20.71 Outbound Inter Processor Messages 22 ISH to Host (ISH2HOST_MSG22)—Offset 10B4h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.72 Outbound Inter Processor Messages 23 ISH to Host (ISH2HOST_MSG23)—Offset 10B8h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.73 Outbound Inter Processor Messages 24 ISH to Host (ISH2HOST_MSG24)—Offset 10BCh

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.74 Outbound Inter Processor Messages 25 ISH to Host (ISH2HOST_MSG25)—Offset 10C0h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.75 Outbound Inter Processor Messages 26 ISH to Host (ISH2HOST_MSG26)—Offset 10C4h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.76 Outbound Inter Processor Messages 27 ISH to Host (ISH2HOST_MSG27)—Offset 10C8h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.77 Outbound Inter Processor Messages 28 ISH to Host (ISH2HOST_MSG28)—Offset 10CCh

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.78 Outbound Inter Processor Messages 29 ISH to Host (ISH2HOST_MSG29)—Offset 10D0h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.79 Outbound Inter Processor Messages 30 ISH to Host (ISH2HOST_MSG30)—Offset 10D4h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.80 Outbound Inter Processor Messages 31 ISH to Host (ISH2HOST_MSG31)—Offset 10D8h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.81 Outbound Inter Processor Messages 32 ISH to Host (ISH2HOST_MSG32)—Offset 10DCh

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.82 Inbound Inter Processor Messages 1 Host to ISH (HOST2ISH_MSG1)—Offset 10E0h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.83 Inbound Inter Processor Messages 2 Host to ISH (HOST2ISH_MSG2)—Offset 10E4h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.84 Inbound Inter Processor Messages 3 Host to ISH (HOST2ISH_MSG3)—Offset 10E8h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.85 Inbound Inter Processor Messages 4 Host to ISH (HOST2ISH_MSG4)—Offset 10ECh

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.86 Inbound Inter Processor Messages 5 Host to ISH (HOST2ISH_MSG5)—Offset 10F0h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.87 Inbound Inter Processor Messages 6 Host to ISH (HOST2ISH_MSG6)—Offset 10F4h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.88 Inbound Inter Processor Messages 7 Host to ISH (HOST2ISH_MSG7)—Offset 10F8h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.89 Inbound Inter Processor Messages 8 Host to ISH (HOST2ISH_MSG8)—Offset 10FCh

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.90 Inbound Inter Processor Messages 9 Host to ISH (HOST2ISH_MSG9)—Offset 1100h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.91 Inbound Inter Processor Messages 10 Host to ISH (HOST2ISH_MSG10)—Offset 1104h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.92 Inbound Inter Processor Messages 11 Host to ISH (HOST2ISH_MSG11)—Offset 1108h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.93 Inbound Inter Processor Messages 12 Host to ISH (HOST2ISH_MSG12)—Offset 110Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.94 Inbound Inter Processor Messages 13 Host to ISH (HOST2ISH_MSG13)—Offset 1110h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.95 Inbound Inter Processor Messages 14 Host to ISH (HOST2ISH_MSG14)—Offset 1114h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.96 Inbound Inter Processor Messages 15 Host to ISH (HOST2ISH_MSG15)—Offset 1118h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.97 Inbound Inter Processor Messages 16 Host to ISH (HOST2ISH_MSG16)—Offset 111Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.98 Inbound Inter Processor Messages 17 Host to ISH (HOST2ISH_MSG17)—Offset 1120h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.99 Inbound Inter Processor Messages 18 Host to ISH (HOST2ISH_MSG18)—Offset 1124h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.100 Inbound Inter Processor Messages 19 Host to ISH (HOST2ISH_MSG19)—Offset 1128h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.101 Inbound Inter Processor Messages 20 Host to ISH (HOST2ISH_MSG20)—Offset 112Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.102 Inbound Inter Processor Messages 21 Host to ISH (HOST2ISH_MSG21)—Offset 1130h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.103 Inbound Inter Processor Messages 22 Host to ISH (HOST2ISH_MSG22)—Offset 1134h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.104 Inbound Inter Processor Messages 23 Host to ISH (HOST2ISH_MSG23)—Offset 1138h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.105 Inbound Inter Processor Messages 24 Host to ISH (HOST2ISH_MSG24)—Offset 113Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.106 Inbound Inter Processor Messages 25 Host to ISH (HOST2ISH_MSG25)—Offset 1140h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.107 Inbound Inter Processor Messages 26 Host to ISH (HOST2ISH_MSG26)—Offset 1144h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.108 Inbound Inter Processor Messages 27 Host to ISH (HOST2ISH_MSG27)—Offset 1148h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.109 Inbound Inter Processor Messages 28 Host to ISH (HOST2ISH_MSG28)—Offset 114Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.110 Inbound Inter Processor Messages 29 Host to ISH (HOST2ISH_MSG29)—Offset 1150h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.111 Inbound Inter Processor Messages 30 Host to ISH (HOST2ISH_MSG30)—Offset 1154h

Inter-processor message registers for Host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from Host to ISH (MSG):** Inter-processor message registers for Host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.112 Inbound Inter Processor Messages 31 Host to ISH (HOST2ISH_MSG31)—Offset 1158h

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.113 Inbound Inter Processor Messages 32 Host to ISH (HOST2ISH_MSG32)—Offset 115Ch

Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from Host to ISH (MSG):** Inter-processor message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.114 Outbound Inter Processor Messages 1 ISH to SEC (ISH2SEC_MSG1)—Offset 1160h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.115 Outbound Inter Processor Messages 2 ISH to SEC (ISH2SEC_MSG2)—Offset 1164h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.116 Outbound Inter Processor Messages 3 ISH to SEC (ISH2SEC_MSG3)—Offset 1168h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.117 Outbound Inter Processor Messages 4 ISH to SEC (ISH2SEC_MSG4)—Offset 116Ch

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.118 Outbound Inter Processor Messages 5 ISH to SEC (ISH2SEC_MSG5)—Offset 1170h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.119 Outbound Inter Processor Messages 6 ISH to SEC (ISH2SEC_MSG6)—Offset 1174h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.120 Outbound Inter Processor Messages 7 ISH to SEC (ISH2SEC_MSG7)—Offset 1178h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.121 Outbound Inter Processor Messages 8 ISH to SEC (ISH2SEC_MSG8)—Offset 117Ch

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.122 Outbound Inter Processor Messages 9 ISH to SEC (ISH2SEC_MSG9)—Offset 1180h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.123 Outbound Inter Processor Messages 10 ISH to SEC (ISH2SEC_MSG10)—Offset 1184h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.124 Outbound Inter Processor Messages 11 ISH to SEC (ISH2SEC_MSG11)—Offset 1188h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.125 Outbound Inter Processor Messages 12 ISH to SEC (ISH2SEC_MSG12)—Offset 118Ch

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.126 Outbound Inter Processor Messages 13 ISH to SEC (ISH2SEC_MSG13)—Offset 1190h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.127 Outbound Inter Processor Messages 14 ISH to SEC (ISH2SEC_MSG14)—Offset 1194h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.128 Outbound Inter Processor Messages 15 ISH to SEC (ISH2SEC_MSG15)—Offset 1198h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.129 Outbound Inter Processor Messages 16 ISH to SEC (ISH2SEC_MSG16)—Offset 119Ch

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.130 Outbound Inter Processor Messages 17 ISH to SEC (ISH2SEC_MSG17)—Offset 11A0h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.131 Outbound Inter Processor Messages 18 ISH to SEC (ISH2SEC_MSG18)—Offset 11A4h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.132 Outbound Inter Processor Messages 19 ISH to SEC (ISH2SEC_MSG19)—Offset 11A8h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.133 Outbound Inter Processor Messages 20 ISH to SEC (ISH2SEC_MSG20)—Offset 11ACh

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.134 Outbound Inter Processor Messages 21 ISH to SEC (ISH2SEC_MSG21)—Offset 11B0h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.135 Outbound Inter Processor Messages 22 ISH to SEC (ISH2SEC_MSG22)—Offset 11B4h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.136 Outbound Inter Processor Messages 23 ISH to SEC (ISH2SEC_MSG23)—Offset 11B8h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.137 Outbound Inter Processor Messages 24 ISH to SEC (ISH2SEC_MSG24)—Offset 11BCh

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.138 Outbound Inter Processor Messages 25 ISH to SEC (ISH2SEC_MSG25)—Offset 11C0h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.139 Outbound Inter Processor Messages 26 ISH to SEC (ISH2SEC_MSG26)—Offset 11C4h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.140 Outbound Inter Processor Messages 27 ISH to SEC (ISH2SEC_MSG27)—Offset 11C8h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.141 Outbound Inter Processor Messages 28 ISH to SEC (ISH2SEC_MSG28)—Offset 11CCh

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.142 Outbound Inter Processor Messages 29 ISH to SEC (ISH2SEC_MSG29)—Offset 11D0h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.143 Outbound Inter Processor Messages 30 ISH to SEC (ISH2SEC_MSG30)—Offset 11D4h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.144 Outbound Inter Processor Messages 31 ISH to SEC (ISH2SEC_MSG31)—Offset 11D8h

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.145 Outbound Inter Processor Messages 32 ISH to SEC (ISH2SEC_MSG32)—Offset 11DCh

Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to SEC (MSG):** Inter-processor message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.146 Inbound Inter Processor Messages 1 SEC to ISH (SEC2ISH_MSG1)—Offset 11E0h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.147 Inbound Inter Processor Messages 2 SEC to ISH (SEC2ISH_MSG2)—Offset 11E4h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.148 Inbound Inter Processor Messages 3 SEC to ISH (SEC2ISH_MSG3)—Offset 11E8h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.149 Inbound Inter Processor Messages 4 SEC to ISH (SEC2ISH_MSG4)—Offset 11ECh

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.150 Inbound Inter Processor Messages 5 SEC to ISH (SEC2ISH_MSG5)—Offset 11F0h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.151 Inbound Inter Processor Messages 6 SEC to ISH (SEC2ISH_MSG6)—Offset 11F4h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.152 Inbound Inter Processor Messages 7 SEC to ISH (SEC2ISH_MSG7)—Offset 11F8h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.153 Inbound Inter Processor Messages 8 SEC to ISH (SEC2ISH_MSG8)—Offset 11FCh

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.154 Inbound Inter Processor Messages 9 SEC To ISH (SEC2ISH_MSG9)—Offset 1200h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.155 Inbound Inter Processor Messages 10 SEC to ISH (SEC2ISH_MSG10)—Offset 1204h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.156 Inbound Inter Processor Messages 11 SEC to ISH (SEC2ISH_MSG11)—Offset 1208h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.157 Inbound Inter Processor Messages 12 SEC to ISH (SEC2ISH_MSG12)—Offset 120Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.158 Inbound Inter Processor Messages 13 SEC to ISH (SEC2ISH_MSG13)—Offset 1210h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.159 Inbound Inter Processor Messages 14 SEC to ISH (SEC2ISH_MSG14)—Offset 1214h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.160 Inbound Inter Processor Messages 15 SEC to ISH (SEC2ISH_MSG15)—Offset 1218h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.161 Inbound Inter Processor Messages 16 SEC to ISH (SEC2ISH_MSG16)—Offset 121Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.162 Inbound Inter Processor Messages 17 SEC to ISH (SEC2ISH_MSG17)—Offset 1220h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.163 Inbound Inter Processor Messages 18 SEC to ISH (SEC2ISH_MSG18)—Offset 1224h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.164 Inbound Inter Processor Messages 19 SEC to ISH (SEC2ISH_MSG19)—Offset 1228h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.165 Inbound Inter Processor Messages 20 SEC to ISH (SEC2ISH_MSG20)—Offset 122Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.166 Inbound Inter Processor Messages 21 SEC to ISH (SEC2ISH_MSG21)—Offset 1230h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.167 Inbound Inter Processor Messages 22 SEC to ISH (SEC2ISH_MSG22)—Offset 1234h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.168 Inbound Inter Processor Messages 23 SEC to ISH (SEC2ISH_MSG23)—Offset 1238h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.169 Inbound Inter Processor Messages 24 SEC to ISH (SEC2ISH_MSG24)—Offset 123Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.170 Inbound Inter Processor Messages 25 SEC to ISH (SEC2ISH_MSG25)—Offset 1240h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.171 Inbound Inter Processor Messages 26 SEC to ISH (SEC2ISH_MSG26)—Offset 1244h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.172 Inbound Inter Processor Messages 27 SEC to ISH (SEC2ISH_MSG27)—Offset 1248h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.173 Inbound Inter Processor Messages 28 SEC to ISH (SEC2ISH_MSG28)—Offset 124Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.174 Inbound Inter Processor Messages 29 SEC To ISH (SEC2ISH_MSG29)—Offset 1250h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.175 Inbound Inter Processor Messages 30 SEC To ISH (SEC2ISH_MSG30)—Offset 1254h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.176 Inbound Inter Processor Messages 31 SEC To ISH (SEC2ISH_MSG31)—Offset 1258h

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.177 Inbound Inter Processor Messages 32 SEC to ISH (SEC2ISH_MSG32)—Offset 125Ch

Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from SEC to ISH (MSG):** Inter-processor message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.178 Outbound Inter Processor Messages 1 ISH to PMC (ISH2PMC_MSG1)—Offset 1260h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.179 Outbound Inter Processor Messages 2 ISH to PMC (ISH2PMC_MSG2)—Offset 1264h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.180 Outbound Inter Processor Messages 3 ISH to PMC (ISH2PMC_MSG3)—Offset 1268h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.181 Outbound Inter Processor Messages 4 ISH to PMC (ISH2PMC_MSG4)—Offset 126Ch

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.182 Outbound Inter Processor Messages 5 ISH to PMC (ISH2PMC_MSG5)—Offset 1270h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.183 Outbound Inter Processor Messages 6 ISH to PMC (ISH2PMC_MSG6)—Offset 1274h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.184 Outbound Inter Processor Messages 7 ISH to PMC (ISH2PMC_MSG7)—Offset 1278h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.185 Outbound Inter Processor Messages 8 ISH to PMC (ISH2PMC_MSG8)—Offset 127Ch

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.186 Outbound Inter Processor Messages 9 ISH to PMC (ISH2PMC_MSG9)—Offset 1280h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.187 Outbound Inter Processor Messages 10 ISH to PMC (ISH2PMC_MSG10)—Offset 1284h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.188 Outbound Inter Processor Messages 11 ISH to PMC (ISH2PMC_MSG11)—Offset 1288h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.189 Outbound Inter Processor Messages 12 ISH to PMC (ISH2PMC_MSG12)—Offset 128Ch

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.190 Outbound Inter Processor Messages 13 ISH to PMC (ISH2PMC_MSG13)—Offset 1290h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.191 Outbound Inter Processor Messages 14 ISH to PMC (ISH2PMC_MSG14)—Offset 1294h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.192 Outbound Inter Processor Messages 15 ISH to PMC (ISH2PMC_MSG15)—Offset 1298h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.193 Outbound Inter Processor Messages 16 ISH to PMC (ISH2PMC_MSG16)—Offset 129Ch

Inter-processor Message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to PMC (MSG):** Inter-processor Message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.194 Outbound Inter Processor Messages 17 ISH to PMC (ISH2PMC_MSG17)—Offset 12A0h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.195 Outbound Inter Processor Messages 18 ISH to PMC (ISH2PMC_MSG18)—Offset 12A4h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.196 Outbound Inter Processor Messages 19 ISH to PMC (ISH2PMC_MSG19)—Offset 12A8h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.197 Outbound Inter Processor Messages 20 ISH To PMC (ISH2PMC_MSG20)—Offset 12ACh

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.198 Outbound Inter Processor Messages 21 ISH to PMC (ISH2PMC_MSG21)—Offset 12B0h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.199 Outbound Inter Processor Messages 22 ISH to PMC (ISH2PMC_MSG22)—Offset 12B4h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.200 Outbound Inter Processor Messages 23 ISH to PMC (ISH2PMC_MSG23)—Offset 12B8h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.201 Outbound Inter Processor Messages 24 ISH to PMC (ISH2PMC_MSG24)—Offset 12BCh

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.202 Outbound Inter Processor Messages 25 ISH to PMC (ISH2PMC_MSG25)—Offset 12C0h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.203 Outbound Inter Processor Messages 26 ISH to PMC (ISH2PMC_MSG26)—Offset 12C4h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.204 Outbound Inter Processor Messages 27 ISH to PMC (ISH2PMC_MSG27)—Offset 12C8h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.205 Outbound Inter Processor Messages 28 ISH to PMC (ISH2PMC_MSG28)—Offset 12CCh

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.206 Outbound Inter Processor Messages 29 ISH to PMC (ISH2PMC_MSG29)—Offset 12D0h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.207 Outbound Inter Processor Messages 30 ISH to PMC (ISH2PMC_MSG30)—Offset 12D4h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.208 Outbound Inter Processor Messages 31 ISH to PMC (ISH2PMC_MSG31)—Offset 12D8h

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.209 Outbound Inter Processor Messages 32 ISH to PMC (ISH2PMC_MSG32)—Offset 12DCh

Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to PMC (MSG):** Inter-processor message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.210 Inbound Inter Processor Messages 1 PMC to ISH (PMC2ISH_MSG1)—Offset 12E0h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.211 Inbound Inter Processor Messages 2 PMC to ISH (PMC2ISH_MSG2)—Offset 12E4h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.212 Inbound Inter Processor Messages 3 PMC to ISH (PMC2ISH_MSG3)—Offset 12E8h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.213 Inbound Inter Processor Messages 4 PMC to ISH (PMC2ISH_MSG4)—Offset 12ECh

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.214 Inbound Inter Processor Messages 5 PMC to ISH (PMC2ISH_MSG5)—Offset 12F0h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.215 Inbound Inter Processor Messages 6 PMC to ISH (PMC2ISH_MSG6)—Offset 12F4h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.216 Inbound Inter Processor Messages 7 PMC to ISH (PMC2ISH_MSG7)—Offset 12F8h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.217 Inbound Inter Processor Messages 8 PMC to ISH (PMC2ISH_MSG8)—Offset 12FCh

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.218 Inbound Inter Processor Messages 9 PMC to ISH (PMC2ISH_MSG9)—Offset 1300h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.219 Inbound Inter Processor Messages 10 PMC to ISH (PMC2ISH_MSG10)—Offset 1304h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.220 Inbound Inter Processor Messages 11 PMC to ISH (PMC2ISH_MSG11)—Offset 1308h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.221 Inbound Inter Processor Messages 12 PMC to ISH (PMC2ISH_MSG12)—Offset 130Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.222 Inbound Inter Processor Messages 13 PMC to ISH (PMC2ISH_MSG13)—Offset 1310h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.223 Inbound Inter Processor Messages 14 PMC to ISH (PMC2ISH_MSG14)—Offset 1314h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.224 Inbound Inter Processor Messages 15 PMC to ISH (PMC2ISH_MSG15)—Offset 1318h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.225 Inbound Inter Processor Messages 16 PMC to ISH (PMC2ISH_MSG16)—Offset 131Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.226 Inbound Inter Processor Messages 17 PMC to ISH (PMC2ISH_MSG17)—Offset 1320h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.227 Inbound Inter Processor Messages 18 PMC to ISH (PMC2ISH_MSG18)—Offset 1324h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.228 Inbound Inter Processor Messages 19 PMC to ISH (PMC2ISH_MSG19)—Offset 1328h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.229 Inbound Inter Processor Messages 20 PMC to ISH (PMC2ISH_MSG20)—Offset 132Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.230 Inbound Inter Processor Messages 21 PMC to ISH (PMC2ISH_MSG21)—Offset 1330h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.231 Inbound Inter Processor Messages 22 PMC to ISH (PMC2ISH_MSG22)—Offset 1334h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.232 Inbound Inter Processor Messages 23 PMC to ISH (PMC2ISH_MSG23)—Offset 1338h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.233 Inbound Inter Processor Messages 24 PMC to ISH (PMC2ISH_MSG24)—Offset 133Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.234 Inbound Inter Processor Messages 25 PMC to ISH (PMC2ISH_MSG25)—Offset 1340h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.235 Inbound Inter Processor Messages 26 PMC to ISH (PMC2ISH_MSG26)—Offset 1344h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.236 Inbound Inter Processor Messages 27 PMC to ISH (PMC2ISH_MSG27)—Offset 1348h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.237 Inbound Inter Processor Messages 28 PMC to ISH (PMC2ISH_MSG28)—Offset 134Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.238 Inbound Inter Processor Messages 29 PMC to ISH (PMC2ISH_MSG29)—Offset 1350h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.239 Inbound Inter Processor Messages 30 PMC to ISH (PMC2ISH_MSG30)—Offset 1354h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.240 Inbound Inter Processor Messages 31 PMC to ISH (PMC2ISH_MSG31)—Offset 1358h

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.241 Inbound Inter Processor Messages 32 PMC to ISH (PMC2ISH_MSG32)—Offset 135Ch

Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from PMC to ISH (MSG):** Inter-processor message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.242 Remap 0 (REMAP0)—Offset 1360h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 0 (REMAP0)**

20.243 Remap 1 (REMAP1)—Offset 1364h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 1 (REMAP1)**

20.244 Remap 2 (REMAP2)—Offset 1368h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 2 (REMAP2)**

20.245 Remap 3 (REMAP3)—Offset 136Ch

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 3 (REMAP3)**

20.246 Remap 4 (REMAP4)—Offset 1370h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 4 (REMAP4)**

20.247 Remap 5 (REMAP5)—Offset 1374h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 5 (REMAP5)**

20.248 ISH IPC Busy Clear (ISH_IPC_BUSY_CLEAR)—Offset 1378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes CAN1EM to respective bit in ISH IPC busy clear register.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RESERVED0):** Reserved.
16	0h RW/1C	**ISH to SEC Busy Clear Status (ISH2SEC_BUSY_CLEAR):** Busy clear interrupt bit of ISH to SEC IPC: • 1: Interrupt active. • 0: Interrupt inactive.
15:9	0h RO	**Reserved (RESERVED1):** Reserved.
8	0h RW/1C	**ISH to PMC Busy Clear Status (ISH2PMC_BUSY_CLEAR):** Busy clear interrupt bit of ISH to PMC IPC: • 1: Interrupt active. • 0: Interrupt inactive.
7:4	0h RO	**Reserved (RESERVED2):** Reserved.
3	0h RW/1C	**ISH to Audio Busy Clear Status (ISH2AUDIO_BUSY_CLEAR):** Busy clear interrupt bit of ISH to Audio IPC: • 1: Interrupt active. • 0: Interrupt inactive.
2	0h RW/1C	**ISH to ISP Busy Clear Status (ISH2ISP_BUSY_CLEAR):** Busy clear interrupt bit of ISH to ISP IPC: • 1: Interrupt active. • 0: Interrupt inactive.
1	0h RW/1C	**ISH to GFX Busy Clear Status (ISH2GFX_BUSY_CLEAR):** Busy clear interrupt bit of ISH to GFX IPC: • 1: Interrupt active. • 0: Interrupt inactive.
0	0h RW/1C	**ISH to Host Busy Clear Status (ISH2HOST_BUSY_CLEAR):** Busy clear interrupt bit of ISH to host IPC: • 1: Interrupt active. • 0: Interrupt inactive.

20.249 ISH Fuse (ISH_FUSE)—Offset 137Ch

This register mirrors the ISH fuse bits.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RESERVED):** Reserved.
3:0	0h RO	**ISH Fuse (ISH_FUSE)**

20.250 UMA Base Address LSB (UMA_RANGE_LOWER_0)—Offset 1380h

This register should be accessed only in ISH 3.0. This is an address range register, holds 32 bit LSB value of the address for UMA base range.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: FFFFF001h

Bit Range	Default & Access	Field Name (ID): Description
31:12	FFFFFh RW	**UMA Space Lower Memory Base Address (UMA_MEMORY_BASE_ADDR_LSB)**
11:1	0h RO	**Size (SIZE):** Memory size, hard wired to 0 indicate 4 KB window granularity.
0	1h RW	**Memory Range Disabled (SIZE_BIT0):** • 1 means No TC7 or RS = 1 cycles, • 0 means TC7 or RS =1.

20.251 UMA Base Address MSB (UMA_RANGE_LOWER_1)—Offset 1384h

This register should be accessed only in ISH 3.0. This is an address range register, holds 32 bit MSB value of the address for UMA base range.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**UMA Memory Base Address MSB (UMA_MEMORY_BASE_ADDR_MSB)**

20.252 UMA Limit Address LSB (UMA_RANGE_UPPER_0)—Offset 1388h

This register should be accessed only in ISH3.0. This is an address range register, holds 32 bit LSB value of the address for UMA limit range.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: FFFFF000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	FFFFFh RW	**UMA Memory Limit Address LSB (UMA_MEMORY_LIMIT_ADDR_LSB)**
11:0	0h RO	**Size (SIZE):** UMA memory size, hard wired to 0 indicate 4 KB window granularity.

20.253 UMA Base Address MSB (UMA_RANGE_UPPER_1)—Offset 138Ch

This register should be accessed only in ISH 3.0. This is an address range register, holds 32 bit MSB value of the address for UMA base range.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**UMA Memory Limit Address MSB (UMA_MEMORY_LIMIT_ADDR_MSB)**

20.254 Outbound Inter Processor Messages 1 ISH to ISP (ISH2ISP_MSG1)—Offset 1390h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.255 Outbound Inter Processor Messages 2 ISH to ISP (ISH2ISP_MSG2)—Offset 1394h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.256 Outbound Inter Processor Messages 3 ISH to ISP (ISH2ISP_MSG3)—Offset 1398h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.257 Outbound Inter Processor Messages 4 ISH to ISP (ISH2ISP_MSG4)—Offset 139Ch

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.258 Outbound Inter Processor Messages 5 ISH to ISP (ISH2ISP_MSG5)—Offset 13A0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.259 Outbound Inter Processor Messages 6 ISH to ISP (ISH2ISP_MSG6)—Offset 13A4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.260 Outbound Inter Processor Messages 7 ISH to ISP (ISH2ISP_MSG7)—Offset 13A8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.261 Outbound Inter Processor Messages 8 ISH to ISP (ISH2ISP_MSG8)—Offset 13ACh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.262 Outbound Inter Processor Messages 9 ISH to ISP (ISH2ISP_MSG9)—Offset 13B0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.263 Outbound Inter Processor Messages 10 ISH to ISP (ISH2ISP_MSG10)—Offset 13B4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.264 Outbound Inter Processor Messages 11 ISH to ISP (ISH2ISP_MSG11)—Offset 13B8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.265 Outbound Inter Processor Messages 12 ISH to ISP (ISH2ISP_MSG12)—Offset 13BCh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.266 Outbound Inter Processor Messages 13 ISH to ISP (ISH2ISP_MSG13)—Offset 13C0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.267 Outbound Inter Processor Messages 14 ISH to ISP (ISH2ISP_MSG14)—Offset 13C4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.268 Outbound Inter Processor Messages 15 ISH to ISP (ISH2ISP_MSG15)—Offset 13C8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.269 Outbound Inter Processor Messages 16 ISH to ISP (ISH2ISP_MSG16)—Offset 13CCh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.270 Outbound Inter Processor Messages 17 ISH to ISP (ISH2ISP_MSG17)—Offset 13D0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.271 Outbound Inter Processor Messages 18 ISH to ISP (ISH2ISP_MSG18)—Offset 13D4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.272 Outbound Inter Processor Messages 19 ISH to ISP (ISH2ISP_MSG19)—Offset 13D8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.273 Outbound Inter Processor Messages 20 ISH to ISP (ISH2ISP_MSG20)—Offset 13DCh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.274 Outbound Inter Processor Messages 21 ISH To ISP (ISH2ISP_MSG21)—Offset 13E0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.275 Outbound Inter Processor Messages 22 ISH to ISP (ISH2ISP_MSG22)—Offset 13E4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.276 Outbound Inter Processor Messages 23 ISH to ISP (ISH2ISP_MSG23)—Offset 13E8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.277 Outbound Inter Processor Messages 24 ISH to ISP (ISH2ISP_MSG24)—Offset 13ECh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.278 Outbound Inter Processor Messages 25 ISH to ISP (ISH2ISP_MSG25)—Offset 13F0h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.279 Outbound Inter Processor Messages 26 ISH to ISP (ISH2ISP_MSG26)—Offset 13F4h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.280 Outbound Inter Processor Messages 27 ISH to ISP (ISH2ISP_MSG27)—Offset 13F8h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.281 Outbound Inter Processor Messages 28 ISH to ISP (ISH2ISP_MSG28)—Offset 13FCh

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.282 Outbound Inter Processor Messages 29 ISH to ISP (ISH2ISP_MSG29)—Offset 1400h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.283 Outbound Inter Processor Messages 30 ISH to ISP (ISH2ISP_MSG30)—Offset 1404h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.284 Outbound Inter Processor Messages 31 ISH to ISP (ISH2ISP_MSG31)—Offset 1408h

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.285 Outbound Inter Processor Messages 32 ISH to ISP (ISH2ISP_MSG32)—Offset 140Ch

Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to ISP (MSG):** Inter-processor message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.286 Inbound Inter Processor Messages 1 ISP to ISH (ISP2ISH_MSG1)—Offset 1410h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.287 Inbound Inter Processor Messages 2 ISP to ISH (ISP2ISH_MSG2)—Offset 1414h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.288 Inbound Inter Processor Messages 3 ISP to ISH (ISP2ISH_MSG3)—Offset 1418h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.289 Inbound Inter Processor Messages 4 ISP to ISH (ISP2ISH_MSG4)—Offset 141Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.290 Inbound Inter Processor Messages 5 ISP to ISH (ISP2ISH_MSG5)—Offset 1420h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.291 Inbound Inter Processor Messages 6 ISP to ISH (ISP2ISH_MSG6)—Offset 1424h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.292 Inbound Inter Processor Messages 7 ISP to ISH (ISP2ISH_MSG7)—Offset 1428h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.293 Inbound Inter Processor Messages 8 ISP to ISH (ISP2ISH_MSG8)—Offset 142Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.294 Inbound Inter Processor Messages 9 ISP to ISH (ISP2ISH_MSG9)—Offset 1430h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.295 Inbound Inter Processor Messages 10 ISP to ISH (ISP2ISH_MSG10)—Offset 1434h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.296 Inbound Inter Processor Messages 11 ISP to ISH (ISP2ISH_MSG11)—Offset 1438h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.297 Inbound Inter Processor Messages 12 ISP to ISH (ISP2ISH_MSG12)—Offset 143Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.298 Inbound Inter Processor Messages 13 ISP to ISH (ISP2ISH_MSG13)—Offset 1440h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.299 Inbound Inter Processor Messages 14 ISP to ISH (ISP2ISH_MSG14)—Offset 1444h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.300 Inbound Inter Processor Messages 15 ISP to ISH (ISP2ISH_MSG15)—Offset 1448h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.301 Inbound Inter Processor Messages 16 ISP to ISH (ISP2ISH_MSG16)—Offset 144Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.302 Inbound Inter Processor Messages 17 ISP to ISH (ISP2ISH_MSG17)—Offset 1450h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.303 Inbound Inter Processor Messages 18 ISP to ISH (ISP2ISH_MSG18)—Offset 1454h

Inter-processor Message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISP to ISH (MSG):** Inter-processor Message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.304 Inbound Inter Processor Messages 19 ISP to ISH (ISP2ISH_MSG19)—Offset 1458h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.305 Inbound Inter Processor Messages 20 ISP to ISH (ISP2ISH_MSG20)—Offset 145Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.306 Inbound Inter Processor Messages 21 ISP to ISH (ISP2ISH_MSG21)—Offset 1460h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.307 Inbound Inter Processor Messages 22 ISP to ISH (ISP2ISH_MSG22)—Offset 1464h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.308 Inbound Inter Processor Messages 23 ISP to ISH (ISP2ISH_MSG23)—Offset 1468h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.309 Inbound Inter Processor Messages 24 ISP to ISH (ISP2ISH_MSG24)—Offset 146Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.310 Inbound Inter Processor Messages 25 ISP to ISH (ISP2ISH_MSG25)—Offset 1470h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.311 Inbound Inter Processor Messages 26 ISP to ISH (ISP2ISH_MSG26)—Offset 1474h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.312 Inbound Inter Processor Messages 27 ISP to ISH (ISP2ISH_MSG27)—Offset 1478h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.313 Inbound Inter Processor Messages 28 ISP to ISH (ISP2ISH_MSG28)—Offset 147Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.314 Inbound Inter Processor Messages 29 ISP to ISH (ISP2ISH_MSG29)—Offset 1480h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.315 Inbound Inter Processor Messages 30 ISP to ISH (ISP2ISH_MSG30)—Offset 1484h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.316 Inbound Inter Processor Messages 31 ISP to ISH (ISP2ISH_MSG31)—Offset 1488h

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.317 Inbound Inter Processor Messages 32 ISP to ISH (ISP2ISH_MSG32)—Offset 148Ch

Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISP to ISH (MSG):** Inter-processor message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.318 Outbound Inter Processor Messages 1 ISH to Audio (ISH2AUDIO_MSG1)—Offset 1490h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.319 Outbound Inter Processor Messages 2 ISH to Audio (ISH2AUDIO_MSG2)—Offset 1494h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.320 Outbound Inter Processor Messages 3 ISH to Audio (ISH2AUDIO_MSG3)—Offset 1498h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.321 Outbound Inter Processor Messages 4 ISH to Audio (ISH2AUDIO_MSG4)—Offset 149Ch

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.322 Outbound Inter Processor Messages 5 ISH to Audio (ISH2AUDIO_MSG5)—Offset 14A0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.323 Outbound Inter Processor Messages 6 ISH to Audio (ISH2AUDIO_MSG6)—Offset 14A4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.324 Outbound Inter Processor Messages 7 ISH to Audio (ISH2AUDIO_MSG7)—Offset 14A8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.325 Outbound Inter Processor Messages 8 ISH to Audio (ISH2AUDIO_MSG8)—Offset 14ACh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.326 Outbound Inter Processor Messages 9 ISH to Audio (ISH2AUDIO_MSG9)—Offset 14B0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.327 Outbound Inter Processor Messages 10 ISH to Audio (ISH2AUDIO_MSG10)—Offset 14B4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.328 Outbound Inter Processor Messages 11 ISH to Audio (ISH2AUDIO_MSG11)—Offset 14B8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.329 Outbound Inter Processor Messages 12 ISH to Audio (ISH2AUDIO_MSG12)—Offset 14BCh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.330 Outbound Inter Processor Messages 13 ISH to Audio (ISH2AUDIO_MSG13)—Offset 14C0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.331 Outbound Inter Processor Messages 14 ISH to Audio (ISH2AUDIO_MSG14)—Offset 14C4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.332 Outbound Inter Processor Messages 15 ISH to Audio (ISH2AUDIO_MSG15)—Offset 14C8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.333 Outbound Inter Processor Messages 16 ISH to Audio (ISH2AUDIO_MSG16)—Offset 14CCh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.334 Outbound Inter Processor Messages 17 ISH to Audio (ISH2AUDIO_MSG17)—Offset 14D0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.335 Outbound Inter Processor Messages 18 ISH to Audio (ISH2AUDIO_MSG18)—Offset 14D4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.336 Outbound Inter Processor Messages 19 ISH to Audio (ISH2AUDIO_MSG19)—Offset 14D8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.337 Outbound Inter Processor Messages 20 ISH to Audio (ISH2AUDIO_MSG20)—Offset 14DCh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.338 Outbound Inter Processor Messages 21 ISH to Audio (ISH2AUDIO_MSG21)—Offset 14E0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.339 Outbound Inter Processor Messages 22 ISH to Audio (ISH2AUDIO_MSG22)—Offset 14E4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.340 Outbound Inter Processor Messages 23 ISH to Audio (ISH2AUDIO_MSG23)—Offset 14E8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.341 Outbound Inter Processor Messages 24 ISH to Audio (ISH2AUDIO_MSG24)—Offset 14ECh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.342 Outbound Inter Processor Messages 25 ISH to Audio (ISH2AUDIO_MSG25)—Offset 14F0h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.343 Outbound Inter Processor Messages 26 ISH to Audio (ISH2AUDIO_MSG26)—Offset 14F4h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.344 Outbound Inter Processor Messages 27 ISH to Audio (ISH2AUDIO_MSG27)—Offset 14F8h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.345 Outbound Inter Processor Messages 28 ISH to Audio (ISH2AUDIO_MSG28)—Offset 14FCh

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.346 Outbound Inter Processor Messages 29 ISH to Audio (ISH2AUDIO_MSG29)—Offset 1500h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.347 Outbound Inter Processor Messages 30 ISH to Audio (ISH2AUDIO_MSG30)—Offset 1504h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.348 Outbound Inter Processor Messages 31 ISH to Audio (ISH2AUDIO_MSG31)—Offset 1508h

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.349 Outbound Inter Processor Messages 32 ISH to Audio (ISH2AUDIO_MSG32)—Offset 150Ch

Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to Audio (MSG):** Inter-processor message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.350 Inbound Inter Processor Messages 1 Audio to ISH (AUDIO2ISH_MSG1)—Offset 1510h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.351 Inbound Inter Processor Messages 2 Audio to ISH (AUDIO2ISH_MSG2)—Offset 1514h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.352 Inbound Inter Processor Messages 3 Audio to ISH (AUDIO2ISH_MSG3)—Offset 1518h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.353 Inbound Inter Processor Messages 4 Audio to ISH (AUDIO2ISH_MSG4)—Offset 151Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.354 Inbound Inter Processor Messages 5 Audio to ISH (AUDIO2ISH_MSG5)—Offset 1520h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.355 Inbound Inter Processor Messages 6 Audio to ISH (AUDIO2ISH_MSG6)—Offset 1524h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.356 Inbound Inter Processor Messages 7 Audio to ISH (AUDIO2ISH_MSG7)—Offset 1528h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.357 Inbound Inter Processor Messages 8 Audio to ISH (AUDIO2ISH_MSG8)—Offset 152Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.358 Inbound Inter Processor Messages 9 Audio to ISH (AUDIO2ISH_MSG9)—Offset 1530h

Inter-processor Message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from Audio to ISH (MSG):** Inter-processor Message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.359 Inbound Inter Processor Messages 10 Audio to ISH (AUDIO2ISH_MSG10)—Offset 1534h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.360 Inbound Inter Processor Messages 11 Audio to ISH (AUDIO2ISH_MSG11)—Offset 1538h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.361 Inbound Inter Processor Messages 12 Audio to ISH (AUDIO2ISH_MSG12)—Offset 153Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.362 Inbound Inter Processor Messages 13 Audio to ISH (AUDIO2ISH_MSG13)—Offset 1540h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.363 Inbound Inter Processor Messages 14 Audio to ISH (AUDIO2ISH_MSG14)—Offset 1544h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.364 Inbound Inter Processor Messages 15 Audio to ISH (AUDIO2ISH_MSG15)—Offset 1548h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.365 Inbound Inter Processor Messages 16 Audio to ISH (AUDIO2ISH_MSG16)—Offset 154Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.366 Inbound Inter Processor Messages 17 Audio to ISH (AUDIO2ISH_MSG17)—Offset 1550h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.367 Inbound Inter Processor Messages 18 Audio to ISH (AUDIO2ISH_MSG18)—Offset 1554h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.368 Inbound Inter Processor Messages 19 Audio to ISH (AUDIO2ISH_MSG19)—Offset 1558h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.369 Inbound Inter Processor Messages 20 Audio to ISH (AUDIO2ISH_MSG20)—Offset 155Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.370 Inbound Inter Processor Messages 21 Audio to ISH (AUDIO2ISH_MSG21)—Offset 1560h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.371 Inbound Inter Processor Messages 22 Audio to ISH (AUDIO2ISH_MSG22)—Offset 1564h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.372 Inbound Inter Processor Messages 23 Audio to ISH (AUDIO2ISH_MSG23)—Offset 1568h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.373 Inbound Inter Processor Messages 24 Audio to ISH (AUDIO2ISH_MSG24)—Offset 156Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.374 Inbound Inter Processor Messages 25 Audio to ISH (AUDIO2ISH_MSG25)—Offset 1570h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.375 Inbound Inter Processor Messages 26 Audio to ISH (AUDIO2ISH_MSG26)—Offset 1574h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.376 Inbound Inter Processor Messages 27 Audio to ISH (AUDIO2ISH_MSG27)—Offset 1578h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.377 Inbound Inter Processor Messages 28 Audio to ISH (AUDIO2ISH_MSG28)—Offset 157Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.378 Inbound Inter Processor Messages 29 Audio to ISH (AUDIO2ISH_MSG29)—Offset 1580h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.379 Inbound Inter Processor Messages 30 Audio to ISH (AUDIO2ISH_MSG30)—Offset 1584h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.380 Inbound Inter Processor Messages 31 Audio to ISH (AUDIO2ISH_MSG31)—Offset 1588h

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.381 Inbound Inter Processor Messages 32 Audio to ISH (AUDIO2ISH_MSG32)—Offset 158Ch

Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from Audio to ISH (MSG):** Inter-processor message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.382 Outbound Inter Processor Messages 1 ISH to Gfx (ISH2GFX_MSG1)—Offset 1590h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.383 Outbound Inter Processor Messages 2 ISH to Gfx (ISH2GFX_MSG2)—Offset 1594h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.384 Outbound Inter Processor Messages 3 ISH to Gfx (ISH2GFX_MSG3)—Offset 1598h

Inter-processor Message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to GFX (MSG):** Inter-processor Message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.385 Outbound Inter Processor Messages 4 ISH to Gfx (ISH2GFX_MSG4)—Offset 159Ch

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.386 Outbound Inter Processor Messages 5 ISH to Gfx (ISH2GFX_MSG5)—Offset 15A0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.387 Outbound Inter Processor Messages 6 ISH to Gfx (ISH2GFX_MSG6)—Offset 15A4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.388 Outbound Inter Processor Messages 7 ISH to Gfx (ISH2GFX_MSG7)—Offset 15A8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.389 Outbound Inter Processor Messages 8 ISH to Gfx (ISH2GFX_MSG8)—Offset 15ACh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.390 Outbound Inter Processor Messages 9 ISH to Gfx (ISH2GFX_MSG9)—Offset 15B0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.391 Outbound Inter Processor Messages 10 ISH to Gfx (ISH2GFX_MSG10)—Offset 15B4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.392 Outbound Inter Processor Messages 11 ISH to Gfx (ISH2GFX_MSG11)—Offset 15B8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.393 Outbound Inter Processor Messages 12 ISH to Gfx (ISH2GFX_MSG12)—Offset 15BCh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.394 Outbound Inter Processor Messages 13 ISH to Gfx (ISH2GFX_MSG13)—Offset 15C0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.395 Outbound Inter Processor Messages 14 ISH to Gfx (ISH2GFX_MSG14)—Offset 15C4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.396 Outbound Inter Processor Messages 15 ISH to Gfx (ISH2GFX_MSG15)—Offset 15C8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.397 Outbound Inter Processor Messages 16 ISH to Gfx (ISH2GFX_MSG16)—Offset 15CCh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.398 Outbound Inter Processor Messages 17 ISH to Gfx (ISH2GFX_MSG17)—Offset 15D0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.399 Outbound Inter Processor Messages 18 ISH to Gfx (ISH2GFX_MSG18)—Offset 15D4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.400 Outbound Inter Processor Messages 19 ISH to Gfx (ISH2GFX_MSG19)—Offset 15D8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.401 Outbound Inter Processor Messages 20 ISH to Gfx (ISH2GFX_MSG20)—Offset 15DCh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.402 Outbound Inter Processor Messages 21 ISH to Gfx (ISH2GFX_MSG21)—Offset 15E0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.403 Outbound Inter Processor Messages 22 ISH to Gfx (ISH2GFX_MSG22)—Offset 15E4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.404 Outbound Inter Processor Messages 23 ISH to Gfx (ISH2GFX_MSG23)—Offset 15E8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.405 Outbound Inter Processor Messages 24 ISH to Gfx (ISH2GFX_MSG24)—Offset 15ECh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.406 Outbound Inter Processor Messages 25 ISH to Gfx (ISH2GFX_MSG25)—Offset 15F0h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.407 Outbound Inter Processor Messages 26 ISH to Gfx (ISH2GFX_MSG26)—Offset 15F4h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.408 Outbound Inter Processor Messages 27 ISH to Gfx (ISH2GFX_MSG27)—Offset 15F8h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.409 Outbound Inter Processor Messages 28 ISH to Gfx (ISH2GFX_MSG28)—Offset 15FCh

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.410 Outbound Inter Processor Messages 29 ISH to Gfx (ISH2GFX_MSG29)—Offset 1600h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.411 Outbound Inter Processor Messages 30 ISH to Gfx (ISH2GFX_MSG30)—Offset 1604h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.412 Outbound Inter Processor Messages 31 ISH to Gfx (ISH2GFX_MSG31)—Offset 1608h

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.413 Outbound Inter Processor Messages 32 ISH to Gfx (ISH2GFX_MSG32)—Offset 160Ch

Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to GFX (MSG):** Inter-processor message registers for ISH core to communicate to the Gfx. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by Gfx.

