code update window 11: Allows additional code update window with power saving
29	0h RW	**RX BIAS AFE Control (RXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal RXBIAS policy is selected (SELSBRXBIASEN = 0b).
28	0h RW	**TX BIAS AFE Control (TXBIASAC):** 1: Enables the AFE bias control 0: Disables the AFE bias control This bit is only valid when internal TXBIAS policy is selected (SELSBTXBIASEN = 0b).
27	0h RW	**RX CLKEN AFE Clock Gating (RXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal RXCLKEN policy is selected (SELRXCLKEN = 0b).
26	0h RW	**TX CLKEN AFE Clock Gating (TXCLKENACG):** 1: Enables the AFE clock gating 0: Disables the AFE clock gating This bit is only valid when internal TXCLKEN policy is selected (SELTXCLKEN = 0b).
25	0h RW	**ENHSCLK2PORT (ENHSCLK2PORT):** This per-port pin will generate HS clock data pattern for testing purposes for that port and ignore the core data during Tx: 1: The port will transmit 10101..clock data pattern when txen=1. 0: The port will resume to c73usb280_normal operation where data is generated by the controller.
24	0h RW	**SELSBRXBIASEN (SELSBRXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE RX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
23	0h RW	**SELSBTXBIASEN (SELSBTXBIASEN):** This is to select between the UTMI internal vs. side-band control over the AFE TX bias enable signal. 1 - select side-band control from Intel SIP controller. 0 - select UTMI internally generated control. This is to be used with third party or external controller IP.
22	0h WO	**RSVD (RSVD):** RSVD

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**SELTXCLKEN (SELTXCLKEN):** This is to select between internal mode vs. side-band control on the TX clock enable signal. 0 - override for TXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
20	0h RW	**SELRXCLKEN (SELRXCLKEN):** This is to select between internal mode vs. side-band control on the RX clock enable signal. 0 - override for RXCLKEN to be internally controlled. To be used with third party or external controller IP. 1 - select side-band control from Intel SIP controller.
19:17	2h RW	**PerPort HS Receiver Bias (PERPORTRXISET):** Config bit (per port) HS Receiver Bias current offset bit (2:0) 000 - 80uA 001 - 90uA 010 (default) - 100uA 011 - 110uA 100 - 120uA 101 - 130uA 110 - 140uA 111 - 150uA
16	1h RW	**PerPort Common Mode Pre-charge (PERPORTTXPRECHARGEEN):** Config bit (per port) To select whether to enable or disable the common mode pre-charge during SOP and EOP. Pre-charge hold for 4 cycles before first data transmission. This is to allow common choke ring back to settle down before driving first data bit to meet eye opening spec. 1 - pre-charge ON 0 - pre-charge OFF
15	1h RW	**RX ERROR FIX ENABLE (RXERROR_FIXEN):** When reg_utmi_rxerror_fixen = 1'b1, Rxerror fix is enabled When reg_utmi_rxerror_fixen = 1'b0, Rxerror fix is disabled
14	1h RW	**PerPort Half Bit Pre-emphasis (PERPORTTXPEHALF):** Config bit (per port) to select between half-bit or full-bit implementation 1 - select half-bit pre-emphasis 0 - select full-bit pre-emphasis
13:11	3h RW	**PerPort HS Pre-emphasis Bias (PERPORTPETXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV
10:8	2h RW	**PerPort HS Transmitter Bias (PERPORTTXISET):** Config bit (per port) HS Pre-emphasis Bias current offset bit2 (2:0) Value Preempen: deempen = 01 Preempen: deempen = 10 Preempen: deempen = 11 (preemphasis strength/demphasis strength) Value (De-emphasis ON) (Pre-emphasis ON) (preemphasis strength/demphasis strength) 000 0mV 0mV 0mV 001 40.5mV 20.5mV 20.5mV/20.5mV 010 60.5mV 30.5mV 30.5mV/30.5mV 011 102mV 52mV 52mV/52mV 100 102mV 52mV 52mV/52mV 101 142mV 72.5mV 72.5mV/72.5mV 110 162.5mV 85mV 85mV/85mV 111 202.5mV 105mV 105mV/105mV

Bit Range	Default & Access	Field Name (ID): Description
7:4	8h RW	**PORTRESERVED_0123 (PORTRESERVED):** PORTRESERVED (PORTRESERVED): Reserved pin for future functionality of the respective ports iusbportreserved[0] is used for differential disconnect purpose. 0 - Differential disconnect and HS squelch uses the same voltage reference (sqref-sqrefb = diffdiscref - diffdiscrefb) 1 - Differential disconnect and HS squelch uses different voltage reference (sqref-sqrefb != diffdiscref - diffdiscrefb) iusbportreserved[1] - iusbafedaten_h_dfxoveride 0 - functional mode. iusbafedaten will be controlled functionally by PCS logic 1 - test mode. The iusbafedaten will be forced to 1 to ensure CL TX is never blocked. iusbportreserved[3:2] - reserved for future functionality.
3	0h RW	**CL TX EMI Reduction Circuit Bypass (CLTXEMIREDCCTBYPASS):** Assert 1 to bypass the EMI reduction circuit. Default is 0b. AFE pin remains as PORTRESERVED for this project.
2	0h RW	**PERPORT ALLPORTZ (PERPORTALLPORTZ):** Legacy pin. No longer carries any functionality as the pull-down enable is now controlled by ilane5:0usbpdnen_h
1	0h RW	**PERPORT PPDPDMBSEL (PERPORTPPDPDMBSEL):** Config bit to select comparator 2:1 mux input either dp or dm for HS TX per port current calibration 1 - select dp (for debug purpose only) 0 - select dm (without 1.5K pullup)
0	1h RW	**PERPORT TX EOS protection enable (PERPORTTXEOS):** Set to 1b enables the TX EOS protection. To protect high speed driver passgate.

§ §

34 Real Time Clock (RTC) Registers

34.1 RTC Index Register (INDEX)—Offset 70h

This 8-bit register selects which indirect register appears in the target register to be manipulated by software. Software will program this register to select the desired RTC indexed register.

Access Method

Type: MSG Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Index Register (INDEX):** Index Register for RTC

34.2 RTC Target Register (TARGET)—Offset 71h

This 32-bit register specifies the data to be read or written to the register pointed to by the INDEX register.

Access Method

Type: MSG Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/V	**RTC Target Register (TARGET):** RTC Target Register for RTC

34.3 Seconds (Sec)—Offset 0h

RTC Index: 00h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time second

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Seconds (Sec):** Time Seconds. The time in seconds can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

34.4 Seconds Alarm (Sec_Alarm)—Offset 1h

RTC Index: 01h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Seconds Alarm

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Seconds Alarm (Sec_Alarm):** Seconds field of the Alarm

34.5 Minutes (Minutes)—Offset 2h

RTC Index: 02h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Minutes

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Minutes (Minutes):** Time Minutes. The time in minutes can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

34.6 Minutes Alarm (Minutes_Alarm)—Offset 3h

RTC Index: 03h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Minutes

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Minutes Alarm (Minutes_Alarm):** Minutes field of the Alarm

34.7 Hours (Hours)—Offset 4h

RTC Index: 04h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Hours

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Hours (Hours):** Time Hours. The time in hours can be represented in either BCD or Binary format depending on the value in RegB.Data Mode. It can also be represented in either 12-hour mode or 24-hour mode depending on the value in RegB.Hour Format.

34.8 Hours Alarm (Hours_Alarm)—Offset 5h

RTC Index: 05h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Hours

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Hours Alarm (Hours_Alarm):** Hours field of the Alarm

34.9 Day of Week (Day_of_Week)—Offset 6h

RTC Index: 06h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Week

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Day of Week (Day_of_Week):** This field indicates current Day of Week. 1-Sunday 2-Monday 3-Tuesday 4-Wednesday 5-Thursday 6-Friday 7-Saturday. The value is the same regardless of the Data Mode.

34.10 Day of Month (Day_of_Month)—Offset 7h

RTC Index: 07h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Month

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Day of Month (Day_of_Month):** This field indicates current Day of Month. The day of month can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

34.11 Month (Month)—Offset 8h

RTC Index: 08h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Month

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Month (Month):** This field indicates current Month. The month can be represented in either BCD or Binary format depending on the value in RegB.Data Mode.

34.12 Year (Year)—Offset 9h

RTC Index: 09h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Year

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Year (Year):** This field indicates current Year. The year can be represented in either BCD or Binary format depending on the value in RegB.Data Mode