20.414 Inbound Inter Processor Messages 1 Gfx to ISH (GFX2ISH_MSG1)—Offset 1610h

Inter-processor Message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from GFX to ISH (MSG):** Inter-processor Message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.415 Inbound Inter Processor Messages 2 Gfx to ISH (GFX2ISH_MSG2)—Offset 1614h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.416 Inbound Inter Processor Messages 3 Gfx to ISH (GFX2ISH_MSG3)—Offset 1618h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.417 Inbound Inter Processor Messages 4 Gfx to ISH (GFX2ISH_MSG4)—Offset 161Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.418 Inbound Inter Processor Messages 5 Gfx to ISH (GFX2ISH_MSG5)—Offset 1620h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.419 Inbound Inter Processor Messages 6 Gfx to ISH (GFX2ISH_MSG6)—Offset 1624h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.420 Inbound Inter Processor Messages 7 Gfx to ISH (GFX2ISH_MSG7)—Offset 1628h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.421 Inbound Inter Processor Messages 8 Gfx to ISH (GFX2ISH_MSG8)—Offset 162Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.422 Inbound Inter Processor Messages 9 Gfx to ISH (GFX2ISH_MSG9)—Offset 1630h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.423 Inbound Inter Processor Messages 10 Gfx to ISH (GFX2ISH_MSG10)—Offset 1634h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.424 Inbound Inter Processor Messages 11 Gfx to ISH (GFX2ISH_MSG11)—Offset 1638h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.425 Inbound Inter Processor Messages 12 Gfx to ISH (GFX2ISH_MSG12)—Offset 163Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.426 Inbound Inter Processor Messages 13 Gfx to ISH (GFX2ISH_MSG13)—Offset 1640h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.427 Inbound Inter Processor Messages 14 Gfx to ISH (GFX2ISH_MSG14)—Offset 1644h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.428 Inbound Inter Processor Messages 15 Gfx to ISH (GFX2ISH_MSG15)—Offset 1648h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.429 Inbound Inter Processor Messages 16 Gfx to ISH (GFX2ISH_MSG16)—Offset 164Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.430 Inbound Inter Processor Messages 17 Gfx to ISH (GFX2ISH_MSG17)—Offset 1650h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.431 Inbound Inter Processor Messages 18 Gfx to ISH (GFX2ISH_MSG18)—Offset 1654h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.432 Inbound Inter Processor Messages 19 Gfx to ISH (GFX2ISH_MSG19)—Offset 1658h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.433 Inbound Inter Processor Messages 20 Gfx to ISH (GFX2ISH_MSG20)—Offset 165Ch

Inter-processor Message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from GFX to ISH (MSG):** Inter-processor Message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.434 Inbound Inter Processor Messages 21 Gfx to ISH (GFX2ISH_MSG21)—Offset 1660h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.435 Inbound Inter Processor Messages 22 Gfx to ISH (GFX2ISH_MSG22)—Offset 1664h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.436 Inbound Inter Processor Messages 23 Gfx to ISH (GFX2ISH_MSG23)—Offset 1668h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.437 Inbound Inter Processor Messages 24 Gfx to ISH (GFX2ISH_MSG24)—Offset 166Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.438 Inbound Inter Processor Messages 25 Gfx to ISH (GFX2ISH_MSG25)—Offset 1670h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.439 Inbound Inter Processor Messages 26 Gfx to ISH (GFX2ISH_MSG26)—Offset 1674h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.440 Inbound Inter Processor Messages 27 Gfx to ISH (GFX2ISH_MSG27)—Offset 1678h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.441 Inbound Inter Processor Messages 28 Gfx to ISH (GFX2ISH_MSG28)—Offset 167Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.442 Inbound Inter Processor Messages 29 Gfx to ISH (GFX2ISH_MSG29)—Offset 1680h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.443 Inbound Inter Processor Messages 30 Gfx to ISH (GFX2ISH_MSG30)—Offset 1684h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.444 Inbound Inter Processor Messages 31 Gfx to ISH (GFX2ISH_MSG31)—Offset 1688h

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.445 Inbound Inter Processor Messages 32 Gfx to ISH (GFX2ISH_MSG32)—Offset 168Ch

Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from GFX to ISH (MSG):** Inter-processor message registers for Gfx to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Gfx to ISH. These registers are meant to be written by the Gfx and read by ISH.

20.446 Inbound Doorbell ISP to ISH (ISP2ISH_DOORBELL)—Offset 1690h

Inbound doorbell register, ISP core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISP to ISH doorbell busy bit. When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISP to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.447 Outbound Doorbell ISH to ISP (ISH2ISP_DOORBELL)—Offset 1694h

Outbound doorbell register for the ISH to interrupt the ISP. Setting bit 31 of this register causes the ISP to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to ISP doorbell busy bit. When this bit is cleared, the ISP is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISH to ISP doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.448 Inbound Doorbell Audio to ISH (AUDIO2ISH_DOORBELL)—Offset 1698h

Inbound doorbell register, audio core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY)**
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** Audio to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.449 Outbound Doorbell ISH to Audio (ISH2AUDIO_DOORBELL)—Offset 169Ch

Outbound doorbell register for the ISH to interrupt the audio. Setting bit 31 of this register causes the audio to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to audio doorbell busy bit. When this bit is cleared, the audio is ready to accept a new message.
30:0	0h RW	**31 bit Payload (PAYLOAD_31BIT):** ISH to audio doorbell 31 bit Payload, 31 bit message payload for backward compatibility.

20.450 Inbound Doorbell GFX to ISH (GFX2ISH_DOORBELL)—Offset 16A0h

Inbound doorbell register, Gfx core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** GFX to ISH doorbell busy bit. when this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** GFX to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.451 Outbound Doorbell ISH to GFx (ISH2GFX_DOORBELL)—Offset 16A4h

Outbound doorbell register for the ISH to interrupt the Gfx. Setting bit 31 of this register causes the Gfx to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to GFX doorbell busy bit. When this bit is cleared, the GFX is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISH to GFX doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.452 CSME to ISH Control and Status (CSME2ISH_CTRL_STATUS)—Offset 16A8h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When CSME writes to any of these bits with 1, an interrupt is generated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (CSME2ISH_CTRL_STATUS):** Control and status information transfer from CSME FW to ISH FW.

20.453 ISH IPC D0I3 Control (IPC_d0i3C_reg)—Offset 16D0h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When CSME writes to any of these bits with 1, an interrupt is generated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED):** Reserved.
4	0h RO	**Interrupt Request Capable (ISH_IPC_d0i3C_reg_RSVD)**
3	1h RW/1C	**Restore Required (ISH_IPC_d0i3C_reg3):** D0i3 register for storing power related information RR: Restore Required bit.
2	0h RW	**D0i3 (ISH_IPC_d0i3C_reg2):** D0i3 register for storing power related information i3: D0i3 bit.
1	0h RW	**Interrupt Request (ISH_IPC_d0i3C_reg1):** D0i3 register for storing power related information IR: Interrupt Request bit.
0	0h RW/1C	**Command-In-Progress (ISH_IPC_d0i3C_reg0):** D0i3 register for storing power related information CIP: Command-In-Progress bit.

20.454 PMC to ISH Control and Status (ipc_pmc2ish_csr_reg)—Offset 16D4h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When PMC writes to any of these bits with 1, an interrupt is generated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_PMC2ISH_CSR_REG):** Control and status information transfer between ISH and PMC FWs and interrupt generation to mIA.

20.455 ISP to ISH Control and Status (ipc_isp2ish_csr_reg)—Offset 16D8h

This is a control and status register for enabling ISP to interrupt mIA incase of ISP writes to any of these bits of the register. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_ISP2ISH_CSR_REG):** Control and status information transfer between ISH and ISP FWs and interrupt generation to mIA.

20.456 Audio to ISH Control and Status (ipc_audio2ish_csr_reg)—Offset 16DCh

This is a control and status register for enabling audio to interrupt mIA incase of audio writes to any of these bits of the register. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_AUDIO2ISH_CSR_REG):** Control and status information transfer between ISH and audio FWs and interrupt generation to mIA.

20.457 Peripheral Interrupt Status (PISR)—Offset 0h

This register contains all the inbound and outbound interrupt status bits of the IPC registers. Interrupts ISH2HOST_Intr, ISH2SEC_Intr, ISH2PMC_Intr, HOST2ISH_intr, SEC2ISH_Intr and PMC2ISH_Intr are generated when PISR[x] & PIMR[x].

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED1):** Reserved.
26	0h RO	**Interrupt Status Bit for Audio CSR Register (PISR_AUDIO_CSR):** Audio to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
25	0h RO	**Interrupt Status Bit for ISP CSR Register (PISR_ISP_CSR):** ISP to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
24	0h RO	**Interrupt Status Bit for PMC CSR Register (PISR_PMC_CSR):** PMC to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
23	0h RO	**Interrupt Status Bit for CSME CSR Register (PISR_CSME_CSR):** CSME to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
22:12	0h RO	**Reserved (RESERVED0):** Reserved.
11	0h RO	**ISH to Audio Status (PISR_ISH2AUDIO):** Outbound IPC request from ISH to audio status: • 1: Interrupt is active. • 0: Interrupt is inactive.
10	0h RO	**ISH to ISP Status (PISR_ISH2ISP):** Outbound IPC request from ISH to ISP status: • 1: Interrupt is active. • 0: Interrupt is inactive.
9	0h RO	**ISH to GFX Status (PISR_ISH2GFX):** Outbound IPC request from ISH to GFX status: • 1: Interrupt is active. • 0: Interrupt is inactive.
8	0h RO	**Audio to ISH Status (PISR_AUDIO2ISH):** Inbound IPC request from audio to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
7	0h RO	**ISP to ISH Status (PISR_ISP2ISH):** Inbound IPC request from ISP to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
6	0h RO	**GFX to ISH Status (PISR_GFX2ISH):** Inbound IPC request from GFX to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
5	0h RO	**ISH to SEC Status (PISR_ISH2SEC):** Outbound IPC request from ISH to SEC status: • 1: Interrupt is active. • 0: Interrupt is inactive.
4	0h RO	**ISH to PMC Status (PISR_ISH2PMC):** Outbound IPC request from ISH to PMC status: • 1: Interrupt is active. • 0: Interrupt is inactive.
3	0h RO	**Reserved (RESERVED):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**SEC to ISH Status (PISR_SEC2ISH):** Inbound IPC request from SEC to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
1	0h RO	**PMC to ISH Status (PISR_PMC2ISH):** Inbound IPC request from PMC to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
0	0h RO	**Host to ISH Status (PISR_HOST2ISH):** Inbound IPC request from host to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.

20.458 Peripheral Interrupt Mask (PIMR)—Offset 4h

This register enables or disables inbound and outbound interrupts between ISH&HOST, ISH&PMC and ISH&PMC. The outbound interrupts cannot be masked by HOST, PMC & SEC since this register is not accessible by external agents like HOST, PMC & SEC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RESERVED1):** Reserved.
27	0h RW	**H2IBCISC Interrupt Mask (H2IBCISC_IE):** Mask bit for H2IBCISC interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
26	0h RW	**Audio CSR Interrupt Mask (PIMR_AUDIO_CSR_MASK):** Mask bit for audio CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
25	0h RW	**ISP CSR Interrupt Mask (PIMR_ISP_CSR_MASK):** Mask bit for ISP CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
24	0h RW	**PMC CSR Interrupt Mask (PIMR_PMC_CSR_MASK):** Mask bit for PMC CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
23	0h RW	**CSME CSR Interrupt Mask (PIMR_CSME_CSR_MASK):** Mask bit for CSME CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
22	0h RW	**ISH to Audio Busy Clear Mask (PIMR_ISH2AUDIO_BUSY_CLEAR):** Mask bit for ISH to audio busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**ISH to ISP Busy Clear Mask (PIMR_ISH2ISP_BUSY_CLEAR):** Mask bit for ISH to ISP busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
20	0h RW	**ISH to GFX Busy Clear Mask (PIMR_ISH2GFX_BUSY_CLEAR):** Mask bit for ISH to GFX busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
19	0h RW	**ISH to Audio Mask (PIMR_ISH2AUDIO):** Outbound IPC request from ISH to audio mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
18	0h RW	**ISH to ISP Mask (PIMR_ISH2ISP):** Outbound IPC request from ISH to ISP mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
17	0h RW	**ISH to GFX Mask (PIMR_ISH2GFX):** Outbound IPC request from ISH to GFX mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
16	0h RW	**Audio to ISH Mask (PIMR_AUDIO2ISH):** Inbound IPC request from audio to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
15	0h RW	**ISP to ISH Mask (PIMR_ISP2ISH):** Inbound IPC request from ISP to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
14	0h RW	**GFX to ISH Mask (PIMR_GFX2ISH):** Inbound IPC request from GFX to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
13	0h RW	**ISH to SEC Busy Clear Mask (PIMR_ISH2SEC_BUSY_CLEAR):** Mask bit for ISH to SEC busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
12	0h RW	**ISH to PMC Busy Clear Mask (PIMR_ISH2PMC_BUSY_CLEAR):** Mask bit for ISH to PMC busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
11	0h RW	**ISH to Host Busy Clear Mask (PIMR_ISH2HOST_BUSY_CLEAR):** Mask bit for ISH to host busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
10:6	0h RO	**Reserved (RESERVED0):** Reserved.
5	0h RW	**ISH to SEC Mask (PIMR_ISH2SEC):** Outbound IPC request from ISH to SEC mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
4	0h RW	**ISH to PMC Mask (PIMR_ISH2PMC):** Outbound IPC request from ISH to PMC mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
3	0h RO	**Reserved (RESERVED):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SEC to ISH Mask (PIMR_SEC2ISH):** Inbound IPC request from SEC to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
1	0h RW	**PMC to ISH Mask (PIMR_PMC2ISH):** Inbound IPC request from PMC to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
0	0h RW	**Host to ISH Mask (PIMR_HOST2ISH):** Inbound IPC request from host to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

20.459 Host Peripheral Interrupt Mask (HOST_PIMR)—Offset 8h

This register is for masking the interrupt, caused by setting the DB bit, for IPC from mIA to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RESERVED1):** Reserved.
8	0h RW	**Host to ISH Busy Clear Mask (PIMR_HOST2ISH_BUSY_CLEAR):** Mask bit for host to ISH busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

20.470 ISH Host Firmware Status (ISH_HOST_FWSTS)—Offset 34h

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1`b1 to indicate its status.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ISH Host Firmware Status (ISH_HOST_FWSTS)**

20.471 Host Communication (HOST_COMM)—Offset 38h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host Communication Register (HOST_COMM)**

20.472 ISH SEC Firmware Status (ISH_SEC_FWSTS)—Offset 3Ch

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1`b1 to indicate its status.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ISH SEC Firmware Status (ISH_SEC_FWSTS)**

20.473 SEC Communication (SEC_COMM)—Offset 40h

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The SEC sets bits of this register to 1`b1 to communicate with the ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SEC Communication (SEC_COMM):** This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The SEC sets bits of this register to 1`b1 to communicate with the ISH.

20.474 ISH Reset (ISH_RST)—Offset 44h

This register is reserved for SEC. SEC should not write to this register. The reset register is a 32 bit register that can be written by ISH Minute IA. The Host cannot read or write this bit. Setting bit 1 will cause MinuteIA to reset.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RESERVED):** Reserved.
0	0h RW	**Reset Bit (RESET_BIT):** ISH Reset Register: • 1: Reset active. • 0: Reset inactive.

20.475 Inbound Doorbell HOST to ISH (HOST2ISH_DOORBELL)—Offset 48h

Inbound doorbell register, host core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.476 Inbound Doorbell PMC to ISH (PMC2ISH_DOORBELL)—Offset 4Ch

Inbound doorbell register, PMC to interrupt ISH Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.477 Inbound Doorbell SEC to ISH (SEC2ISH_DOORBELL)—Offset 50h

Inbound doorbell register, SEC to interrupt ISH Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.478 Outbound Doorbell ISH to Host (ISH2HOST_DOORBELL)—Offset 54h

Outbound doorbell register for the ISH to interrupt the host. Setting bit 31 of this register causes the host to receive a IRQn interrupt. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the host CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.479 Outbound Doorbell ISH to PMC (ISH2PMC_DOORBELL)—Offset 58h

Outbound doorbell register for the ISH to interrupt the PMC. Setting bit 31 of this register causes the PMC to receive interrupt on OOB. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the PMC CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.480 Outbound Doorbell ISH to SEC (ISH2SEC_DOORBELL)—Offset 5Ch

Outbound doorbell register for the ISH to interrupt the SEC. Setting bit 31 of this register causes the SEC to receive interrupt on OOB Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the SEC CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.481 Outbound Inter-processor Messages 1 ISH to Host (ISH2HOST_MSG1)—Offset 60h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.482 Outbound Inter-processor Messages 2 ISH to Host (ISH2HOST_MSG2)—Offset 64h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to Host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to Host.

20.483 Outbound Inter-processor Messages 3 ISH to Host (ISH2HOST_MSG3)—Offset 68h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.484 Outbound Inter-processor Messages 4 ISH to Host (ISH2HOST_MSG4)—Offset 6Ch

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.485 Outbound Inter-processor Messages 5 ISH to Host (ISH2HOST_MSG5)—Offset 70h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.486 Outbound Inter-processor Messages 6 ISH to Host (ISH2HOST_MSG6)—Offset 74h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.487 Outbound Inter-processor Messages 7 ISH to Host (ISH2HOST_MSG7)—Offset 78h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.488 Outbound Inter-processor Messages 8 ISH to Host (ISH2HOST_MSG8)—Offset 7Ch

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.489 Outbound Inter-processor Messages 9 ISH to Host (ISH2HOST_MSG9)—Offset 80h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.490 Outbound Inter-processor Messages 10 ISH to Host (ISH2HOST_MSG10)—Offset 84h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.491 Outbound Inter-processor Messages 11 ISH to Host (ISH2HOST_MSG11)—Offset 88h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.492 Outbound Inter-processor Messages 12 ISH to Host (ISH2HOST_MSG12)—Offset 8Ch

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.493 Outbound Inter-processor Messages 13 ISH to Host (ISH2HOST_MSG13)—Offset 90h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.494 Outbound Inter-processor Messages 14 ISH to Host (ISH2HOST_MSG14)—Offset 94h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.495 Outbound Inter-processor Messages 15 ISH to Host (ISH2HOST_MSG15)—Offset 98h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.496 Outbound Inter-processor Messages 16 ISH to Host (ISH2HOST_MSG16)—Offset 9Ch

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.497 Outbound Inter-processor Messages 17 ISH to Host (ISH2HOST_MSG17)—Offset A0h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.498 Outbound Inter-processor Messages 18 ISH to Host (ISH2HOST_MSG18)—Offset A4h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.499 Outbound Inter-processor Messages 19 ISH to Host (ISH2HOST_MSG19)—Offset A8h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.500 Outbound Inter-processor Messages 20 ISH to Host (ISH2HOST_MSG20)—Offset ACh

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.501 Outbound Inter-processor Messages 21 ISH to Host (ISH2HOST_MSG21)—Offset B0h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.502 Outbound Inter-processor Messages 22 ISH to Host (ISH2HOST_MSG22)—Offset B4h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.503 Outbound Inter-processor Messages 23 ISH to Host (ISH2HOST_MSG23)—Offset B8h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.504 Outbound Inter-processor Messages 24 ISH to Host (ISH2HOST_MSG24)—Offset BCh

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.505 Outbound Inter-processor Messages 25 ISH to Host (ISH2HOST_MSG25)—Offset C0h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.506 Outbound Inter-processor Messages 26 ISH to Host (ISH2HOST_MSG26)—Offset C4h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.507 Outbound Inter-processor Messages 27 ISH to Host (ISH2HOST_MSG27)—Offset C8h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.508 Outbound Inter-processor Messages 28 ISH to Host (ISH2HOST_MSG28)—Offset CCh

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.509 Outbound Inter-processor Messages 29 ISH to Host (ISH2HOST_MSG29)—Offset D0h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.510 Outbound Inter-processor Messages 30 ISH to Host (ISH2HOST_MSG30)—Offset D4h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.511 Outbound Inter-processor Messages 31 ISH to Host (ISH2HOST_MSG31)—Offset D8h

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.512 Outbound Inter-processor Messages 32 ISH to Host (ISH2HOST_MSG32)—Offset DCh

Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to Host (MSG):** Inter-process message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.513 Inbound Inter-processor Messages 1 Host to ISH (HOST2ISH_MSG1)—Offset E0h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.514 Inbound Inter-processor Messages 2 Host to ISH (HOST2ISH_MSG2)—Offset E4h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.515 Inbound Inter-processor Messages 3 Host to ISH (HOST2ISH_MSG3)—Offset E8h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.516 Inbound Inter-processor Messages 4 Host to ISH (HOST2ISH_MSG4)—Offset ECh

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.517 Inbound Inter-processor Messages 5 Host to ISH (HOST2ISH_MSG5)—Offset F0h

Inter-process Message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from Host to ISH (MSG):** Inter-process Message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the Host to ISH.

20.518 Inbound Inter-processor Messages 6 Host to ISH (HOST2ISH_MSG6)—Offset F4h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.519 Inbound Inter-processor Messages 7 Host to ISH (HOST2ISH_MSG7)—Offset F8h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.520 Inbound Inter-processor Messages 8 Host to ISH (HOST2ISH_MSG8)—Offset FCh

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.521 Inbound Inter-processor Messages 9 Host to ISH (HOST2ISH_MSG9)—Offset 100h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.522 Inbound Inter-processor Messages 10 Host to ISH (HOST2ISH_MSG10)—Offset 104h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.523 Inbound Inter-processor Messages 11 Host to ISH (HOST2ISH_MSG11)—Offset 108h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.524 Inbound Inter-processor Messages 12 Host to ISH (HOST2ISH_MSG12)—Offset 10Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.525 Inbound Inter-processor Messages 13 Host to ISH (HOST2ISH_MSG13)—Offset 110h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.526 Inbound Inter-processor Messages 14 Host to ISH (HOST2ISH_MSG14)—Offset 114h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.527 Inbound Inter-processor Messages 15 Host to ISH (HOST2ISH_MSG15)—Offset 118h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.528 Inbound Inter-processor Messages 16 Host to ISH (HOST2ISH_MSG16)—Offset 11Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.529 Inbound Inter-processor Messages 17 Host to ISH (HOST2ISH_MSG17)—Offset 120h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.530 Inbound Inter-processor Messages 18 Host to ISH (HOST2ISH_MSG18)—Offset 124h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.531 Inbound Inter-processor Messages 19 Host to ISH (HOST2ISH_MSG19)—Offset 128h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.532 Inbound Inter-processor Messages 20 Host to ISH (HOST2ISH_MSG20)—Offset 12Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.533 Inbound Inter-processor Messages 21 Host to ISH (HOST2ISH_MSG21)—Offset 130h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.534 Inbound Inter-processor Messages 22 Host to ISH (HOST2ISH_MSG22)—Offset 134h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.535 Inbound Inter-processor Messages 23 Host to ISH (HOST2ISH_MSG23)—Offset 138h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.536 Inbound Inter-processor Messages 24 Host to ISH (HOST2ISH_MSG24)—Offset 13Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.537 Inbound Inter-processor Messages 25 Host to ISH (HOST2ISH_MSG25)—Offset 140h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.538 Inbound Inter-processor Messages 26 Host to ISH (HOST2ISH_MSG26)—Offset 144h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.539 Inbound Inter-processor Messages 27 Host to ISH (HOST2ISH_MSG27)—Offset 148h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.540 Inbound Inter-processor Messages 28 Host to ISH (HOST2ISH_MSG28)—Offset 14Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.541 Inbound Inter-processor Messages 29 Host to ISH (HOST2ISH_MSG29)—Offset 150h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.542 Inbound Inter-processor Messages 30 Host to ISH (HOST2ISH_MSG30)—Offset 154h

Inter-process message registers for Host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from Host to ISH (MSG):** Inter-process message registers for Host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.543 Inbound Inter-processor Messages 31 Host to ISH (HOST2ISH_MSG31)—Offset 158h

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.544 Inbound Inter-processor Messages 32 Host to ISH (HOST2ISH_MSG32)—Offset 15Ch

Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from Host to ISH (MSG):** Inter-process message registers for host to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the host to ISH.

20.545 Outbound Inter-processor Messages 1 ISH to SEC (ISH2SEC_MSG1)—Offset 160h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.546 Outbound Inter-processor Messages 2 ISH to SEC (ISH2SEC_MSG2)—Offset 164h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.547 Outbound Inter-processor Messages 3 ISH to SEC (ISH2SEC_MSG3)—Offset 168h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.548 Outbound Inter-processor Messages 4 ISH to SEC (ISH2SEC_MSG4)—Offset 16Ch

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.549 Outbound Inter-processor Messages 5 ISH to SEC (ISH2SEC_MSG5)—Offset 170h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.550 Outbound Inter-processor Messages 6 ISH to SEC (ISH2SEC_MSG6)—Offset 174h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.551 Outbound Inter-processor Messages 7 ISH to SEC (ISH2SEC_MSG7)—Offset 178h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.552 Outbound Inter-processor Messages 8 ISH to SEC (ISH2SEC_MSG8)—Offset 17Ch

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.553 Outbound Inter-processor Messages 9 ISH to SEC (ISH2SEC_MSG9)—Offset 180h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.554 Outbound Inter-processor Messages 10 ISH to SEC (ISH2SEC_MSG10)—Offset 184h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.555 Outbound Inter-processor Messages 11 ISH to SEC (ISH2SEC_MSG11)—Offset 188h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.556 Outbound Inter-processor Messages 12 ISH to SEC (ISH2SEC_MSG12)—Offset 18Ch

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.557 Outbound Inter-processor Messages 13 ISH to SEC (ISH2SEC_MSG13)—Offset 190h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.558 Outbound Inter-processor Messages 14 ISH to SEC (ISH2SEC_MSG14)—Offset 194h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.559 Outbound Inter-processor Messages 15 ISH to SEC (ISH2SEC_MSG15)—Offset 198h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.560 Outbound Inter-processor Messages 16 ISH to SEC (ISH2SEC_MSG16)—Offset 19Ch

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.561 Outbound Inter-processor Messages 17 ISH to SEC (ISH2SEC_MSG17)—Offset 1A0h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.562 Outbound Inter-processor Messages 18 ISH to SEC (ISH2SEC_MSG18)—Offset 1A4h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.563 Outbound Inter-processor Messages 19 ISH to SEC (ISH2SEC_MSG19)—Offset 1A8h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.564 Outbound Inter-processor Messages 20 ISH to SEC (ISH2SEC_MSG20)—Offset 1ACh

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.565 Outbound Inter-processor Messages 21 ISH to SEC (ISH2SEC_MSG21)—Offset 1B0h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.566 Outbound Inter-processor Messages 22 ISH to SEC (ISH2SEC_MSG22)—Offset 1B4h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.567 Outbound Inter-processor Messages 23 ISH to SEC (ISH2SEC_MSG23)—Offset 1B8h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.568 Outbound Inter-processor Messages 24 ISH to SEC (ISH2SEC_MSG24)—Offset 1BCh

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.569 Outbound Inter-processor Messages 25 ISH to SEC (ISH2SEC_MSG25)—Offset 1C0h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.570 Outbound Inter-processor Messages 26 ISH to SEC (ISH2SEC_MSG26)—Offset 1C4h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.571 Outbound Inter-processor Messages 27 ISH to SEC (ISH2SEC_MSG27)—Offset 1C8h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.572 Outbound Inter-processor Messages 28 ISH to SEC (ISH2SEC_MSG28)—Offset 1CCh

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.573 Outbound Inter-processor Messages 29 ISH to SEC (ISH2SEC_MSG29)—Offset 1D0h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.574 Outbound Inter-processor Messages 30 ISH to SEC (ISH2SEC_MSG30)—Offset 1D4h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.575 Outbound Inter-processor Messages 31 ISH to SEC (ISH2SEC_MSG31)—Offset 1D8h

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.576 Outbound Inter-processor Messages 32 ISH to SEC (ISH2SEC_MSG32)—Offset 1DCh

Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to SEC (MSG):** Inter-process message registers for ISH core to communicate to the SEC. These are thirty-two 32 bit registers that hold the message payload from the ISH to SEC.

20.577 Inbound Inter-processor Messages 1 SEC to ISH (SEC2ISH_MSG1)—Offset 1E0h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.578 Inbound Inter-processor Messages 2 SEC to ISH (SEC2ISH_MSG2)—Offset 1E4h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.579 Inbound Inter-processor Messages 3 SEC to ISH (SEC2ISH_MSG3)—Offset 1E8h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.580 Inbound Inter-processor Messages 4 SEC to ISH (SEC2ISH_MSG4)—Offset 1ECh

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.581 Inbound Inter-processor Messages 5 SEC to ISH (SEC2ISH_MSG5)—Offset 1F0h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.582 Inbound Inter-processor Messages 6 SEC to ISH (SEC2ISH_MSG6)—Offset 1F4h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.583 Inbound Inter-processor Messages 7 SEC to ISH (SEC2ISH_MSG7)—Offset 1F8h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.584 Inbound Inter-processor Messages 8 SEC to ISH (SEC2ISH_MSG8)—Offset 1FCh

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.585 Inbound Inter-processor Messages 9 SEC to ISH (SEC2ISH_MSG9)—Offset 200h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.586 Inbound Inter-processor Messages 10 SEC to ISH (SEC2ISH_MSG10)—Offset 204h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.587 Inbound Inter-processor Messages 11 SEC to ISH (SEC2ISH_MSG11)—Offset 208h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.588 Inbound Inter-processor Messages 12 SEC to ISH (SEC2ISH_MSG12)—Offset 20Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.589 Inbound Inter-processor Messages 13 SEC to ISH (SEC2ISH_MSG13)—Offset 210h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message13 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.590 Inbound Inter-processor Messages 14 SEC to ISH (SEC2ISH_MSG14)—Offset 214h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.591 Inbound Inter-processor Messages 15 SEC to ISH (SEC2ISH_MSG15)—Offset 218h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.592 Inbound Inter-processor Messages 16 SEC to ISH (SEC2ISH_MSG16)—Offset 21Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.593 Inbound Inter-processor Messages 17 SEC to ISH (SEC2ISH_MSG17)—Offset 220h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.594 Inbound Inter-processor Messages 18 SEC to ISH (SEC2ISH_MSG18)—Offset 224h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.595 Inbound Inter-processor Messages 19 SEC to ISH (SEC2ISH_MSG19)—Offset 228h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.596 Inbound Inter-processor Messages 20 SEC to ISH (SEC2ISH_MSG20)—Offset 22Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.597 Inbound Inter-processor Messages 21 SEC to ISH (SEC2ISH_MSG21)—Offset 230h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.598 Inbound Inter-processor Messages 22 SEC to ISH (SEC2ISH_MSG22)—Offset 234h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.599 Inbound Inter-processor Messages 23 SEC to ISH (SEC2ISH_MSG23)—Offset 238h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.600 Inbound Inter-processor Messages 24 SEC to ISH (SEC2ISH_MSG24)—Offset 23Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.601 Inbound Inter-processor Messages 25 SEC to ISH (SEC2ISH_MSG25)—Offset 240h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.602 Inbound Inter-processor Messages 26 SEC to ISH (SEC2ISH_MSG26)—Offset 244h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.603 Inbound Inter-processor Messages 27 SEC to ISH (SEC2ISH_MSG27)—Offset 248h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.604 Inbound Inter-processor Messages 28 SEC to ISH (SEC2ISH_MSG28)—Offset 24Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.605 Inbound Inter-processor Messages 29 SEC to ISH (SEC2ISH_MSG29)—Offset 250h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.606 Inbound Inter-processor Messages 30 SEC to ISH (SEC2ISH_MSG30)—Offset 254h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.607 Inbound Inter-processor Messages 31 SEC to ISH (SEC2ISH_MSG31)—Offset 258h

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.608 Inbound Inter-processor Messages 32 SEC to ISH (SEC2ISH_MSG32)—Offset 25Ch

Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from SEC to ISH (MSG):** Inter-process message registers for SEC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the SEC to ISH.

20.609 Outbound Inter-processor Messages 1 ISH to PMC (ISH2PMC_MSG1)—Offset 260h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.610 Outbound Inter-processor Messages 2 ISH to PMC (ISH2PMC_MSG2)—Offset 264h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.611 Outbound Inter-processor Messages 3 ISH to PMC (ISH2PMC_MSG3)—Offset 268h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.612 Outbound Inter-processor Messages 4 ISH to PMC (ISH2PMC_MSG4)—Offset 26Ch

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.613 Outbound Inter-processor Messages 5 ISH to PMC (ISH2PMC_MSG5)—Offset 270h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.614 Outbound Inter-processor Messages 6 ISH to PMC (ISH2PMC_MSG6)—Offset 274h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.615 Outbound Inter-processor Messages 7 ISH to PMC (ISH2PMC_MSG7)—Offset 278h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.616 Outbound Inter-processor Messages 8 ISH to PMC (ISH2PMC_MSG8)—Offset 27Ch

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.617 Outbound Inter-processor Messages 9 ISH to PMC (ISH2PMC_MSG9)—Offset 280h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.618 Outbound Inter-processor Messages 10 ISH to PMC (ISH2PMC_MSG10)—Offset 284h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.619 Outbound Inter-processor Messages 11 ISH to PMC (ISH2PMC_MSG11)—Offset 288h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.620 Outbound Inter-processor Messages 12 ISH to PMC (ISH2PMC_MSG12)—Offset 28Ch

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.621 Outbound Inter-processor Messages 13 ISH to PMC (ISH2PMC_MSG13)—Offset 290h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.622 Outbound Inter-processor Messages 14 ISH to PMC (ISH2PMC_MSG14)—Offset 294h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.623 Outbound Inter-processor Messages 15 ISH to PMC (ISH2PMC_MSG15)—Offset 298h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.624 Outbound Inter-processor Messages 16 ISH to PMC (ISH2PMC_MSG16)—Offset 29Ch

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.625 Outbound Inter-processor Messages 17 ISH to PMC (ISH2PMC_MSG17)—Offset 2A0h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.626 Outbound Inter-processor Messages 18 ISH to PMC (ISH2PMC_MSG18)—Offset 2A4h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.627 Outbound Inter-processor Messages 19 ISH to PMC (ISH2PMC_MSG19)—Offset 2A8h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.628 Outbound Inter-processor Messages 20 ISH to PMC (ISH2PMC_MSG20)—Offset 2ACh

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.629 Outbound Inter-processor Messages 21 ISH to PMC (ISH2PMC_MSG21)—Offset 2B0h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.630 Outbound Inter-processor Messages 22 ISH to PMC (ISH2PMC_MSG22)—Offset 2B4h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.631 Outbound Inter-processor Messages 23 ISH to PMC (ISH2PMC_MSG23)—Offset 2B8h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.632 Outbound Inter-processor Messages 24 ISH to PMC (ISH2PMC_MSG24)—Offset 2BCh

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.633 Outbound Inter-processor Messages 25 ISH to PMC (ISH2PMC_MSG25)—Offset 2C0h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.634 Outbound Inter-processor Messages 26 ISH to PMC (ISH2PMC_MSG26)—Offset 2C4h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.635 Outbound Inter-processor Messages 27 ISH to PMC (ISH2PMC_MSG27)—Offset 2C8h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.636 Outbound Inter-processor Messages 28 ISH to PMC (ISH2PMC_MSG28)—Offset 2CCh

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.637 Outbound Inter-processor Messages 29 ISH to PMC (ISH2PMC_MSG29)—Offset 2D0h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.638 Outbound Inter-processor Messages 30 ISH to PMC (ISH2PMC_MSG30)—Offset 2D4h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.639 Outbound Inter-processor Messages 31 ISH to PMC (ISH2PMC_MSG31)—Offset 2D8h

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.640 Outbound Inter-processor Messages 32 ISH to PMC (ISH2PMC_MSG32)—Offset 2DCh

Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to PMC (MSG):** Inter-process message registers for ISH core to communicate to the PMC. These are thirty-two 32 bit registers that hold the message payload from the ISH to PMC.

20.641 Inbound Inter-processor Messages 1 PMC to ISH (PMC2ISH_MSG1)—Offset 2E0h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.642 Inbound Inter-processor Messages 2 PMC to ISH (PMC2ISH_MSG2)—Offset 2E4h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.643 Inbound Inter-processor Messages 3 PMC to ISH (PMC2ISH_MSG3)—Offset 2E8h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.644 Inbound Inter-processor Messages 4 PMC to ISH (PMC2ISH_MSG4)—Offset 2ECh

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.645 Inbound Inter-processor Messages 5 PMC to ISH (PMC2ISH_MSG5)—Offset 2F0h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.646 Inbound Inter-processor Messages 6 PMC to ISH (PMC2ISH_MSG6)—Offset 2F4h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.647 Inbound Inter-processor Messages 7 PMC to ISH (PMC2ISH_MSG7)—Offset 2F8h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.648 Inbound Inter-processor Messages 8 PMC to ISH (PMC2ISH_MSG8)—Offset 2FCh

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.649 Inbound Inter-processor Messages 9 PMC to ISH (PMC2ISH_MSG9)—Offset 300h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.650 Inbound Inter-processor Messages 10 PMC to ISH (PMC2ISH_MSG10)—Offset 304h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.651 Inbound Inter-processor Messages 11 PMC to ISH (PMC2ISH_MSG11)—Offset 308h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.652 Inbound Inter-processor Messages 12 PMC to ISH (PMC2ISH_MSG12)—Offset 30Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.653 Inbound Inter-processor Messages 13 PMC to ISH (PMC2ISH_MSG13)—Offset 310h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.654 Inbound Inter-processor Messages 14 PMC to ISH (PMC2ISH_MSG14)—Offset 314h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.655 Inbound Inter-processor Messages 15 PMC to ISH (PMC2ISH_MSG15)—Offset 318h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.656 Inbound Inter-processor Messages 16 PMC to ISH (PMC2ISH_MSG16)—Offset 31Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.657 Inbound Inter-processor Messages 17 PMC to ISH (PMC2ISH_MSG17)—Offset 320h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.658 Inbound Inter-processor Messages 18 PMC to ISH (PMC2ISH_MSG18)—Offset 324h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.659 Inbound Inter-processor Messages 19 PMC to ISH (PMC2ISH_MSG19)—Offset 328h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.660 Inbound Inter-processor Messages 20 PMC to ISH (PMC2ISH_MSG20)—Offset 32Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.661 Inbound Inter-processor Messages 21 PMC to ISH (PMC2ISH_MSG21)—Offset 330h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.662 Inbound Inter-processor Messages 22 PMC to ISH (PMC2ISH_MSG22)—Offset 334h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.663 Inbound Inter-processor Messages 23 PMC to ISH (PMC2ISH_MSG23)—Offset 338h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.664 Inbound Inter-processor Messages 24 PMC to ISH (PMC2ISH_MSG24)—Offset 33Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.665 Inbound Inter-processor Messages 25 PMC to ISH (PMC2ISH_MSG25)—Offset 340h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.666 Inbound Inter-processor Messages 26 PMC to ISH (PMC2ISH_MSG26)—Offset 344h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.667 Inbound Inter-processor Messages 27 PMC to ISH (PMC2ISH_MSG27)—Offset 348h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.668 Inbound Inter-processor Messages 28 PMC to ISH (PMC2ISH_MSG28)—Offset 34Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.669 Inbound Inter-processor Messages 29 PMC to ISH (PMC2ISH_MSG29)—Offset 350h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from PMC to ISH. (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.670 Inbound Inter-processor Messages 30 PMC to ISH (PMC2ISH_MSG30)—Offset 354h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.671 Inbound Inter-processor Messages 31 PMC to ISH (PMC2ISH_MSG31)—Offset 358h

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.672 Inbound Inter-processor Messages 32 PMC to ISH (PMC2ISH_MSG32)—Offset 35Ch

Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from PMC to ISH (MSG):** Inter-process message registers for PMC to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the PMC to ISH.

20.673 Remap 0 (REMAP0)—Offset 360h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 0 (REMAP0)**

20.674 Remap 1 (REMAP1)—Offset 364h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 1 (REMAP1)**

20.675 Remap 2 (REMAP2)—Offset 368h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 2 (REMAP2)**

20.676 Remap 3 (REMAP3)—Offset 36Ch

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 3 (REMAP3)**

20.677 Remap 4 (REMAP4)—Offset 370h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 4 (REMAP4)**

20.678 Remap 5 (REMAP5)—Offset 374h

At boot time, the host can write these registers with any dynamically allocated address spaces that ISH will have to access.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Remap 5 (REMAP5)**

20.679 ISH IPC Busy Clear (ISH_IPC_BUSY_CLEAR)—Offset 378h

This register holds the status of the ISH IPC busy clear interrupts. ISH IPC busy clear interrupt is set when busy bit of respective outbound doorbell register gets cleared and interrupt is cleared when ISH writes CAN1EM to respective bit in ISH IPC busy clear register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RESERVED0):** Reserved.
16	0h RW/1C	**ISH to SEC Busy Clear Status (ISH2SEC_BUSY_CLEAR):** Busy clear interrupt bit of ISH to SEC IPC: • 1: Interrupt active. • 0: Interrupt inactive.
15:9	0h RO	**Reserved (RESERVED1):** Reserved.
8	0h RW/1C	**ISH to PMC Busy Clear Status (ISH2PMC_BUSY_CLEAR):** Busy clear interrupt bit of ISH to PMC IPC: • 1: Interrupt active. • 0: Interrupt inactive.
7:4	0h RO	**Reserved (RESERVED2):** Reserved.
3	0h RW/1C	**ISH to Audio Busy Clear Status (ISH2AUDIO_BUSY_CLEAR):** Busy clear interrupt bit of ISH to audio IPC: • 1: Interrupt active. • 0: Interrupt inactive.
2	0h RW/1C	**ISH to ISP Busy Clear Status (ISH2ISP_BUSY_CLEAR):** Busy clear interrupt bit of ISH to ISP IPC: • 1: Interrupt active. • 0: Interrupt inactive.
1	0h RW/1C	**ISH to GFX Busy Clear Status (ISH2GFX_BUSY_CLEAR):** Busy clear interrupt bit of ISH to GFX IPC: • 1: Interrupt active. • 0: Interrupt inactive.
0	0h RW/1C	**ISH to Host Busy Clear Status (ISH2HOST_BUSY_CLEAR):** Busy clear interrupt bit of ISH to host IPC: • 1: Interrupt active. • 0: Interrupt inactive.

20.680 ISH Fuse (ISH_FUSE)—Offset 37Ch

This register mirrors the ISH fuse bits.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RESERVED):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO	**ISH Fuse (ISH_FUSE)**

20.681 UMA Base Address LSB (UMA_RANGE_LOWER_0)—Offset 380h

This register should be accessed only in ISH3.0. This is an address range register, holds 32 bit LSB value of the address for UMA base range.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: FFFFF001h

Bit Range	Default & Access	Field Name (ID): Description
31:12	FFFFFh RW	**UMA Memory Base Address LSB (UMA_MEMORY_BASE_ADDR_LSB)**
11:1	0h RO	**NUL Memory Size (SIZE):** Hard wired to 0 indicate 4 KB window granularity.
0	1h RW	**Memory Range Disabled (SIZE_BIT0):** • 1: No TC7 or RS = 1 cycles. • 0: TC7 or RS =1.

20.682 UMA Base Address MSB (UMA_RANGE_LOWER_1)—Offset 384h

This register should be accessed only in ISH3.0. This is an address range register, holds 32 bit MSB value of the address for UMA base range.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**UMA Memory Base Address MSB (UMA_MEMORY_BASE_ADDR_MSB)**

20.683 UMA Limit Address LSB (UMA_RANGE_UPPER_0)—Offset 388h

This register should be accessed only in ISH3.0. This is an address range register, holds 32 bit LSB value of the address for UMA limit range.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: FFFFF000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	FFFFFh RW	**UMA Memory Limit Address LSB (UMA_MEMORY_LIMIT_ADDR_LSB)**
11:0	0h RO	**UMA Range Upper (SIZE):** NUL UMA Memory size, hard wired to 0 indicate 4 KB window granularity.

20.684 UMA Base Address MSB (UMA_RANGE_UPPER_1)—Offset 38Ch

This register should be accessed only in ISH3.0. This is an address range register, holds 32 bit MSB value of the address for UMA base range.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**UMA Memory Limit Address MSB (UMA_MEMORY_LIMIT_ADDR_MSB)**

20.685 Outbound Inter-processor Messages 1 ISH to ISP (ISH2ISP_MSG1)—Offset 390h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.686 Outbound Inter-processor Messages 2 ISH to ISP (ISH2ISP_MSG2)—Offset 394h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.687 Outbound Inter-processor Messages 3 ISH to ISP (ISH2ISP_MSG3)—Offset 398h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.688 Outbound Inter-processor Messages 4 ISH to ISP (ISH2ISP_MSG4)—Offset 39Ch

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.689 Outbound Inter-processor Messages 5 ISH to ISP (ISH2ISP_MSG5)—Offset 3A0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.690 Outbound Inter-processor Messages 6 ISH to ISP (ISH2ISP_MSG6)—Offset 3A4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.691 Outbound Inter-processor Messages 7 ISH to ISP (ISH2ISP_MSG7)—Offset 3A8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.692 Outbound Inter-processor Messages 8 ISH to ISP (ISH2ISP_MSG8)—Offset 3ACh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.693 Outbound Inter-processor Messages 9 ISH to ISP (ISH2ISP_MSG9)—Offset 3B0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.694 Outbound Inter-processor Messages 10 ISH to ISP (ISH2ISP_MSG10)—Offset 3B4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.695 Outbound Inter-processor Messages 11 ISH to ISP (ISH2ISP_MSG11)—Offset 3B8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.696 Outbound Inter-processor Messages 12 ISH to ISP (ISH2ISP_MSG12)—Offset 3BCh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.697 Outbound Inter-processor Messages 13 ISH to ISP (ISH2ISP_MSG13)—Offset 3C0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.698 Outbound Inter-processor Messages 14 ISH to ISP (ISH2ISP_MSG14)—Offset 3C4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.699 Outbound Inter-processor Messages 15 ISH to ISP (ISH2ISP_MSG15)—Offset 3C8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.700 Outbound Inter-processor Messages 16 ISH to ISP (ISH2ISP_MSG16)—Offset 3CCh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.701 Outbound Inter-processor Messages 17 ISH to ISP (ISH2ISP_MSG17)—Offset 3D0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.702 Outbound Inter-processor Messages 18 ISH to ISP (ISH2ISP_MSG18)—Offset 3D4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.703 Outbound Inter-processor Messages 19 ISH to ISP (ISH2ISP_MSG19)—Offset 3D8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.704 Outbound Inter-processor Messages 20 ISH to ISP (ISH2ISP_MSG20)—Offset 3DCh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.705 Outbound Inter-processor Messages 21 ISH to ISP (ISH2ISP_MSG21)—Offset 3E0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.706 Outbound Inter-processor Messages 22 ISH to ISP (ISH2ISP_MSG22)—Offset 3E4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.707 Outbound Inter-processor Messages 23 ISH to ISP (ISH2ISP_MSG23)—Offset 3E8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.708 Outbound Inter-processor Messages 24 ISH to ISP (ISH2ISP_MSG24)—Offset 3ECh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.709 Outbound Inter-processor Messages 25 ISH to ISP (ISH2ISP_MSG25)—Offset 3F0h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.710 Outbound Inter-processor Messages 26 ISH to ISP (ISH2ISP_MSG26)—Offset 3F4h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.711 Outbound Inter-processor Messages 27 ISH to ISP (ISH2ISP_MSG27)—Offset 3F8h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.712 Outbound Inter-processor Messages 28 ISH to ISP (ISH2ISP_MSG28)—Offset 3FCh

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.713 Outbound Inter-processor Messages 29 ISH to ISP (ISH2ISP_MSG29)—Offset 400h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.714 Outbound Inter-processor Messages 30 ISH to ISP (ISH2ISP_MSG30)—Offset 404h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.715 Outbound Inter-processor Messages 31 ISH to ISP (ISH2ISP_MSG31)—Offset 408h

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.716 Outbound Inter-processor Messages 32 ISH to ISP (ISH2ISP_MSG32)—Offset 40Ch

Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to ISP (MSG):** Inter-process message registers for ISH core to communicate to the ISP. These are thirty-two 32 bit registers that hold the message payload from the ISH to ISP. These registers are meant to be written by the ISH and read by ISP.

20.717 Inbound Inter-processor Messages 1 ISP to ISH (ISP2ISH_MSG1)—Offset 410h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.718 Inbound Inter-processor Messages2 ISP to ISH (ISP2ISH_MSG2)—Offset 414h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.719 Inbound Inter-processor Messages 3 ISP to ISH (ISP2ISH_MSG3)—Offset 418h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.720 Inbound Inter-processor Messages 4 ISP to ISH (ISP2ISH_MSG4)—Offset 41Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.721 Inbound Inter-processor Messages 5 ISP to ISH (ISP2ISH_MSG5)—Offset 420h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.722 Inbound Inter-processor Messages 6 ISP to ISH (ISP2ISH_MSG6)—Offset 424h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.723 Inbound Inter-processor Messages 7 ISP to ISH (ISP2ISH_MSG7)—Offset 428h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.724 Inbound Inter-processor Messages 8 ISP to ISH (ISP2ISH_MSG8)—Offset 42Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.725 Inbound Inter-processor Messages 9 ISP to ISH (ISP2ISH_MSG9)—Offset 430h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.726 Inbound Inter-processor Messages 10 ISP to ISH (ISP2ISH_MSG10)—Offset 434h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.727 Inbound Inter-processor Messages 11 ISP to ISH (ISP2ISH_MSG11)—Offset 438h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.728 Inbound Inter-processor Messages 12 ISP to ISH (ISP2ISH_MSG12)—Offset 43Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.729 Inbound Inter-processor Messages 13 ISP to ISH (ISP2ISH_MSG13)—Offset 440h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.730 Inbound Inter-processor Messages 14 ISP to ISH (ISP2ISH_MSG14)—Offset 444h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.731 Inbound Inter-processor Messages 15 ISP to ISH (ISP2ISH_MSG15)—Offset 448h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.732 Inbound Inter-processor Messages 16 ISP to ISH (ISP2ISH_MSG16)—Offset 44Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.733 Inbound Inter-processor Messages 17 ISP to ISH (ISP2ISH_MSG17)—Offset 450h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.734 Inbound Inter-processor Messages 18 ISP to ISH (ISP2ISH_MSG18)—Offset 454h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.735 Inbound Inter-processor Messages 19 ISP to ISH (ISP2ISH_MSG19)—Offset 458h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.736 Inbound Inter-processor Messages 20 ISP to ISH (ISP2ISH_MSG20)—Offset 45Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.737 Inbound Inter-processor Messages 21 ISP to ISH (ISP2ISH_MSG21)—Offset 460h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.738 Inbound Inter-processor Messages 22 ISP to ISH (ISP2ISH_MSG22)—Offset 464h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.739 Inbound Inter-processor Messages 23 ISP to ISH (ISP2ISH_MSG23)—Offset 468h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.740 Inbound Inter-processor Messages 24 ISP to ISH (ISP2ISH_MSG24)—Offset 46Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.741 Inbound Inter-processor Messages 25 ISP to ISH (ISP2ISH_MSG25)—Offset 470h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.742 Inbound Inter-processor Messages 26 ISP to ISH (ISP2ISH_MSG26)—Offset 474h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.743 Inbound Inter-processor Messages 27 ISP to ISH (ISP2ISH_MSG27)—Offset 478h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.744 Inbound Inter-processor Messages 28 ISP to ISH (ISP2ISH_MSG28)—Offset 47Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.745 Inbound Inter-processor Messages 29 ISP to ISH (ISP2ISH_MSG29)—Offset 480h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.746 Inbound Inter-processor Messages 30 ISP to ISH (ISP2ISH_MSG30)—Offset 484h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.747 Inbound Inter-processor Messages 31 ISP to ISH (ISP2ISH_MSG31)—Offset 488h

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.748 Inbound Inter-processor Messages 32 ISP to ISH (ISP2ISH_MSG32)—Offset 48Ch

Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISP to ISH (MSG):** Inter-process message registers for ISP to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the ISP to ISH. These registers are meant to be written by the ISP and read by ISH.

20.749 Outbound Inter-processor Messages 1 ISH to Audio (ISH2AUDIO_MSG1)—Offset 490h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.750 Outbound Inter-processor Messages 2 ISH to Audio (ISH2AUDIO_MSG2)—Offset 494h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.751 Outbound Inter-processor Messages 3 ISH to Audio (ISH2AUDIO_MSG3)—Offset 498h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.752 Outbound Inter-processor Messages 4 ISH to Audio (ISH2AUDIO_MSG4)—Offset 49Ch

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.753 Outbound Inter-processor Messages 5 ISH to Audio (ISH2AUDIO_MSG5)—Offset 4A0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.754 Outbound Inter-processor Messages 6 ISH to Audio (ISH2AUDIO_MSG6)—Offset 4A4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.755 Outbound Inter-processor Messages 7 ISH to Audio (ISH2AUDIO_MSG7)—Offset 4A8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.756 Outbound Inter-processor Messages 8 ISH to Audio (ISH2AUDIO_MSG8)—Offset 4ACh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.757 Outbound Inter-processor Messages 9 ISH to Audio (ISH2AUDIO_MSG9)—Offset 4B0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.758 Outbound Inter-processor Messages 10 ISH to Audio (ISH2AUDIO_MSG10)—Offset 4B4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.759 Outbound Inter-processor Messages 11 ISH to Audio (ISH2AUDIO_MSG11)—Offset 4B8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.760 Outbound Inter-processor Messages 12 ISH to Audio (ISH2AUDIO_MSG12)—Offset 4BCh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.761 Outbound Inter-processor Messages 13 ISH to Audio (ISH2AUDIO_MSG13)—Offset 4C0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.762 Outbound Inter-processor Messages 14 ISH to Audio (ISH2AUDIO_MSG14)—Offset 4C4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.763 Outbound Inter-processor Messages 15 ISH to Audio (ISH2AUDIO_MSG15)—Offset 4C8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.764 Outbound Inter-processor Messages 16 ISH to Audio (ISH2AUDIO_MSG16)—Offset 4CCh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.765 Outbound Inter-processor Messages 17 ISH to Audio (ISH2AUDIO_MSG17)—Offset 4D0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.766 Outbound Inter-processor Messages 18 ISH to Audio (ISH2AUDIO_MSG18)—Offset 4D4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.767 Outbound Inter-processor Messages 19 ISH to Audio (ISH2AUDIO_MSG19)—Offset 4D8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.768 Outbound Inter-processor Messages 20 ISH to Audio (ISH2AUDIO_MSG20)—Offset 4DCh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.769 Outbound Inter-processor Messages 21 ISH to Audio (ISH2AUDIO_MSG21)—Offset 4E0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.770 Outbound Inter-processor Messages 22 ISH to Audio (ISH2AUDIO_MSG22)—Offset 4E4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.771 Outbound Inter-processor Messages 23 ISH to Audio (ISH2AUDIO_MSG23)—Offset 4E8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.772 Outbound Inter-processor Messages 24 ISH to Audio (ISH2AUDIO_MSG24)—Offset 4ECh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.773 Outbound Inter-processor Messages 25 ISH to Audio (ISH2AUDIO_MSG25)—Offset 4F0h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.774 Outbound Inter-processor Messages 26 ISH to Audio (ISH2AUDIO_MSG26)—Offset 4F4h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.775 Outbound Inter-processor Messages 27 ISH to Audio (ISH2AUDIO_MSG27)—Offset 4F8h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.776 Outbound Inter-processor Messages 28 ISH to Audio (ISH2AUDIO_MSG28)—Offset 4FCh

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.777 Outbound Inter-processor Messages 29 ISH to Audio (ISH2AUDIO_MSG29)—Offset 500h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.778 Outbound Inter-processor Messages 30 ISH to Audio (ISH2AUDIO_MSG30)—Offset 504h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.779 Outbound Inter-processor Messages 31 ISH to Audio (ISH2AUDIO_MSG31)—Offset 508h

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.780 Outbound Inter-processor Messages 32 ISH to Audio (ISH2AUDIO_MSG32)—Offset 50Ch

Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to Audio (MSG):** Inter-process message registers for ISH core to communicate to the audio. These are thirty-two 32 bit registers that hold the message payload from the ISH to audio. These registers are meant to be written by the ISH and read by audio.

20.781 Inbound Inter-processor Messages 1 Audio to ISH (AUDIO2ISH_MSG1)—Offset 510h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.782 Inbound Inter-processor Messages 2 Audio to ISH (AUDIO2ISH_MSG2)—Offset 514h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.783 Inbound Inter-processor Messages 3 Audio to ISH (AUDIO2ISH_MSG3)—Offset 518h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.784 Inbound Inter-processor Messages 4 Audio to ISH (AUDIO2ISH_MSG4)—Offset 51Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.785 Inbound Inter-processor Messages 5 Audio to ISH (AUDIO2ISH_MSG5)—Offset 520h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.786 Inbound Inter-processor Messages 6 Audio to ISH (AUDIO2ISH_MSG6)—Offset 524h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.787 Inbound Inter-processor Messages 7 Audio to ISH (AUDIO2ISH_MSG7)—Offset 528h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.788 Inbound Inter-processor Messages 8 Audio to ISH (AUDIO2ISH_MSG8)—Offset 52Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.789 Inbound Inter-processor Messages 9 Audio to ISH (AUDIO2ISH_MSG9)—Offset 530h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.790 Inbound Inter-processor Messages 10 Audio to ISH (AUDIO2ISH_MSG10)—Offset 534h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.791 Inbound Inter-processor Messages 11 Audio to ISH (AUDIO2ISH_MSG11)—Offset 538h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.792 Inbound Inter-processor Messages 12 Audio to ISH (AUDIO2ISH_MSG12)—Offset 53Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.793 Inbound Inter-processor Messages 13 Audio to ISH (AUDIO2ISH_MSG13)—Offset 540h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.794 Inbound Inter-processor Messages 14 Audio to ISH (AUDIO2ISH_MSG14)—Offset 544h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.795 Inbound Inter-processor Messages 15 Audio to ISH (AUDIO2ISH_MSG15)—Offset 548h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.796 Inbound Inter-processor Messages 16 Audio to ISH (AUDIO2ISH_MSG16)—Offset 54Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.797 Inbound Inter-processor Messages 17 Audio to ISH (AUDIO2ISH_MSG17)—Offset 550h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.798 Inbound Inter-processor Messages 18 Audio to ISH (AUDIO2ISH_MSG18)—Offset 554h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.799 Inbound Inter-processor Messages 19 Audio to ISH (AUDIO2ISH_MSG19)—Offset 558h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.800 Inbound Inter-processor Messages 20 Audio to ISH (AUDIO2ISH_MSG20)—Offset 55Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.801 Inbound Inter-processor Messages 21 Audio to ISH (AUDIO2ISH_MSG21)—Offset 560h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.802 Inbound Inter-processor Messages 22 Audio to ISH (AUDIO2ISH_MSG22)—Offset 564h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.803 Inbound Inter-processor Messages 23 Audio to ISH (AUDIO2ISH_MSG23)—Offset 568h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.804 Inbound Inter-processor Messages 24 Audio to ISH (AUDIO2ISH_MSG24)—Offset 56Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.805 Inbound Inter-processor Messages 25 Audio to ISH (AUDIO2ISH_MSG25)—Offset 570h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.806 Inbound Inter-processor Messages 26 Audio to ISH (AUDIO2ISH_MSG26)—Offset 574h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.807 Inbound Inter-processor Messages 27 Audio to ISH (AUDIO2ISH_MSG27)—Offset 578h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.808 Inbound Inter-processor Messages 28 Audio to ISH (AUDIO2ISH_MSG28)—Offset 57Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.809 Inbound Inter-processor Messages 29 Audio to ISH (AUDIO2ISH_MSG29)—Offset 580h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.810 Inbound Inter-processor Messages 30 Audio to ISH (AUDIO2ISH_MSG30)—Offset 584h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.811 Inbound Inter-processor Messages 31 Audio to ISH (AUDIO2ISH_MSG31)—Offset 588h

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.812 Inbound Inter-processor Messages 32 Audio to ISH (AUDIO2ISH_MSG32)—Offset 58Ch

Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from Audio to ISH (MSG):** Inter-process message registers for audio to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the audio to ISH. These registers are meant to be written by the audio and read by ISH.

20.813 Outbound Inter-processor Messages 1 ISH to GFX (ISH2GFX_MSG1)—Offset 590h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.814 Outbound Inter-processor Messages 2 ISH to GFX (ISH2GFX_MSG2)—Offset 594h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.815 Outbound Inter-processor Messages 3 ISH to GFX (ISH2GFX_MSG3)—Offset 598h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.816 Outbound Inter-processor Messages 4 ISH to GFX (ISH2GFX_MSG4)—Offset 59Ch

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.817 Outbound Inter-processor Messages 5 ISH to GFX (ISH2GFX_MSG5)—Offset 5A0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.818 Outbound Inter-processor Messages 6 ISH to GFX (ISH2GFX_MSG6)—Offset 5A4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.819 Outbound Inter-processor Messages 7 ISH to GFX (ISH2GFX_MSG7)—Offset 5A8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.820 Outbound Inter-processor Messages 8 ISH to GFX (ISH2GFX_MSG8)—Offset 5ACh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to Gfx. These registers are meant to be written by the ISH and read by GFX.

20.821 Outbound Inter-processor Messages 9 ISH to GFX (ISH2GFX_MSG9)—Offset 5B0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.822 Outbound Inter-processor Messages 10 ISH to GFX (ISH2GFX_MSG10)—Offset 5B4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.823 Outbound Inter-processor Messages 11 ISH to GFX (ISH2GFX_MSG11)—Offset 5B8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.824 Outbound Inter-processor Messages 12 ISH to GFX (ISH2GFX_MSG12)—Offset 5BCh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.825 Outbound Inter-processor Messages 13 ISH to GFX (ISH2GFX_MSG13)—Offset 5C0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.826 Outbound Inter-processor Messages 14 ISH to GFX (ISH2GFX_MSG14)—Offset 5C4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.827 Outbound Inter-processor Messages 15 ISH to GFX (ISH2GFX_MSG15)—Offset 5C8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.828 Outbound Inter-processor Messages 16 ISH to GFX (ISH2GFX_MSG16)—Offset 5CCh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.829 Outbound Inter-processor Messages 17 ISH to GFX (ISH2GFX_MSG17)—Offset 5D0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.830 Outbound Inter-processor Messages 18 ISH to GFX (ISH2GFX_MSG18)—Offset 5D4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.831 Outbound Inter-processor Messages 19 ISH to GFX (ISH2GFX_MSG19)—Offset 5D8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.832 Outbound Inter-processor Messages 20 ISH to GFX (ISH2GFX_MSG20)—Offset 5DCh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.833 Outbound Inter-processor Messages 21 ISH to GFX (ISH2GFX_MSG21)—Offset 5E0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.834 Outbound Inter-processor Messages 22 ISH to GFX (ISH2GFX_MSG22)—Offset 5E4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.835 Outbound Inter-processor Messages 23 ISH to GFX (ISH2GFX_MSG23)—Offset 5E8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.836 Outbound Inter-processor Messages 24 ISH to GFX (ISH2GFX_MSG24)—Offset 5ECh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.837 Outbound Inter-processor Messages 25 ISH to GFX (ISH2GFX_MSG25)—Offset 5F0h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.838 Outbound Inter-processor Messages 26 ISH to GFX (ISH2GFX_MSG26)—Offset 5F4h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.839 Outbound Inter-processor Messages 27 ISH to GFX (ISH2GFX_MSG27)—Offset 5F8h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.840 Outbound Inter-processor Messages 28 ISH to GFX (ISH2GFX_MSG28)—Offset 5FCh

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.841 Outbound Inter-processor Messages 29 ISH to GFX (ISH2GFX_MSG29)—Offset 600h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.842 Outbound Inter-processor Messages 30 ISH to GFX (ISH2GFX_MSG30)—Offset 604h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.843 Outbound Inter-processor Messages 31 ISH to GFX (ISH2GFX_MSG31)—Offset 608h

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.844 Outbound Inter-processor Messages 32 ISH to GFX (ISH2GFX_MSG32)—Offset 60Ch

Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from ISH to GFX (MSG):** Inter-process message registers for ISH core to communicate to the GFX. These are thirty-two 32 bit registers that hold the message payload from the ISH to GFX. These registers are meant to be written by the ISH and read by GFX.

20.845 Inbound Inter-processor Messages 1 GFX to ISH (GFX2ISH_MSG1)—Offset 610h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.846 Inbound Inter-processor Messages 2 GFX to ISH (GFX2ISH_MSG2)—Offset 614h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.847 Inbound Inter-processor Messages 3 GFX to ISH (GFX2ISH_MSG3)—Offset 618h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.848 Inbound Inter-processor Messages 4 GFX to ISH (GFX2ISH_MSG4)—Offset 61Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.849 Inbound Inter-processor Messages 5 GFX to ISH (GFX2ISH_MSG5)—Offset 620h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.850 Inbound Inter-processor Messages 6 GFX to ISH (GFX2ISH_MSG6)—Offset 624h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.851 Inbound Inter-processor Messages 7 GFX to ISH (GFX2ISH_MSG7)—Offset 628h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.852 Inbound Inter-processor Messages 8 GFX to ISH (GFX2ISH_MSG8)—Offset 62Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.853 Inbound Inter-processor Messages 9 GFX to ISH (GFX2ISH_MSG9)—Offset 630h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.854 Inbound Inter-processor Messages 10 GFX to ISH (GFX2ISH_MSG10)—Offset 634h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.855 Inbound Inter-processor Messages 11 GFX to ISH (GFX2ISH_MSG11)—Offset 638h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.856 Inbound Inter-processor Messages 12 GFX to ISH (GFX2ISH_MSG12)—Offset 63Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.857 Inbound Inter-processor Messages 13 GFX to ISH (GFX2ISH_MSG13)—Offset 640h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.858 Inbound Inter-processor Messages 14 GFX to ISH (GFX2ISH_MSG14)—Offset 644h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.859 Inbound Inter-processor Messages 15 GFX to ISH (GFX2ISH_MSG15)—Offset 648h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.860 Inbound Inter-processor Messages 16 GFX to ISH (GFX2ISH_MSG16)—Offset 64Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.861 Inbound Inter-processor Messages 17 GFX to ISH (GFX2ISH_MSG17)—Offset 650h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.862 Inbound Inter-processor Messages 18 GFX to ISH (GFX2ISH_MSG18)—Offset 654h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.863 Inbound Inter-processor Messages 19 GFX to ISH (GFX2ISH_MSG19)—Offset 658h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.864 Inbound Inter-processor Messages 20 GFX to ISH (GFX2ISH_MSG20)—Offset 65Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.865 Inbound Inter-processor Messages 21 GFX to ISH (GFX2ISH_MSG21)—Offset 660h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.866 Inbound Inter-processor Messages 22 GFX to ISH (GFX2ISH_MSG22)—Offset 664h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 22 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.867 Inbound Inter-processor Messages 23 GFX to ISH (GFX2ISH_MSG23)—Offset 668h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 23 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.868 Inbound Inter-processor Messages 24 GFX to ISH (GFX2ISH_MSG24)—Offset 66Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 24 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.869 Inbound Inter-processor Messages 25 GFX to ISH (GFX2ISH_MSG25)—Offset 670h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 25 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.870 Inbound Inter-processor Messages 26 GFX to ISH (GFX2ISH_MSG26)—Offset 674h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 26 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.871 Inbound Inter-processor Messages 27 Gfx to ISH (GFX2ISH_MSG27)—Offset 678h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 27 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.872 Inbound Inter-processor Messages 28 GFX to ISH (GFX2ISH_MSG28)—Offset 67Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 28 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.873 Inbound Inter-processor Messages 29 GFX to ISH (GFX2ISH_MSG29)—Offset 680h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 29 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.874 Inbound Inter-processor Messages 30 GFX to ISH (GFX2ISH_MSG30)—Offset 684h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 30 from GFX to ISH (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.875 Inbound Inter-processor Messages 31 GFX to ISH (GFX2ISH_MSG31)—Offset 688h

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 31 from GFX to ISH. (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.876 Inbound Inter-processor Messages 32 GFX to ISH (GFX2ISH_MSG32)—Offset 68Ch

Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 32 from GFX to ISH. (MSG):** Inter-process message registers for GFX to communicate to the ISH. These are thirty-two 32 bit registers that hold the message payload from the GFX to ISH. These registers are meant to be written by the GFX and read by ISH.

20.877 Inbound Doorbell ISP to ISH (ISP2ISH_DOORBELL)—Offset 690h

Inbound doorbell register, ISP core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISP to ISH doorbell busy bit. When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISP to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.878 Outbound Doorbell ISH to ISP (ISH2ISP_DOORBELL)—Offset 694h

Outbound doorbell register for the ISH to interrupt the ISP. Setting bit 31 of this register causes the ISP to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to ISP doorbell busy bit. When this bit is cleared, the ISP is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISH to ISP doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.879 Inbound Doorbell Audio to ISH (AUDIO2ISH_DOORBELL)—Offset 698h

Inbound doorbell register, audio core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY)**
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** Audio to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.880 Outbound Doorbell ISH to Audio (ISH2AUDIO_DOORBELL)—Offset 69Ch

Outbound doorbell register for the ISH to interrupt the audio. Setting bit 31 of this register causes the audio to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to audio doorbell busy bit. When this bit is cleared, the audio is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISH to audio doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.881 Inbound Doorbell GFX to ISH (GFX2ISH_DOORBELL)—Offset 6A0h

Inbound doorbell register, GFX core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** GFX to ISH doorbell busy bit. When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** GFX to ISH doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.882 Outbound Doorbell ISH to GFX (ISH2GFX_DOORBELL)—Offset 6A4h

Outbound doorbell register for the ISH to interrupt the GFX. Setting bit 31 of this register causes the GFX to receive a legacy INTA interrupt. Data 30:0 is 31 bit message payload used for backward compatibility. Software can use either this 31 bit message payload or 256 bit payload registers.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** ISH to GFX doorbell busy bit. When this bit is cleared, the GFX is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** ISH to GFX doorbell 31 bit payload, 31 bit message payload for backward compatibility.

20.883 CSME to ISH Control and Status (CSME2ISH_CTRL_STATUS)—Offset 6A8h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When CSME writes to any of these bits with 1, an interrupt is genrated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (CSME2ISH_CTRL_STATUS):** Control and status information transfer from CSME FW to ISH FW.

20.884 ISH IPC D0I3 Control (IPC_d0i3C_reg)—Offset 6D0h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When CSME writes to any of these bits with 1, an interrupt is genrated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED):** Reserved.
4	0h RO	**Interrupt Request Capable (ISH_IPC_d0i3C_reg_RSVD)**
3	1h RW/1C	**Restore Required (ISH_IPC_d0i3C_reg3):** D0i3 register for storing power related information RR: Restore Required bit.
2	0h RW	**D0i3 (ISH_IPC_d0i3C_reg2):** D0i3 register for storing power related information i3: D0i3 bit.
1	0h RW	**Interrupt Request (ISH_IPC_d0i3C_reg1):** D0i3 register for storing power related information IR: Interrupt Request bit.
0	0h RW/1C	**Command-in-Progress (ISH_IPC_d0i3C_reg0):** D0i3 register for storing power related information CIP: Command-in-Progress bit.

20.885 PMC to ISH Control and Status (ipc_pmc2ish_csr_reg)—Offset 6D4h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When PMC writes to any of these bits with 1, an interrupt is generated to mIA. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_PMC2ISH_CSR_REG):** Control and status information transfer between ISH and PMC FWs and interrupt generation to mIA.

20.886 ISP to ISH Control and Status (ipc_isp2ish_csr_reg)—Offset 6D8h

This is a control and status register for enabling ISP to interrupt mIA incase of ISP writes to any of these bits of the register. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_ISP2ISH_CSR_REG):** Control and status information transfer between ISH and ISP FWs and interrupt generation to mIA.

20.887 Audio to ISH Control and Status (ipc_audio2ish_csr_reg)—Offset 6DCh

This is a control and status register for enabling audio to interrupt mIA incase of audio writes to any of these bits of the register. The Interrupt is then cleared by mIA by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S	**32 Bit Payload (ISH_IPC_AUDIO2ISH_CSR_REG):** Control and status information transfer between ISH and audio FWs and interrupt generation to mIA.

20.888 RID - Bridge revision ID Register (RID)—Offset 30h

register contains the Bridge Revision ID

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	0h RO	**RID:** Revision ID of the Bridge.

20.889 GEN_REGRW1 - General Purpose register (GEN_REGRW1)—Offset 600h

General Purpose PRV RW Register 1.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:** This register value is brought out as oob_gen_prv_rw_reg1 out of band signal

20.890 GEN_REGRW2 - General Purpose register (GEN_REGRW2)—Offset 604h

General Purpose PRV RW Register 2.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:** This register value is brought out as oob_gen_prv_rw_reg2 out of band signal

20.891 GEN_REGRW3 - General Purpose register (GEN_REGRW3)—Offset 608h

General Purpose PRV RW Register 3.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:** This register value is brought out as oob_gen_prv_rw_reg3 out of band signal

20.892 GEN_REGRW4 - General Purpose register (GEN_REGRW4)—Offset 60Ch

General Purpose PRV RW Register 4.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:** This register value is brought out as oob_gen_prv_rw_reg4 out of band signal

§ §

21 HECI Registers

This chapter documents the registers of the HECI devices. The processor contains multiple HECI devices:

- Bus: 0, Device: 15, Function: 0 (HECI1)
- Bus: 0, Device: 15, Function: 1 (HECI2)
- Bus: 0, Device: 15, Function: 2 (HECI3)

NOTE: Register default values are taken from device HECI1 only. Refer Vol1 for Device IDs

21.1 Identifiers (HECI1_ID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device ID (DID):** Indicates device number assigned by Intel. The upper 9 bits of this field are set by a special sideband message (SetIDValue). The lower 7 bits are set by soft straps. Note that the default value of this field is not 0, but depends on the value of soft straps. Refer to CSE spec in order to find the value of 7 LSBs.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

21.2 Command (HECI1_CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

21.3 Status (HECI1_STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 6h	10 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0h RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	**Reserved (RSVD_6_6):** Reserved
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved (RSVD_2_0):** Reserved

21.4 Revision ID And Class Code (HECI1_RID_CC) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 8h	7800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller. This field is set by a special IOSF SB message (SetIDValue).

21.5 Cache Line Size (HECI1_CLS) — Offset Ch

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

21.6 Master Latency Timer (HECI1_MLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

21.7 Header Type (HECI1_HTYPE) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

21.8 Built In Self-Test (HECI1_BIST) — Offset Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	**Reserved (RSVD):** Reserved

21.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

21.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI) — Offset 14h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

21.11 Sub System Identifiers (HECI1_SS) — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

21.12 Capabilities Pointer (HECI1_CAP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 34h	50 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

21.13 Interrupt Information (HECI1_INTR) — Offset 3Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

21.14 Minimum Grant (HECI1_MGNT) — Offset 3Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + 3Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Grant (GNT):** Not implemented, hardwired to 0.

21.15 Maximum Latency (HECI1_MLAT) — Offset 3Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + 3Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**LAT:** Not implemented, hardwired to 0.

21.16 Host Firmware Status (HECI1_HFS) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

21.17 Miscellaneous Shadow (HECI1_MISC_SHDW) — Offset 44h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 44h	80000000 h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register. This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not.
30:17	0h RO	**Reserved (RSVD_30_17):** Reserved
16	0h RO/V	**CSE UMA Size Valid (CUSZV):** This bit indicates that FW has written the CUSZ field. This field reflects the value of CSE CUBA.CUSZV.
15:7	0h RO	**Reserved (RSVD_15_7):** Reserved
6:0	0h RO/V	**CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region. It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory. The legal CSEUMA sizes and encodings for this field are: 0000000b (0MB, no CSEUMA region) 0000001b (1MB) 0000010b (2MB) 0000100b (4MB) 0001000b (8MB) 0010000b (16MB) 0100000b (32MB) 1000000b (64MB). This field reflects the value of CSE CUBA.CUSZ.

21.18 General Status Shadow 1 (HECI1_GS_SHDW1) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

21.19 Host General Status (HECI1_H_GS1) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

21.20 PCI Power Management Capability ID (HECI1_PID) — Offset 50h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 50h	8C01 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	8Ch RO	**NEXT:** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

21.21 PCI Power Management Capabilities (HECI1_PC) — Offset 52h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 52h	4003 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

21.22 PCI Power Management Control And Status (HECI1_PMCS) — Offset 54h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	**Reserved (RSVD_14_9):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	**Reserved (RSVD_7_4):** Reserved
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform an internal reset.
2	0h RO	**Reserved (RSVD_2_2):** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

21.23 General Status Shadow 2 (HECI1_GS_SHDW2) — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

21.24 General Status Shadow 3 (HECI1_GS_SHDW3) — Offset 64h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

21.25 General Status Shadow 4 (HECI1_GS_SHDW4) — Offset 68h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

21.26 General Status Shadow 5 (HECI1_GS_SHDW5) — Offset 6Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

21.27 Host General Status 2 (HECI1_H_GS2) — Offset 70h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

21.28 Host General Status 3 (HECI1_H_GS3) — Offset 74h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

21.29 Message Signaled Interrupt Identifiers (HECI1_MID) — Offset 8Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 8Ch	A405 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A4h RO	**NEXT:** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

21.30 Message Signaled Interrupt Message Control (HECI1_MC) — Offset 8Eh

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 8Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

21.31 Message Signaled Interrupt Message Address (HECI1_MA) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved (RSVD):** Reserved

21.32 Message Signaled Interrupt Upper Address (HECI1_MUA) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

21.33 Message Signaled Interrupt Message Data (HECI1_MD) — Offset 98h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

21.34 HECI Interrupt Delivery Mode (HECI1_HIDM) — Offset A0h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

21.35 Vendor Specific Capability Register (HECI1_VSCR) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + A4h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of 4'hF in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of 4'hF, this field is reserved 4'h0.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer. It has the value of 8'h14 for the DevIdle Capability.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NEXT:** Pointer to the configuration offset of the next Capability item. It is 8'h00 since it is the final item in the Capability list.
7:0	9h RO	**Capability ID (CAPID):** The value of 8h09 in this field indicates a Vendor Specific capability.

21.36 Vendor Specific Extended Capability Register (HECI1_VSEC) — Offset A8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + A8h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the number of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 12'h14.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSECREV):** For this revision of DevIdle, this field is 4h0.
15:0	10h RO	**Vendor Specific Extended Capability ID (NEXT):** DevIdle has been assigned the Intel VSEC ID of 16h10.

21.37 SW LTR Pointer Register (HECI1_SWLTRPTR) — Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

21.38 Device Idle Pointer Register (HECI1_DEVIDLEPTR) — Offset B0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + B0h	8001 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	1h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

21.39 Device Idle Power On Latency (HECI1_DEVIDLEPOL) — Offset B4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + B4h	D38 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD_15_13):** Reserved
12:10	3h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved (not enforced by HW). The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.
9:0	138h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.

21.40 DevIdle Power Control Enabled Register (HECI1_PWRCTRLEN) — Offset B6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + B6h	E h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD_15_6):** Reserved
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	**Reserved (RSVD_4_4):** Reserved
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

21.41 Host Extend Register Status (HECI1_HERS) — Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + BCh	40000000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers. If ERA field is SHA-1, the result of the extend operation is in HER:5-1. If ERA field is SHA-256, the result is in HER:8-1.
30	1h RO	**Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature.
29:4	0h RO	**Reserved (RSVD_29_4):** Reserved
3:0	0h RO/V	**Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation. Encodings are: 0x0: SHA-1, 0x2: SHA-256. Other values: reserved. This field is set by FW with the used hash algorithm value when the ERV bit is set to 1. This field is meaningless when the ERV bit is 0. This field does NOT have any defined reset value.

21.42 Host Extend Register DW1 (HECI1_HER1) — Offset C0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW1 (ERDW1):** Host Extend Register DW1.

21.43 Host Extend Register DW2 (HECI1_HER2) — Offset C4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW2 (ERDW2):** Host Extend Register DW2.

21.44 Host Extend Register DW3 (HECI1_HER3) — Offset C8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW3 (ERDW3):** Host Extend Register DW3.

21.45 Host Extend Register DW4 (HECI1_HER4) — Offset CCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + CCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW4 (ERDW4):** Host Extend Register DW4.

21.46 Host Extend Register DW5 (HECI1_HER5) — Offset D0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW5 (ERDW5):** Host Extend Register DW5.

21.47 Host Extend Register DW6 (HECI1_HER6) — Offset D4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW6 (ERDW6):** Host Extend Register DW6.

21.48 Host Extend Register DW7 (HECI1_HER7) — Offset D8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW7 (ERDW7):** Host Extend Register DW7.

21.49 Host Extend Register DW8 (HECI1_HER8) — Offset DCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW8 (ERDW8):** Host Extend Register DW8.

21.50 Manufacturer's ID (HECI1_MANID) — Offset F8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_31_28):** Reserved
27:24	0h RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process. This field is set by a special IOSF SB message (SetIDValue).
23:16	0h RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).
15:8	0h RO/V	**Manufacturing ID (MID):** This field is set by a special IOSF SB message (SetIDValue).
7:0	0h RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).

§ §

22 HECI1 Registers

This chapter documents the registers in Bus: 0, Device 15, Function 0.

22.1 Identifiers (HECI1_ID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device ID (DID):** Indicates device number assigned by Intel. The upper 9 bits of this field are set by a special sideband message (SetIDValue). The lower 7 bits are set by soft straps. Note that the default value of this field is not 0, but depends on the value of soft straps. Refer to CSE spec in order to find the value of 7 LSBs.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

22.2 Command (HECI1_CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

22.3 Status (HECI1_STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 6h	10 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0h RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	**Reserved (RSVD_6_6):** Reserved
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved (RSVD_2_0):** Reserved

22.4 Revision ID And Class Code (HECI1_RID_CC) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 8h	7800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller. This field is set by a special IOSF SB message (SetIDValue).

22.5 Cache Line Size (HECI1_CLS) — Offset Ch

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

22.6 Master Latency Timer (HECI1_MLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

22.7 Header Type (HECI1_HTYPE) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

22.8 Built In Self-Test (HECI1_BIST) — Offset Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	**Reserved (RSVD):** Reserved

22.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

22.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI) — Offset 14h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

22.11 BAR1 — Offset 18h

BAR1 -Base Address Register1. Not in use in CSE

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.12 BAR1_HIGH — Offset 1Ch

BAR1 -Base Address Register1 High. Not in use in CSE

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.13 Sub System Identifiers (HECI1_SS) — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

22.14 EXPANSION_ROM_BASEADDR — Offset 30h

EXPANSION ROM base address

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.15 Capabilities Pointer (HECI1_CAP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 34h	50 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

22.16 Interrupt Information (HECI1_INTR) — Offset 3Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

22.17 Minimum Grant (HECI1_MGNT) — Offset 3Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + 3Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Grant (GNT):** Not implemented, hardwired to 0.

22.18 Maximum Latency (HECI1_MLAT) — Offset 3Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + 3Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**LAT:** Not implemented, hardwired to 0.

22.19 Host Firmware Status (HECI1_HFS) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

22.20 Miscellaneous Shadow (HECI1_MISC_SHDW) — Offset 44h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 44h	80000000 h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register. This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not.
30:17	0h RO	**Reserved (RSVD_30_17):** Reserved
16	0h RO/V	**CSE UMA Size Valid (CUSZV):** This bit indicates that FW has written the CUSZ field. This field reflects the value of CSE CUBA.CUSZV.
15:7	0h RO	**Reserved (RSVD_15_7):** Reserved
6:0	0h RO/V	**CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region. It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory. The legal CSEUMA sizes and encodings for this field are: 0000000b (0MB, no CSEUMA region) 0000001b (1MB) 0000010b (2MB) 0000100b (4MB) 0001000b (8MB) 0010000b (16MB) 0100000b (32MB) 1000000b (64MB). This field reflects the value of CSE CUBA.CUSZ.