34.13 Register A (Register_A)—Offset Ah

RTC Index: 0Ah Attribute: Read/Write Default Value: 0UUUUUUU Size: 8-bit Lockable: No Power Well: RTC This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO/V	**UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag. When asserted as a 1, the update is soon to occur or is in progress. If 0, the update cycle will not start for at least 488 s. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. The ICH provides the ability to generate SMI# based on either the 0-to-1 or 1-to-0 transition of this bit. This can be useful for work-arounds and debug in silicon. See Chapter 32 for SMI# status bits related to the Update In Progress.
6:4	7h RW	**Division Chain Select (DV_2_0):** These three bits control the divider chain for the oscillator, and are not affected by RSMRST# or any other reset signal. DV(2) corresponds to bit 6. DV2 DV1 DV0 Function 0 1 0 Normal Operation 1 1 X Divider Reset 1 0 1 Bypass 15 stages (test mode only) 1 0 0 Bypass 10 stages (test mode only) 0 1 1 Bypass 5 stages (test mode only) 0 0 1 Invalid 0 0 0 Invalid
3:0	0h RW	**Rate Select (RS_3_0):** Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt if the PIE bit is set in Register B. Otherwise this tap will set the PF flag of Register C. If the periodic interrupt is not to be used, these bits should all be set to zero. RS3 corresponds to bit 3. RS3 RS2 RS1 RS0 Periodic Rate 0 0 0 0 Interrupt never toggles 0 0 0 1 3.90625 ms 0 0 1 0 7.8125 ms 0 0 1 1 122.070 s 0 1 0 0 244.141 s 0 1 0 1 488.281 s 0 1 1 0 976.5625s 0 1 1 1 1.953125 ms 1 0 0 0 3.90625 ms 1 0 0 1 7.8125 ms 1 0 1 0 15.625 ms 1 0 1 1 31.25 ms 1 1 0 0 62.5 ms 1 1 0 1 125 ms 1 1 1 0 250 ms 1 1 1 1 500 ms

34.14 Register B - General Configuration (Register_B)—Offset Bh

RTC Index: 0Bh Attribute: Read/Write Default Value: 10000UUU Size: 8-bit Lockable: No Power Well: RTC

Access Method

Type: IO Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**Update Cycle Inhibit (SET):** Enables/Inhibits the update cycles. When SET is 0, update cycle occurs normally once each second. If set to one, a current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set is one, the BIOS may initialize time and calendar bytes safely. This bit is not affected by RSMRST# nor any other reset signal. Note: Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly.
6	0h RW	**Periodic Interrupt Enable (PIE):** If set to 1, the Periodic Interrupt Enable (PIE) bit allows an interrupt to occur with a time base set with the RS bits of register A. This bit is cleared by RSMRST#, but not on any other reset
5	0h RW	**Alarm Interrupt Enable (AIE):** If set to one, the Alarm Interrupt Enable (AIE) bit allows an interrupt to occur when the AF is one as set from an alarm match from the update cycle. An alarm can occur once a second, one an hour, once a day, or once a month. This bit is cleared by RTEST# #, but not on any other reset
4	0h RW	**Update-ended Interrupt Enable: (UIE):** If set to one, the Update-ended Interrupt Enable (UIE) bit allows an interrupt to occur when the update cycle ends. This bit is cleared by RSMRST#, but not on any other reset
3	0h RW	**Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device, yet is left in this register bank to provide compatibility with the Motorola 146818B. There is not SQW pin on this device. This bit is cleared by RSMRST#, but not on any other reset.
2	0h RW	**Data Mode (DM):** The Data Mode (DM) bit specifies either binary or BCD data representation. A one denotes binary, and zero denotes BCD. This bit is not affected by RSMRST# nor any other reset signal.
1	0h RW	**Hour Format (HOURFORM):** This bit indicates the hour byte format. If one, twenty-four hour mode is selected. If zero, twelve-hour mode is selected. In twelve hour mode, the seventh bit represents AM as zero and PM as one. This bit is not affected by RSMRST# nor any other reset signal.
0	0h RW	**Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one. One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM. The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM. The time must increment normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly. These special update conditions do not occur when the DSE bit is set to zero. The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years. This bit is not affected by RSMRST# nor any other reset signal. If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit.

34.15 Register C - Flag Register (Register_C)—Offset Ch

RTC Index: 0Ch Attribute: Read-Only (Writes have no effect). Default Value: 00000000 Size: 8-bit Lockable: No Power Well: RTC

Access Method

Type: IO Register (Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Interrupt Request Flag (IRQF):** Interrupt Request Flag = PF * PIE + AF * AIE + UF * UFE. This also causes the RTC Interrupt to be asserted. This bit is cleared upon RSMRST# or a read of Register C.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one. If no taps are specified, this flag bit will remain at zero. This bit is cleared upon RSMRST# or a read of Register C.
5	0h RO	**Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time. This bit is cleared upon RTEST# or a read of Register C.
4	0h RO	**Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second. The bit is cleared upon RSMRST# or a read of Register C.
3:0	0h RO	**Reserved (RSVD):** Will always report 0

34.16 Register D - Flag Register (Register_D)—Offset Dh

RTC Index: 0Dh Attribute: Read/Write Default Value: 10UUUUUU Size: 8-bit Lockable: No Power Well: RTC

Access Method

Type: IO Register (Size: 8 bits)

Device:

Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well. This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.
6	0h RO	**Reserved (RSVD):** This bit always returns a 0 and should be set to 0 for write cycles.
5:0	0h RW	**Date Alarm (Date_Alarm):** These bits store the date of month alarm value. If set to 000000, then a dont care state is assumed. The host must configure the dates alarm for these bits to do anything, yet they can be written at any time. If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B. These bits are not affected by any reset assertion.