22.21 General Status Shadow 1 (HECI1_GS_SHDW1) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

22.22 Host General Status (HECI1_H_GS1) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

22.23 PCI Power Management Capability ID (HECI1_PID) — Offset 50h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 50h	8C01 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	8Ch RO	**NEXT:** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

22.24 PCI Power Management Capabilities (HECI1_PC) — Offset 52h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 52h	4003 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

22.25 PCI Power Management Control And Status (HECI1_PMCS) — Offset 54h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	**Reserved (RSVD_14_9):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	**Reserved (RSVD_7_4):** Reserved
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform an internal reset.
2	0h RO	**Reserved (RSVD_2_2):** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

22.26 General Status Shadow 2 (HECI1_GS_SHDW2) — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

22.27 General Status Shadow 3 (HECI1_GS_SHDW3) — Offset 64h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

22.28 General Status Shadow 4 (HECI1_GS_SHDW4) — Offset 68h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

22.29 General Status Shadow 5 (HECI1_GS_SHDW5) — Offset 6Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

22.30 Host General Status 2 (HECI1_H_GS2) — Offset 70h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

22.31 Host General Status 3 (HECI1_H_GS3) — Offset 74h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

22.32 POWERCAPID — Offset 80h

POWERCAPID - PowerManagement Capability ID. Not in use in CSE

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.33 PMECTRLSTATUS — Offset 84h

Not in use in CSE

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.34 Message Signaled Interrupt Identifiers (HECI1_MID) — Offset 8Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 8Ch	A405 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A4h RO	**NEXT:** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

22.35 Message Signaled Interrupt Message Control (HECI1_MC) — Offset 8Eh

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 8Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

22.36 Message Signaled Interrupt Message Address (HECI1_MA) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Reserved (RSVD):** Reserved

22.37 Message Signaled Interrupt Upper Address (HECI1_MUA) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

22.38 Message Signaled Interrupt Message Data (HECI1_MD) — Offset 98h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

22.39 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.40 HECI Interrupt Delivery Mode (HECI1_HIDM) — Offset A0h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

22.41 Vendor Specific Capability Register (HECI1_VSCR) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + A4h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of 4'hF in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of 4'hF, this field is reserved 4'h0.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer. It has the value of 8'h14 for the DevIdle Capability.
15:8	0h RO	**NEXT:** Pointer to the configuration offset of the next Capability item. It is 8'h00 since it is the final item in the Capability list.
7:0	9h RO	**Capability ID (CAPID):** The value of 8h09 in this field indicates a Vendor Specific capability.

22.42 Vendor Specific Extended Capability Register (HECI1_VSEC) — Offset A8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + A8h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the number of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 12'h14.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSECREV):** For this revision of DevIdle, this field is 4h0.
15:0	10h RO	**Vendor Specific Extended Capability ID (NEXT):** DevIdle has been assigned the Intel VSEC ID of 16h10.

22.43 SW LTR Pointer Register (HECI1_SWLTRPTR) — Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

22.44 Device Idle Pointer Register (HECI1_DEVIDLEPTR) — Offset B0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + B0h	8001 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

22.45 Device Idle Power On Latency (HECI1_DEVIDLEPOL) — Offset B4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + B4h	D38 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD_15_13):** Reserved
12:10	3h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved (not enforced by HW). The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.
9:0	138h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.

22.46 DevIdle Power Control Enabled Register (HECI1_PWRCTRLEN) — Offset B6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:0] + B6h	E h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD_15_6):** Reserved
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	**Reserved (RSVD_4_4):** Reserved
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).

Bit Range	Default & Access	Field Name (ID): Description
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

22.47 GEN_REGRW3 — Offset B8h

General Purpose Read Write Register3. Not in use in CSE

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
Reserved		

22.48 Host Extend Register Status (HECI1_HERS) — Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + BCh	40000000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers. If ERA field is SHA-1, the result of the extend operation is in HER:5-1. If ERA field is SHA-256, the result is in HER:8-1.
30	1h RO	**Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature.
29:4	0h RO	**Reserved (RSVD_29_4):** Reserved
3:0	0h RO/V	**Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation. Encodings are: 0x0: SHA-1, 0x2: SHA-256. Other values: reserved. This field is set by FW with the used hash algorithm value when the ERV bit is set to 1. This field is meaningless when the ERV bit is 0. This field does NOT have any defined reset value.

22.49 Host Extend Register DW1 (HECI1_HER1) — Offset C0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW1 (ERDW1):** Host Extend Register DW1.

22.50 Host Extend Register DW2 (HECI1_HER2) — Offset C4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW2 (ERDW2):** Host Extend Register DW2.

22.51 Host Extend Register DW3 (HECI1_HER3) — Offset C8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW3 (ERDW3):** Host Extend Register DW3.

22.52 Host Extend Register DW4 (HECI1_HER4) — Offset CCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + CCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW4 (ERDW4):** Host Extend Register DW4.

22.53 Host Extend Register DW5 (HECI1_HER5) — Offset D0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW5 (ERDW5):** Host Extend Register DW5.

22.54 Host Extend Register DW6 (HECI1_HER6) — Offset D4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW6 (ERDW6):** Host Extend Register DW6.

22.55 Host Extend Register DW7 (HECI1_HER7) — Offset D8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW7 (ERDW7):** Host Extend Register DW7.

22.56 Host Extend Register DW8 (HECI1_HER8) — Offset DCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW8 (ERDW8):** Host Extend Register DW8.

22.57 Manufacturer's ID (HECI1_MANID) — Offset F8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_31_28):** Reserved
27:24	0h RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process. This field is set by a special IOSF SB message (SetIDValue).
23:16	0h RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).
15:8	0h RO/V	**Manufacturing ID (MID):** This field is set by a special IOSF SB message (SetIDValue).
7:0	0h RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).

§ §

23 HECI2 Registers

This chapter documents the registers in Bus: 0, Device 15, Function 1.

23.1 Identifiers (HECI2_ID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device ID (DID):** Indicates device number assigned by Intel. The upper 9 bits of this field are set by a special sideband message (SetIDValue). The lower 7 bits are set by soft straps. Note that the default value of this field is not 0, but depends on the value of soft straps. Refer to CSE spec in order to find the value of 7 LSBs.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

23.2 Command (HECI2_CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

23.3 Status (HECI2_STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 6h	10 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0h RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	**Reserved (RSVD_6_6):** Reserved
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved (RSVD_2_0):** Reserved

23.4 Revision ID And Class Code (HECI2_RID_CC) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 8h	7800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller. This field is set by a special IOSF SB message (SetIDValue).

23.5 Cache Line Size (HECI2_CLS) — Offset Ch

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

23.6 Master Latency Timer (HECI2_MLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

23.7 Header Type (HECI2_HTYPE) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

23.8 Built In Self-Test (HECI2_BIST) — Offset Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	**Reserved (RSVD):** Reserved

23.9 HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

23.10 HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI) — Offset 14h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

23.11 Sub System Identifiers (HECI2_SS) — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

23.12 Capabilities Pointer (HECI2_CAP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 34h	50 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

23.13 Interrupt Information (HECI2_INTR) — Offset 3Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

23.14 Minimum Grant (HECI2_MGNT) — Offset 3Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + 3Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Grant (GNT):** Not implemented, hardwired to 0.

23.15 Maximum Latency (HECI2_MLAT) — Offset 3Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + 3Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**LAT:** Not implemented, hardwired to 0.

23.16 Host Firmware Status (HECI2_HFS) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

23.17 General Status Shadow 1 (HECI2_GS_SHDW1) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

23.18 Host General Status (HECI2_H_GS1) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

23.19 PCI Power Management Capability ID (HECI2_PID) — Offset 50h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 50h	8C01 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	8Ch RO	**NEXT:** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

23.20 PCI Power Management Capabilities (HECI2_PC) — Offset 52h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 52h	4003 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

23.21 PCI Power Management Control And Status (HECI2_PMCS) — Offset 54h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	**Reserved (RSVD_14_9):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	**Reserved (RSVD_7_4):** Reserved
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform an internal reset.
2	0h RO	**Reserved (RSVD_2_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

23.22 General Status Shadow 2 (HECI2_GS_SHDW2) — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

23.23 General Status Shadow 3 (HECI2_GS_SHDW3) — Offset 64h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

23.24 General Status Shadow 4 (HECI2_GS_SHDW4) — Offset 68h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

23.25 General Status Shadow 5 (HECI2_GS_SHDW5) — Offset 6Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

23.26 Host General Status 2 (HECI2_H_GS2) — Offset 70h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

23.27 Host General Status 3 (HECI2_H_GS3) — Offset 74h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

23.28 Message Signaled Interrupt Identifiers (HECI2_MID) — Offset 8Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 8Ch	A405 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A4h RO	**NEXT:** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

23.29 Message Signaled Interrupt Message Control (HECI2_MC) — Offset 8Eh

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 8Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

23.30 Message Signaled Interrupt Message Address (HECI2_MA) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved (RSVD):** Reserved

23.31 Message Signaled Interrupt Upper Address (HECI2_MUA) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

23.32 Message Signaled Interrupt Message Data (HECI2_MD) — Offset 98h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

23.33 HECI Interrupt Delivery Mode (HECI2_HIDM) — Offset A0h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:1] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

23.34 Vendor Specific Capability Register (HECI2_VSCR) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + A4h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of 4'hF in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of 4'hF, this field is reserved 4'h0.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer. It has the value of 8'h14 for the DevIdle Capability.
15:8	0h RO	**NEXT:** Pointer to the configuration offset of the next Capability item. It is 8'h00 since it is the final item in the Capability list.
7:0	9h RO	**Capability ID (CAPID):** The value of 8h09 in this field indicates a Vendor Specific capability.

23.35 Vendor Specific Extended Capability Register (HECI2_VSEC) — Offset A8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + A8h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the number of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 12'h14.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSECREV):** For this revision of DevIdle, this field is 4h0.
15:0	10h RO	**Vendor Specific Extended Capability ID (NEXT):** DevIdle has been assigned the Intel VSEC ID of 16h10.

23.36 SW LTR Pointer Register (HECI2_SWLTRPTR) — Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

23.37 Device Idle Pointer Register (HECI2_DEVIDLEPTR) — Offset B0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + B0h	8001 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	1h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

23.38 Device Idle Power On Latency (HECI2_DEVIDLEPOL) — Offset B4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + B4h	D38 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD_15_13):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
12:10	3h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved (not enforced by HW). The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.
9:0	138h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.

23.39 DevIdle Power Control Enabled Register (HECI2_PWRCTRLEN) — Offset B6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:1] + B6h	E h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD_15_6):** Reserved
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	**Reserved (RSVD_4_4):** Reserved
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

23.40 Manufacturer's ID (HECI2_MANID) — Offset F8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:1] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_31_28):** Reserved
27:24	0h RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process. This field is set by a special IOSF SB message (SetIDValue).

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).
15:8	0h RO/V	**Manufacturing ID (MID):** This field is set by a special IOSF SB message (SetIDValue).
7:0	0h RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).

§ §

24 HECI3 Registers

This chapter documents the registers in Bus: 0, Device 15, Function 2.

24.1 Identifiers (HECI3_ID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device ID (DID):** Indicates device number assigned by Intel. The upper 9 bits of this field are set by a special sideband message (SetIDValue). The lower 7 bits are set by soft straps. Note that the default value of this field is not 0, but depends on the value of soft straps. Refer to CSE spec in order to find the value of 7 LSBs.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

24.2 Command (HECI3_CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

24.3 Status (HECI3_STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 6h	10 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0h RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	**Reserved (RSVD_6_6):** Reserved
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	**Reserved (RSVD_2_0):** Reserved

24.4 Revision ID And Class Code (HECI3_RID_CC) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 8h	7800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller. This field is set by a special IOSF SB message (SetIDValue).

24.5 Cache Line Size (HECI3_CLS) — Offset Ch

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

24.6 Master Latency Timer (HECI3_MLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

24.7 Header Type (HECI3_HTYPE) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

24.8 Built In Self-Test (HECI3_BIST) — Offset Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	**Reserved (RSVD):** Reserved

24.9 HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

24.10 HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI) — Offset 14h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

24.11 Sub System Identifiers (HECI3_SS) — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

24.12 Capabilities Pointer (HECI3_CAP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 34h	50 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

24.13 Interrupt Information (HECI3_INTR) — Offset 3Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

24.14 Minimum Grant (HECI3_MGNT) — Offset 3Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + 3Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Grant (GNT):** Not implemented, hardwired to 0.

24.15 Maximum Latency (HECI3_MLAT) — Offset 3Fh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + 3Fh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**LAT:** Not implemented, hardwired to 0.

24.16 Host Firmware Status (HECI3_HFS) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

24.17 General Status Shadow 1 (HECI3_GS_SHDW1) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

24.18 Host General Status (HECI3_H_GS1) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

24.19 PCI Power Management Capability ID (HECI3_PID) — Offset 50h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 50h	8C01 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	8Ch RO	**NEXT:** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

24.20 PCI Power Management Capabilities (HECI3_PC) — Offset 52h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 52h	4003 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

24.21 PCI Power Management Control And Status (HECI3_PMCS) — Offset 54h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0h RO	**Reserved (RSVD_14_9):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0h RO	**Reserved (RSVD_7_4):** Reserved
3	1h RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform an internal reset.
2	0h RO	**Reserved (RSVD_2_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

24.22 General Status Shadow 2 (HECI3_GS_SHDW2) — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

24.23 General Status Shadow 3 (HECI3_GS_SHDW3) — Offset 64h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

24.24 General Status Shadow 4 (HECI3_GS_SHDW4) — Offset 68h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

24.25 General Status Shadow 5 (HECI3_GS_SHDW5) — Offset 6Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

24.26 Host General Status 2 (HECI3_H_GS2) — Offset 70h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

24.27 Host General Status 3 (HECI3_H_GS3) — Offset 74h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

24.28 Message Signaled Interrupt Identifiers (HECI3_MID) — Offset 8Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 8Ch	A405 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A4h RO	**NEXT:** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

24.29 Message Signaled Interrupt Message Control (HECI3_MC) — Offset 8Eh

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 8Eh	80 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

24.30 Message Signaled Interrupt Message Address (HECI3_MA) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved (RSVD):** Reserved

24.31 Message Signaled Interrupt Upper Address (HECI3_MUA) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

24.32 Message Signaled Interrupt Message Data (HECI3_MD) — Offset 98h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

24.33 HECI Interrupt Delivery Mode (HECI3_HIDM) — Offset A0h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:15, F:2] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

24.34 Vendor Specific Capability Register (HECI3_VSCR) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + A4h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VSID):** A value of 4'hF in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor Specific Capability Revision (VSREV):** For a VSID of 4'hF, this field is reserved 4'h0.
23:16	14h RO	**Vendor Specific Capability Length (VSLEN):** This field indicates the number of bytes of this Vendor Specific capability as required by the PCI spec inclusive of the CapID and Next Pointer. It has the value of 8'h14 for the DevIdle Capability.
15:8	0h RO	**NEXT:** Pointer to the configuration offset of the next Capability item. It is 8'h00 since it is the final item in the Capability list.
7:0	9h RO	**Capability ID (CAPID):** The value of 8h09 in this field indicates a Vendor Specific capability.

24.35 Vendor Specific Extended Capability Register (HECI3_VSEC) — Offset A8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + A8h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**Vendor Specific Extended Capability Length (VSECLEN):** This field indicates the number of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 12'h14.
19:16	0h RO	**Vendor Specific Extended Capability Revision (VSECREV):** For this revision of DevIdle, this field is 4h0.
15:0	10h RO	**Vendor Specific Extended Capability ID (NEXT):** DevIdle has been assigned the Intel VSEC ID of 16h10.

24.36 SW LTR Pointer Register (HECI3_SWLTRPTR) — Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + ACh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

24.37 Device Idle Pointer Register (HECI3_DEVIDLEPTR) — Offset B0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + B0h	8001 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	1h RO	**VALID:** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

24.38 Device Idle Power On Latency (HECI3_DEVIDLEPOL) — Offset B4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + B4h	D38 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD_15_13):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
12:10	3h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved (not enforced by HW). The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.
9:0	138h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the device idle valid bit is 1'b0.

24.39 DevIdle Power Control Enabled Register (HECI3_PWRCTRLEN) — Offset B6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:15, F:2] + B6h	E h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	**Reserved (RSVD_15_6):** Reserved
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	**Reserved (RSVD_4_4):** Reserved
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

24.40 Manufacturer's ID (HECI3_MANID) — Offset F8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:15, F:2] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_31_28):** Reserved
27:24	0h RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process. This field is set by a special IOSF SB message (SetIDValue).

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).
15:8	0h RO/V	**Manufacturing ID (MID):** This field is set by a special IOSF SB message (SetIDValue).
7:0	0h RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).

§ §

25 HD Audio Registers

This chapter documents the registers in Bus: 0, Device 14, Function 0.

25.1 VID_DID — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 0h	8C208086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	8C20h RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG. Bits(2:0) of the DID is controlled by fuse. IOSF Sideband Set ID Value message initializes bits 15:7 of this register value, whilst bits 6:0 of this register value are hardcoded. See the Global Device ID table in Register and Memory Mappings CSpec chapter for the DID value.
15:0	8086h RO	**Vendor ID (VID):** Indicates that Intel is the vendor.

25.2 CMD_STS — Offset 4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0h RO	**SERR# Status (SERRS):** Not implemented. Hardwired to 0.
29	0h RW/1C/V	**Received Master Abort (RMA):** If the completion status received from IOSF is UR, this bit is set. SW writes a 1 to this bit to clear it.
28	0h RW/1C/V	**Received Target Abort (RTA):** If the completion status received from IOSF is CA, this bit is set. SW writes a 1 to this bit to clear it.
27	0h RO	**Signaled Target-Abort (STA):** Not implemented. Hardwired to 0.
26:25	0h RO	**DEVSEL# Timing Status (DEVT):** Does not apply. Hardwired to 0.
24	0h RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	0h RO	**Fast Back to Back Capable (FBC):** Does not apply. Hardwired to 0.
22	0h RO	**Reserved (RSVD1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**66 MHz Capable (C66):** Does not apply. Hardwired to 0.
20	1h RO	**Capabilities List Exists (CLIST):** Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at configuration offset 34h.
19	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
18:16	0h RO	**Reserved (RSVD0):** Reserved
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** Enables the device to assert an INTx#. When set, the Intel(r) HD Audio controller' s INTx# signal will be de-asserted. When cleared, the INTx# signal may be asserted. Note that this bit does not affect the generation of MSIs.
9	0h RO	**Fast Back to Back Enable (FBE):** Not implemented. Hardwired to 0.
8	0h RW	**SERR Enable (SEN):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
7	0h RO	**Wait Cycle Control (WCC):** Not implemented. Hardwired to 0.
6	0h RW	**Parity Error Response (PER):** Functionality not implemented. This bit is R/W to pass PCIe compliance testing.
5	0h RO	**VGA Palette Snoop (VPS):** Not implemented. Hardwired to 0.
4	0h RO	**Memory Write and Invalidate Enable (MWI):** Not implemented. Hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented. Hardwired to 0.
2	0h RW	**Bus Master Enable (BME):** • 1: Enable • 0: Disable Controls standard PCI Express bus mastering capabilities for Memory and IO, reads and writes. Note that this also controls MSI generation since MSI are essentially Memory writes.
1	0h RW	**Memory Space Enable (MSE):** When set, enables memory space accesses to the Intel HD Audio controller.
0	0h RO	**I/O Space (IOS):** The Intel HD Audio controller does not implement IO Space, therefore this bit is hardwired to 0.

25.3 RID_PI_SCC_BCC — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 8h	4030000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	4h RO	**Base Class Code (BCC):** This register indicates that the function implements a multimedia device.
23:16	3h RO	**Sub Class Code (SCC):** This indicates the device is an Intel HD Audio audio device, in the context of a multimedia device.
15:8	0h RO	**Programming Interface (PI):** Value assigned to the Intel HD Audio subsystem.
7:0	0h RO/V	**Revision ID (RID):** Indicates the device specific revision identifier. IOSF Sideband Set ID Value message initializes this register value.

25.4 CLS_LT_HTYPE_BIST — Offset Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Built-in Self Test (BIST):** Not implemented in the Intel HD Audio subsystem. Hardwired to 00h.
23	0h RO	**Multi Function Device (MFD):** Value of 0 indicates a single function device. Value of 1 indicates a multi function device.
22:16	0h RO	**Header Type (HTYPE):** Implements Type 0 Configuration header.
15:8	0h RO	**Latency Timer (LT):** Doesn't apply to PCI Express. RO as 00h if PCI Express. If configured to appear as PCI device, maintain RW for Legacy PCI SW compliance.
7:0	0h RW	**Cache Line Size (CLS):** Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the PCH.

25.5 Intel HD Audio Base Lower Address (HDALBA) — Offset 10h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Intel HD Audio memory mapped configuration registers depending on implementation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**Lower Base Address (LBA):** Base address for the Intel HD Audio subsystem's memory mapped configuration registers. 16 Kbytes are requested by hardwiring bits 13:4 to 0.

Bit Range	Default & Access	Field Name (ID): Description
13:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

25.6 Intel HD Audio Base Upper Address (HDAUBA) — Offset 14h

This BAR creates a selected size of memory space to signify the base address (upper 32 bits) of the Intel HD Audio memory mapped configuration registers, depending on implementation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Intel HD Audio Upper Base Address (UBA):** Upper 32 bits of the Base address for the Intel(r) HD Audio controller's memory mapped configuration registers.

25.7 Shadowed PCI Configuration Lower Base Address (SPCLBA) — Offset 18h

This BAR creates 4 Kbytes of memory space to signify the base address (lower 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Lower Base Address (LBA):** Base address for the PCI Configuration register shadowed to memory mapped. 4 KB is requested by hardwiring bits 11:4 to 0.
11:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO/V	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

25.8 Shadowed PCI Configuration Upper Base Address (SPCUBA) — Offset 1Ch

This BAR creates 4 Kbytes of memory space to signify the base address (upper 32 bits) of the shadowed PCI configuration when used as an ACPI device.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the PCI Configuration register shadowed to memory mapped.

25.9 Audio DSP Lower Base Address (ADSPLBA) — Offset 20h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Audio DSP memory mapped configuration registers depending on implementation. The number of LBA bits in this register is depending on the size of the memory window implemented, represented as x in the register table. The x value is determined by the parameter HDMBABC.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 20h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Lower Base Address (LBA):** Base address for the Audio DSP memory mapped configuration registers.
19:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PREF:** Indicates that this BAR is NOT pre-fetchable.
2:1	2h RO	**Address Range (ADDRNG):** Indicates that this BAR can be located anywhere in 64-bit address space.
0	0h RO	**Space Type (SPTYP):** Indicates that this BAR is located in memory space.

25.10 Audio DSP Upper Base Address (ADSPUBA) — Offset 24h

This BAR creates a selected size of memory space to signify the base address (lower 32 bits) of the Audio DSP memory-mapped configuration registers, depending on implementation.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Base Address (UBA):** Upper 32 bits of the Base address for the Audio DSP memory mapped configuration registers.

25.11 SVID_SID — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Subsystem Identifier (SID):** These RW bits have no functionality.
15:0	0h RO	**Subsystem Vendor Identifier (SVID):** These RW bits have no functionality.

25.12 INTLN_INTPN — Offset 3Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP1):** Reserved
23:16	0h RO	**Reserved (RSVDP0):** Reserved
15:12	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RO	**Interrupt Pin (INTPN):** Identifies the interrupt pin the function uses. • 0h: No interrupt pin • 1h: INTA • 2h: INTB • 3h: INTC • 4h: INTD • 5h Fh: reserved
7:0	0h RW	**Interrupt Line (INTLN):** Hardware does not use this field directly. It is used to communicate to software the interrupt line that the interrupt pin is connected to.

25.13 PID_PC — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 50h	C8436001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME_Support (PMES):** Indicates PME# can be generated from D3 and D0 states. Programmable by BIOS for the option to declare SUS well wake is supported or not: 19h (SUS well wake supported) or 09h (SUS well wake not supported).
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	1h RO	**Aux_Current (AC):** Reports 55 mA maximum Suspend well current required when in the D3cold state. P rogrammable by BIOS for the option to declare SUS well wake is supported or not: 001b (SUS well wake supported) or 000b (SUS well wake not supported).
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Does not apply. Hardwired to 0.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. Programmable by BIOS to older revision if compatibility issue is found.
15:8	60h RO	**NEXT:** Points to the next capability structure (MSI).
7:0	1h RO	**CAP:** Indicates that this pointer is a PCI power management capability.

25.14 Power Management Control And Status (PCS) — Offset 54h

This register is used to manage the PCI functions power management state as well as to enable/monitor PMEs. PMES and PMEE bits reside in Resume well, and reset by resume reset.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DT):** Does not apply. Hardwired to 0.
23	0h RO	**Bus Power/Clock Control Enable (BPCCE):** Does not apply. Hardwired to 0.
22	0h RO	**B2/B3 Support (B23):** Does not apply. Hardwired to 0.
21:16	0h RO	**Reserved (RSVD3):** Reserved
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME bit. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
14:9	0h RO	**Reserved (RSVD2):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, and if corresponding PMES is also set, the Intel HD Audio subsystem send PME to PMC. This bit is cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately.
7:4	0h RO	**Reserved (RSVD1):** Reserved
3	1h RO	**No Soft Reset (NSR):** When set (1), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. When clear (0), devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the PowerState bits. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD0):** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the Intel HD Audio subsystem and to set a new power state. The values are: • 00: D0 state • 1 1: D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio subsystem's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.

25.15 MID_MMC — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 60h	807005 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**64b Address Capability (ADD64):** Indicates the ability to generate a 64-bit message address.
22:20	0h RO	**Multiple Message Enable (MME):** Normally this is a R/W register. However, since only 1 message is supported, these bits are hardwired to 000 = 1 message.
19:17	0h RO	**Multiple Message Capable (MMC):** Hardwired to 0 indicating request for 1 message.
16	0h RW	**MSI Enable (ME):** If set to 1 an MSI will be generated instead of an INTx#signal. If set to 0, an MSI may not be generated.
15:8	70h RO/V	Default value:00 **NEXT:** This field has a value of 00h to indicate that this is the last capability structure in the list.
7:0	5h RO	**CAP:** Indicates that this pointer is a MSI capability.

25.16 MSI Message Lower Address (MMLA) — Offset 64h

This register specifies the MSI message address (lower 32 bits).

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSI Message Lower Address (MMLA):** Lower Address used for MSI Message.
1:0	0h RO	**Reserved (RSVD):** Reserved

25.17 MSI Message Upper Address (MMUA) — Offset 68h

This register specifies the MSI message address (Upper 32 bits).

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI Message Upper Address (MMUA):** Upper 32 bits of address used for MSIMessage.

25.18 MSI Message Data (MMD) — Offset 6Ch

This register specifies the MSI message data.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:14, F:0] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP1):** Reserved
23:16	0h RO	**Reserved (RSVDP0):** Reserved
15:0	0h RW	**MSI Message Data (MMD):** Data used for MSI Message.

25.19 (GCAP_VMIN_VMAJ)—Offset 0h

This is a BAR0 MMIO Register**.**

AccessMethod

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1006701h

Bit Range	Default & Access	Field Name (ID): Description
31:24	1h RO	**Major Version (VMAJ):** Indicates the Intel HD Audio controller supports major revision number 1 of the Intel HD Audio specification.
23:16	0h RO	**Minor Version (VMIN):** Indicates the Intel HD Audio controller supports minor revision number 00h of the Intel HD Audio specification.

Bit Range	Default & Access	Field Name (ID): Description
15:12	6h RO	**Number of Output Streams Supported (OSS):** 0100b indicates that the Intel HD Audio controller supports four output streams. [p]Reset value is hardcoded to parameter HSTOSC.
11:8	7h RO	**Number of Input Streams Supported (ISS):** 0100b indicates that the Intel HD Audio controller supports four input streams. [p]Reset value is hardcoded to parameter HSTISC.
7:3	0h RO	**Number of Bidirectional Streams Supported (BSS):** 00000b indicates that the Intel HD Audio controller supports 0 bidirectional streams.
2:1	0h RO	**Number of Serial Data Out Signals (NSDO):** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. For the case in which multiple link segments are supported, this field indicates the number of SDOs for link 0.
0	1h RO	**64 Bit Address Supported (ADD64OK):** A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses, data buffer addresses, and command buffer addresses.

25.20 (OUTPAY_INPAY)—Offset 4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1D003Ch

Bit Range	Default & Access	Field Name (ID): Description
31:16	1Dh RO	**Input Payload Capability (INPAY):** Indicates the total input payload available on the link. This does not include bandwidth used for response. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz provides 500 bits per frame, or 31.25 words in total. 36 bits are used for response, leaving 29 words for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDI lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Note: In the event that multiple links are supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link.

Bit Range	Default & Access	Field Name (ID): Description
15:0	3Ch RO	**Output Payload Capability (OUTPAY):** Indicates the total output payload available on the link. This does not include bandwidth used for command and control. This measurement is in 16-bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz (the data is double pumped) provides 1000 bits per frame, or 62.5 words in total. 40 bits are used for command and control, leaving 60 words available for data payload. Note that this value does not reflect any bandwidth increase due to support for multiple SDO lines. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload Note: In the event that multiple links are supported (GCAP2.LCOUNT) 0), the payload advertised will be the lowest common denominator offered by the default clock frequency on each link.

25.21 Global Control (GCTL)—Offset 8h

CRSTB bit is not affected by controller reset.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD1):** Reserved.
8	0h RW	**Accept Unsolicited Response Enable (UNSOL):** If UNSOL is a 1, Unsolicited Responses from the codecs are accepted by the controller and placed into the Response Input Ring Buffer. If UNSOL is a 0, unsolicited responses are not accepted, and dropped on the floor.
7:2	0h RO	**Reserved (RSVD2):** Reserved.
1	0h RW/1S/V	**Flush Control (FCNTRL):** Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller, hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated, the DMA Position Buffer must be programmed with a valid memory address by software, but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also, all streams must be stopped (the associated RUN bit must be 0). When the flush is initiated, the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/V	**Controller Reset# (CRSTB):** values. After the hardware has completed sequencing into the reset state, it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and deassert the Intel HD Audio link RESET# signal. Software is responsible for setting/clearing this bit such that the minimum Intel HD Audio link RESET# signal assertion pulse width specification is met. When the controller hardware is ready to begin operation, it will report a 1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST# bit defaults to a 0 after hardware reset, therefore software needs to write a 1 to this bit to begin operation. Note that the CORB/RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST# is written to 0 (asserted) in order to assure a clean re-start. When setting or clearing CRST#, software must ensure that minimum link timing requirements (minimum RESET# assertion time, etc.) are met. When CRST# is 0 indicating that the controller is in reset, writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST# bit itself. The Global Control register is write-able as a DWord, Word, or Byte even when CRST# is 0 if the byte enable for the byte containing the CRST# bit (Byte Enable 0) is active. If Byte Enable 0 is not active, writes to the Global Control register will be ignored when CRST# is 0. When CRST# is 0, reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST# or on a D3hot to D0 transition.

25.22 (WAKEEN_WAKESTS)—Offset Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved (RSVD1_1):** Reserved.
18:16	0h RW/1C/V	**SDIN State Change Status Flags (WAKESTS):** Flag bits that indicate which SDI signal(s) received a State Change event. The bits are cleared by writing 1's to them. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.

Bit Range	Default & Access	Field Name (ID): Description
15:3	0h RO	**Reserved (RSVD1):** Reserved.
2:0	0h RW	**SDIN Wake Enable Flags (WAKEEN):** Bits which control which SDI signal(s) may generate a wake event. A 1 bit in the bit mask indicates that the associated SDIN signal is enabled to generate a wake. These bits are cleared on a power-on reset. Software must not make assumptions about the reset state of these bits and must set them appropriately.[/ p]

25.23 (GSTS_GCAP2)—Offset 10h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD1_1):** Reserved.
17	0h RO	**Dynamic FIFO Limit Change Dapability (DFIFOLCC):** Indicates whether the energy efficient audio FIFOLC operation is static or dynamic. • 0: Static. FIFOLC bit only has effect before RUN bit is set for the first time. • 1: Dynamic. FIFOLC bit has effect before RUN bit is set for the first time, as well as after that.
16	1h RW/V	**Energy Efficient Audio Capability (EEAC):** Indicates whether the energy efficient audio with deeper buffering is supported or not. • 0: Not supported. FIFOL register and FIFOLC bit behave as RO. • 1: Supported. FIFOL register and FIFOLC bit behave as RW.
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/1C/V	**Flush Status (FSTS):** This bit is set to a 1 by the hardware to indicate that the flush cycle initiated when the FCNTRL bit was set has completed. Software must write a 1to clear this bit before the next time FCNTRL is set.
0	0h RO	**Reserved (RSVD2):** Reserved.

25.24 Linked List Capabilities Header (LLCH)—Offset 14h

This register resides in Primary well (always on), or resides in Primary well (gated) with state retention, and reset by platform reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: C00h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP1):** Reserved.
23:16	0h RO	**Reserved (RSVDP0):** Reserved.
15:0	C00h RO	**First Capability Pointer (PTR):** This field contains the offset to the first capability structure of the linked list capabilities, or 0000h if no linked list capabilities exist. Point to Multiple Links Capability.

25.25 (OUTSTRMPAY_INSTRMPAY)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 180030h

Bit Range	Default & Access	Field Name (ID): Description
31:16	18h RO	**Input Stream Payload Capability (INSTRMPAY):** Indicates maximum number of words per frame for any single input stream. This measurement is in 16-bit word quantities per 48 kHz frame. 24 Words (48B) is the maximum supported, therefore a value of 18h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Input Stream Descriptor register. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload
15:0	30h RO	**Output Stream Payload Capability (OUTSTRMPAY):** Indicates maximum number of words per frame for any single output stream. This measurement is in 16 bit word quantities per 48 kHz frame. 48 Words (96B) is the maximum supported, therefore a value of 30h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Output Stream Descriptor register. • 00h: 0 word • 01h: 1 word payload • ... • FFh: 255h word payload

25.26 Interrupt Control (INTCTL)—Offset 20h

The Interrupt Status and Control register provides a central point for controlling and monitoring interrupt generation. The SIE (Stream Interrupt Enable) register controls the interrupt mask for each individual Input or Output Stream. Setting a 1 in the appropriate bit allows the particular interrupt source to generate a processor interrupt. The SIS (Stream Interrupt Status) register indicates the current interrupt status of each interrupt source. A 1 indicates that an interrupt is being requested. Note that the state of these bits is independent of the SIE bits; even if the corresponding bit is set to a 0 in the Stream Interrupt Enable register to disable processor interrupt generation, the Status bit may still be set to indicate that stream is requesting service. This can be used by polling software to determine which Streams need attention without incurring system interrupts.
The CIE (Controlle r Interrupt Enable) and CIS (Controller Interrupt Status) control and indicate the status of the general controller interrupt. General controller interrupt sources are to a Response Interrupt, a Response Buffer Overrun, and State Change events. Note that the CIS is independent of the CIE bit; even if the CIE bit is set to a 0 to disable processor interrupt generation, the CIS bit may still be set to indicate that stream is requesting service.
The GIE (Global Interrupt Enable) and GIS (Global Interrupt Status) control and indicate the status of all hardware interrupt sources in the Intel HD Audio controller. If GIS bit is a 1, a processor interrupt is currently being requested. If GIE is a 1, a processor interrupt may be requested; if GIE is a 0, then no processor interrupt may be requested. Note that the GIS is independent of the GIE bit; even if the GIE bit is set to a 0 to disable processor interrupt generation, the GIS bit may still be set to indicate that stream is requesting service.
GIE and CIE bits are not affected by controller reset.
The number of SIE bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Global Interrupt Enable (GIE):** Global bit to enable device interrupt generation. When set to 1 the Intel HD Audio function is enabled to generate an interrupt. This control is in addition to any bits in the bus specific address space, such as the Interrupt Enable bit in the PCI Configuration Space.
30	0h RW	**Controller Interrupt Enable (CIE):** Enables the general interrupt for controller functions. When set to 1 (and GIE is enabled), the controller generates an interrupt when the CIS bit gets set.
29:13	0h RO	**Reserved (RSVD1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
12:0	0h RW	**Stream Interrupt Enable (SIE):** When set to 1 the individual Streams are enabled to generate an interrupt when the corresponding stream status bits get set. A stream interrupt will be caused as a result of a buffer with IOC=1 in the BDL entry being completed, or as a result of a FIFO error (underrun or overrun) occurring. Control over the generation of each of these sources is in the associated Stream Descriptor. The streams are numbered and the SIE bits assigned sequentially, based on their order in the register set.

25.27 Interrupt Status (INTSTS)—Offset 24h

GIS and CIS bits are not affected by controller reset.
The number of SIS bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Global Interrupt Status (GIS):** This bit is an OR of all of the interrupt status bits in this register and PPSTS register.
30	0h RW/V	**Controller Interrupt Status (CIS):** Status of general controller interrupt. A 1 indicates that an interrupt condition occurred due to a Response Interrupt, a Response Buffer Overrun Interrupt, CORB Memory Error Interrupt, or a SDIN State Change event. The exact cause can be determined by interrogating other registers. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the stated interrupt status bits for this register.
29:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW/V	**Stream Interrupt Status (SIS):** A 1 indicates that an interrupt condition occurred on the corresponding Stream. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of an individual stream s interrupt status bits. Th e streams are numbered and the SIS bits assigned sequentially, based on their order in the register set.

25.28 Wall Clock Counter (WALCLK)—Offset 30h

The 32-bit monotonic counter provides a 'wall clock' that can be used by system software to synchronize independent audio controllers. The counter must be implemented.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Wall Clock Counter (WALCLK):** 32-bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. With the introduction of multiple link segments for the Intel HD Audio controller, and the capability of running each link segment at different clock speed, the BCLK definition for this counter is fixed at 24 MHz equivalent rate always, independent of the physical link clock speed, and reports the link 0 wall clock value.

25.29 Stream Synchronization (SSYNC)—Offset 38h

To synchronize two or more streams the corresponding SSYNC bits for the streams to be synchronized should be set to 1 before the 'RUN' bit for each stream is set.
The RUN bit for the corresponding stream must be set to 1 (and FIFORDY=1) prior to that stream's SSYNC bit being written to 0. To start multiple streams synchronously, the stream sync bits for those streams should be written to 0 at the same time. For all SSYNC bits on output engines that transition from 1 to 0 on the same write, the formatter will deliver a sample over the link in the same 48kHz frame. For all SSYNC bits on input engines that transition from 1 to 0 on the same write, the formatter will take stream data off the link and place it in the FIFO.
If synchronization is not desired, the stream synchronization bits may be left 0, and the stream will simply begin running normally when the stream's 'RUN' bit is set.
In addition to platform reset, FLR, and controller reset, the register is also reset by stream reset.
The number of SSYNC bits in this register is depending on the total number of stream DMA implemented, represented as x in the register table. The x value is determined by the sum of parameter HSTISC and HSTOSC.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD1):** Reserved.
12:0	0h RW	**Stream Synchronization Bits (SSYNC):** The Stream Synchronization bits, when set to 1, block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor, bit 0 corresponds to the first Stream Descriptor, etc. To synchronously start a set of DMA engines, the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready (FIFORDY=1), the associated SSYNC bits can all be set to 0 at the same time, and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams, first the bits are set in the SSYNC register, and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially, based on their order in the register set.

25.30 CORB Lower Base Address (CORBLBASE)—Offset 40h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**CORB Lower Base Address (CORBLBASE):** Lower address of the Command Output Ring Buffer, allowing the CORB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	0h RO	**CORB Lower Base Unimplemented Bits (RSVD):** Hardwired to 0. This requires the CORB to be allocated with 128-byte granularity to allow for cache line fetch optimizations.

25.31 CORB Upper Base Address (CORBUBASE)—Offset 44h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**CORB Upper Base Address (CORBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

25.32 (CORBWP_CORBRP)—Offset 48h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**CORB Read Pointer Reset (CORBRPRST):** Software writes a 1 to this bit to reset the CORB Read Pointer to 0 and clear any residual pre-fetched commands in the CORB hardware buffer within the Intel Audio controller. The hardware will physically update this bit to 1 when the CORB Pointer reset is complete. Software must read a 1 to verify that the reset completed correctly. Software must clear this bit back to 0 and read back the 0 to verify that the clear completed correctly. The CORB DMA engine must be stopped prior to resetting the Read Pointer or else DMA transfer may be corrupted.
30:24	0h RO	**Reserved (RSVD1_1):** Reserved.
23:16	0h RO/V	**CORB Read Pointer (CORBRP):** Software reads this field to determine how many commands it can write to the CORB without over-running. The value read indicates the CORB Read Pointer offset in Dword granularity. The offset entry read from this field has been successfully fetched by the DMA controller and may be over-written by software. Supports 256 CORB entries (256 x 4B=1KB). This field may be read while the DMA engine is running.
15:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RW	**CORB Write Pointer (CORBWP):** Software writes the last valid CORB entry offset into this field in Dword granularity. The DMA engine fetches commands from the CORB until the Read Pointer matches the Write Pointer. Supports 256 CORB entries (256 x 4B=1KB). This field may be written while the DMA engine is running.

25.33 (CORBCTL_CORBSTS_CORBSIZE)—Offset 4Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 420000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP0):** Reserved.
23:20	4h RO	**CORB Size Capability (CORBSZCAP):** 0100b indicates that the ICH9 only supports a CORB size of 256 CORB entries (1024B).
19:18	0h RO	**Reserved (RSVD1_2):** Reserved.
17:16	2h RO	**CORB Size (CORBSIZE):** Hardwired to 10b which sets the CORB size to 256 entries (1024B).
15:9	0h RO	**Reserved (RSVD1_1):** Reserved.
8	0h RW/1C/V	**CORB Memory Error Indication (CMEI):** If this status bit is set, the controller has detected an error in the pathway between the controller and memory. This may be an ECC bit error or any other type of detectable data error which renders the command data fetched invalid. Software can clear this bit by writing a 1 to it. However, this type of error leaves the audio subsystem in an unviable state and typically requires CRST#.
7:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/V	**Enable CORB DMA Engine (CORBRUN):** • 0: DMA Stop • 1: DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**CORB Memory Error Interrupt Enable (CMEIE):** If this bit is set (and GIE and CIE are enabled), the controller will generate an interrupt if the MEI status bit is set.

25.34 RIRB Lower Base Address (RIRBLBASE)—Offset 50h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**RIRB Lower Base Address (RIRBLBASE):** Lower address of the Response Input Ring Buffer, allowing the RIRB Base Address to be assigned on any 128-B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.
6:0	0h RO	**RIRB Lower Base Unimplemented Bits (RSVD):** Hardwired to 0 to force 128-byte buffer alignment for cache line fetch optimizations.

25.35 RIRB Upper Base Address (RIRBUBASE)—Offset 54h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RIRB Upper Base Address (RIRBUBASE):** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

25.36 (RIRBWP_RINTCNT)—Offset 58h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD1_1):** Reserved.
23:16	0h RW	**N Response Interrupt Count (RINTCNT):** • 0000_0001b: 1 Response sent to RIRB • ... • 1111_1111b: 255 Responses sent to RIRB • 0000_0000b: 256 Responses sent to RIRB The DMA engine should be stopped when changing this field or else an interrupt may be lost. [p]Note that each Response occupies 2 Dwords in the RIRB. This is compared to the total number of responses that have been returned, as opposed to the number of frames in which there were responses. If more than one codec responds in one frame, then the count is increased by the number of responses received in the frame.

Bit Range	Default & Access	Field Name (ID): Description
15	0h WO	**RIRB Write Pointer Reset (RIRBWPRST):** Software writes a 1 to this bit to reset the RIRB Write Pointer to 0's. The RIRB DMA engine must be stopped prior to resetting the Write Pointer or else DMA transfer may be corrupted. This bit will always be read as 0.
14:8	0h RO	**Reserved (RSVD1):** Reserved.
7:0	0h RO/V	**RIRB Write Pointer (RIRBWP):** Indicates the last valid RIRB entry written by the DMA controller. Software reads this field to determine how many responses it can read from the RIRB. The value read indicates the RIRB Write Pointer offset in 2 Dword RIRB entry units (since each RIRB entry is 2 Dwords long). Supports up to 256 RIRB entries (256 x 8B=2KB). This field may be read while the DMA engine is running.

25.37 (RIRBCTL_RIRBSTS_RIRBSIZE)—Offset 5Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 420000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP0):** Reserved.
23:20	4h RO	**RIRB Size Capability (RIRBSZCAP):** 0100b indicates that the PCH only supports a RIRB size of 256 RIRB entries (2048B) .
19:18	0h RO	**Reserved (RSVD1_2):** Reserved.
17:16	2h RO	**RIRB Size (RIRBSIZE):** Hardwired to 10b which sets the RIRB size to 256 entries (2048B).
15:11	0h RO	**Reserved (RSVD1_1):** Reserved.
10	0h RW/1C/V	**Response Overrun Interrupt Status (RIRBOIS):** Hardware sets this bit to a 1 when the RIRB DMA engine is not able to write the incoming responses to memory before additional incoming responses overrun the internal FIFO. When the overrun occurs, the hardware will drop the responses which overrun the buffer. An interrupt may be generated if the Response Overrun Interrupt Control bit is set. Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.
9	0h RO	**Reserved (RSVD2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C/V	**Response Interrupt (RINTFL):** Hardware sets this bit to a 1 when an interrupt has been generated after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI(x) inputs (whichever occurs first). Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit.
7:3	0h RO	**Reserved (RSVD1):** Reserved.
2	0h RW	**Response Overrun Interrupt Control (RIRBOIC):** If this bit is set (and GIE and CIE are enabled), the hardware will generate an interrupt when the Response Overrun Interrupt Status bit is set.
1	0h RW/V	**RIRB DMA Enable (RIRBRUN):** • 0: DMA Stop • 1: DMA Run After SW writes a 0 to this bit, the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped.
0	0h RW	**Response Interrupt Control (RINTCTL):** • 0: Disable Interrupt. • 1: Generate an interrupt (if GIE and CIE are enabled) after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI_x inputs (whichever occurs first). The N counter is reset when the interrupt is generated.

25.38 Immediate Command (IC)—Offset 60h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Immediate Command (IC):** The command to be sent to the codec via the Immediate Command mechanism is written to this register. The command stored in this register is sent out over the link during the next available frame after a 1 is written to the ICB bit.

25.39 Immediate Response (IR)—Offset 64h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Immediate Response (IR):** This register contains the response received from a codec resulting from a command sent via the Immediate Command mechanism. If multiple codecs responded in the same frame, there is no guarantee as to which response will be latched. Therefore broadcast-type commands must not be issued via the Immediate Command mechanism.

25.40 Immediate Command Status (ICS)—Offset 68h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVDP1):** Reserved.
23:16	0h RO	**Reserved (RSVDP0):** Reserved.
15:2	0h RO	**Reserved (RSVD1):** Reserved.
1	0h RW/1C/V	**Immediate Result Valid (IRV):** This bit is set to a 1 by hardware when a new response is latched into the IR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit (by writing a one to it) before issuing a new command so that the software may determine when a new response has arrived.
0	0h RW/V	**Immediate Command Busy (ICB):** When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 (via software writing a 1), the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register, the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB/RIRB mechanism is operating, otherwise the responses conflict. This must be enforced by software.

25.41 DMA Position Lower Base Address (DPLBASE)—Offset 70h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RW	**DMA Position Lower Base Address (DPLBASE):** Lower 32 bits of the DMA Position Buffer Base Address. This register field must not be written when any DMA engine is running or the DMA transfer may be corrupted. This same address is used by the Flush Control, and must be programmed with a valid value before the FLCNRTL bit is set.
6:1	0h RO	**DMA Position Lower Base Unimplemented Bits (RSVD):** Hardwired to 0 to force 128 byte buffer alignment for cache line write optimizations.
0	0h RW	**DMA Position Buffer Enable (DPBE):** When this bit is set to a '1', the controller will write the DMA positions of each of the DMA engines to the buffer in main memory periodically (typically once/frame). Software can use this value to know what data in memory is valid data. The controller must guarantee that the values in the DMA Position Buffer that the software can read represent positions in the stream for which valid data exists in the Stream's DMA buffer. This has particular relevance in systems which support isochronous transfer, the stream positions in the software-visible memory buffer must represent stream data which has reached the Global Observation point.

25.42 DMA Position Upper Base Address (DPUBASE)—Offset 74h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DMA Position Upper Base Address (DPUBASE):** Upper 32 bits of address of the DMA Position Buffer Base Address. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted.

25.43 (ISD0CTL_ISD0STS)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD1_1):** Reserved.
29	0h RO/V	**FIFO Ready (FIFORDY):** This bit defaults to 0 on reset because the FIFO is cleared on a reset. Input Stream: For input streams, the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. Output Stream: For output streams, the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link.
28	0h RW/1C/V	**Descriptor Error (DESE):** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort, a Parity or ECC error on the bus, or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error, as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it.
27	0h RW/1C/V	**FIFO Error (FIFOE):** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. Input Stream: For an input stream, this indicates a FIFO overrun occurring while the RUN bit is set. When this happens, the FIFO pointers don't increment and the incoming data is not written into the FIFO, thereby being lost. Output Stream: For an output stream, this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.
26	0h RW/1C/V	**Buffer Completion Interrupt Status (BCIS):** This bit is set to 1 by the hardware after the last sample of a buffer has been processed, AND if the Interrupt on Completion (IOC) bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.
25:24	0h RO	**Reserved (RSVD2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**Stream Number (STRM):** This value reflects the Tag associated with the data being transferred on the link. • 0000=Reserved (Indicates Unused) • 0001=Stream 1 • ... • 1110=Stream 14 • 1111=Stream 15 Input Stream: When an input stream is detected on any of the SDIx signals that match this value, the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number, two different SDIx inputs may not be configured with the same stream number. Output Stream:[/p] When data controlled by this descriptor is sent out over the link, it will have this stream number encoded on the SYNC signal.
19	0h RO	**Bidirectional Direction Control (DIR):** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0.
18	1h RO	**Traffic Priority (TP):** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers.
17:16	0h RO	**Stripe Control (STRIPE):** Input Stream: This field is meaningless for input streams. Output Stream: For output streams it controls the number of SDO signals to stripe data across.
15:6	0h RO	**Reserved (RSVD1):** Reserved.
5	0h RW/V	**FIFO Limit Change (FIFOLC):** Writing a 1 to this bit indicates a new update to the FIFOL register has been made. After the HW has completed sequencing into the new effective FIFO size, it will clear this bit. This bit is RO if GSTS_GCAP2.EEAC = 0. If GSTS_GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 0 (static), this bit will only have effect when the stream is idle (before the first time RUN bit is set). If GSTS_GCAP2.EEAC = 1 and GCAP2.DFIFOLCC = 1 (dynamic), on top of supporting the static behavior describe above, this bit also has effect when the stream is active (after the first time RUN bit is set).
4	0h RW	**Descriptor Error Interrupt Enable (DEIE):** Controls whether an interrupt is generated when the Descriptor Error Status (DESE) bit is set.
3	0h RW	**FIFO Error Interrupt Enable (FEIE):** This bit controls whether the occurrence of a FIFO error (overrun for input or underrun for output) will cause an interrupt or not. If this bit is not set, bit 3 in the Status register will be set, but the interrupt will not occur. Either way, the samples will be dropped.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Interrupt On Completion Enable (IOCE):** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set, bit 2 in the Status register will be set, but the interrupt will not occur
1	0h RW/V	**Stream Run (RUN):** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.
0	0h RW/V	**Stream Reset (SRST):** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers (except the SRST bit itself) and FIFO's for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state, it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation, it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted.

25.44 Input/Output Stream Descriptor x Link Position in Buffer (ISD0LPIB)—Offset 84h

Register for Input/Output Stream Descriptor x Link Position in Buffer.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Link Position in Buffer (LPIB):** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register (inclusive) for the first round, and then repeat counting from 1 to the value in the Cyclic Buffer Length register again for subsequent rounds. Note that SW may initialize the value for resume operation usage before RUN bit is set for the first time (and if RSM = 1). Once RUN bit is set, the register will become read only until SRST occurs.

25.45 Input/Output Stream Descriptor x Cyclic Buffer Length (ISD0CBL)—Offset 88h

Register for Input/Output Stream Descriptor x Cyclic Buffer Length.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Cyclic Buffer Length (CBL):** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer (LPIB) will be reset when it reaches this value. Software may only write to this register after Global Reset, Controller Reset, or Stream Reset has occurred. This value should only be modified when the RUN bit is '0'. Once the RUN bit has been set to enable the engine, software must not write to this register until after the next reset is asserted, or transfers may be corrupted.

25.46 (ISD0LVI_ISD0FIFOW)—Offset 8Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved (RSVD1_1):** Reserved.
18:16	4h RO/V	**FIFO Watermark (FIFOW):** Indicates the minimum number of bytes accumulated (for input) or free (for output) in the FIFO before the controller will start an eviction (for input) or fetch (fo r output) of data. The PCH HD Audio controller hardwires the FIFO Watermark, either 32B or 64B based on the following. Bit(2:0) Description [*]000-011 Reserved

§ §

26 SRAM Registers

This chapter documents the registers in Bus: 0, Device 13, Function 3.

26.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the particular Device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 0h	AEC8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AECh RO/V	**DEVICEVENDORID - Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO/V	**DEVICEVENDORID - Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

26.2 STATUSCOMMAND — Offset 4h

Command register to programme interrupt disable bus master enable and Memory space enable. Status register to read the errors and aborts

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved Field (RESERVED0):** Reserved
29	0h RW/1C/V	**STATUSCOMMAND- RMA Field (RMA):** Received Master Abort
28	0h RW/1C/V	**STATUSCOMMAND- RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved Field (RESERVED1):** Reserved
20	1h RO	**STATUSCOMMAND- Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**STATUSCOMMAND- Intrerrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**Reserved Field (RESERVED2):** Reserved
15:11	0h RO	**Reserved Field (RESERVED3):** Reserved
10	0h RW	**STATUSCOMMAND- Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved Field (RESERVED4):** Reserved
8	0h RW	**STATUSCOMMAND- SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved Field (RESERVED5):** Reserved
2	0h RW	**STATUSCOMMAND- BME Field (BME):** Bus Master Enable
1	0h RW	**STATUSCOMMAND- MSE Field (MSE):** Memory Space Enable
0	0h RW/V	**STATUSCOMMAND. IOSR FIELD (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

26.3 REVCLASSCODE — Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 8h	5000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	50000h RO/V	**REVCLASSCODE - Class code Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	0h RO/V	**REVCLASSCODE - Revision ID Field (RID):** Revision ID identifies the revision of particular PCI device.

26.4 CLLATHEADERBIST — Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved Field (RESERVED0):** Reserved
23	0h RO	**CLLATHEADERBIST - MultiFunction Device Field (MULFNDEV):** Multi-Function Device
22:16	0h RO	**CLLATHEADERBIST - Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**CLLATHEADERBIST - Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CLLATHEADERBIST - Cache Line Size Field (CACHELINE_SIZE):** Cacheline Size

26.5 BAR — Offset 10h

Base Address Register low [31:2] type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR -Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**BAR -Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**BAR -Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**BAR -Type Field (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR - Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

26.6 BAR -Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR -Base Address High Field (BASEADDR_HIGH):** Base Address high - MSB

26.7 BAR1 — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR1 - Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**BAR1 -Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**BAR1 - Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**BAR1 -Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR1 - Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

26.8 BAR1 -Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR1 -Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

26.9 BAR2 — Offset 20h

BAR -Base Address Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR:**
1	0h RO	**RESERVED0:** Reserved
0	0h RO	**MESSAGE_SPACE:**

26.10 SUBSYSTEMID — Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMID -Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

26.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR) — Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

26.12 CAPABILITYPTR — Offset 34h

Capabilities Pointer register indicates what the next capability is

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved Field (RESERVED0):** Reserved
7:0	80h RO	**CAPABILITYPTR - Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

26.13 INTERRUPTREG — Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latenc

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**INTERRUPTREG - Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**INTERRUPTREG - Min Gnt Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved Field (RESERVED0):** Reserved
11:8	1h RO	**INTERRUPTREG - Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTERRUPTREG - Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

26.14 POWERCAPID — Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability with Power management capabilities register for PME support and version

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 80h	30001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**POWERCAPID - PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved Field (RESERVED0):** Reserved
18:16	3h RO	**POWERCAPID - Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**POWERCAPID - Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWERCAPID - Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

26.15 PMECTRLSTATUS — Offset 84h

power management control and status register to set and read PME status PME enable No Soft reset and power state

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved Field (RESERVED0):** Reserved
15	0h RW/1C/V	**PMECTRLSTATUS - PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved Field (RESERVED1):** Reserved
8	0h RW	**PMECTRLSTATUS - PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved Field (RESERVED2):** Reserved
3	1h RO	**PMECTRLSTATUS - No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved Field (RESERVED3):** Reserved
1:0	0h RW	**PMECTRLSTATUS - Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

26.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**PCIDEVIDLE_CAP_REG - Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**PCIDEVIDLE_CAP_REG - Revision IDField (REVID):** Revision ID of capability structure
23:16	14h RO	**PCIDEVIDLE_CAP_REG - Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	0h RO	**PCIDEVIDLE_CAP_REG - Next Capability Field (NEXT_CAP):** Next Capability
7:0	9h RO	**PCIDEVIDLE_CAP_REG - Capability ID Field (CAPID):** Capability ID

26.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor capability register for VSEC Length revision and ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	10h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

26.18 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

26.19 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**DEVICE_IDLE_POINTER_REG - BAR NUM Field (BAR_NUM):** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

26.20 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + A0h	800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved Field (RESERVED0):** Reserved
21	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved Field (RESERVED1):** Reserved
19	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Sleep Enable Field (SLEEP_EN):** Sleep Enable

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If ?1? then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Device Idle En Field (I3_ENABLE):** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - PMC Request Enable Field (PMCRE):** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved Field (RESERVED2):** Reserved
12:10	2h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	0h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

26.21 GEN_REGRW1 - General Purpose Read Write Register1 (GEN_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW1 - General Purpose Read Write Field (GEN_REG_RW1):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

26.22 GEN_REGRW2 — Offset B4h

General Purpose PCI Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW2 - General Purpose Read Write Field (GEN_REG_RW2):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

26.23 GEN_REGRW3 — Offset B8h

General Purpose PCI Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW3 - General Purpose Read Write Field (GEN_REG_RW3):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

26.24 GEN_REGRW4 — Offset BCh

General Purpose PCI Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW4 - General Purpose Read Write Field (GEN_REG_RW4):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

26.25 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_INPUT_REG - General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

26.26 Manufacturers ID (MANID) — Offset F8h

MAN ID Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:3] + F8h	4000F1C h

Bit Range	Default & Access	Field Name (ID): Description
31:0	4000F1Ch RO/V	**Manufacturers ID - MAN ID (MANID):** Manufacturer ID: Default value comes from straps.

§ §

27 SPI Controller Registers

This chapter documents the registers in Bus: 0, Device 13, Function 2.

27.1 Device ID and Vendor ID (BIOS_SPI_DID_VID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 0h	31968086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	3196h RO/V	**Device Identification (DID):** Identifier for the SPI Flash Controller in Host Root Space. The upper 9-bits of this field can be overridden by the SetIDValue IOSF-SB Message. The value of the lower 7 bits is parameterized to allow different SOCs to configure the SPI IP. (The recommendation is to use pin-ties for the parameter to allow IP reuse without re-compilation.)
15:0	8086h RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. 0x8086 indicates Intel

27.2 Status and Command (BIOS_SPI_STS_CMD) — Offset 4h

This is a standard PCI config register. See the PCI spec for bit descriptions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 4h	400 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** See the PCI spec.
30	0h RW/1C/V	**Signaled System Error (SSE):** See the PCI spec.
29	0h RO	**Received Master Abort (RMA):** See the PCI spec.
28	0h RO	**Received Target Abort (RTA):** See the PCI spec.
27	0h RW/1C/V	**Signaled Target Abort (STA):** See the PCI spec.
26:25	0h RO	**Devsel Timing (DEVT):** See the PCI spec.
24	0h RO	**Master Data Parity Error (MDPE):** See the PCI spec.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Fast Back to Back Capable (FBTBC):** Has no meaning on the internal backbone.
22	0h RO	**Reserved (RSVD0):** Reserved
21	0h RO	**66 Mhz Capable (MCAP):** Not 66 MHz capable device. Has no meaning on the internal backbone.
20	0h RO	**Capablities List (CAPL):** See the PCI spec.
19	0h RO	**Interrupt Status (INTS):** See the PCI spec.
18:11	0h RO	**Reserved (RSVD1):** Reserved
10	1h RO	**Interrupt Disable (INTD):** See the PCI spec.
9	0h RO	**Fast Back to Back Enable (FBTBEN):** See the PCI spec.
8	0h RW	**System Error Enable (SERREN):** See the PCI spec.
7	0h RO	**Reserved (RSVD):** Reserved
6	0h RW	**Parity Error Response (PERRR):** See the PCI spec.
5	0h RO	**VGA Palette Snoop (VGAPS):** See the PCI spec.
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** See the PCI spec.
3	0h RO	**Special Cycles (SPCYC):** See the PCI spec.
2	0h RW	**Bus Master Enable (BME):** See the PCI spec.
1	0h RW	**Memory Space Enable (MSE):** Memory Space Enable may default False because the BIOS boot fetch decoding is hardcoded and does not rely on a BAR in config space.
0	0h RO	**IO Space Enable (IOSE):** See the PCI spec.

27.3 Revision ID and Class Code (BIOS_SPI_CC_RID) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 8h	C800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ch RO	**Base Class Code (BCC):**

Bit Range	Default & Access	Field Name (ID): Description
23:16	80h RO	**Sub-Class Code (SCC):**
15:8	0h RO	**Programming Interface (PI):**
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but will overridden by the SetID IOSF-SB message during the power-up sequence.

27.4 BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS) — Offset Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**Multi-function Device (MFD):** See the PCI spec.
22:16	0h RO	**Header Type (HTYPE):** See the PCI spec.
15:8	0h RO	**Latency Timer (LT):** See the PCI spec.
7:0	0h RO	**Cacheline Size (CLSZ):** See the PCI spec.

27.5 SPI BAR0 MMIO (BIOS_SPI_BAR0) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. The Host/BIOS MMIO registers in the flash controller are offset from this BAR.
11:4	0h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space.
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

27.6 CSXE BAR1 Direct Reads (CSXE_SPI_BAR1) — Offset 14h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. CSME direct reads to flash region 2.
22:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 8MB of memory space.
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

27.7 CSXE BAR2 Huffman Decompression (CSXE_SPI_BAR2) — Offset 18h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's Huffman decompression region. The concatenation of this field and MEMSIZE is referred to as CSME Hardware Decompression Flash Range Base (MEHDFRB) within this document. Software programs this register with the base address of the Huffman decompression region. **The base address must be 32MB aligned.** The size is fixed at 16MB.
23:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 16MB of memory space.
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

27.8 CSXE BAR3 Touch BAR (CSXE_SPI_BAR3) — Offset 1Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the Touch region. The base address must be 128 kB aligned. The size is fixed at 128 kBytes.
16:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 128KB of memory space.
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

27.9 CSXE BAR4 BIOS Direct Reads (CSXE_SPI_BAR4) — Offset 20h

This BAR enables the CSE firmware to efficiently read and authenticate the BIOS image in SPI flash without changing the SPI controller's fundamental requirement that regions be non-overlapping. The SPI controller supports two independent regions for BIOS code, region 1 and region 6. The architecture defines CSE access to either region, but the implementation only requires region 1. The CSE direct read of the BIOS region is directed to either region 1 or region 6 based on the CSE's PCI Config register CSXEFCTRL.BRS bit. Address translation from the BAR to the flash linear address is similar to other CSE direct reads, meaning address BAR+n maps to region_base + n. Range checking is also similar. The direct read will be UR'd if the address exceeds the MIN(16MB, ars), where ars is the size of the active BIOS region.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. CSME direct reads to the active BIOS region in flash. The size is fixed at 16MB.
23:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 16MB of memory space
3	0h RO	**PREFETCH:** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	0h RO	**TYP:** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

27.10 Cardbus CIS Pointer (CSXE_SPI_CCP) — Offset 28h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 28h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

27.11 Subsystem and Vendor ID (BIOS_SPI_SID_SVID) — Offset 2Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):**
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):**

27.12 Expansion ROM Base Address (CSXE_SPI_XRBAR) — Offset 30h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

27.13 Capabilities List Pointer (CSXE_SPI_CAPP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 34h	44 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	44h RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list

27.14 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (CSXE_SPI_MAXL_MING_INTP_INTL) — Offset 3Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

27.15 CSXE Capabilities List Pointer (CSXE_SPI_CCAPP) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RO	**CSXE Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the CSXE capabilities list

27.16 MSI Message Control, Next Pointer and Capability ID (CSXE_SPI_MSIMC_MSINP_MSICID) — Offset 44h

These PCI Config registers does not support MSI functionality, therefore the SSIE and MSIE interrupts must not be enabled by software.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 44h	5005 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RO	**Per Vector Masking Capable (PVMC):** This function does not support MSI per vector masking
23	0h RO	**64 bit address capable (XAC):** This function is not capable of sending 64 bit message address
22:20	0h RO	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. Value of zero indicates one vector.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors supported. Value of zero indicates one vector.
16	0h RW	**MSI Enable (MSIE):** If set to '1' CXME MSI interrupt delivery is enabled. When this bit is cleared, prior to returning the configuration write completion, the device must send any pending MSI(s).
15:8	50h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list
7:0	5h RO	**Capability ID (CAPID):** Indicates the linked list item as being the MSI Capability registers

27.17 MSI Message Address (CSXE_SPI_MSIMA) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MADDR):** DW aligned MSI message address.
1:0	0h RO	**Reserved (RSVD):** Reserved

27.18 MSI Message Data (CSXE_SPI_MSIMD) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Message Data (MDAT):** MSI Message Data

27.19 PCI Power Management Capability (CSXE_SPI_PMCAP_PMNP_PMCID) — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 50h	30001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(27) X XXX1b - PME# can be asserted from D0 bit(28) X XX1Xb - PME# can be asserted from D1 bit(29) X X1XXb - PME# can be asserted from D2 bit(30) X 1XXXb - PME# can be asserted from D3hot bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0h RO	**D2 Support (D2S):** This device does not support D2
25	0h RO	**D1 Support (D1S):** This device does not support D1
24:22	0h RO	**Aux Current (AUXC):** Not Applicable
21	0h RO	**Device Specific Initialization (DSI):** See PCI Power Management Interface specification.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMECLK):** Not Applicable
18:16	3h RO	**VER:** Value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list
7:0	1h RO	**Capability ID (CAPP):** Indicates the linked list item as being the PCI Power Management registers

27.20 PCI Power Management Control and Status (CSXE_SPI_PMD_PMCSRBSE_PMCSR) — Offset 54h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMESTS):** See PCI Power Management Interface specification.
14:13	0h RO	**Data Scale (DS):** Not Applicable
12:9	0h RO	**Data Select (DSEL):** Not Applicable
8	0h RO	**PME Enable (PMEEN):** See PCI Power Management Interface specification.
7:4	0h RO	**Reserved (RSVD1):** Reserved
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	**Reserved (RSVD2):** Reserved
1:0	0h RO	**Power State (PWRST):** See PCI Power Management Interface specification.

27.21 CSXE Flash Control (CSXE_SPI_CSXEFCTRL) — Offset 80h

Note: The BIOS Region Select bit is reset on early_boot_side_rst_b, not on the CSXE partition reset.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 80h	3 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RSVD):** Reserved
26:6	0h RW	**CSXE Hardware Decompression LUT Base (HDLUTB):** Specifies bits [26:6] of the base of the Look-Up-Table as an offset from the CSME Flash Region 2 Base. See 'CSME Region HDLUT' for a description of how this field is used.
5	0h RW/L	**CSXE HD Page Size (HDPAGESIZE):** Defines the page size within the hardware decompression range. 0 : 1KB (default) 1 : 4KB This register is locked by the CSME Flash Address Lockdown MEFAL register.
4	0h RW/L	**CSXE Hardware Decompression Enable (HDEN):** Set to '1' by CSME FW after programming the CSME HE Flash Range Base and limit registers to enable HW Decompression. This register is locked by the CSME Flash Address Lockdown MEFAL register.
3	0h RW/P/L	**BIOS Region Select (BRS):** When set to a '1' by CSME FW, BIOS direct reads to SPI flash are mapped to the Secondary BIOS flash region 6. When this bit is '0' (default), BIOS direct reads to SPI flash are mapped to flash region 1. Note: The Flash controller only allows this bit to be written if the Server Feature Disable Fuse 6 is '0'. This bit is reset on early_boot_side_rst_b.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/L	**CSXE Flash Address Lockdown (FAL):** When set, this bit locks fields in CSXEFCTRL and CSMEHDFL. This register locks itself.
1	1h RW	**CSXE Direct Read Prefetch Enable (DRPE):** When set to a '1', CSME direct reads are prefetched in the Flash Controller. When this bit is set to '1' the Cache Enable (MEDRCE) must also be set to '1'.
0	1h RW	**CSXE Direct Read Cache Enable (DRCE):** When set to a '1', CSME direct reads are cached in the Flash Controller. Note that if CSME direct read caching is disabled while data has already been cached internally, subsequent CSME direct reads will continue to return data from the cache until the cache is invalidated.

27.22 CSXE Hardware Decompression Flash Limit (CSXE_SPI_CSXEHDFL) — Offset 84h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW/L	**CSXE HD Flash Range Limit (HDFRL):** CSME Hardware Decompression Flash Range Limit. The limit is 4KB aligned. This register is locked by the CSME Flash Address Lockdown MEFAL register.
11:0	0h RO	**Reserved (RSVD):** Reserved

27.23 SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL) — Offset D0h

See the IOSF Specification for required behavior.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RSVD):** Reserved
1	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unspported Request that is not considered an Advisory Non-Fatal error. Cleared to 0 when software writes a 1 to this register.
0	0h RW	**Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the flash controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1.

27.24 B-Unit Copy of the BIOS Decode Enable register for SPI (B_CR_BDE_SPI) — Offset D8h

Affects B-Unit SAD for BIOS regions, only when BIOS is resident in SPI.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + D8h	FFCF h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_0):** Reserved
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS ranges: FFF80000h-FFFFFFFFh and FFB80000h-FFBFFFFFh.
14	1h RW/V	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS ranges: FFF00000h-FFF7FFFFh and FFB00000h-FFB7FFFFh.
13	1h RW/V	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS ranges: FFE80000h-FFEFFFFFh and FFA80000h-FFAFFFFFh.
12	1h RW/V	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS ranges: FFE00000h-FFE7FFFFh and FFA00000h-FFA7FFFFh.
11	1h RW/V	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS ranges: FFD80000h-FFDFFFFFh and FF980000h-FF9FFFFFh.
10	1h RW/V	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS ranges: FFD00000h-FFD7FFFFh and FF900000h-FF97FFFFh.
9	1h RW/V	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS ranges: FFC80000h-FFCFFFFFh and FF880000h-FF8FFFFFh.
8	1h RW/V	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS ranges: FFC00000h-FFC7FFFFh and FF800000h-FF87FFFFh.
7	1h RW/V	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h-FFFFFh.
6	1h RW/V	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h-EFFFFh.
5:4	0h RO	**Reserved (RESERVED_1):** Reserved
3	1h RW/V	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS ranges: FF700000h-FF7FFFFFh and FF300000h-FF3FFFFFh.
2	1h RW/V	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS ranges: FF600000h-FF6FFFFFh and FF200000h-FF2FFFFFh.
1	1h RW/V	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS ranges: FF500000h-FF5FFFFFh and FF100000h-FF1FFFFFh.
0	1h RW/V	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS ranges: FF400000h-FF4FFFFFh and FF000000h-FF0FFFFFh.

27.25 BIOS Control (BIOS_SPI_BC) — Offset DCh

This register collects bits that were previously distributed in various IPs and input to the SPI controller via discrete wires.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + DCh	28 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD):** Reserved
11	0h RW/L	**Async SMI Enable for BIOS Write Protection (ASE_BWP):** When set to '1', the flash controller will generate an SMI when it blocks a BIOS write or erase. The value in this field can be written by software as long as the BIOS Interface Lock-Down (BILD) is not set.
10	0h RO/V	**Asynchronous SMI Status (SPI_ASYNC_SS):** Status indication that the SPI Flash Controller has asserted an asynchronous SMI. Hardware clears the bit when it sends the De-assert SMI message. 0: default state 1: SPI flash controller asserted Asynchronous SMI
9	0h RW/L	**OS Function Hide (OSFH):** This bit controls read access over IOSF Primary to SPI's Device ID, Vendor ID PCI Config register. This bit does not affect access to any other PCI Config registers. This bit is locked with BILD. Trusted BIOS must set this bit prior to starting the OS. 0 : DeviceID, VendorID can be read 1 : reads to Device ID, Vendor ID return a UR **Note:** This bit is still implemented as a RW/L bit, but is no longer used by the hardware to return UR as specified above.
8	0h RW/1C/V	**Synchronous SMI Status (SPI_SYNC_SS):** Status indication that the SPI Flash Controller has asserted a synchronous SMI. Hardware clears the bit when it sends the De-assert Synchronous SMI message. 0: default state 1: SPI flash controller asserted Synchronous SMI
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents BBS and ASE_BWP from being changed. This bit can only be written from 0 to 1 once.
6	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. 0 SPI 1 LPC When SPI is selected, the range that is decoded is further qualified by the BIOS Decode Enable (BDE) register. The initial value of this bit is determined by the BBS pinstrap. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (BILD) is not set.
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until the CPU is in SMM mode. SPI receives this indication either via the InSMM.STS bit discrete wire input or via SAI. If this bit [5] is set, then WPD must be a '1' and the CPU must be in SMM mode in order to write to BIOS regions of SPI Flash. If this bit [5] is clear, then SMM mode is a don't care.This bit is locked by LE (bit 1 of this register).
4	0h RO/V	**Top Swap Status (TSS):** This bit provides a read-only path to view the state of the Top Swap bit. It is duplicated here to be consistent with the LPC version of the BC register.
3:2	2h RW	**SPI Read Configuration (SRC):** These bits are located in PCI Config space to allow them to be set early in the boot flow. This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3 - Prefetch Enable Bit 2 - Cache Disable Settings are summarized below: Bits 3:2 -- Description 00 **No prefetching, but caching enabled.** Direct Memory reads load the read buffer cache with 'valid' data, allowing repeated reads to the same range to complete quickly 01 **No prefetching and no caching.** One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. 10 **Prefetching and Caching enabled.** This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing) 11 **Illegal.** Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism
1	0h RW/L	**Lock Enable (LE):** When set, setting the WPD bit will cause a synchronous SMI. When cleared, setting the WPD bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the SPI flash. When this bit is written from a '0' to a '1' and the LE bit is also set, a synchronous SMI is generated. This ensures that only SMM code can update BIOS.

27.26 Manufacturer's ID (BIOS_SPI_MANID) — Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetIDValue message.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:2] + F8h	F00 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27:24	0h RO/V	**DOT:** Indicates the dot process.
23:16	0h RO/V	**Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Stepping Revision ID may not change.
15:8	Fh RO/V	**Manufacturing Identifier (MID):** 0Fh = Intel
7:0	0h RO/V	**PROC:** Indicates the process. The dot portion of the process is reflected in bits [27:24]

27.27 SSP Control Register 0 (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MOD (MOD):** Mode 0 - Normal SSP Mode 1 - reserved
30	0h RW	**ACS (ACS):** Audio Clock Select 0 - Clock selection is determined by the NCS and ECS bits 1 - reserved
29	0h RW	**LNW_CKBIT_ECO716771 (LNW_CKBIT_ECO716771)**
28:24	0h NA	**RSVD0 (RSVD0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**TIM (TIM):** Transmit FIFO Under Run Interrupt Mask 0 - TUR events will generate an SSP interrupt 1 - TUR events will not generate an SSP interrupt
22	0h RW	**RIM (RIM):** Receive FIFO Over Run Interrupt Mask 0 - ROR events will generate an SSP interrupt 1 - ROR events will not generate an SSP interrupt
21	0h RW	**NCS (NCS):** Network Clock Select 0 - Clock selection is determined by ECS bit 1 - Network clock is used to create the SSP's serial clock (SSPSCLK)
20	0h RW	**EDSS (EDSS):** Extended Data Size Select 0 - A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 - A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits
19:8	0h RW	**SCR (SCR):** Serial Clock Rate Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer.
7	0h RW	**SSE (SSE):** Synchronous Serial Port Enable 0 - SSP operation disabled 1 - SSP operation enabled
6	0h RW	**ECS (ECS):** External Clock Select 0 - On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 - SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK
5:4	0h RW	**FRF (FRF):** Frame Format 00 - Motorola Serial Peripheral Interface (SPI) 01 - reserved 10 - reserved 11 - reserved
3:0	0h RW	**DSS (DSS):** Data Size Select With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed.

27.28 SSP Control Register 1 (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**TTELP (TTELP):** TXD Tristate Enable on Last Phase 0 - TXD line will be tristated on same clock edge as TXD is to be flopped 1 - TXD line will be tristated clock edge after TXD is to be flopped
30	0h RW	**TTE (TTE):** TXD Tristate Enable 0 - TXD line will not be tristated 1 - TXD line will be tristated when no transmitting data

Bit Range	Default & Access	Field Name (ID): Description
29:24	0h NA	**Reserved_29_24 (Res_29_24)**
23	0h RW	**RWOT (RWOT):** Receive With Out Transmit 0 - Transmit/Receive mode 1 - Receive without transmit mode
22	0h RW	**TRAIL (TRAIL):** Trailing Byte 0 - Processor based, trailing bytes are handled by processor 1 - DMA based, trailing bytes are handled by DMA
21	0h RW	**TSRE (TSRE):** Transmit Service Request Enable 0 - DMA Service Request is disabled 1 - DMA Service Request is enabled
20	0h RW	**RSRE (RSRE):** Receive Service Request Enable 0 - DMA Service Request is disabled 1 - DMA Service Request is enabled
19	0h RW	**TINTE (TINTE):** Receiver Time-out Interrupt Enable 0 - Receiver Time-out interrupts are disabled 1 - Receiver Time-out interrupts are enabled
18	0h RW	**PINTE (PINTE):** Peripheral Trailing Byte Interrupts Enable 0 - Peripheral Trailing Byte Interrupts are disabled 1 - Peripheral Trailing Byte Interrupts are enabled
17	0h NA	**RSVD1 (RSVD1):** Reserved
16	0h RW	**IFS (IFS):** Invert Frame Signal 0 - Frame polarity is determined by SSP format and PSP polarity bits 1 - Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits)
15	0h RW	**STRF (STRF):** Select FIFO for EFWR (test mode bit) (when EFWR=1) 0 - Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 - Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR)
14	0h RW	**EFWR (EFWR):** Enable FIFO Write/Read (test mode bit) 0 - FIFO write/read special function is disabled (normal SSP operational mode) 1 - FIFO write/read special function is enabled
13:6	0h NA	**Reserved_13_6 (Res_13_6)**
5	0h RW	**MWDS (MWDS):** Microwire Transmit Data Size 0 - 8-bit command words are transmitted 1 - 16-bit command words are transmitted
4	0h RW	**SPH (SPH):** Motorola SPI SSPSCLK phase setting 0 - SSPSCLK is inactive one sycle at the start of a fram and cycle at the end of a frame 1 - SSPSCLK is inactive cycle at the start of a frame and one cycle at the end of a frame
3	0h RW	**SPO (SPO):** Motorola SPI SSPSCLK polarity setting 0 - The inactive or idle state of SSPSCLK is low 1 - The inactive or idle state of SSPSCLK is high
2	0h RW	**LBM (LBM):** Loop-Back Mode (test mode bit) 0 - Normal serial port operation enabled 1 - Output of transmit serial shifter connected to input of receive serial shifter, internally

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**TIE (TIE):** Transmit FIFO Interrupt Enable 0 - Transmit FIFO level interrupt is disabled 1 - Transmit FIFO level interrupt is enabled
0	0h RW	**RIE (RIE):** Receive FIFO Interrupt Enable 0 - Receive FIFO level interrupt is disabled 1 - Receive FIFO level interrupt is enabled

27.29 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: F004h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h NA	**RSVD2 (RSVD2):** Reserved
21	0h RW/1C	**TUR (TUR):** Transmit FIFO Under Run 0 - Transmit FIFO has not experienced an under run 1 - Attempted read from the transmit FIFO when the FIFO was empty, request interrupt
20	0h RW/1C	**EOC (EOC):** End of Chain 0 - DMA has not signaled an end of chain condition 1 - DMA has signaled an end of chain condition
19	0h RW/1C	**TINT (TINT):** Receiver Time-out Interrupt 0 - No receiver time-out pending 1 - Receiver time-out pending
18	0h RW/1C	**PINT (PINT):** Peripheral Trailing Byte Interrupt 0 - No peripheral trailing byte interrupt pending 1 - Peripheral trailing byte interrupt pending
17:16	0h NA	**RSVD5 (RSVD5):** Reserved
15:12	Fh NA	**RSVD6 (RSVD6):** Reserved
11:8	0h NA	**RSVD7 (RSVD7):** Reserved
7	0h RW/1C	**ROR (ROR):** Receive FIFO Overrun 0 - Receive FIFO has not experienced an overrun 1 - Attempted data write to full receive FIFO, request interrupt

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**RFS (RFS):** Receive FIFO Service Request 0 - Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 - Receive FIFO level exceeds RFT threshold (RFT), request interrupt
5	0h RO	**TFS (TFS):** Transmit FIFO Service Request 0 - Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 - Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt
4	0h RO	**BSY (BSY):** SSP Busy 0 - SSP is idle or disabled 1 - SSP currently transmitting or receiving a frame
3	0h RO	**RNE (RNE):** Receive FIOF Not Empty 0 - Receive FIFO is empty 1 - Receive FIFO is not empty
2	1h RO	**TNF (TNF):** Transmit FIFO Not Full 0 - Transmit FIFO is full 1 - Transmit FIFO is not full
1:0	0h RO	**RSVD8 (RSVD8):** Reserved

27.30 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RSVD9 (RSVD9):** Reserved
7	0h RW	**TROR (TROR):** Test Receive FIFO overrun 0 - No receive FIFO overrun service request 1 - Generates non-maskable interrupt to CPU. No DMA request is generated
6	0h RW	**TRFS (TRFS):** Test Receive FIFO service request 0 - No receive FIFO service request 1 - Generates non-maskable interrupt to CPU and a DMA request for receive FIFO

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**TTFS (TTFS):** Test Transmit FIFO service request 0 - No transmit FIFO service request pending 1 - Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO
4:0	0h NA	**RSVD10 (RSVD10):** Reserved

27.31 SSP Data (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DATA (DATA):** Data word to be written to/read from transmit/ receive FIFO

27.32 SSP Time Out (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h NA	**RSVD11 (RSVD11):** Reserved
23:0	0h RW	**TIMEOUT (TIMEOUT):** Timeout Value Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency

27.33 reserved (SSPSP_res)—Offset 2Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

27.42 TPM Reg 1 (TPM_REG_1)—Offset FED40004h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**TPM Reg 1 (TPMR1):** This register is for TPM accesses.

27.43 TPM Reg 2 (TPM_REG_2)—Offset FED40008h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**TPM Reg 2 (TPMR2):** This register is for TPM accesses.

27.44 TPM Reg 3 (TPM_REG_3)—Offset FED4000Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**TPM Reg 3 (TPMR3):** This register is for TPM accesses.

27.45 TPM Reg 4 (TPM_REG_4)—Offset FED40010h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**TPM Reg 4 (TPMR4):** This register is for TPM accesses.

27.46 CSXE Flash Primary Region (CSXE_MEFPREG)—Offset 0h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**CSME Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	0h RO/V	**CSME Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base.

27.47 Hardware Sequencing Flash Status and Control (CSXE_HSFSTS_CTL)—Offset 4h

Several hardware sequenced operations are not supported in slave-attach flash mode.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Flash Data Byte Count (FDBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
23:22	0h RW	**Reserved RW Scratch Pad (Reserved_SCRATCHPAD):** Scratch Pad bits that are R/W to be used during ECO.
21	0h RW	**Write Enable Type (WET):** 0: Use 06h as the write enable instruction 1: Use 50h as the write enable instruction Note: No supported flash devices require the 50h opcode to enable a non-volatile status register write. This bit is no longer required.
20:17	0h RW	**Flash Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 0h: Read (1 up to 64 bytes by setting FDBC) 1h: Reserved 2h: Write (1 up to 64 bytes by setting FDBC) 3h: 4k Block Erase 4h: 64k Sector erase 5h: Read SFDP 6h: Read JEDEC ID 7h: write status 8h: read status 9h: RPMC Op1 (only legal in slave-attach flash mode) Ah: RPMC Op2 (only legal in slave-attach flash mode) Bh: Reserved Ch: Reserved Dh: Reserved Eh: Reserved Fh: Reserved Flash controller hardware automatically inserts a write enable opcode prior to Write and erase operations. Hardware automatically polls for device not-busy using read status after write and erase operations. If the device does not support 64k erase size (or if it does not support SFDP) then only 4k is allowed. Note: If reserved '1' is programmed to this field, flash controller will handle it as if it is 0 (Read) (Preserves legacy behavior.) Other reserved operations, including the RPMC, set the FCERR bit and do not issue a cycle on the SPI bus.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/1S/V	**Flash Cycle Go (FGO):** A write to this register with a '1' in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
15	0h RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
14	0h RO/V	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	1h RO/V	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register indicates whether the flash controller is overriding descriptor permissions due to the Pin-Strap. Note: the register value is the inversion of the level sampled on the external pinstrap. 1: No override 0: The Flash Descriptor Overide strap is set
12:9	0h RO	**Reserved (RSVD_1):** Reserved.
8	0h RW/1C/V	**SAF ctype error (H_SAF_CE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI controller with ctype error.
7	0h RO/V	**SAF Mode Active (H_SAF_MODE_ACTIVE):** 0 : indicates flash is attached directly to the PCH via the SPI bus 1 : indicates flash is attached to the EC/BMC and is accessed via tunneled eSPI commands
6	0h RW/1C/V	**SAF link Error (H_SAF_LE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with link error.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO/V	**SPI Cycle In Progress (H_SCIP):** Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4	0h RW/1C/V	**SAF Data length Error (H_SAF_DLE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with an incorrect data length.
3	0h RW/1C/V	**SAF Error (H_SAF_ERROR):** Hardware sets this bit to 1 when a transaction is requested that is not supported by slave-attached flash, e.g. read status.
2	0h RW/1C/V	**Access Error Log (H_AEL):** Hardware sets this bit to a 1 when an attempt was made to access the BIOS region using the direct access method or an access to the BIOS Program Registers that violated the security restrictions. This bit is simply a log of an access security violation. This bit is cleared by software writing a '1'.
1	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until a partition reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.
0	0h RW/1C/V	**Flash Cycle Done (FDONE):** The PCH sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or partition reset.