34.17 114 Bytes of Lower User RAM (Register_E)—Offset Eh

Remaining 114 Bytes of Lower User RAM. Each byte in this bank share the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Access Method

Type: IO Register (Size: 8 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Lower User RAM (LOWER_USER_RAM):** RTC RAM lower unused range

34.18 128 Bytes of Upper User RAM (Register_80)—Offset 80h

128 Bytes of Upper User RAM. Each byte in this bank share the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Upper User RAM (UPPER_USER_RAM):** RTC RAM upper unused range

34.19 RTC Configuration (RC)—Offset 3400h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1L	**Bios Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed. This bit can only be written from 0 to 1 once. This BILD bit has different function compared to LPC, SPI and eSPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly.
30:7	0h RO	**Reserved (RSVD_RC_1):** Reserved
6	0h RW	**RTC High Power Mode HW Disable (HPM_HW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled when SLP_S0# is asserted to '0'. (via irtcdswen pin to RTC EBB). When 0, HW control of the RTC internal VRM is disabled.
5	0h RW	**RTC High Power Mode SW Disable (HPM_SW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled (via irtcdswen pin to RTC EBB). When 0 the internal VRM powers the rtc well when RSMRST# is '1'. (default)

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1L	**Partial Range Lock in Upper 128 Bytes (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
3	0h RW/1L	**Partial Range Lock in Lower 128 Bytes (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
2	0h RW	**Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed.
1:0	0h RO	**Reserved (RSVD_RC_0):** Reserved

34.20 Backed Up Control (BUC)—Offset 3414h

All bits in this register are in the RTC well and only cleared by RTEST.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD_BUC_4):** Reserved
7	0h RO	**Reserved (RSVD_BUC_3):** Reserved
6	0h RW	**Reserved (RSVD_BUC_2):** Reserved
5	0h RW	**LAN Disable (LanDisable):** '0': LAN is Enabled '1': LAN is Disabled. It will not claim any configuration cycles on SPXB or MBB nor initiate any cycles on SPXB or MBB. When the RTC backup copy of the LAN Disable Fuse is set, this register is Read Only '1'. If the RTC backup copy of the LAN Disable Fuse is not set, this register is reset to 0 on RTEST#. If the Function Disable SUS Well Lockdown register is set, this bit can not be changed by software.
4	0h RW	**Daylight Savings Override (SDO):** When this bit is a '1', the DSE bit in the RTC Register B bit(0) is a RW bit but has no effect where daylight savings is hard-disabled internally. When this bit is a '0', the DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized.
3	0h RW	**NetDetect Enable (NDE):** If this bit is '1' and the South MLink Enable bit is '0' (ME PM RTCPMCFG.SMLEN), then the GPIO(14) input signal is muxed onto the South MLink MLCLK pin as a NetDetect Request signal to the wireless LAN component. If the South MLink Enable bit is a '1', then the South MLink MLCLK pin is used as MLCLK, independent of the value of this register. If both the South MLink Enable bit is '0' and this NetDetect Enable bit is '0', then the South MLink MLCLK pin is tri-stated. This register is in the RTC well instead of the SUS well to maintain state if the SUS well power is removed in S4.
2	0h RW	**Reserved (RSVD_BUC_1):** Reserved
1	0h RO	**Reserved (RSVD_BUC_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Top Swap (TS):** This should be set by BIOS when the corresponding TS bit in the LPC or eSPI controller is set in order to properly restore the state of that field after reset since they are not preserved in an RTC well bit in those devices. *If PCH is strapped for Top-Swap (GNT(3)# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted.

34.21 RTC Dynamic Clock Gating Control (RTCDCG)—Offset 3418h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD_RTCDCG_1):** Reserved
7:3	0h RW	**Reserved (RSVD_RTCDCG_0):** Reserved for future use
2	0h RW	**pgcb_clk (12MHz) Dynamic Clock Gate Enable (RTCPGCBDCGEN):** 0 - Disable dynamic clock gate on pgcb_clk (Default) 1 - Enable dynamic clock gate on pgcb_clk
1	0h RW	**ipciclk_clk (24MHz) Dynamic Clock Gate Enable (RTCPCICLKDCGEN):** 0 - Disable dynamic clock gate on ipci_clk (Default) 1 - Enable dynamic clock gate on ipci_clk
0	0h RW	**rosc_side_clk (120MHz) Dynamic Clock Gate Enable (RTCROSIDEDCGEN):** 0 - Disable dynamic clock gate on rosc_side_clk (Default) 1 - Enable dynamic clock gate on rosc_side_clk