27.48 Flash Address (CSXE_FADDR)—Offset 8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:0	0h RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which CSXE has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus.

27.49 Discrete Lock Bits (CSXE_DLOCK)—Offset Ch

Lockable CSxE registers may be locked by either the global FLOCKDN bit or by the individual DLOCK.* bit. Each lockable bit in this register is locked either by itself or by the FLOCKDN bit.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD):** Reserved.
16	0h RW/L	**SSEQ Lock-Down (SSEQLOCKDN):** CSxE Software Sequencing registers are locked when the logical OR of this bit and FLOCKDN is true. The affected registers are SSFSTS_CTL.SCF, PREOP_OPTYPE, OPMENU0, and OPMENU1.**Once set to 1 this register is only cleared by CSxE partition reset.**

27.50 Flash Data 0 (CSXE_FDATA0)—Offset 10h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24 Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

27.51 Flash Data 1 (CSXE_FDATA1)—Offset 14h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 1 (FD1):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

27.52 Flash Data 2 (CSXE_FDATA2)—Offset 18h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 2 (FD2):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

27.53 Flash Data 3 (CSXE_FDATA3)—Offset 1Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 3 (FD3):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

27.54 Flash Data 4 (CSXE_FDATA4)—Offset 20h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 4 (FD4):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

27.55 Flash Data 5 (CSXE_FDATA5)—Offset 24h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 5 (FD5):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD4 has completely shifted in/out.

27.56 Flash Data 6 (CSXE_FDATA6)—Offset 28h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 6 (FD6):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD5 has completely shifted in/out.

27.57 Flash Data 7 (CSXE_FDATA7)—Offset 2Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 7 (FD7):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD6 has completely shifted in/out.

27.58 Flash Data 8 (CSXE_FDATA8)—Offset 30h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 8 (FD8):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD7 has completely shifted in/out.

27.59 Flash Data 9 (CSXE_FDATA9)—Offset 34h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 9 (FD9):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD8 has completely shifted in/out.

27.60 Flash Data 10 (CSXE_FDATA10)—Offset 38h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 10 (FD10):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD9 has completely shifted in/out.

27.61 Flash Data 11 (CSXE_FDATA11)—Offset 3Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 11 (FD11):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD10 has completely shifted in/out.

27.62 Flash Data 12 (CSXE_FDATA12)—Offset 40h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 12 (FD12):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD11 has completely shifted in/out.

27.63 Flash Data 13 (CSXE_FDATA13)—Offset 44h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 13 (FD13):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD12 has completely shifted in/out.

27.64 Flash Data 14 (CSXE_FDATA14)—Offset 48h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 14 (FD14):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD13 has completely shifted in/out.

27.65 Flash Data 15 (CSXE_FDATA15)—Offset 4Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 15 (FD15):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD14 has completely shifted in/out.

27.66 Flash Region Access Permissions (CSXE_FRACC)—Offset 50h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:404h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**CSME Master Write Access Grant (MEMWAG):** Each bit [31:24] corresponds to Master[7:0]. CSME can grant one or more masters write access to the CSxE region 2 overriding the permissions in the Flash Descriptor.
23:16	0h RW/L	**CSME Master Read Access Grant (MEMRAG):** Each bit [23:16] corresponds to Master[7:0]. CSME can grant one or more masters read access to the CSME region 2 overriding the read permissions in the Flash Descriptor.
15:8	4h RO/V	**CSME Region Write Access (MERWA):** Each bit [15:8] corresponds to Regions [7:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 2.Master Region Write Access OR a particular master has granted CSME write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. CSME always have the write access to its own Region 2 by default. See also CM_WAP
7:0	4h RO/V	**CSME Region Read Access (MERRA):** Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 2.Master Region Read Access OR a particular master has granted CSME read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. CSME always have the read access to its own Region 2 by default. See also CM_RAP

27.67 Flash Region 0 (CSXE_FREG0)—Offset 54h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	0h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base.

27.68 Flash Region 1 (CSXE_FREG1)—Offset 58h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 1 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 1 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base.

27.69 Flash Region 2 (CSXE_FREG2)—Offset 5Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 2 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 2 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base.

27.70 Flash Region 3 (CSXE_FREG3)—Offset 60h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 3 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 3 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base.

27.71 Flash Region 4 (CSXE_FREG4)—Offset 64h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 4 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 4 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base.

27.72 Flash Region 5 (CSXE_FREG5)—Offset 68h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 5 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 5 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base.

27.73 Flash Region 6 (CSXE_FREG6)—Offset 6Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 6 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Limit if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all zeros.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 6 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Base if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all ones.

27.74 Flash Region 7 (CSXE_FREG7)—Offset 70h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 7 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 7 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Base.

27.75 Flash Region 8 (CSXE_FREG8)—Offset 74h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 8 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 8 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Base.

27.76 Flash Region 9 (CSXE_FREG9)—Offset 78h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 9 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Limit.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 9 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Base.

27.77 Flash Region 10 (CSXE_FREG10)—Offset 7Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 10 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 10 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Base

27.78 Flash Region 11 (CSXE_FREG11)—Offset 80h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 11 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 11 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Base

27.79 Flash Protected Range 0 (CSXE_FPR0)—Offset 84h

This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.80 Flash Protected Range 1 (CSXE_FPR1)—Offset 88h

This register can not be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.81 Flash Protected Range 2 (CSXE_FPR2)—Offset 8Ch

This register can not be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.82 Flash Protected Range 3 (CSXE_FPR3)—Offset 90h

This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.83 Flash Protected Range 4 (CSXE_FPR4)—Offset 94h

This register can not be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.84 Write Protected Range 0 (CSXE_WPR0)—Offset 98h

The region defined by this register is neither writable nor erasable by any master. The writes/erases are blocked regardless of access method, e.g. hardware sequencing, software sequencing, IOSF sideband message, etc. In contrast to the CSME's Protected Range registers which only prevent the CSME from accessing the Protected Range, the Blocked Range register blocks access by all masters. If the hardware detects an illegal access to the Write Protected Range, it shall not perform the write/erase to the flash device. Error reporting and completion of the transaction is the same as for an illegal Protected Range access. In response to an IOSF sideband SpiWrite or SpiErase to the Write Protected Range, the Flash Controller shall return a Completion message with Unsupported Request without sending the transaction to the flash device. This register cannot be written when the CSME Flash Program Register HSFSTS.FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Blocked Range Limit (BRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO	**Reserved (RSVD):** Reserved.
14:0	0h RW/L	**Blocked Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.85 Software Sequencing Flash Status and Control (CSXE_SSFSTS_CTL)—Offset A0h

The Software Sequencing control and status registers are intended to be used only as a back-up mode to the hardware sequencing control and status registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:FE000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	1Fh RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
26:24	6h RW/L	**SPI Cycle Frequency (SCF):** The listed frequencies are approximate. 000: 120MHz (not supported in SPT) 001: 60MHz (not supported in SPT) 010: 48MHz 011: 40MHz (not supported in SPT) 100: 30MHz 101: 24MHz (not supported in SPT) 110: 17MHz All others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, etc) except for the Read cycle which always run at 20MHz. This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set. Note: Fast Reset Testmode overrides the value programmed into this register.
23	0h RO	**Reserved (SME):** Reserved. Was previously the SMI Enable field
22	0h RW	**Data Cycle (DS):** When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are do not care.
21:16	0h RW	**Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:12	0h RW	**Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0h RW	**Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the ICH supports flash devices that have different opcodes for enabling writes to the data space vs. status register.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the PCH will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles. The sequence is composed of: - Atomic Sequence Prefix Command (8-bit opcode only) - Primary Command specified below by software (can include address and data) - Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0h RW/1S/V	**SPI Cycle Go (SCGO):** A write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
8	0h RO	**Reserved (RSVD_2):** Reserved.
7	0h RO/V	**Fast Read Supported (FAST_READ_SUPPORT):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0h RO/V	**Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0h RO	**Reserved (RSVD_3):** Reserved.
4	0h RO/V	**Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or partition reset.
2	0h RW/1C/V	**Cycle Done Status (CYCLE_DONE_STS):** The PCH sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	**Reserved (RSVD_4):** Reserved.
0	0h RO/V	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.

27.86 Prefix Opcode and Opcode Type Configuration (CSXE_PREOP_OPTYPE)—Offset A4h

This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, 'Chip Erase' and 'Auto-Address Increment Byte Program').

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW/L	**Opcode Type 7 (OPCODE_TYPE7):** See the description for bits 1:0.
29:28	0h RW/L	**Opcode Type 6 (OPCODE_TYPE6):** See the description for bits 1:0.
27:26	0h RW/L	**Opcode Type 5 (OPCODE_TYPE5):** See the description for bits 1:0.
25:24	0h RW/L	**Opcode Type 4 (OPCODE_TYPE4):** See the description for bits 1:0.
23:22	0h RW/L	**Opcode Type 3 (OPCODE_TYPE3):** See the description for bits 1:0.
21:20	0h RW/L	**Opcode Type 2 (OPCODE_TYPE2):** See the description for bits 1:0.
19:18	0h RW/L	**Opcode Type 1 (OPCODE_TYPE1):** See the description for bits 1:0.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW/L	**Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00: No Address associated with this Opcode and Read Cycle type 01: No Address associated with this Opcode and Write Cycle type 10: Address required; Read cycle type 11: Address required; Write cycle type
15:8	0h RW/L	**Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	0h RW/L	**Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

27.87 Opcode Menu0 Configuration (CSXE_OPMENU0)—Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**Allowable Opcode 3 (OPCODE3):** See the description for bits 7:0.
23:16	0h RW/L	**Allowable Opcode 2 (OPCODE2):** See the description for bits 7:0.
15:8	0h RW/L	**Allowable Opcode 1 (OPCODE1):** See the description for bits 7:0.
7:0	0h RW/L	**Allowable Opcode 0 (OPCODE0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register.

27.88 Opcode Menu1 Configuration (CSXE_OPMENU1)—Offset ACh

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**Allowable Opcode 7 (OPCODE7):** See the description in OPMENU0.
23:16	0h RW/L	**Allowable Opcode 6 (OPCODE6):** See the description in OPMENU0.
15:8	0h RW/L	**Allowable Opcode 5 (OPCODE5):** See the description in OPMENU0.
7:0	0h RW/L	**Allowable Opcode 4 (OPCODE4):** See the description in OPMENU0.

27.89 Vendor Specific Component Capabilities for Component 0 (CSXE_SFDP0_VSCC0)—Offset C4h

The fields in this register pertain to cycles targeting addresses within Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:2000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0. Note: If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0h RW/L	**Vendor Component Lock (VCL)**
29	0h RW/V/L	**64k Erase Valid (EO_64k_VALID)**
28	0h RW/V/L	**4k Erase Valid (EO_4k_VALID)**
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED)**

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED)**
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED)**
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED)**
23:16	0h RW/V/L	**64k Erase Opcode (EO_64k)**
15:8	20h RW/V/L	**4k Erase Opcode (EO_4k)**
7:5	0h RW/V/L	**Quad Enable Requirements (QER)**
4	0h RW/V/L	**Write Enable on Write Status (WEWS)**
3	0h RW/V/L	**Write Status Required (WSR)**
2	0h RW/V/L	**Write Granularity (WG)**
1:0	0h RW/L	**Reserved (RSVD)**

27.90 Vendor Specific Component Capabilities for Component 1 (CSXE_SFDP1_VSCC1)—Offset C8h

The fields in this register pertain to cycles targeting addresses outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:2000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 1. Note: If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0h RO	**Reserved (RSVD)**
29	0h RW/V/L	**64k Erase Valid (EO_64k_VALID)**
28	0h RW/V/L	**4k Erase Valid (EO_4k_VALID)**

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0 the device does not support RPMC 1 the device supports RPMC
26	0h RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED)**
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED)**
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED)**
23:16	0h RW/V/L	**64k Erase Opcode (EO_64k)**
15:8	20h RW/V/L	**4k Erase Opcode (EO_4k)**
7:5	0h RW/V/L	**Quad Enable Requirements (QER)**
4	0h RW/V/L	**Write Enable on Write Status (WEWS)**
3	0h RW/V/L	**Write Status Required (WSR)**
2	0h RW/V/L	**Write Granularity (WG)**
1:0	0h RW/L	**Reserved (RSVD_1)**

27.91 Parameter Table Index (CSXE_PTINX)—Offset CCh

Observability control for Component Property Tables. Note: The PTINX and PTDATA registers do not have any meaning in slave-attach flash mode because the SPI controller does not perform SFDP discovery.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:14	0h RW	**Supported Parameter Table (SPT):** Selects which supported parameter table to observe. 00: Component 0 Property Parameter Table. 01: Component 1 Property Parameter Table. 10 - 11: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13:12	0h RW	**Header or Data (HORD):** Select parameter table header DW vs Data DW. 00: SFDP Header. 01: Parameter Table Header. 10: Data. 11: Reserved.
11:2	0h RW	**Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe. The returned data is undefined if the index is programmed to a value greater than the size of the header or table.
1:0	0h RO	**Reserved (RSVD_1):** Reserved.

27.92 Parameter Table Data (CSXE_PTDATA)—Offset D0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register. Note: The returned value of reserved fields in the SFDP header or table must be ignored by software. The flash controller may return either 0 or 1 for these fields.

27.93 SPI Bus Requester Status (CSXE_SBRS)—Offset D4h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**TPM Access Ongoing (TPM_ACC_ONG)**
30	0h RO/V	**eSPI Access Ongoing (ESPI_ACC_ONG):** This bit is only defined if eSPI and SPI are sharing the SPI bus.
29	0h RO/V	**Touch Access Ongoing (TOUCH_ACC_ONG)**

Bit Range	Default & Access	Field Name (ID): Description
28	0h RO/V	**CSME accessing the Huffman Decompression (CSME_ACC_HWD)**
27:18	0h RO	**Reserved (RSVD):** Reserved
17:15	0h RO/V	**Master 5 Status (M5STATUS):** See description under M1STATUS Note: Master numbering was changed in a late revision of the Cspec, after this register was already implemented in RTL. Hence the master numbering in this register is not consecutive.
14:12	0h RO/V	**Master 6 Status (M6STATUS):** See description under M1STATUS.
11:9	0h RO/V	**Master 4 Status (M4STATUS):** See description under M1STATUS.
8:6	0h RO/V	**Master 3 Status (M3STATUS):** See description under M1STATUS.
5:3	0h RO/V	**Master 2 Status (M2STATUS):** See description under M1STATUS.
2:0	0h RO/V	**Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type. 0xx: No transaction. 100: Flash read transaction. 101: Flash write transaction. 110: Flash erase transaction. 111: Flash RPMC transaction.

27.94 Huffman Decompression Compressed Page Offset (CSXE_HDCOMPOFF)—Offset D8h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RSVD):** Reserved.
26:0	0h RW	**Compressed Offset (COMPOFF):** Hardware adds this field to the address read from the LUT to calculate a page's start address.

27.95 Touch Controller Configuration Register (CSXE_TCCR)—Offset DCh

Touch devices are required to support single IO fast read 0Bh, therefore no control bits are allocated in this register. Timing is always 8 dummy clocks, mode bits are not supported, and the opcodes are fixed to de-facto standards from the flash industry. Firmware is required to enforce the Touch Maximum Frequency softstrap when programming this register; no hardware checks are done.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:60h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Reserved (RSVD):** Reserved.
6:4	6h RW	**Touch Cycle Frequency (TCF):** The listed frequencies are approximate. 000 : 120MHz (not supported) 001 : 60MHz (not supported) 010 : 48MHz, divide by 2.5 011 : 40MHz (not supported) 100 : 30MHz, divide by 4 101 : 24MHz, divide by 5 (supported by some SOCs) 110 : 17MHz, divide by 7 111 : Reserved
3	0h RW	**Quad IO Read (EBh) enabled (QIORE):** Firmware programs this bit after discovering capabilities of Touch device. 0 : not enabled 1 : enabled
2	0h RW	**Dual IO Read (BBh) enabled (DIORE):** Firmware programs this bit after discovering capabilities of Touch device. 0 : not enabled 1 : enabled
1	0h RW	**Reserved (RSVD_1):** Reserved.
0	0h RO/V	**Touch Cycle Busy (TCB):** This bit is '1' if and only if the flash controller is busy with a touch transaction. When this bit is '0' the SPI controller is ready to accept another write transaction from firmware.

27.96 Flash Region 12 (CSXE_FREG12)—Offset E0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 12 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 12 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Base

27.97 Flash Region 13 (CSXE_FREG13)—Offset E4h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 13 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 13 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Base

27.98 Flash Region 14 (CSXE_FREG14)—Offset E8h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 14 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 14 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Base

27.99 Flash Region 15 (CSXE_FREG15)—Offset ECh

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 15 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 15 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Base

27.100 Interrupt Cause Enable (CSXE_ICE)—Offset F0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW/V/P	**IE Software Sequencing Enable (IESSEN):** <product specific = [quote]DNV, LBG[/quote]> This bit is only implemented in DNV, LBG and later SOCs. This bit controls whether the IE software sequencing 'go' bit can be set by the IE. The initial value of this bit is loaded from softstrap spi_ie_ss_enable_default. 0 : 'go' bit in IE software sequencing register is read-only 1 : 'go' bit in IE software sequencing register is writable
10:9	0h RO	**Reserved (RSVD_4):** Reserved.
8	0h RW/V/P	**Host Software Sequencing Enable (HSSEN):** This bit controls whether the host software sequencing 'go' bit can be set by the host. The initial value of this bit is loaded from softstrap spi_host_ss_enable_default. 0 : 'go' bit in host software sequencing register is read-only 1 : 'go' in host software sequencing register is writable
7	0h RO	**Reserved (RSVD_3):** Reserved.
6	0h RO/V	**Server Features Disable Fuse 6 Shadow (SFDF6):** This bit reflects the state of the Server Features Disable fuse 6 input to the SPI controller.
5:3	0h RO	**Reserved (RSVD_1):** Reserved.
2	0h RO	**Reserved (RSVD_2):** Reserved.
1	0h RW	**Software Sequencing Interrupt Enable (SSIE):** This functionality is not supported by the SPI flash controller. Setting this bit to 1 may cause undefined behavior. Note: CSxE firmware does not use this feature.
0	0h RW	**Hardware Sequencing Interrupt Enable (HSIE):** This functionality is not supported by the SPI flash controller. Setting this bit to 1 may cause undefined behavior. Note: CSxE firmware does not use this feature.

27.101 Interrupt Cause Status (CSXE_ICS)—Offset F4h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved (RSVD):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/1C/V	**Software Sequencing Interrupt Status (SSIS):** This register is set to '1' whenever the CSxE Software Sequencing Cycle Done status register is set to a '1'. This register is cleared when firmware writes a '1' to it.
0	0h RW/1C/V	**Hardwareware Sequencing Interrupt Status (HSIS):** This register is set to '1' whenever the CSxE Hardware Sequencing Flash Cycle Done status register is set to a '1'. This register is cleared when firmware writes a '1' to it.

27.102 Device 0 Write/Erase Count (CSXE_D0WEC)—Offset FCh

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD)**
30:0	0h RW/V	**Device 0 Write/Erase Count (D0WEC):** Incremented by the flash controller on every write or erase to device 0, regardless of which master initiated the transaction.

27.103 Device 1 Write/Erase Count (CSXE_D1WEC)—Offset 100h

This functionality is not implemented in the SIP

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD)**
30:0	0h RW/V	**Device 1 Write/Erase Count (D1WEC):** Incremented by the flash controller on every write or erase to device 1, regardless of which master initiated the transaction.

27.104 Write/Erase Count Threshold (CSXE_WECTHR)—Offset 104h

This functionality is not implemented in the SIP

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**WEC Interrupt Enable (WEC_IE):** 0 : Write/Erase count interrupts to the CSME are disabled 1 : Write/Erase count interrupts to the CSME are enabled **Note:** This functionality is not supported by the SPI flash controller. Setting this bit to 1 may cause undefined behavior.
30:0	0h RW	**Write/Erase Count Threshold (WEC_THR):** Threshold for generating a wear-out attack interrupt to the CSME.

27.105 RPMC SFDP Table (CSXE_RPMC0_D0)—Offset 108h

The SPI controller hardware does not read the RPMC tables from SFDP. If RPMC operations are desired via Software Sequencing, CSxE firmware must at a minimum program the RPMC opcodes supported by the flash device. All other bits of this register are not used by the SPI controller hardware in any version of the SIP. Mapping the registers into CSxE MMIO space allows the option of firmware discovering RPMC rather than hardware.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:969B00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	969B00h RW	**RPMC SFDP Table dword 0 Device 0 (RPMC0_D0):** See definition in the RPMC specification. http://downloadcenter.intel.com/Detail_Desc.aspx?agr=Y&DwnldID=22646 Bits 15:8 = RPMC OP1 Opcode Bits 23:16 = RPMC OP2 Opcode During software sequenced cycles from CSxE, the SPI controller hardware will compare the SW sequenced opcode with the OP1 and OP2 opcodes programmed here to determine if an RPMC cycle is being attempted via software sequencing.

27.106 RPMC SFDP Table (CSXE_RPMC1_D0)—Offset 10Ch

This RPMC register is not used by the SPI controller hardware in any version of the SIP. Mapping this register into CSxE MMIO space allows the option of firmware discovering RPMC rather than hardware.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 1 Device 0 (RPMC1_D0):** See definition in the RPMC specification. http://downloadcenter.intel.com/Detail_Desc.aspx?agr=Y&DwnldID=22646

27.107 RPMC SFDP Table (CSXE_RPMC0_D1)—Offset 110h

The SPI controller hardware does not read the RPMC tables from SFDP. If RPMC operations are desired via Software Sequencing, CSxE firmware must at a minimum program the RPMC opcodes supported by the flash device. All other bits of this register are not used by the SPI controller hardware in any version of the SIP. Mapping the registers into CSxE MMIO space allows the option of firmware discovering RPMC rather than hardware.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:969B00h

Bit Range	Default & Access	Field Name (ID): Description
31:0	969B00h RW	**RPMC SFDP Table dword 0 Device 1 (RPMC0_D1):** See definition in the RPMC specification. http://downloadcenter.intel.com/Detail_Desc.aspx?agr=Y&DwnldID=22646 Bits 15:8 = RPMC OP1 Opcode Bits 23:16 = RPMC OP2 Opcode During software sequenced cycles from CSxE, the SPI controller hardware will compare the SW sequenced opcode with the OP1 and OP2 opcodes programmed here to determine if an RPMC cycle is being attempted via software sequencing.

27.108 RPMC SFDP Table (CSXE_RPMC1_D1)—Offset 114h

This RPMC register is not used by the SPI controller hardware in any version of the SIP. Mapping this register into CSxE MMIO space allows the option of firmware discovering RPMC rather than hardware.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 1 Device 1 (RPMC1_D1):** See definition in the RPMC specification. http://downloadcenter.intel.com/Detail_Desc.aspx?agr=Y&DwnldID=22646

27.109 CSME Master Read Access Permissions (CSXE_CM_RAP)—Offset 118h

CM_RAP, CM_RAP registers are implemented in DNV, LBG and subsequent programs.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:0	4h RO/V	**CSME Master Read Access Pemissions (CMRAP) (CMRAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 2.Master Region Read Access OR a particular master has granted CSME read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. CSME has read access to its own Region 2 by default. Thus, the reset default of this field will be read as [quote]4h[/quote].

27.110 CSME Master Write Access Permissions (CSXE_CM_WAP)—Offset 11Ch

CM_RAP, CM_RAP registers are implemented in DNV, LBG and subsequent programs.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:0	4h RO/V	**CSME Master Write Access Pemissions (CMRAP) (CMWAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 2.Master Region Write Access OR a particular master has granted CSME write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. CSME has write access to its own Region 2 by default. Thus, the reset default of this field will be read as [quote]4h[/quote].

27.111 Host Flash Protected Range 0 (CSXE_HOST_PR0)—Offset 184h

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the BIOS Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.112 Host Flash Protected Range 1 (CSXE_HOST_PR1)—Offset 188h

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.113 Host Flash Protected Range 2 (CSXE_HOST_PR2)—Offset 18Ch

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.114 Host Flash Protected Range 3 (CSXE_HOST_PR3)—Offset 190h

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.115 Host Flash Protected Range 4 (CSXE_HOST_PR4)—Offset 194h

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.116 Host Global Protected Range 0 (CSXE_HOST_GPR0)—Offset 198h

These are not physical registers in the CSME memory space. These addresses provide the CSME with a read-only view of the values stored in the Host Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the Host Flash Program Registers, PR0-PR4, GPR0.

27.117 IE Flash Protected Range 0 (CSXE_IE_PR0)—Offset 1B0h

These are not physical registers in the CSxE memory space. These addresses provide the CSxE with a read-only view of the values stored in the IE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.

27.118 IE Flash Protected Range 1 (CSXE_IE_PR1)—Offset 1B4h

These are not physical registers in the CSxE memory space. These addresses provide the CSxE with a read-only view of the values stored in the IE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.

27.119 IE Flash Protected Range 2 (CSXE_IE_PR2)—Offset 1B8h

These are not physical registers in the CSxE memory space. These addresses provide the CSxE with a read-only view of the values stored in the IE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.

27.120 IE Flash Protected Range 3 (CSXE_IE_PR3)—Offset 1BCh

These are not physical registers in the CSxE memory space. These addresses provide the CSxE with a read-only view of the values stored in the IE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.

27.121 IE Flash Protected Range 4 (CSXE_IE_PR4)—Offset 1C0h

These are not physical registers in the CSxE memory space. These addresses provide the CSxE with a read-only view of the values stored in the IE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, GPR0.

27.122 BIOS Flash Primary Region (BIOS_BFPREG)—Offset 0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Shadowed BIOS Region Select (SBRS):** This bit reflects the CSXEFCTRL.BRS bit under the CSME SPI CSME root space configuration register.

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**BIOS Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit, or the Flash Descriptor.FLREG6.Region Limit depending on the BFPREG.SBRS bit.
15	0h RO	**Reserved (RSVD):** Reserved.
14:0	0h RO/V	**BIOS Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base, or the Flash Descriptor.FLREG6.Region Base depending on the BFPREG.SBRS bit.

27.123 Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h

Several hardware sequenced operations are not supported in slave-attach flash mode.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done bit is 1.
30	0h RO	**Reserved (RSVD):** Reserved.
29:24	0h RW	**Flash Data Byte Count (FDBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes. The number of bytes transferred is the value of this field plus 1. This field is ignored for the Block Erase command.
23:22	0h RW	**Reserved RW Scratch Pad (Reserved_SCRATCHPAD):** Scratch Pad bits that are R/W to be used during ECO.
21	0h RW	**Write Enable Type (WET):** 0: Use 06h as the write enable instruction 1: Use 50h as the write enable instruction Note: No supported flash devices require the 50h opcode to enable a non-volatile status register write. This bit is no longer required.

Bit Range	Default & Access	Field Name (ID): Description
20:17	0h RW	**Flash Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 0h: Read (1 up to 64 bytes by setting FDBC) 1h: Reserved 2h: Write (1 up to 64 bytes by setting FDBC) 3h: 4k Block Erase 4h: 64k Sector erase 5h: Read SFDP 6h: Read JEDEC ID 7h: write status 8h: read status 9h: RPMC Op1 (only legal in slave-attach flash mode) Ah: RPMC Op2 (only legal in slave-attach flash mode) Bh: Reserved Ch: Reserved Dh: Reserved Eh: Reserved Fh: Reserved Flash controller hardware automatically inserts a write enable opcode prior to Write and erase operations. Hardware automatically polls for device not-busy using read status after write and erase operations. If the device does not support 64k erase size (or if it doesn't support SFDP) then only 4k is allowed. See Program Register Access section for opcode values. Note: If reserved '1' is programmed to this field, flash controller will handle it as if it is 0 (Read) (Preserves legacy behavior.) Other reserved operations, including the RPMC, set the FCERR bit and do not issue a cycle on the SPI bus.
16	0h RW/1S/V	**Flash Cycle Go (FGO):** A write to this register with a '1' in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
15	0h RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RO/V	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	1h RO/V	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register indicates whether the flash controller is overriding descriptor permissions due to the Pin-Strap. Note: the register value is the inversion of the level sampled on the external pinstrap. 1: No override 0: The Flash Descriptor Overide strap is set
12	0h RW/L	**PRR3 PRR4 Lock-Down (PRR34_LOCKDN):** When set to 1, the BIOS PRR3 and PRR4 registers cannot be written. Once set to 1, this bit can only be cleared by a hardware reset. See also the BIOS PR3 and BIOS PR4 register descriptions. Note: This bit is not used if the DLOCK register is implemented.
11	0h RW/L	**Write Status Disable (WRSDIS):** 0: Write status operation may be issued using Hardware Sequencing. 1: Write status is not allowed as a Hardware Sequencing operation. The flash controller will block the operation and set the FCERR bit when software sets the 'go' bit.
10:9	0h RO	**Reserved (RSVD_1):** Reserved.
8	0h RW/1C/V	**SAF ctype error (H_SAF_CE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI controller with ctype error.
7	0h RO/V	**SAF Mode Active (H_SAF_MODE_ACTIVE):** 0 : indicates flash is attached directly to the PCH via the SPI bus 1 : indicates flash is attached to the EC/BMC and is accessed via tunneled eSPI commands
6	0h RW/1C/V	**SAF link Error (H_SAF_LE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with link error.
5	0h RO/V	**SPI Cycle In Progress (H_SCIP):** Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4	0h RW/1C/V	**SAF Data length Error (H_SAF_DLE):** Hardware sets this bit to 1 when a transaction is returned from the eSPI channel with an incorrect data length.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**SAF Error (H_SAF_ERROR):** Hardware sets this bit to 1 when a transaction is requested that is not supported by slave-attached flash, e.g. read status.
2	0h RW/1C/V	**Access Error Log (H_AEL):** Hardware sets this bit to a 1 when an attempt was made to access the BIOS region using the direct access method or an access to the BIOS Program Registers that violated the security restrictions. This bit is simply a log of an access security violation. This bit is cleared by software writing a '1'.
1	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until a partition reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.
0	0h RW/1C/V	**Flash Cycle Done (FDONE):** The PCH sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or partition reset. When this bit is set and the SPI SMI Enable bit is set the flash controller sends SMI messages. Software must make sure this bit is cleared prior to enabling the SPI SMI assertion for a new programmed access.

27.124 Flash Address (BIOS_FADDR)—Offset 8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RSVD):** Reserved.
26:0	0h RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which BIOS has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus.

27.125 Discrete Lock Bits (BIOS_DLOCK)—Offset Ch

Lockable BIOS registers may be locked by either the global FLOCKDN bit or by the individual DLOCK.* bit. Each lockable bit in this register is locked either by itself or by the FLOCKDN bit.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD):** Reserved.
16	0h RW/L	**SSEQ Lock-Down (SSEQLOCKDN):** BIOS Software Sequencing registers are locked when the logical OR of this bit and FLOCKDN is true. The affected registers are SSFSTS_CTL.SCF, PREOP_OPTYPE, OPMENU0, and OPMENU1.**Once set to 1 this register is only cleared by host partition reset.**

27.126 Flash Data 0 (BIOS_FDATA0)—Offset 10h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13- ... 8-23-22- ... 16-31 ... 24 Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. Note that the data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

27.127 Flash Data 1 (BIOS_FDATA1)—Offset 14h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 1 (FD1):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

27.128 Flash Data 2 (BIOS_FDATA2)—Offset 18h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 2 (FD2):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

27.129 Flash Data 3 (BIOS_FDATA3)—Offset 1Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 3 (FD3):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

27.130 Flash Data 4 (BIOS_FDATA4)—Offset 20h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 4 (FD4):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

27.131 Flash Data 5 (BIOS_FDATA5)—Offset 24h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 5 (FD5):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD4 has completely shifted in/out.

27.132 Flash Data 6 (BIOS_FDATA6)—Offset 28h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 6 (FD6):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD5 has completely shifted in/out.

27.133 Flash Data 7 (BIOS_FDATA7)—Offset 2Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 7 (FD7):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD6 has completely shifted in/out.

27.134 Flash Data 8 (BIOS_FDATA8)—Offset 30h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 8 (FD8):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD7 has completely shifted in/out.

27.135 Flash Data 9 (BIOS_FDATA9)—Offset 34h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 9 (FD9):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD8 has completely shifted in/out.

27.136 Flash Data 10 (BIOS_FDATA10)—Offset 38h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 10 (FD10):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD9 has completely shifted in/out.

27.137 Flash Data 11 (BIOS_FDATA11)—Offset 3Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 11 (FD11):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD10 has completely shifted in/out.

27.138 Flash Data 12 (BIOS_FDATA12)—Offset 40h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 12 (FD12):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD11 has completely shifted in/out.

27.139 Flash Data 13 (BIOS_FDATA13)—Offset 44h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 13 (FD13):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD12 has completely shifted in/out.

27.140 Flash Data 14 (BIOS_FDATA14)—Offset 48h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 14 (FD14):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD13 has completely shifted in/out.

27.141 Flash Data 15 (BIOS_FDATA15)—Offset 4Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Flash Data 15 (FD15):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD14 has completely shifted in/out.

27.142 Flash Region Access Permissions (BIOS_FRACC)—Offset 50h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:42C2h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**BIOS Master Write Access Grant (BMWAG):** Each bit [31:24] corresponds to Master[7:0]. BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor.
23:16	0h RW/L	**BIOS Master Read Access Grant (BMRAG):** Each bit [23:16] corresponds to Master[7:0]. BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor.
15:8	42h RO/V	**BIOS Region Write Access (BRWA):** Each bit [15:8] corresponds to Regions [7:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the write access to its own Region 1 and Region 6 by default. Thus, the reset default of this field will be read as '42h'.

Bit Range	Default & Access	Field Name (ID): Description
7:0	C2h RO/V	**BIOS Region Read Access (BRRA):** Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the read access to its own Regions 1, 6, and 7 by default. Thus, the reset default of this field will be read as 'C2h'.

27.143 Flash Region 0 (BIOS_FREG0)—Offset 54h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	0h RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base.

27.144 Flash Region 1 (BIOS_FREG1)—Offset 58h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 1 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 1 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base.

27.145 Flash Region 2 (BIOS_FREG2)—Offset 5Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 2 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 2 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base.

27.146 Flash Region 3 (BIOS_FREG3)—Offset 60h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 3 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 3 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base.

27.147 Flash Region 4 (BIOS_FREG4)—Offset 64h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 4 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 4 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base.

27.148 Flash Region 5 (BIOS_FREG5)—Offset 68h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 5 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 5 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base.

27.149 Flash Region 6 (BIOS_FREG6)—Offset 6Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 6 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Limit if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all zeros.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 6 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Base if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all ones.

27.150 Flash Region 7 (BIOS_FREG7)—Offset 70h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 7 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 7 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Base.

27.151 Flash Region 8 (BIOS_FREG8)—Offset 74h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 8 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 8 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Base.

27.152 Flash Region 9 (BIOS_FREG9)—Offset 78h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved.
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 9 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Limit.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 9 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Base.

27.153 Flash Region 10 (BIOS_FREG10)—Offset 7Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 10 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 10 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Base

27.154 Flash Region 11 (BIOS_FREG11)—Offset 80h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 11 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 11 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Base

27.155 Flash Protected Range 0 (BIOS_FPR0)—Offset 84h

This register cannot be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.156 Flash Protected Range 1 (BIOS_FPR1)—Offset 88h

This register can not be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.157 Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch

This register can not be written when the FLOCKDN bit is set to 1.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.158 Flash Protected Range 3 (BIOS_FPR3)—Offset 90h

If the DLOCK register is not implemented, then this register cannot be written when the PRR34_LOCKDN bit is set to 1. Else this register cannot be written when either FLOCKDN or the DLOCK.PRnLOCKDN corresponding to this register is set.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.159 Flash Protected Range 4 (BIOS_FPR4)—Offset 94h

If the DLOCK register is not implemented, then this register cannot be written when the PRR34_LOCKDN bit is set to 1. Else this register cannot be written when either FLOCKDN or the DLOCK.PRnLOCKDN corresponding to this register is set.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.160 Global Protected Range 0 (BIOS_GPR0)—Offset 98h

This register is initialized via softstraps. This protected range applies globally to all masters / flash requesters. If SPT users do not want a register that applies across all masters then the enable bits must be set false. Since this register is a descriptor-based protection, it is disabled (both enable bits are treated as false) when the Flash Descriptor Security Override pinstrap is asserted. Note: since this register is a RO view of the softstraps the underlying values are only reset when softstraps are reset.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. Note: If either Write or Read protection is enabled, then Limit must be configured greater than or equal to Base.
15	0h RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that reads directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0h RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. Note: If either Write or Read protection is enabled, then Limit must be configured greater than or equal to Base.

27.161 Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h

The Software Sequencing control and status registers are intended to be used only as a back-up mode to the hardware sequencing control and status registers.**When HSSEN = 0 the SCGO bit must become read-only.** It is an implementation decision whether to make all register bits RO when HSSEN=0. Software sequencing is not supported in slave-attach flash mode.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:FE000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	1Fh RO	**Reserved (RSVD):** Reserved: This field is not programmable, it is fixed at 1Fh.

Bit Range	Default & Access	Field Name (ID): Description
26:24	6h RW/L	**SPI Cycle Frequency (SCF):** The listed frequencies are approximate. 000: 120MHz (not supported in SPT) 001: 60MHz (not supported in SPT) 010: 48MHz 011: 40MHz (not supported in SPT) 100: 30MHz 101: 24MHz (not supported in SPT) 110: 17MHz All others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status, etc) except for the Read cycle which always run at 20MHz. This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set. Note: Fast Reset Testmode overrides the value programmed into this register.
23	0h RW	**SPI SMI Enable (SME):** When set to 1, the SPI sends an assert SMI when the Cycle Done Status bit changes to a 1.
22	0h RW	**Data Cycle (DS):** When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are do not care.
21:16	0h RW	**Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0h RO	**Reserved (RSVD_1):** Reserved.
14:12	0h RW	**Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0h RW	**Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the ICH supports flash devices that have different opcodes for enabling writes to the data space vs. status register.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the PCH will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles. The sequence is composed of: Atomic Sequence Prefix Command (8-bit opcode only) Primary Command specified below by software (can include address and data) Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0h RW/1S/V	**SPI Cycle Go (SCGO):** A write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the SPI Controller's internal arbiter.
8	0h RO	**Reserved (RSVD_2):** Reserved.
7	0h RO/V	**Fast Read Supported (FAST_READ_SUPPORT):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0h RO/V	**Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0h RO	**Reserved (RSVD_3):** Reserved.
4	0h RO/V	**Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0h RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or partition reset.
2	0h RW/1C/V	**Cycle Done Status (CYCLE_DONE_STS):** The PCH sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0h RO	**Reserved (RSVD_4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface or the transaction is prevented due to any protection policy violation (descriptor, address range, protected region, etc). Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.

27.162 Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h

This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, 'Chip Erase' and 'Auto-Address Increment Byte Program').

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW/L	**Opcode Type 7 (OPCODE_TYPE7):** See the description for bits 1:0.
29:28	0h RW/L	**Opcode Type 6 (OPCODE_TYPE6):** See the description for bits 1:0.
27:26	0h RW/L	**Opcode Type 5 (OPCODE_TYPE5):** See the description for bits 1:0.
25:24	0h RW/L	**Opcode Type 4 (OPCODE_TYPE4):** See the description for bits 1:0.
23:22	0h RW/L	**Opcode Type 3 (OPCODE_TYPE3):** See the description for bits 1:0.
21:20	0h RW/L	**Opcode Type 2 (OPCODE_TYPE2):** See the description for bits 1:0.
19:18	0h RW/L	**Opcode Type 1 (OPCODE_TYPE1):** See the description for bits 1:0.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RW/L	**Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00: No Address associated with this Opcode and Read Cycle type 01: No Address associated with this Opcode and Write Cycle type 10: Address required; Read cycle type 11: Address required; Write cycle type
15:8	0h RW/L	**Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	0h RW/L	**Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

27.163 Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.
Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.
It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. 27.165 Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**Secondary BIOS Master Write Access Grant (SECONDARYBIOS_MWAG):** Each bit [31:29] corresponds to Master[7:0]. BIOS can grant one or more masters write access to the Secondary BIOS region 6 overriding the permissions in the Flash Descriptor.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW/L	**Secondary BIOS Master Read Access Grant (SECONDARYBIOS_MRAG):** Each bit [28:16] corresponds to Master[7:0]. BIOS can grant one or more masters read access to the Secondary BIOS region 6 overriding the read permissions in the Flash Descriptor.
15:0	0h RO	**Reserved (RSVD):** Reserved.

27.166 Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h

This is a test mode only register that can be used to observe the contents of the Flash Descriptor that is stored internally in the PCH Flash Controller. The CPU Complex soft straps are not observable in PCH as these are forwarded to the CPU Complex and not stored.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD):** Reserved.
14:12	0h RW	**Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe. 000 : Flash Signature and Descriptor Map 001 : Component 010 : Region 011 : Master 100 : PCH Soft Straps Other : Reserved
11:2	0h RW	**Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe.
1:0	0h RO	**Reserved (RSVD_1):** Reserved.

27.167 Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Flash Descriptor Section Data (FDSD):** Returns the DW of data to observe as selected in the Flash Descriptor Observability Control.

27.168 Additional Flash Control (BIOS_AFC)—Offset C0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD):** Reserved.
9:1	0h RW	**Reserved RW Scratch Pad (Reserved_SCRATCHPAD):** Scratch Pad bits that are R/W to be used during ECO.
0	0h RW/V/P	**Stop Prefetch on Flush Pending (SPFP):** When set to '1', the in progress of a prefetch will be ended if subsequence access from the master of the same Root Space is detected to be a cache-miss and read cache will be flushed. When set to '0', the prefetch will be allowed to complete prior to flushing. This register is only reset on an Early boot reset of both the Host and the CSME partitions. Hardware loads this bit from the PCH soft strap SPI_SPFP when the strap completion is received from the strap pull message.

27.169 Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h

Support for non-SFDP capable flash devices is deprecated.
Hardware uses the data it loads from the flash device's SFDP tables. Hardware copies some SFDP data to the SFDP_VSCCn registers for the convenience of BIOS/FW, but does not directly use the data in those registers. Hardware locks the SFDP_VSCCn registers after copying SFDP data into them and setting the CPPTV bit.
Firmware requirements:
The QER bits are not used by the hardware. The QER bits are used by software/ firmware to ensure the QE bit is not changed while doing status register write. The QER field in SFDP_VSCC is only valid if the flash device contains a rev 1.5 or higher SFDP table. Firmware must use PTINX/PTDATA to read the Parameter Table Header to determine the SFDP revision.
If the SFDP revision is < 1.5 then firmware must use some other means to determine QER, e.g. the Flash Upper Map VSCC tables.
The fields in this register pertain to cycles targeting addresses within Component 0.
The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:2000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0. Note: If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0h RW/L	**Vendor Component Lock (VCL):** 0: The lock bit is not set. 1: The Vendor Component Lock bit is set. This register locks itself when set.
29	0h RW/V/L	**64k Erase Valid (EO_64k_VALID):** 0: The EO_64k opcode is not valid. 1: The EO_64k opcode is valid.
28	0h RW/V/L	**4k Erase Valid (EO_4k_VALID):** 0: The EO_4k opcode is not valid. 1: The EO_4k opcode is valid.
27	0h RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0: The device does not support RPMC. 1: The device supports RPMC.
26	0h RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):** 0: The device does not support Deep Powerdown. 1: The device supports Deep Powerdown.
25	0h RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 1: The device does not support Suspend/Resume. 0: The device supports Suspend/Resume.
24	0h RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0: The device does not support Soft Reset. 1: The device supports Soft Reset.
23:16	0h RW/V/L	**64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 0. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
15:8	20h RW/V/L	**4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 0. Software must program this register if the SFDP table for this component does not show 4 kByte erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RW/V/L	**Quad Enable Requirements (QER):** This field is defined by the JEDEC JESD216A standard for SFDP, reference 2. Information is copied here for reference. The JEDEC standard shall take precedence in the event of a discrepancy. This field describes whether the device contains a Quad Enable (QE) bit used to enable 1-1-4 and 1-4-4 quad read or quad program operations. If QE exists, this field also identifies the bit location and method to set/clear the bit. In this specification, status register 1 refers to the first data byte transferred on a Read Status (05h) or Write Status (01h) command. Status register 2 refers to the byte read using instruction 35h. Status register 2 is the second byte transferred in a Write Status (01h) command. Bits are numbered from 7 to 0, where bit 7 is transferred first on the wire. Note: Industry naming and definitions of these status registers may differ. The user will typically perform a read-modify-write sequence of operations to maintain the state of all other writable status register bits. For example read both status registers, set/clear QE, Write Status with both data bytes. 000b: Device does not have a QE bit. Device detects 1-1-4 and 1-4-4 reads based on instruction. DQ3/HOLD# functions as hold during instruction phase. 001b: QE is bit 1 of status register 2. It is set via Write Status with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. Writing only one byte to the status register has the side-effect of clearing status register 2, including the QE bit. The 100b code is used if writing one byte to the status register does not modify status register 2. 010b: QE is bit 6 of status register 1. It is set via Write Status with one data byte where bit 6 is one. It is cleared via Write Status with one data byte where bit 6 is zero. 011b: QE is bit 7 of status register 2. It is set via Write status register 2 instruction 3Eh with one data byte where bit 7 is one. It is cleared via Write status register 2 instruction 3Eh with one data byte where bit 7 is zero. The status register 2 is read using instruction 3Fh. 100b: QE is bit 1 of status register 2. It is set via Write Status with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. In contrast to the 001b code, writing one byte to the status register does not modify status register 2. 101b: QE is bit 1 of the status register 2. Status register 1 is read using Read Status instruction 05h. Status register 2 is read using instruction 35h. QE is set via Write Status instruction 01h with two data bytes where bit 1 of the second byte is one. It is cleared via Write Status with two data bytes where bit 1 of the second byte is zero. Other: Reserved. This register is locked by the Vendor Component Lock (VCL) bit. The flash controller hardware does not use this field. NOTE: This field is only valid for SFDP revision 1.5 and above. Firmware must check the revision prior to acting on the contents of this register.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/V/L	**Write Enable on Write Status (WEWS):** 0: 50h is the opcode to enable a status register write. 1: 06h is the opcode to enable a status register write. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit and only issues 06h as a write enable. See the specification for a Lynxpoint generation SPI controller for a description of how this bit was previously used.
3	0h RW/V/L	**Write Status Required (WSR):** 0: No requirement to write to the Write Status Register prior to a write. 1: A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit and behaves as if WSR=0. Flash devices that contain a 1 in this field are no longer supported by the flash controller. See the specification for a Lynxpoint generation SPI controller for a description of how this bit was previously used.
2	0h RW/V/L	**Write Granularity (WG):** 0 : Reserved. 1 : 64 Byte. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. Note: Hardware ignores the state of this bit.
1:0	0h RW/L	**Reserved (RSVD):** Reserved.

27.170 Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h

The fields in this register pertain to cycles targeting addresses outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Software must program this register if the SFDP table for this component does not show 4 kByte erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
7:5	0h RW/V/L	**Quad Enable Requirements (QER):** See description in BIOS_SFDP0_VSCC0.QER field.
4	0h RW/V/L	**Write Enable on Write Status (WEWS):** See description in BIOS_SFDP0_VSCC0.WEWS field.
3	0h RW/V/L	**Write Status Required (WSR):** See description in BIOS_SFDP0_VSCC0.WSR field.
2	0h RW/V/L	**Write Granularity (WG):** See description in BIOS_SFDP0_VSCC0.WG field.
1:0	0h RW/L	**Reserved (RSVD_1):** Reserved.

27.171 Parameter Table Index (BIOS_PTINX)—Offset CCh

Observability control for Component Property Tables. Note: The PTINX and PTDATA registers do not have any meaning in slave-attach flash mode because the SPI controller does not perform SFDP discovery.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15:14	0h RW	**Supported Parameter Table (SPT):** Selects which supported parameter table to observe. 00: Component 0 Property Parameter Table. 01: Component 1 Property Parameter Table. 10 - 11: Reserved.
13:12	0h RW	**Header or Data (HORD):** Select parameter table header DW vs Data DW. 00: SFDP Header. 01: Parameter Table Header. 10: Data. 11: Reserved.
11:2	0h RW	**Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe. The returned data is undefined if the index is programmed to a value greater than the size of the header or table.
1:0	0h RO	**Reserved (RSVD_1):** Reserved.

27.172 Parameter Table Data (BIOS_PTDATA)—Offset D0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register. Note: The returned value of reserved fields in the SFDP header or table must be ignored by software. The flash controller may return either 0 or 1 for these fields.

27.173 SPI Bus Requester Status (BIOS_SBRS)—Offset D4h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**TPM Access Ongoing (TPM_ACC_ONG)**
30	0h RO/V	**eSPI Access Ongoing (ESPI_ACC_ONG):** This bit is only defined if eSPI and SPI are sharing the SPI bus.
29	0h RO/V	**Touch access ongoing (TOUCH_ACC_ONG):** <product specific = [quote]BXT-P, CNP, KBP[/quote]>
28	0h RO/V	**CSME accessing the Huffman Decompression (CSME_ACC_HWD):** <product specific = [quote]CNP, KBP[/quote]>
27:18	0h RO	**Reserved (RSVD):** Reserved
17:15	0h RO/V	**Master 5 Status (M5STATUS):** See description under M1STATUS. Note: Master numbering was changed in a late revision of the Cspec, after this register was already implemented in RTL. Hence the master numbering in this register is not consecutive.
14:12	0h RO/V	**Master 6 Status (M6STATUS):** See description under M1STATUS.
11:9	0h RO/V	**Master 4 Status (M4STATUS):** See description under M1STATUS.
8:6	0h RO/V	**Master 3 Status (M3STATUS):** See description under M1STATUS.
5:3	0h RO/V	**Master 2 Status (M2STATUS):** See description under M1STATUS.
2:0	0h RO/V	**Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type. 0xx: No transaction. 100: Flash read transaction. 101: Flash write transaction. 110: Flash erase transaction. 111: Flash RPMC transaction.

27.174 Flash Region 12 (BIOS_FREG12)—Offset E0h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 12 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 12 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Base

27.175 Flash Region 13 (BIOS_FREG13)—Offset E4h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 13 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 13 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Base

27.176 Flash Region 14 (BIOS_FREG14)—Offset E8h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 14 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 14 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Base

27.177 Flash Region 15 (BIOS_FREG15)—Offset ECh

Access Method

Type:MEM Register
(Size: 32 bits)

Default:7FFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:16	0h RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 15 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Limit
15	0h RO	**Reserved (RSVD_1):** Reserved
14:0	7FFFh RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 15 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Base

27.178 RPMC SFDP Table (BIOS_RPMC0_D0)—Offset 108h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 0 Device 0 (RPMC0_D0)**

27.179 RPMC SFDP Table (BIOS_RPMC1_D0)—Offset 10Ch

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 1 Device 0 (RPMC1_D0)**

27.180 RPMC SFDP Table (BIOS_RPMC0_D1)—Offset 110h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 0 Device 1 (RPMC0_D1)**

27.181 RPMC SFDP Table (BIOS_RPMC1_D1)—Offset 114h

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RPMC SFDP Table dword 0 Device 1 (RPMC1_D1)**

27.182 BIOS Master Read Access Permissions (BIOS_BM_RAP)—Offset 118h

BM_RAP, BM_RAP registers are implemented in DNV, LBG and subsequent programs.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:C2h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	C2h RO/V	**BIOS Master Read Access Pemissions (BMRAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has read access to its own Region 1, 6 and 7 by default. Thus, the reset default of this field will be read as [quote]C2h[/quote].

27.183 BIOS Master Write Access Permissions (BIOS_BM_WAP)—Offset 11Ch

BM_RAP, BM_RAP registers are implemented in DNV, LBG and subsequent programs.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:42h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	42h RO/V	**BIOS Master Write Access Pemissions (BMWAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has write access to its own Region 1 and 6 by default. Thus, the reset default of this field will be read as [quote]42h[/quote].

27.184 CSXE Flash Protected Range 0 (BIOS_CSXE_PR0)—Offset 184h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.

27.185 CSXE Flash Protected Range 1 (BIOS_CSXE_PR1)—Offset 188h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.

27.186 CSXE Flash Protected Range 2 (BIOS_CSXE_PR2)—Offset 18Ch

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.

27.187 CSXE Flash Protected Range 3 (BIOS_CSXE_PR3)—Offset 190h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.

27.188 CSXE Flash Protected Range 4 (BIOS_CSXE_PR4)—Offset 194h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the CSxE Protected Range registers.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the CSXE Flash Program Registers, PR0-PR4, WPR0.

27.189 Write Protected Range 0 (BIOS_CSXE_WPR0)—Offset 198h

This is not a physical register in the Host memory space. This address provides the Host with a read-only view of the values stored in the CSXE Write Protected Range register.

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0h RO/V	**Blocked Range Limit (BRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0h RO	**Reserved (RSVD):** Reserved.
14:0	0h RO/V	**Blocked Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

27.190 IE Flash Protected Range 0 (BIOS_IE_PR0)—Offset 1B0h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the IE Protected Range registers. <product specific = [quote]DNV, LBG[/quote]>

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.

27.191 IE Flash Protected Range 1 (BIOS_IE_PR1)—Offset 1B4h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the IE Protected Range registers. <product specific = [quote]DNV, LBG[/quote]>

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.

27.192 IE Flash Protected Range 2 (BIOS_IE_PR2)—Offset 1B8h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the IE Protected Range registers. <product specific = [quote]DNV, LBG[/quote]>

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.

27.193 IE Flash Protected Range 3 (BIOS_IE_PR3)—Offset 1BCh

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the IE Protected Range registers. <product specific = [quote]DNV, LBG[/quote]>

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.

27.194 IE Flash Protected Range 4 (BIOS_IE_PR4)—Offset 1C0h

These are not physical registers in the Host memory space. These addresses provide the host with a read-only view of the values stored in the IE Protected Range registers.
<product specific = [quote]DNV, LBG[/quote]>

Access Method

Type:MEM Register
(Size: 32 bits)

Default:0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**Write Protection Enable (WPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
30:16	0h RO/V	**Protected Range Limit (PRL):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
15	0h RO/V	**Read Protection Enable (RPE):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.
14:0	0h RO/V	**Protected Range Base (PRB):** See description in the IE Flash Program Registers, PR0-PR4, WPR0.

27.195 eSPI Controller HW Status 1 (ESPI_HW_STS_2)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	0h RO/V	**EC Flash Rx Payload Size in Bytes (EC_FLASH_RX_PAYLOAD_SIZE):** The length specified in this field determines which bytes in the ESPI_EC_FLASH_RX_DATA_,0...15> registers contain valid received packet data. Set upon the completion of a EC Flash Rx packet transacation on eSPI bus; cleared when CSME FW clears the ESPI_MSI_STS.EC_FLASH_Avail bit.
15:12	0h RO	**Reserved (RSVD_1)**

Bit Range	Default & Access	Field Name (ID): Description
11:8	0h RO/V	**EC FLash Rx Tag (EC_FLASH_RX_TAG):** Tag value from the header in the eSPI Flash Rx packet. Tag may be used to track request-response handshakes by FW. It is not inspected or used by eSPI-MC.
7:6	0h RO	**Reserved (RSVD_2)**
5:4	0h RO/V	**EC Flash Rx Cmd (EC_FLASH_RX_CMD):** Command value form the header in the eSPI Flash Rx packet.
3:1	0h RO/V	**EC Flash Rx Status (EC_FLASH_RX_STATUS):** Set upon completion of a Flash Rx packet transaction on eSPI bus; cleared when CSME FW clears the ESPI_MSI_STS.EC_FLASH_REQ_Avail bit. This field is not set when an eSPI-MC HW serviced message is received from the Slave. Note that the ESPI_EC_FLASH_DATA[0..N] bytes are valid only if the EC_FLASH_Rx_Status is OK or Slave_Non_Fatal_Error. 3b000: Status not valid 3b001: Link Fatal Error Type 1 3b001: Reserved 3b010: Reserved 3b011: Malformed Slave Response Payload; Payload length > Max Payload Size or Read request size > Max Read Request Size [Fatal Error Type 2] 3b100: Slave Response Non_Fatal_Error 3b101 3b110: Reserved 3b111: OK
0	0h RO/V	**EC_FLASH Rx In Progress (EC_FLASH_RX_IN_PROGRESS):** Set when EC Flash Rx (Slave to eSPI/CSME) packet has grant on eSPI Bus bus, cleared when Rx packet is buffered in eSPI-MC and grant on eSPI bus is removed

27.196 (EC_FLASH_WR_DATA_0)—Offset 1A0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_0:** EC Flash write data recieved from the EC, with length (in bytes) specified in ESPI_HW_STS.OOB_SMBus_Rx_Payload_Size. When the data is valid, eSPI-MC asserts the Rx Avail MSI to CSME. Note: Data in these registers are invalid when the ESPI_HW_STS_0.OOB_Rx_in_Progress bit is set or when the ESPI_HW_STS_0.OOB_SMBus_Rx_Status field indicates an invalid/ error state

27.197 (EC_FLASH_WR_DATA_1)—Offset 1A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_1:** same as register EC FLASH WR DATA 0

27.198 (EC_FLASH_WR_DATA_2)—Offset 1A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_2:** same as register EC FLASH WR DATA 0

27.199 (EC_FLASH_WR_DATA_3)—Offset 1ACh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_3:** same as register EC FLASH WR DATA 0

27.200 (EC_FLASH_WR_DATA_4)—Offset 1B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_4:** same as register EC FLASH WR DATA 0

27.201 (EC_FLASH_WR_DATA_5)—Offset 1B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_5:** same as register EC FLASH WR DATA 0

27.202 (EC_FLASH_WR_DATA_6)—Offset 1B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_6:** same as register EC FLASH WR DATA 0

27.203 (EC_FLASH_WR_DATA_7)—Offset 1BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_7:** same as register EC FLASH WR DATA 0

27.204 (EC_FLASH_WR_DATA_8)—Offset 1C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_8:** same as register EC FLASH WR DATA 0

27.205 (EC_FLASH_WR_DATA_9)—Offset 1C4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_9:** same as register EC FLASH WR DATA 0

27.206 (EC_FLASH_WR_DATA_10)—Offset 1C8h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_10:** same as register EC FLASH WR DATA 0

27.207 (EC_FLASH_WR_DATA_11)—Offset 1CCh

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_11:** same as register EC FLASH WR DATA 0

27.208 (EC_FLASH_WR_DATA_12)—Offset 1D0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_12:** same as register EC FLASH WR DATA 0

27.209 (EC_FLASH_WR_DATA_13)—Offset 1D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_13:** same as register EC FLASH WR DATA 0

27.210 (EC_FLASH_WR_DATA_14)—Offset 1D8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_14:** same as register EC FLASH WR DATA 0

27.211 (EC_FLASH_WR_DATA_15)—Offset 1DCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_WR_DATA_15:** same as register EC FLASH WR DATA 0

27.212 (EC_FLASH_REQ_ADDR)—Offset 1E0h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**EC_FLASH_REQ_ADDR:** same as register EC FLASH WR DATA 0

27.213 (EC_FLASH_CPL_CTL)—Offset 1E4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**EC Flash CPL Done (EC_FLASH_CPL_DONE):** Set by CSME; cleared by eSPI-MC. CSME sets this bit after it has loaded the EC_FLASH_RD_DATA_xx registers and set the EC_FLASH_STS register.
30:0	0h RO	**Reserved (RSVD)**

27.214 (EC_FLASH_CPL_STS)—Offset 1E8h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**EC Flash CPL Cycle Type (EC_FLASH_CPL_CYC_TYP):** CSME stes this field after it has completed the flash acces before setting the EC_FLASH_CPL_DONE bit.

27.215 (EC_FLASH_RD_DATA_0)—Offset 200h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_0:** CSME to Slave. Flash read completion data loaded by CSME, with length (in bytes) specified in ESPI_HW_STS_2.EC_FLASH_REQ_Size.

27.216 (EC_FLASH_RD_DATA_1)—Offset 204h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_1:** same as register EC FLASH RD DATA 0

27.217 (EC_FLASH_RD_DATA_2)—Offset 208h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_2:** same as register EC FLASH RD DATA 0

27.218 (EC_FLASH_RD_DATA_3)—Offset 20Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_3:** same as register EC FLASH RD DATA 0

27.219 (EC_FLASH_RD_DATA_4)—Offset 210h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_4:** same as register EC FLASH RD DATA 0

27.220 (EC_FLASH_RD_DATA_5)—Offset 214h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_5:** same as register EC FLASH RD DATA 0

27.221 (EC_FLASH_RD_DATA_6)—Offset 218h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_6:** same as register EC FLASH RD DATA 0

27.222 (EC_FLASH_RD_DATA_7)—Offset 21Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_7:** same as register EC FLASH RD DATA 0

27.223 (EC_FLASH_RD_DATA_8)—Offset 220h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_8:** same as register EC FLASH RD DATA 0

27.224 (EC_FLASH_RD_DATA_9)—Offset 224h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_9:** same as register EC FLASH RD DATA 0

27.225 (EC_FLASH_RD_DATA_10)—Offset 228h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_10:** same as register EC FLASH RD DATA 0

27.226 (EC_FLASH_RD_DATA_11)—Offset 22Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_11:** same as register EC FLASH RD DATA 0

27.227 (EC_FLASH_RD_DATA_12)—Offset 230h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_12:** same as register EC FLASH RD DATA 0

27.228 (EC_FLASH_RD_DATA_13)—Offset 234h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_13:** same as register EC FLASH RD DATA 0

27.229 (EC_FLASH_RD_DATA_14)—Offset 238h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_14:** same as register EC FLASH RD DATA 0

27.230 (EC_FLASH_RD_DATA_15)—Offset 23Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EC_FLASH_RD_DATA_15:** same as register EC FLASH RD DATA 0

27.231 Device and Vendor ID (CSXE_ESPI_DID_VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 31978086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	3197h RO	**Device Identification (DID)**
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

27.232 Device Control (CSXE_ESPI_STS_CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 6100400h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0h RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0h RO	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is terminated with an Unsupported Request (UR) completion status (a.k.a. Master Abort). All master devices must implement this bit. eSPI does not initiate any upstream transactions to CSME system memory space.
28	0h RO	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is terminated with a Completer Abort (CA) completion status (a.k.a. Target Abort). All master devices must implement this bit. eSPI does not initiate any upstream transactions to CSME system memory space.
27	0h RO	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (CA) completion status (a.k.a.Target Abort). Devices that will never signal Target-Abort do not need to implement this bit. eSPI does not signal CA on any downstream Posted or Non-Posted transaction on the CSME root space.
26:25	3h RO	**Devsel Timing (DEVT)**
24	0h RO	**Master Data Parity Error (MDPE)**
23	0h RO	**Fast Back to Back Capable (FBTBC)**
22	0h RO	**Reserved (RSVD0)**
21	0h RO	**66 Mhz Capable (MCAP):** Not 66MHz Capable Device
20	1h RO	**Capablities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0h RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit.
18:11	0h RO	**Reserved (RSVD1)**

Bit Range	Default & Access	Field Name (ID): Description
10	1h RO	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0. Read-only and hardwired to 1 for a device that does NOT support pin-based interrupt.
9	0h RO	**Fast Back to Back Enable (FBTBEN)**
8	0h RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0h RO	**Reserved (RSVD)**
6	0h RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0h RO	**VGA Palette Snoop (VGAPS)**
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN)**
3	0h RO	**Special Cycles (SPCYC)**
2	0h RW	**Bus Master Enable (BME):** Controls a device's ability to act as a master on the bus. A value of 0 disables the device from generating traffic. A value of 1 allows the device to behave as a bus master. State after RST# is 0. **Note:** This bit must be set to 1b to enable eSPI-MC to generate upstream MSI (posted write over IOSF-P) to CSME (in addition to ESPI_MSI_MC_NP_CID.MSIE).
1	0h RW	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0. Typically, FW programs BAR while MSE is cleared and then enables MSE.
0	0h RO	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. Read-only and hardwired to 0 for a device that does NOT support I/O Space accesses.

27.233 Revision ID and Class Code (CSXE_ESPI_CC_RID)—Offset 8h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Base Class Code (BCC):** Base Class Code
23:16	0h RO	**Sub-Class Code (SCC):** Sub-Class Code
15:8	0h RO	**Programming Interface (PI):** Programming Interface
7:0	0h RO/V	**Revision ID (RID):** Revision ID

27.234 CSXE BAR0 MMIO (CSXE_ESPI_MBAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region
11:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 4KB of memory space
3	1h RO	**Prefetchable (PREFETCH):** Set to '1' to indicate there are no side-effects on reads
2:1	0h RO	**Type (TYP):** Set to '00' to allow mapping anywhere in 32-bit address space
0	0h RO	**Memory Space Indicator (MEMSPACE):** Set to 0 for Memory Space

27.235 Capabilities List Pointer (CSXE_ESPI_CAPP)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 44h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	44h RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list

27.236 MSI Message Control, Next Pointer and Capability ID (CSXE_ESPI_MSIMC_MSINP_MSICID)—Offset 44h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 5005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD)**
24	0h RO	**Per Vector Masking Capable (PVMC):** This function does not support MSI per vector masking
23	0h RO	**64 bit address capable (XAC):** This function is not capable of sending 64 bit message address
22:20	0h RO	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. Value of zero indicates one vector.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors supported. Value of zero indicates one vector.
16	0h RW	**MSI Enable (MSIE):** If set (1) CXME MSI interrupt delivery is enabled. When this bit is cleared, prior to returning the configuration write completion, the device must send any pending MSI(s).
15:8	50h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list.
7:0	5h RO	**Capability ID (CAPID):** Hardwired to 05h to indicate the linked list item as being the MSI Capability registers

27.237 MSI Message Address (CSXE_ESPI_MSIMA)—Offset 48h

MSI format is DW memory write in CSME root space with 32-bit addressing, 16 bit of data (upper word of data is zeros). The FW will only know the source (based on the FW programmed data field or vector) and it will need to read the cause/status register in device to get reason for MSI. FW clears after reading it.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MADDR):** DW aligned MSI message address.
1:0	0h RO	**Reserved (RSVD)**

27.238 MSI Message Data (CSXE_ESPI_MSIMD)—Offset 4Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:0	0h RW	**Message Data (MDAT):** MSI Message Data

27.239 PCI Power Management Capability (CSXE_ESPI_PMCAP_PMNP_PMCID)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 40030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	8h RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1 bit(13) X X1XXb - PME# can be asserted from D2 bit(14) X 1XXXb - PME# can be asserted from D3hot bit(15) 1 XXXXb - PME# can be asserted from D3cold
26	0h RO	**D2 Support (D2S):** This device does not support D2
25	0h RO	**D1 Support (D1S):** This device does not support D1

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RO	**Aux Current (AUXC):** Not Applicable
21	0h RO	**Device Specific Initialization (DSI):** Indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 0 to indicate NO Device Specific Initialization is required.
20	0h RO	**Reserved (RSVD)**
19	0h RO	**PME Clock (PMECLK):** Not Applicable
18:16	3h RO	**Version (VER):** Value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	1h RO	**Capability ID (CAPP):** Hardwired to 01h to indicate the linked list item as being the PCI Power Management registers

27.240 PCI Power Management Control and Status (CSXE_ESPI_PMD_PMCSRBSE_PMCSR)—Offset 54h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DATA):** Not implemented. Hardwired to 0.
23:16	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V/P	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded
14:13	0h RO	**Data Scale (DS):** Not Applicable
12:9	0h RO	**Data Select (DSEL):** Not Applicable
8	0h RW	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD1)**
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	**Reserved (RSVD2)**
1:0	0h RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below. 00b - D0 01b - D1 10b - D2 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

27.241 eSPI MSI cause (CSXE_ESPI_MSI_STS)—Offset 0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (RSVD)**
5	0h RO/V	**EC Flash Load Done (EC_FLASH_LOAD_DONE):** This bit is set when a SLAVE_LOAD_DONE_VW is received from slave 0. This is an indication of: a. SPI controller has completed the strap pull, and b. eSPI-MC has enabled and configured the VW, OOB channel, and flash channel in MAF mode c. EC has completed loading its firmware
4	0h RW/1C/V	**EC Flash Request Avail (EC_FLASH_REQ_AVAIL):** This bit is set when a new EC Master Atttached Flash packet is received. ESPI_HW_STS_2 and ESPI_EC_FLASH_WR_DATA <0...1> registers contain the related flash packet data. The eSPI-MC will not accept any new OOB packets from the Slave until this bit is cleared when ESPI_MSI_EN.OOB_FW_STATE bit is 2'1X. The MSI generation is gated by the ESPI_MSI_EN.EC_FLASH_REQ_AVAIL_EN bit.
3	0h RW/1C/V	**OOB IOSF Unsupported Request (OOB_IOSF_URD):** Set to 1 by hardware upon detecting an Unsupported Request (UR) for a Posted Transaction on IOSF-P CSME Root Space that is not considered an Advisory Non-Fatal error. This MSI status is for notification only; it does not impact the Rx, Tx or processing of any HW serviced OOB packets. The MSI generation is gated by teh ESPI_MSI_EN.OOB_IOSF_URRE bit. Software must write a '1' in order to clear the state of this bit.
2	0h RW/1C/V	**OOB Hardware Serviced Packet Error (OOB_HWSVC_ERR):** This bit is set when an error is detected on the Rx/Tx of an OOB HW serviced packet. CSME FW can inspect and clear the appropriate ESPI_OOB_CTL_STS.OOB_HWSVC_*_ERROR_* register and take appropriate action, if necessary. This MSI is for notification only; it does not impact the Rx, Tx or processing of any HW serviced OOB packets. The MSI generation is gated by the ESPI_MSI_EN.OOB_HWSVC_Error_En bit.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW/1C/V	**OOB SMBus Sent (OOB_SMBUS_SENT):** This bit is set when a CSME-to-EC OOB packet has been transmitted to the EC on the eSPI bus. ESPI_HW_STS_0 contains related transmit status. eSPI-MC will not start transmit of the next CSME-to-EC OOB packet until this bit is cleared when ESPI_MSI_EN.OOB_FW_STATE bit is 2'1X. This bit is not set when a eSPI-MC HW serviced OOB messages to the slave. This bit does not gate any eSPI-MC HW serviced OOB messages to the slave. The MSI generation is gated by the ESPI_MSI_EN.OOB_SMBus_Sent_En bit.
0	0h RW/1C/V	**OOB SMBus Available (OOB_SMBUS_AVAIL):** This bit is set when a new EC-to-CSME OOB packet is received. ESPI_HW_STS_1 and ESPI_OOB_SMBUS_RX_DATA_<0..18> registers contain the related packet data. The eSPI-MC will not accept any new OOB packets (CSME or eSPI-MC HW serviced) from the slave until this bit is cleared when ESPI_MSI_EN.OOB_FW_STATE bit is 2'1X. This bit is not set when an eSPI-MC HW serviced OOB message is received from the slave. The MSI generation is gated by the ESPI_MSI_EN.OOB_SMBus_Avail_En bit.

27.242 eSPI MSI Enables (CSXE_ESPI_MSI_EN)—Offset 4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**OOB FW State (OOB_FW_STATE):** 00 - CSME FW is not ready. PME is disabled and all MSIs are masked. (CSME is in reset). 01 - CSME FW is supsended, PME is enabled and all MSIs are masked. (CSME is powergated). 10 - CSME FW is ready, PME is disabled, and all MSIs are masked. (CSME Active: Interrupt-Service / No-MSI Mode) 11 - CSME FW is ready, PME is disabled, and MSIs are unmasked. (CSME active).
29:5	0h RO	**Reserved (RSVD)**
4	0h RW	**EC Flash REQ Avail MSI Enable (EC_FLASH_REQ_AVAIL_MSI_EN):** MSI enable for the ESPI_MSI_STS.EC_FLASH_REQ_AVAIL status. Note: Depending on the setting of ESPI_OOB_CTL_STS.OOB_FW_STATE field, a MSI or a PME to the CSME may be generated when this bit is set

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**OOB IOSF URRE MSI Enable (OOB_IOSF_URRE_MSI_EN):** If set to 1 by software, it allows reporting of an Unsupported Request (UR) for a Posted transaction on IOSF-P CSME Root Space as a MSI. When such a transaction is detected, OOB_IOSF_URD bit is set and a MSI is sent to the CSME
2	0h RW	**OOB Hardware Serviced Packet Error MSI Enable (OOB_HWSVC_ERR_MSI_EN):** Enable for the OOB_HWSVC_ERR MSI.
1	0h RW	**OOB SM Bus Sent Enable Bit (OOB_SMBUS_SENT_EN):** MSI enable for the ESPI_MSI_STS.OOB_SMBus_Sent status. Refer to Note for bit [0] for additional details. Enable for the OOB_SMBus_Sent MSI. Note: eSPI-MC will not start transmit of the next OOB CSME-to-EC packet until this bit is set.
0	0h RW	**OOB SM Bus Available Enable Bit (OOB_SMBUS_AVAIL_EN):** MSI enable for the ESPI_MSI_STS.OOB_SMBus_Avail status. Note: Depending on the setting of ESPI_OOB_CTL_STS.OOB_FW_STATE field, a MSI or a PME to the CSME may be generated when this bit is set. Enable for the OOB_SMBus_Avail MSI. Note: eSPI-MC will not accept any new OOB packets until this bit is set when OOB_FW_Rdy is asserted

27.243 eSPI Controller HW Status 0 (CSXE_ESPI_HW_STS_0)—Offset 10h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD)**
3:1	0h RO/V	**OOB SMBus Tx Status Bits (OOB_SMBUS_TX_STATUS):** Set upon completion of an OOB SMBus Tx packet transaction on eSPI bus,cleared when CSME FW clears the ESPI_MSI_STS.OOB_SMBus_Sent bit. 3'b000: Status not valid 3'b001: Fatal Error Type 1 3'b010 - 3'b011 : Reserved 3'b100: Slave Response Non_Fatal_Error 3'b101 3'b110: Reserved 3'b111: OK
0	0h RO/V	**OOB SMBus Tx In Progress (OOB_SMBUS_TX_IN_PROGRESS):** Set when OOB SMBus Tx CSME to Slave packet has grant on eSPI bus; cleared when Tx packet is sent and grant on eSPI bus is removed

27.244 eSPI Controller HW Status 1 (CSXE_ESPI_HW_STS_1)—Offset 14h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	0h RO/V	**OOB SMBus Recieved payload size in Bytes (OOB_SMBUS_RX_PAYLOAD_SIZE):** Set upon completion of a OOB SMBus Rx packet transaction on eSPI bus, cleared when CSME FW clears the ESPI_MSI_STS.OOB_SMBus_Avail bit. This field is not set when an eSPI-MC HW serviced message is received from the Slave.
15:12	0h RO	**Reserved (RSVD_1)**
11:8	0h RO/V	**OOB SMBus Rx Tag (OOB_SMBUS_RX_TAG):** Tag value from the header in the eSPI OOB Rx packet. Tag can be potentially used to track request-response handshakes. It is not inspected or used by eSPI-MC.
7:6	0h RO	**Reserved (RSVD_2)**
5:4	0h RO/V	**OOB SMBus Recieve Slave ID (OOB_SMBUS_RX_SLVID):** Set upon completion of an OOB SMBus Rx packet transaction on eSPI bus; cleared when CSME FW clears the ESPI_MSI_STS.OOB_SMBus_Avail bit. This field is not set when an eSPI-MC HW serviced message is received from the Slave. 2'b00: OOB SMBus packet received from eSPI Slave 0 2'b01: OOB SMBus packet received from eSPI Slave 1 (Note: *Only* supported when a when a second eSPI Slave device is present) 2b10: Reserved 2b11: Reserved
3:1	0h RO/V	**OOB SMBus Recieve Status (OOB_SMBUS_RX_STATUS):** Set upon completion of an OOB SMBus Rx packet transaction on eSPI bus; cleared when CSME FW clears the ESPI_MSI_STS.OOB_SMBus_Avail bit. This field is not set when an eSPI-MC HW serviced message is received from the Slave. Note that the ESPI_RX_DATA[0..N] bytes are valid only if the OOB_SMBus_Rx_Status is OK or Slave_Non_Fatal_Error. 3b000: Status not valid 3b001: Fatal Error Type 1 3b010: Reserved 3b011: Rx_Invalid_Size (payload exceeds OOB_MPS) 3b100: Slave Response Non_Fatal_Error 3b101 3b110: Reserved 3b111: OK

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**OOB Rx In Progress (OOB_RX_IN_PROGRESS):** Set when OOB Rx (Slave to eSPI/CSME) packet has grant on eSPI Bus bus, cleared when Rx packet is buffered in eSPI-MC and grant on eSPI bus is removed

27.245 eSPI OOB Channel Controller and Status 0 (CSXE_ESPI_OOB_CTL_STS_0)—Offset 1Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15	0h RW/O	**Slave OOB Reset Ack Override (SLV1_OOB_RST_ACK_OVRD):** This bit has no impact since eSPI-MC does not support OOB_Reset_Ack VW for Slave 1.
14	0h RW/1C/V	**OOB SMBus Packet Dropped (SLV1_OOB_SMBUS_PKT_DROPPED):** 1 indicates that the eSPI-MC received one or more OOB messages from the Slave addressed to CSME FW prior to the CSME FW being ready or if the eSPI CSME function is in D3Hot set and the ESPI_PME_EN bit is cleared. This bit is sticky and CSMW FW can clear it by writing a 1 to it.
13	0h RO/V	**Slave Status OOB Avail (SLV1_STS_OOB_AVAIL):** Reflects the most recent state of the OOB_AVAIL bit in the Slave STATUS register. A 1 in this bit indicates that the Slave has a OOB message (either CSME FW or HW serviced) available to send to the master.
12	0h RO/V	**Slave Status OOB Free (SLV1_STS_OOB_FREE):** Reflects the most recent state of the OOB_FREE bit in the Slave STATUS register. A 1 in this bit indicates that the Slave has buffer space available to receive the next OOB packet from the eSPI Master (PCH).
11:9	0h RO/V	**OOB Max Packet Size (SLV1_OOB_MPS):** The negotiated Maximum Payload Size for the OOB channel supported by the eSPI-MC and Slave. Note that this size refers to the data payload itself and excludes the additional SMBus header/PEC bytes. The encodings are the same as in the eSPI Specification OOB Channel Slave Configuration Register.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO/V	**OOB Channel Supported (SLV1_OOB_CH_SUPPORTED):** Reflects whether the Slave supports the OOB Channel. If this is set to zero, it implies that the platform does not support any CSME EC communication in an eSPI enabled platform. Note: The SLV1_* bits in this register are *only* supported when a when a second eSPI Slave device is present
7	0h RW/O	**Slave OOB Reset Ack Override (SLV0_OOB_RST_ACK_OVRD):** A 1 in this bit will cause the eSPI-MC to not wait for the Slave OOB_RESET_ACK Virtual Wire before (immediately) asserting the ResetPrepAck (CSXE space, GenPrep). The OOB_Reset_Warn VW will be transmitted to the Slave independent of the setting for this bit. This is a Write Once bit and cleared only by a eSPI_RESET# assertion.
6	0h RW/1C/V	**OOB SMBus Packet Dropped (SLV0_OOB_SMBUS_PKT_DROPPED):** 1 indicates that the eSPI-MC received one or more OOB messages from the Slave addressed to CSME FW prior to the CSME FW being ready or if the eSPI CSME function is in D3Hot set and the ESPI_PME_EN bit is cleared. This bit is sticky and CSMW FW can clear it by writing a 1 to it.
5	0h RO/V	**Slave Status OOB Avail (SLV0_STS_OOB_AVAIL):** Reflects the most recent state of the OOB_AVAIL bit in the Slave STATUS register. A 1 in this bit indicates that the Slave has a OOB message (either CSME FW or HW serviced) available to send to the master.
4	0h RO/V	**Slave Status OOB Free (SLV0_STS_OOB_FREE):** Reflects the most recent state of the OOB_FREE bit in the Slave STATUS register. A 1 in this bit indicates that the Slave has buffer space available to receive the next OOB packet from the eSPI Master (PCH).
3:1	0h RO/V	**OOB Max Packet Size (SLV0_OOB_MPS):** The negotiated Maximum Payload Size for the OOB channel supported by the eSPI-MC and Slave. Note that this size refers to the data payload itself and excludes the additional SMBus header/PEC bytes. The encodings are the same as in the eSPI Specification OOB Channel Slave Configuration Register.
0	0h RO/V	**OOB Channel Supported (SLV0_OOB_CH_SUPPORTED):** Reflects whether the Slave supports the OOB Channel. If this is set to zero, it implies that the platform does not support any CSME EC communication in an eSPI enabled platform. Note: This bit reflects the RDY bit of the Slave's OOB Configuration register.

27.246 eSPI OOB Channel Controller and Status 1 (CSXE_ESPI_OOB_CTL_STS_1)—Offset 20h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD)**
13:12	0h RO/V	**OOB Hardware Serviced Packet Tx Error Slave ID (OOB_HWSVC_TX_ERROR_SLVID):** Set upon the unsuccessful transmit of a non-CSME OOB message to the Slave. This field is valid only if the OOB_HWSVC_TX_ERROR_STATUS bit is set. 2'b00: Error on HWSVC packet transmitted to eSPI Slave 0 2'b01: Error on HWSVC packet transmitted to eSPI Slave 1 (Note: *Only* supported when a when a second eSPI Slave device is present) 2b10: Reserved 2b11: Reserved
11:9	0h RO/V	**OOB Hardware Serviced Packet Tx Error Cause (OOB_HWSVC_TX_ERROR_CAUSE):** Set upon the unsuccessful transmit of a non-CSME OOB message to the Slave. This field is valid only if the OOB_HWSVC_TX_ERROR_STATUS bit is set. Note: A Link Fatal Error Type 1 on any PUT_OOB command is reported in ESPI_HW_STS_1.OOB_SMBus_Tx_Status. 3'b000: Status not valid. 3'b001: Link Fatal Error Type 1 3'b010 - 3'b011: Reserved 3'b100: Slave Response Code: Non_Fatal_Error 3'b101 - 3'b111: Reserved
8	0h RO/V	**OOB Hardware Serviced Packet Tx Error Status (OOB_HWSVC_TX_ERROR_STATUS):** 1 indicates that the eSPI-MC detected errors on one or more HW serviced OOB messages to the Slave. Refer to Note for bit [0] for additional details.
7:6	0h RO	**Reserved (RSVD_2)**
5:4	0h RO/V	**OOB Hardware Serviced Packet Rx Error Slave ID (OOB_HWSVC_RX_ERROR_SLVID):** Set upon the unsuccessful receipt of a non-CSME OOB message from the slave. This field is valid only if the OOB_HWSVC_RX_ERROR_STATUS bit is set. 2'b00: Error on HWSVC packet received from eSPI Slave 0 2'b01: Error on HWSVC packet received from eSPI Slave 1 (Note: *Only* supported when a when a second eSPI Slave device is present) 2b10: Reserved 2b11: Reserved

Bit Range	Default & Access	Field Name (ID): Description
3:1	0h RO/V	**OOB Hardware Serviced Packet Rx Error Cause (OOB_HWSVC_RX_ERROR_CAUSE):** Set upon the unsuccessful receive of a non-CSME OOB message from the Slave. This field is valid only if the OOB_HWSVC_RX_ERROR_STATUS bit is set. 3'b000: Status not valid. 3'b001: Malformed Slave Response Payload: Invalid Slave Destination Address for a non-CSME message [Fatal Error Type 2]. 3'b010: Malformed Slave Response Payload: Invalid Command Code for a non-CSME message [Fatal Error Type 2]. 3'b011: Malformed Slave Response Payload: Payload length > Max Payload Size for HW serviced message Command Code [Fatal Error Type 2] 3'b100: Slave Response Code: Non_Fatal_Error 3'b101: Reserved 3'b110: Reserved 3'b111: Reserved
0	0h RO/V	**OOB Hardware Serviced Packet Rx Error Status (OOB_HWSVC_RX_ERROR_STATUS):** A 1 indicates that the eSPI-MC received one or more OOB messages with invalid payload from the Slave addressed to a non-CSME target. This bit is sticky and CSMW FW can clear it by writing a 1 to it. It does not cause a MSI to be generated to the CSME and does not affect the operation of the OOB channel. Note: When this bit is set, the ESPI_MSI_STS.OOB_HWSVC_Error bit is also set and a MSI/PME is generated depending on the state of the ESPI_MSI_EN.OOB_FW_STATE field. This bit is cleared when FW clears the ESPI_MSI_STS.OOB_HWSVC_Error bit. This state of this bit does not affect the servicing of subsequent OOB packets.

27.247 OOB SMBus Tx Control (CSXE_ESPI_OOB_SMBUS_TX_CTL)—Offset 2Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**OOB SMBus Tx Go (OOB_SMBUS_TX_GO):** Set by CSME; cleared by eSPI-MC upon OOB SMBus Tx packet transmission to the Slave being completed on the eSPI Bus, which can only happen after Slave had indicated OOB_FREE status. CSME sets this bit after it has loaded the ESPI_SMBUS_TX_DATA_xx registers and set the OOB_SMBus_Tx_Payload_Size in this register. eSPI-MC will set the ESPI_MSI_STS.OOB_SMBus_Sent bit (if ESPI_MSI_EN.OOB_SMBus_Sent_En bit is set) when the Slave has received the packet. Note: If ESPI_MSI_EN. OOB_SMBus_Sent_En bit is set then ESPI_MSI_STS.OOB_ SMBus_Sent bit must be cleared in order for this bit to take effect
30	0h RW/1S/V	**OOB SMBus Tx Abort (OOB_SMBUS_TX_ABORT):** Set by CSME; cleared by eSPI-MC upon invalidating a pending OOB SMBus Tx packet. This bit has no impact if the pending OOB SMBus Tx packet has already been arbitrated on to the eSPI bus. Writing a 1 to this bit also clears the OOB_SMBus_Tx_Go bit.
29:16	0h RO	**Reserved (RSVD_1)**
15:12	0h RW	**OOB SMBus Tx Tag (OOB_SMBUS_TX_TAG):** Tag value for the header in the eSPI OOB Tx packet. Tag can be potentially used to track request-response handshakes. It is not inspected or used by eSPI-MC.
11:10	0h RO	**Reserved (RSVD_0)**
9:8	0h RW	**OOB SMBus Transmit Slave ID (OOB_SMBUS_TX_SLVID):** This field specifies the eSPI Slave device that is the target of the OOB SMBus Tx packet. 2'b00: eSPI Slave 0 is the target of OOB SMBus Tx packet 2'b01: eSPI Slave 1 is the target of OOB SMBus Tx packet (Note: *Only* supported when a when a second eSPI Slave device is present) 2b10: Reserved 2b11: Reserved
7:0	0h RW	**OOB SMBus Tx Payload Size (OOB_SMBUS_TX_PAYLOAD_SIZE):** Payload size in bites

27.248 (CSXE_ESPI_OOB_SMBUS_TX_DATA_0)—Offset 30h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**OOB_SMBUS_TX_DATA_0:** CSME to Slave SMBusTx packet loaded by CSME, with length (in bytes) specified in ESPI_OOB_SMBus_TX_CTL.OOB_SMBus_Tx_Payload_Size. eSPIMC transmits these bytes to the EC upon a subsequent write to ESPI_OOB_TX_CTL register. Note: These registers should not be written to as long as the ESPI_OOB_TX_CTL.OOB_Tx_Go bit is asserted (it is set by CSME and cleared by eSPI-MC,otherwise it will result in undefined behavior

27.249 (CSXE_ESPI_OOB_SMBUS_TX_DATA_1)—Offset 34h

27.275 (CSXE_ESPI_OOB_SMBUS_RX_DATA_8)—Offset 170h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_8**

27.276 (CSXE_ESPI_OOB_SMBUS_RX_DATA_9)—Offset 174h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_9**

27.277 (CSXE_ESPI_OOB_SMBUS_RX_DATA_10)—Offset 178h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_10**

27.278 (CSXE_ESPI_OOB_SMBUS_RX_DATA_11)—Offset 17Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_11**

27.279 (CSXE_ESPI_OOB_SMBUS_RX_DATA_12)—Offset 180h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_12**

27.280 (CSXE_ESPI_OOB_SMBUS_RX_DATA_13)—Offset 184h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_13**

27.281 (CSXE_ESPI_OOB_SMBUS_RX_DATA_14)—Offset 188h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_14**

27.282 (CSXE_ESPI_OOB_SMBUS_RX_DATA_15)—Offset 18Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_15**

27.283 (CSXE_ESPI_OOB_SMBUS_RX_DATA_16)—Offset 190h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_16**

27.284 (CSXE_ESPI_OOB_SMBUS_RX_DATA_17)—Offset 194h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_17**

27.285 (CSXE_ESPI_OOB_SMBUS_RX_DATA_18)—Offset 198h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**OOB_SMBUS_RX_DATA_18**

§ §

28 CNVi Registers

This chapter documents the registers in Bus: 0, Device 12, Function 0.

28.1 CNVI_WIFI_VEN_DEV_ID — Offset 0h

identifies the manufacturer of the device(vendor) and type.(Offset 000 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEV_ID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VEN_ID:** vendor ID

28.2 CNVI_WIFI_PCI_COM_STAT — Offset 4h

command and status register .(Offset 004 h) HARDWIRED --]] HARDWIRED

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**DET_PAR_ERR:** Detected Parity Error
30	0h RW/1C	**SIG_SYS_ERR:** Signaled System Error
29	0h RW/1C	**REC_MAS_ABRT:** Received Master Abort
28	0h RW/1C	**REC_TAR_ABRT:** Received Target Abort
27	0h RW/1C	**SIG_TAR_ABRT:** Signaled Target Abort
26:25	0h RO	**DEVSEL_TIMING:** DEVSEL Timing, does not apply to PCI Express HARDWIRED
24	0h RW/1C	**MAS_DATA_PAR_ER:** Master Data Parity Error
23	0h RO	**FAST_BTB_TCAP:** Fast Back-to-Back Transaction Capable, does not apply to PCI Express HARDWIRED

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**OLF_FREQ_CAP:** 66 MHz Capable, does not apply to PCI Express HARDWIRED
20	1h RO	**CAP_LST:** Capability List, must be set to 1
19	0h RO	**INTRPT_STS:** Interrupt status, reflects the state of the interrupt in the device
18:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**INTRPT_DIS:** Interrupt Disable, controls the ability of the device to generate legacy interrupt messages
9	0h RO	**FAST_BTB_TNSCEN:** Fast Back-to-Back Transaction Enable, does not apply to PCI Express HARDWIRED
8	0h RW	**SERR_EN:** SERR Enable, when set 1, the device can drive the SERR# line
7	0h RO	**IDSEL_STEP_W_CY:** IDSEL Stepping/Wait Cycle Control, does not apply to PCI Express HARDWIRED
6	0h RW	**PAR_ERR:** Parity Error Enable
5	0h RO	**VGA_PALT_SNOOP:** VGA Palette Snoop, does not apply to PCI Express HARDWIRED
4	0h RO	**MEM_WR_INVALD:** Memory Write and Invalidate, does not apply to PCI Express HARDWIRED
3	0h RO	**SPEC_CYC_ENB:** Special Cycle Enable, does not apply to PCI Express HARDWIRED
2	0h RW	**BUS_MAS:** Bus Master Enable
1	0h RW	**MEM_SP_ACC:** Memory Space access enable
0	0h RO	**IO_SPC_AC_EN_0:** IO Space access enable

28.3 CNVI_WIFI_PCI_CLASS_CODE — Offset 8h

revision identifier and class code(Offset 008 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 8h	2800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	2h RO	**SE_CLASS:** Base Class, classifies the type of function the device per form

Bit Range	Default & Access	Field Name (ID): Description
23:16	80h RO	**SUB_CLASS:** Sub-Class, identifies more specifically the function of the device
15:8	0h RO	**INTERFACE:** Interface, identifies a specific register-level programming interface
7:0	0h RO	**REV_ID:** Revision ID identifies the revision of particular PCI device

28.4 CNVI_WIFI_PCI_BUS_COM — Offset Ch

revision identifier and class code(Offset 00C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + Ch	800000 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BIST_CAPB:** BIST Capable, BIST is implemented but not controlled by Configuration HARDWIRED
30	0h RO	**START_BIST:** Start BIST HARDWIRED
29:28	0h RO	**Reserved (RSVD):** Reserved
27:24	0h RO	**BIST_COMPL_CODE:** BIST Completion Code HARDWIRED
23	1h RO	**MUL_FUNC_DEV:** Multifunction Device. is used to identify multifunction device
22:16	0h RO	**PRFIND_HEAD_LAY:** Predefined Header Layout HARDWIRED
15:8	0h RO	**LATNCY_TIMR:** Latency Timer, Does not apply to PCI Express HARDWIRED
7:0	0h RW	**CACH_LN_SIZE:** Cache Line Size

28.5 CNVI_WIFI_BAR0 — Offset 10h

Base Address Register BAR0 Low (Offset 010 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RW	**BS_ADD_FLD_RW:** Base Address Field
13:4	0h RO	**BS_ADD_FLD_RO:** Base Address Field HARDWIRED
3	0h RO	**PREFETCHBL:** Prefetchable, defines the block of memory as Prefetchable or not
2:1	2h RO	**DECOD_WDTH_FLD:** Decoder Width Field (10b-64bit reg) HARDWIRED
0	0h RO	**MEM_SPAC_INDIC:** Memory Space Indicator HARDWIRED

28.6 CNVI_WIFI_BAR1 — Offset 14h

Base Address Register BAR0 High (Offset 014 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BS_ADD_FLD:** Base Address Field

28.7 CNVI_WIFI_BAR2 — Offset 18h

Reserved hard coded to 0 (Offset 018 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved hard coded to 0

28.8 CNVI_WIFI_BAR3 — Offset 1Ch

Reserved hard coded to 0 (Offset 01C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved hard coded to 0

28.9 CNVI_WIFI_BAR4 — Offset 20h

Reserved hard coded to 0 (Offset 020 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved hard coded to 0

28.10 CNVI_WIFI_BAR5 — Offset 24h

Reserved hard coded to 0 (Offset 024 h) cooment: common to all functions

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved hard coded to 0

28.11 CNVI_WIFI_CIS_PTR — Offset 28h

Reserved hard coded to 0 (Offset 028 h) Optional, is implemented by devices that share silicon between CardBus and PCI, points to the Card Information Structure (CIS) the CardBus card, contains the offset of the CIS

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 28h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**CARDB_PTR:** CardBus CIS Pointer

28.12 CNVI_WIFI_SUBSYS_ID — Offset 2Ch

Identifies the manufacturer of the device(vendor) and type.(Offset 02C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 2Ch	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**SB_DEV_ID:** Subsystem (device) ID
15:0	8086h RO	**SB_VEN_ID:** Subsystem Vendor ID

28.13 CNVI_WIFI_ROM_BAR — Offset 30h

Expansion ROM Base Address (Offset 030 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**EXPN_ROM_ADD:** Expansion ROM Base Address HARDWIRED
10:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RO	**EXPN_ROM_ENB:** Expansion ROM Enable HARDWIRED

28.14 CNVI_WIFI_CAP_PTR — Offset 34h

capabilities pointer register (Offset 034 h) bit [7:0] Point to the first item in the list of capabilities, provides an offset in the device's PCI Configuration Space for the location of the first item in the Capabilities List

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 34h	C8 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	C8h RO	**CARDB_PTR:** Capabilities Pointer

28.15 CNVI_WIFI_RES_ADDRESS — Offset 38h

Reserved hard coded to 0 (Offset 038 h) Optional, is implemented by devices that share silicon between CardBus and PCI, points to the Card Information Structure (CIS) the CardBus card, contains the offset of the CIS

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 38h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved

28.16 CNVI_WIFI_INTERRUPT — Offset 3Ch

revision identifier and class code(Offset 03C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LATNC:** Max_Lat , Does not apply to PCI Express HARDWIRED
23:16	0h RO	**MIN_GNT:** Min_Gnt , Does not apply to PCI Express HARDWIRED
15:8	1h RO	**INT_PIN:** Interrupt Pin , Tells which interrupt pin the device uses For IOSF - option to write once
7:0	0h RW	**INT_LINE:** Interrupt Line, id which input interrupt request pin is routed to

28.17 CNVI_WIFI_GIO_CAP — Offset 40h

PCI Express Capabilities Register. (Offset 040 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 40h	928010 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD):** Reserved
29:25	0h RO	**INTRPT_MSG_NUM:** Interrupt Message Number HARDWIRED
24	0h RO	**SLT_IMPLNT:** Slot Implemented HARDWIRED
23:20	9h RO	**DEV_POR_TYP:** Device/Port Type
19:16	2h RO	**CAP_VER:** Capability Version (0x2 at gen 2.0)
15:8	80h RO	**GIO_CAP_NXT_OFS:** The offset to the next PCI capability structure HARDWIRED
7:0	10h RO	**INCD_PCIE_CST:** indicates PCI Express Capability Structure HARDWIRED

28.18 CNVI_WIFI_GIO_DEV_CAP — Offset 44h

The Device Capabilities register identifies PCI Express device specific capabilities.(Offset 044 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 44h	10000EC0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	1h RO	**FUNC_LVL_RES:** Function Level Reset Capability [too add GEN_2]
27:26	0h RO	**SLT_PW_LSCL:** Captured Slot Power Limit Scale
25:18	0h RO	**SLT_PW_LVAL:** Captured Slot Power Limit Value
17:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**ROLE_BASED_ERR:** This field indicates that the device support Error reporting
14:12	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:9	7h RO	**L1_ACC_LAT:** Endpoint L1 Acceptable Latency
8:6	3h RO	**L0S_ACC_LAT:** Endpoint L0s Acceptable Latency
5	0h RO	**EX_TAG_FIELD:** Extended Tag Field Supported
4:3	0h RO	**PHAN_FUNCS:** Phantom Functions Supported
2:0	0h RO	**MAX_PL_SIZE:** Max_Payload_Size Supported

28.19 CNVI_WIFI_GIO_DEV — Offset 48h

Device Control Register. (Offset 048 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 48h	100C10 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**TRANS_PEND:** indicates that a device has Non-Posted Requests which have not been completed
20	1h RO	**AUX_P_DET:** device that requires AUX power reports this bit (asynch signal)
19	0h RW/1C	**UNSOP_REQ_DET:** indicates that the device received Unsupported Request
18	0h RW/1C	**FAT_ERR_DET:** indicates status of fatal errors detected
17	0h RW/1C	**NFAT_ER_DET:** indicates status of non-fatal errors detected
16	0h RW/1C	**COR_ERR_DET:** indicates status of correctable errors detected
15	0h RO	**INIT_FNC_LV_RS:** Initiate Function Level Reset - A write of 1b initiates Function (init FLR)
14:12	0h RW	**MAX_RDRQ_SIZE:** sets the maximum Read Request size
11	1h RW	**EN_NO_SNOOP:** Enable No Snoop (if set device is permitted to set No Snoop bit)
10	1h RW	**AUX_PM_EN:** Auxiliary (AUX) Power PM Enable. sticky value.
9	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**IO_SPC_AC_EN_8:** IO Space access enable
7:5	0h RW	**MAX_PAY_SIZE:** sets maximum TLP payload size for the device functions
4	1h RW	**EN_REL_ORD:** when set device permitted to set the Relaxed Ordering bit
3	0h RW	**UNSOP_REQ_REP:** enables reporting of Unsupported Request when set
2	0h RW	**FAT_ERR_REP:** controls reporting of fatal errors
1	0h RW	**NFAT_ER_REP:** controls reporting of non-fatal errors
0	0h RW	**COR_ERR_REP:** controls reporting of correctable errors

28.20 CNVI_WIFI_GIO_LNK_CAP — Offset 4Ch

The Link Capabilities register identifies PCI Express Link specific capabilities.(Offset 04C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** Reserved

28.21 CNVI_WIFI_GIO_LINK — Offset 50h

Link Control and Link status Register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** RESERVED for IOSF

28.22 CNVI_WIFI_GIO_DEV_CAP_2 — Offset 64h

device control 2 (and status) register. (Offset 064 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 64h	80812 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	2h RO	**OBFF_MEC_SUP:** OBFF suported : 0x00 -unsupported , 0x01 -sup using message signaling A, 0x10 -sup using signaling B ,0x11-supported using WAKE signaling
17:12	0h RO	**Reserved (RSVD):** Reserved
11	1h RO	**LTR_MEC_SUP:** LTR Mechanism Supported - a value of 1b indicates support for LTR.
10:5	0h RO	**Reserved (RSVD):** Reserved
4	1h RO	**CMP_TO_DIS_SUP:** 1- support for the Completion Timeout Disable, 0- not supported hardwired to 0x1
3:0	2h RO	**CMP_TO_RNG_SUP:** Completion Timeout Ranges Supported hardwired to 0x2

28.23 CNVI_WIFI_GIO_DEV_2 — Offset 68h

Device control (and status) register. (Offset 068 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 68h	5 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD):** Reserved
14:13	0h RW	**OBFF_MEC_ENA:** OBFF enable: 0x00 -disable , 0x01 - enabled using message signaling A, 0x10 - message signaling B ,0x11-enabled using WAKE signaling
12:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**LTR_MEC_EN:** LTR Mechanism Enable - When Set enables the LTR.
9:5	0h RO	**Reserved (RSVD):** Reserved
4	0h RW	**CMP_TO_DIS:** When Set, this bit disables the Completion Timeout mechanism
3:0	5h RW	**CMP_TO_VAL:** this field allows system SW to modify the Completion Timeout value

28.24 CNVI_WIFI_GIO_LINK_2 — Offset 70h

link control 2 (and status) register (Offset 070 h) at this reg bits of type RWS - allow software to write sticky values to register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**DAT_RESERVED:** RESERVED for IOSF

28.25 CNVI_WIFI_MSIX_CAP_HEAD — Offset 80h

MSIX Capability .(Offset 080 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 80h	F0011 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MSIX_ENABLE:** If set to 1, the function is permitted to use MSI-X to request service. System configuration software sets this bit to enable MSI-X. A device driver is prohibited from writing this bit to mask a function's service request. If 0, the function is prohibited from using MSI-X to request service.
30	0h RW	**FUN_MASK:** If set to 1, all of the vectors associated with the function are masked, regardless of their per-vector Mask bit states. If 0, each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per-vector Mask bits
29:27	0h RO	**Reserved (RSVD):** Reserved
26:16	Fh RO	**TABLE_SIZE:** System software reads this field to determine the MSI-X Table Size N, which is encoded as (N-1). Wifi Host supports Table Size of 16 and encodes a number of 15 (Pulsar).
15:8	0h RO	**NEXT_PTR:** Pointer to the next item in the capabilities list. NULL if last
7:0	11h RO	**MSIX_CAP_ID:** The value of 11h in this field identifies the function as being MSI-X capable.

28.26 CNVI_WIFI_MSIX_TABLE_OFFSET — Offset 84h

MSIX Capability Structure - Table Offset Reg.(Offset 084 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 84h	2000 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	400h RO	**TABLE_OFFSET:** Used as an offset from the address contained by the Base Address register to point to the base of the MSI-X Table. The lower 3 bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. In Wifi Host the table is at 0x2000, so the value of this field in 0x400.
2:0	0h RO	**TABLE_BIR:** Indicates which one of a function's Base Address registers, located beginning at 10h in configuration Space, and is used to map the function's MSI-X Table into Memory Space. Wifi Host cluster uses a single BAR to point to the MSI-X structures.

28.27 CNVI_WIFI_MSIX_PBA_OFFSET — Offset 88h

MSIX Capability Structure - Pending Bit Array Offset Reg.(Offset 088 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 88h	3000 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	600h RO	**TABLE_OFFSET:** Used as an offset from the address contained by the Base Address register to point to the base of the MSI-X PBA Table. The lower 3 bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. In Wifi Host the table is at 0x3000, so the value of this field in 0x600.
2:0	0h RO	**TABLE_BIR:** Indicates which one of a function's Base Address registers, located beginning at 10h in configuration Space, and is used to map the function's MSI-X Table into Memory Space. Wifi Host cluster uses a single BAR to point to the MSI-X structures.

28.28 CNVI_WIFI_PMC — Offset C8h

Power Management Capabilities Register(Offset 0C8 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + C8h	C823D001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME_SUPRT:** PME Support,indicates the power states in which the device may assert PME
26	0h RO	**D2_PWR_MANG:** D2 Power Management State support
25	0h RO	**D1_PWR_MANG:** D1 Power Management State support
24:22	0h RO	**AUX_CUR:** AUX Current (Used data register instead)
21	1h RO	**DEV_SPC_INT:** Device Specific Initialization

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME_CLK:** PME Clock, does not apply to PCI Express HARDWIRED
18:16	3h RO	**VERSION:** value indicates that this function complies with the Revision 1.2
15:8	D0h RO	**PMC_NXT_PTR:** Next PTR, pointing to the location of next item in the functions capability list HARDWIRED
7:0	1h RO	**PMC_CAP_ID:** Capability ID, Indicates the linked list item is the PCI Power Management Registers HARDWIRED

28.29 CNVI_WIFI_PMCSR — Offset CCh

Power Management Status and Control (Offset 0CC h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + CCh	D000008 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Dh RO	**PWR_DIS_CON:** used to report power consumption and heat dissipation (default for D3-0x1)
23	0h RO	**BUS_PWR_CLK_CEN:** Bus Power/Clock Control Enable, does not apply to PCI Express HARDWIRED
22	0h RO	**B2_B3_SUPRT:** B2/B3 Support, does not apply to PCI Express HARDWIRED
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW/1C	**PME_STAT:** This bit reflects whether the function has experienced a PME. sticky value.
14:13	0h RO	**DAT_SCALE:** Data Scale
12:9	0h RW	**DAT_SEL:** Data Select, selects the data value to be viewed through the Data register
8	0h RW	**PME_ENA:** PME Enable. sticky value.
7:4	0h RO	**Reserved (RSVD):** Reserved
3	1h RO	**NO_SOFT_RESET:** No_Soft_Reset
2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**PWR_STATE:** Power State

28.30 CNVI_WIFI_MSI_MSG_CTRL — Offset D0h

Capability ID and Message Control.(Offset 0D0 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + D0h	804005 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**BITA_CAP_64:** 64 bit address capable HARDWIRED
22:20	0h RO	**MUL_MSG_ENB:** Multiple Message Enable HARDWIRED
19:17	0h RO	**MUL_MSG_CAP:** Multiple Message Capable HARDWIRED
16	0h RW	**MSI_ENA:** function is enabled to use MSI to request service and is forbidden to use its interrupt pin
15:8	40h RO	**MSI_MC_NXT_PTR:** Next Capability pointer offset HARDWIRED
7:0	5h RO	**MSI_MC_CAP_ID:** Capability ID HARDWIRED

28.31 CNVI_WIFI_MSI_LOW_ADD — Offset D4h

Specifies the lower DWORD of the address for the MSI memory write transaction (Offset 0D4 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSG_ADD_LOW:** lower DWORD of the address
1:0	0h RO	**MSI_LOW_AD_1_0:** HARDWIRED

28.32 CNVI_WIFI_MSI_HIGH_ADD — Offset D8h

Specifies the upper DWORD of the address for the MSI memory write transaction (Offset 0D8 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSG_ADD_UP:** upper DWORD of the address

28.33 CNVI_WIFI_MSI_DATA — Offset DCh

Written by the system to indicate the lower 16 bits of the data written in the MSI memory write DWORD transaction (Offset 0DC h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**MSG_DATA:** data written in the MSI memory write DWORD transaction

28.34 CNVI_WIFI_GIO_SERIAL_CAP — Offset 100h

Device Serial Number Capability.(Offset 100 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 100h	14C00000 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14Ch RO	**NXT_CAP_OFF:** Next Capability Offset, next is the LTR header
19:16	0h RO	**CAP_VER:** Capability Version: Zero to skip Serial Number
15:0	0h RO	**EXT_CAP_ID:** PCI Express Extended Capability ID: Zero to skip Serial Number

28.35 CNVI_WIFI_GIO_SERIAL_LOW — Offset 104h

Serial number low.(Offset 104 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 104h	FF000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RO	**HARDWIRED_SR_LW:** hardwired to 0xFF
23:16	0h RO	**BYTE_6:** byte 6 from OTP
15:8	0h RO	**BYTE_5:** byte 5 from OTP
7:0	0h RO	**BYTE_4:** byte 4 from OTP

28.36 CNVI_WIFI_GIO_SERIAL_UP — Offset 108h

Serial number up.(Offset 108 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 108h	FF h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**BYTE_1:** byte 1 from OTP
23:16	0h RO	**BYTE_2:** byte 2 from OTP
15:8	0h RO	**BYTE_3:** byte 3 from OTP
7:0	FFh RO	**HARDWIRED_SR_UP:** hardwired to 0xFF

28.37 CNVI_WIFI_UNCORRECT_ERR_SEV — Offset 10Ch

Uncorrectable Error severity Register. (Offset 10C h) at this reg bits of type RWS - the error is reported as fatal when the field is set to 1, g if it is cleared to 0, the error is considered non-fatal

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 10Ch	462031 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**TLP_PRFIX_BLOCKED_SVR:** TLP Prefix Blocked Error Severity (Optional) - report is not implemented. sticky value
24	0h RW	**ATMC_EGRS_BLOCKED_SVR:** AtomicOps Egress Blocked Severity (Optional) - report is not implemented. sticky value
23	0h RW	**MC_BLOCKED_TLP_SVR:** MC Blocked TLP Severity (Optional) - report is not implemented. sticky value
22	1h RW	**UNCORCT_INT_ERR_SVR:** Uncorrectable Internal Error Severity (Optional) - report is not implemented. sticky value
21	0h RW	**ACS_VIOL_SVR:** ACS Violation Severity (Optional) - report is not implemented. sticky value
20	0h RW	**UNSPR_REQ_ERR_SVR:** Unsupported Request Error severity sticky value
19	0h RO	**ECRC_ERR_SVR_19:** ECRC Error severity
18	1h RW	**MAL_TLP_SVR:** Malformed TLP severity . sticky value
17	1h RW	**REC_OVRF_SVR:** Receiver Overflow severity . sticky value
16	0h RW	**UNXPL_COM_SVR:** Unexpected Completion severity . sticky value
15	0h RW	**COM_AB_SVR:** Completer Abort severity . sticky value
14	0h RW	**COM_TO_SVR:** Completion Timeout severity. sticky value
13	1h RW	**FLWCNT_PR_SVR:** Flow Control Protocol Error severity. sticky value
12	0h RW	**POIS_TLP_SVR:** Poisoned TLP severity . sticky value
11:6	0h RO	**Reserved (RSVD):** Reserved
5	1h RW	**SURPRISE_DWN_SVR:** Surprise Down Error Severity (Optional) . sticky value
4	1h RW	**DLNK_PRERR_SVR:** Data Link Protocol Error severity . sticky value
3:1	0h RO	**Reserved (RSVD):** Reserved
0	1h RO	**TRNG_ERR_SVR_0:** Training Error severity

28.38 CNVI_WIFI_CORRECT_ERR_STAT — Offset 110h

PCI Express Capabilities Register. (Offset 110 h) at this reg bits of type RW1CS - , if is set to 1 indicates that the error occurred; g software may clear the bit by writing a 1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 110h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW	**ADV_NON_FATAL:** Advisory Non Fatal Error
12	0h RW/1C	**REPL_TO_ST:** Replay Timer Timeout Error status . sticky value
11:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW/1C	**REPL_ROLVR_ST:** REPLAY_NUM Rollover status . sticky value
7	0h RW/1C	**BD_DLLP_ST:** Bad DLLP status . sticky value
6	0h RW/1C	**BD_TLP_ST:** Bad TLP status . sticky value
5:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/1C	**REV_ERR_ST:** Receiver Error status . sticky value

28.39 CNVI_WIFI_CORRECT_ERR_MASK — Offset 114h

PCI Express Capabilities Register. (Offset 114 h) at this reg bits of type RWS - if set to 1 the error is masked.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 114h	2000 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	1h RW	**ADV_NON_FATAL:** Advisory Non Fatal Error -- masked by default
12	0h RW	**REPL_TO_MSK:** Replay Timer Timeout Error mask . sticky value
11:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**REPL_ROLVR_MSK:** REPLAY_NUM Rollover mask . sticky value

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**BD_DLLP_MSK:** Bad DLLP mask . sticky value
6	0h RW	**BD_TLP_MSK:** Bad TLP mask . sticky value
5:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW	**REV_ERR_MSK:** Receiver Error mask . sticky value

28.40 CNVI_WIFI_ADVANCED_ERR_CAP — Offset 118h

Advanced Error Capabilities and Control register. (Offset 118 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 118h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC_CHK_EN:** ECRC Check Enable, if set enables ECRC checking
7	0h RO	**ECRC_CHK_CP:** ECRC Check Capable, indicates the device is capable of checking ECRC
6	0h RO	**ECRC_GEN_EN:** ECRC Generation Enable, if set enables ECRC generation
5	0h RO	**ECRC_GEN_CP:** ECRC Generation Capable, indicates that the device is capable of generation ECRC
4:0	0h RO	**FRST_ERR_PNT:** error reported in the Uncorrectable Error Status register First Error Pointer, identifies bit position of the first

28.41 CNVI_WIFI_HEADER_LOG1 — Offset 11Ch

captures the header of TLP associated with error. (Offset 11C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 11Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**HEADER_LOG_1:** captures the header of TLP associated with error

28.42 CNVI_WIFI_HEADER_LOG2 — Offset 120h

captures the header of TLP associated with error. (Offset 120 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 120h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**HEADER_LOG_2:** captures the header of TLP associated with error

28.43 CNVI_WIFI_HEADER_LOG3 — Offset 124h

captures the header of TLP associated with error. (Offset 124 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 124h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**HEADER_LOG_3:** captures the header of TLP associated with error

28.44 CNVI_WIFI_HEADER_LOG4 — Offset 128h

captures the header of TLP associated with error. (Offset 128 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 128h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**HEADER_LOG_4:** captures the header of TLP associated with error

28.45 CNVI_WIFI_LTR_EXTND_CAP_HEAD — Offset 14Ch

header of LTR extended capability reg.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 14Ch	16410018 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	164h RO	**LTR_HD_NXT_PTR:** Next Capability Offset. next is the Vendor Specific Capability Header
19:16	1h RO	**LTR_HD_CAP_VER:** Capability Version. must be 1 for this version
15:0	18h RO	**LTR_HD_CAP_ID:** PCI Express Extended Capability ID for the LTR Extended Capability is 0018h

28.46 CNVI_WIFI_LTR_MAX_SNOOP_NOSNOOP_LAT — Offset 150h

this register specifies the maximum nosnoop latency that a device is permitted to request.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 150h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28:26	0h RW	**NSNP_MX_LAT_SCL:** no-snoop max latency scale. set by SW
25:16	0h RW	**NSNP_MX_LAT_VAL:** no-snoop max latency value. set by SW
15:13	0h RO	**Reserved (RSVD):** Reserved
12:10	0h RW	**SNP_MAX_LAT_SCL:** snoop max latency scale. set by SW
9:0	0h RW	**SNP_MAX_LAT_VAL:** snoop max latency value. set by SW

28.47 CNVI_WIFI_L1PM_SUB_EXTND_CAP_HEAD — Offset 154h

L1_SUBSTATES extended capability header.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 154h	1001E h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**NXT_PTR:** Next Capability Offset. 0x0 for last extended cap
19:16	1h RO	**CAP_VER:** Capability Version. must be 1 for this version
15:0	1Eh RO	**EXT_CAP_ID:** PCI Express Extended Capability ID for L1 PM

28.48 CNVI_WIFI_L1PM_SUB_CAP — Offset 158h

L1_SUBSTATES capability register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 158h	481E1F h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:19	9h RO	**L1SUB_PWRON_REQ:** Port requirement for T_POWER_ON value
18	0h RO	**Reserved (RSVD):** Reserved
17:16	0h RO	**T_PWRON_SCALE:** Portrequirement for T_POWER_ON scale
15:8	1Eh RO	**CMN_RESTORE_TM:** Port common mode restore time
7:5	0h RO	**Reserved (RSVD):** Reserved
4	1h RO	**L1SUB_PM_SUP:** L1 PM substate supported from OTP
3	1h RO	**L11_ASPM_SUP:** ASPM L1.1 is supported from OTP
2	1h RO	**L12_ASPM_SUP:** ASPM L1.2 is supported from OTP
1	1h RO	**L11_PM_SUP:** PM L1.1 is supported from OTP
0	1h RO	**L12_PM_SUP:** PM L1.2 is supported from OTP

28.49 CNVI_WIFI_L1PM_SUB_CNTRL — Offset 15Ch

L1_SUBSTATES control register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 15Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**LTR_L1_THRS_SCL:** LTR L1.2 threshold scale
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**LTR_L1_THRS_VAL:** LTR L1.1 threshold value, detemines if entry to L1 results in L1.1 or L1.2 (if they are enabled). scale of value set by: LTR L1.2 threshold scale
15:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**L11_ASPM_EN:** L1.1 ASPM is enabled
2	0h RW	**L12_ASPM_EN:** L1.2 ASPM is enabled
1	0h RW	**L11_PM_EN:** L1.1 PM is enabled
0	0h RW	**L12_PM_EN:** L1.2 PM is enabled

28.50 CNVI_WIFI_L1PM_SUB_CNTRL2 — Offset 160h

L1_SUBSTATES control register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 160h	28 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:3	5h RW	**T_POWER_ON_VAL:** T power on value. Along with power on scale - sets min time in L1.2.exit
2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**L12_PWRON_SCALE:** T power on scale. 0 =2us, 1=10us, 2=100us, 11 = reserved

28.51 CNVI_WIFI_VEN_SPEC_CAP — Offset 164h

Vendor Specific Capability Header.(Offset 164 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 164h	1000B h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**VSNEXT:** Next Capability Offset (VSNEXT): This field contains the offset to the next PCI Express capability structure or 000h if no other items exist in the linked list of capabilities. For Extended Capabilities implemented in device Configuration Space, this offset is relative to the beginning of PCI-compatible Configuration Space and thus must always be either 000h (for terminating list of capabilities) or greater than 0FFh. Next Capability Offset, next is the Device Serial Number Cap
19:16	1h RO	**VSECREV:** Vendor Specific Extended Capability Revision (VSECREV): the version of the PCIe capability structure present. Must be 1h for this version of the specification.
15:0	Bh RO	**VSPCIECID:** Vendor Specific PCI Express Extended Capability ID (VSPCIECID): The Extended Capability ID for the Vendor-Specific Capability is 000Bh.

28.52 CNVI_WIFI_VEN_SPEC_EXTND_CAP — Offset 168h

Vendor Specific Extended Capability Register.(Offset 168 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 168h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSECLEN:** Vendor Specific Extended Capability Length (VSECLEN): This field indicates the # of bytes of this Vendor Specific capability inclusive of the 1st DW which includes the capability ID and Next pointer. For DevIdle, this is 14h
19:16	0h RO	**VSECREV:** Vendor Specific Extended Capability Revision (VSECREV): For this revision of DevIdle, this field is 0h
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID (VSECID): DevIdle has been assigned the Intel VSEC ID of 10h

28.53 CNVI_WIFI_LTP_PTR — Offset 16Ch

SW LTR pointer.(Offset 16C h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 16Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**SWLTRLOC:** SW LTR Update MMIO Offset Location This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set

Bit Range	Default & Access	Field Name (ID): Description
19:4	0h RO	**Reserved (RSVD):** Reserved
3:1	0h RO	**BARNUM:** Base Address Register Number. Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register.
0	0h RO	**VALID:** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR. Need to be fixed to 1'b0

28.54 CNVI_WIFI_DEV_IDLE_PTR — Offset 170h

DevIdle Pointer.(Offset 170 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 170h	31800001 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	318h RO	**DEVIDLELOC:** DevIdle MMIO Offset Location.Contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set
19:4	0h RO	**Reserved (RSVD):** Reserved
3:1	0h RO	**BARNUM:** Base Address Register Number. Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set. Fixed to 3'b0
0	1h RO	**VALID:** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle. set to fix 1'b1

28.55 CNVI_WIFI_DEV_IDLE_PWR — Offset 174h

DevIdle Power on latency.(Offset 174 h)

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:12, F:0] + 174h	800 h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
12:10	2h RO	**POLS:** Power On Latency Scale. Latency Scale multiplier: 010: 1us, 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms.
9:0	0h RO	**POLV:** Power On Latency Value. 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us.

§ §

29 GPIO Registers

29.1 Revision ID (REV_ID)—Offset 0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 940000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	94h RO	**Hardware Base Revision ID (HWBASEREVID):** This field is used to indicate the baseline hardware revision. 0091h = RTL release for HAS0.91
15:0	0h RO	**Hardware Sub Revision ID (HWSUBIREVID):** This field is used to indicate the revision of the hardware derived from the baseline.

29.2 Capability List Register (CAP_LIST_0)—Offset 4h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD_0):** Reserved
23:16	0h RO	**Capability Identification (CAPID):** A unique identification for the current capability. A value of 0 is reserved, and must not be used by any capability. Note:This field is always 0 for the first Capability List register.
15:0	0h RO	**Next Capability List Pointer (NXTCAPLPTR):** Specify the DW-aligned Pointer/ Address to the next item in this capabilities list and must be 0 if there is no capability at all or this is the last capability in the list.

29.3 Family Base Address (FAMBAR)—Offset 8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD_0):** Reserved
15:0	300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

29.4 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 600h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD_0):** Reserved
15:0	600h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

29.5 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: E043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Eh RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RW	**Reserved (Reserved1):** Reserved
19:16	4h RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.

29.6 Miscellaneous Secured Configuration (MISCSECCFG)—Offset 14h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD_0):** Reserved
7:4	0h RW	**Reserved (Reserved1):** Reserved
3	0h RW/1C/V	**Soft strap pull status bit (SSTRAPPULLSTAT):** Indicate the status of the last soft strap pull operation. If the implementation guarantee the success of the operation, then this bit can be hard-wired to 0. 0 = No error 1 = Error FW writes 1 to this bit to clear. This bit is set to 1 when soft strap pull request has been completed with completion without data (for both successful and unsuccessful completion status) or completion with data but with unsuccessful completion status. This bit will also set to 1 if there is any failure on the security and error checking in the fuse puller such as invalid SAI and etc. Fuse puller will assert puller_error in this case and this will set this bit to 1.
2	0h RW/1C/V	**Soft strap re-pull done bit (SSTRAPPULLDONE):** Indication if the soft strap pull has finished the operation 0 = operation is not done. Either not started or in progress 1 = operation is done/finish. FW writes 1 to this bit to clear.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Soft strap re-pull request bit (SSTRAPREPULLREQ):** Specify if fuse puller need to re-pull the soft strap. The SoC/PMC/FW can set this bit to request the community fuse puller to re-pull the soft strap. 0 to 1 transition = soft strap re-pull request trigger. A soft strap re-pull request will not trigger IP_READY message sent as the IP_READY message shall be sent during the initial soft strap pull by HW as part of the reset sequences. The SSTRAPREPULLREQ, SSTRAPPULLDONE and SSTRAPPULLSTAT are only meaningful for community with soft strap pull capability.
0	0h RW	**Event Trigger IOSF-SB Message Initiation Disable (SBTRIGDIS):** This bit disables the following list of IOSF-SB Message initiation. It does not disable the event trigger. When this bit is cleared to '0', any pending message due to event trigger while this bit is '1' shall be sent on IOSF-SB. Event list: 'Virtual Wire' message IRQ GPE/SCI NMI SMI

17:16	0h RW	**Pad Ownership (PAD_OWN_GPIO_168):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: o GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or o Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/ write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, IE and ISH do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into nsuccessful Completionstatus. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = ISH GPIO Mode. Same description as CSME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. '11' = IE GPIO Mode. Same description as CSME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. All other values are reserved. Implementation shall treat reserved values the same as 0h. ** During DFx mode, Secure DFx can write to the PAD_OWN.

29.34 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_audio_0)—Offset 84h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_38):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_37):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_36):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_35):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_34):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_33):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_32):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_31):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_175):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_156):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Refer to Cspec Chapter 16 Power Management. If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN[i] does not prevent the setting of GPI_GPE_STS[i]. Each bit position correspond to 1 pad in the Community: Bit0 = Pad0 Bit1 = Pad1 Bit2 = Pad2 ... Bit N-1= Pad N-1

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/1C	**GPI General Purpose Events Status (GPI_GPE_STS_GPIO_162):** These bits are set any time the corresponding GPIO pad is set up as an input, under host ownership and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS[i] bit is set: If the system is in an S3-S5 state, the event will also wake the system. Refer to Cspec Chapter 16 Power Management. If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. 31:0	0h RO	**rsvd (RSVD):** FAM reserved register DW7

29.134 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_156)—Offset 600h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.136 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_156)—Offset 608h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.142 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_158)—Offset 620h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.148 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_159)—Offset 638h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD_0):** Reserved
11	0h RO/V	**Pin-strap value (PINSTRAPVAL):** This bit reflects the pin-strap value.
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.150 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_160)—Offset 640h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.158 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_162)—Offset 660h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.166 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_164)—Offset 680h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.174 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_166)—Offset 6A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.186 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_169)—Offset 6D0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.194 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_171)—Offset 6F0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.200 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_172)—Offset 708h

Access Method

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.202 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_173)—Offset 710h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.208 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_174)—Offset 728h

Access Method

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.210 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_175)—Offset 730h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.218 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_32)—Offset 750h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.226 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_34)—Offset 770h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.238 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_37)—Offset 7A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.244 Pad Configuration DW2 (PAD_CFG_DW2_vGPIO_38)—Offset 7B8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.245 Pad Configuration DW3 (PAD_CFG_DW3_vGPIO_38)—Offset 7BCh

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.246 Revision ID (REV_ID)—Offset 0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 940000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	94h RO	**Hardware Base Revision ID (HWBASEREVID):** This field is used to indicate the baseline hardware revision. 0091h = RTL release for HAS0.91
15:0	0h RO	**Hardware Sub Revision ID (HWSUBIREVID):** This field is used to indicate the revision of the hardware derived from the baseline.

29.247 Capability List Register (CAP_LIST_0)—Offset 4h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD_0):** Reserved
23:16	0h RO	**Capability Identification (CAPID):** A unique identification for the current capability. A value of 0 is reserved, and must not be used by any capability. Note:This field is always 0 for the first Capability List register.
15:0	0h RO	**Next Capability List Pointer (NXTCAPLPTR):** Specify the DW-aligned Pointer/ Address to the next item in this capabilities list and must be 0 if there is no capability at all or this is the last capability in the list.

29.248 Family Base Address (FAMBAR)—Offset 8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD_0):** Reserved
15:0	300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

29.249 Pad Base Address (PADBAR)—Offset Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 600h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15:0	600h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

29.250 Miscellaneous Configuration (MISCCFG)—Offset 10h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: E043200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Eh RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RW	**Reserved (Reserved1):** Reserved
19:16	4h RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. The setting is SoC specific.
7:6	0h RW	**Reserved (Reserved2):** Reserved
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating
2	0h RW	**GSX Static Local Clock Gating (GSXSLCGEN):** Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). 0 = Disable static local clock gating 1 = Enable static local clock gating
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating

29.251 Miscellaneous Secured Configuration (MISCSECCFG)—Offset 14h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD_0):** Reserved
7:4	0h RW	**Reserved (Reserved1):** Reserved
3	0h RW/1C/V	**Soft strap pull status bit (SSTRAPPULLSTAT):** Indicate the status of the last soft strap pull operation. If the implementation guarantee the success of the operation, then this bit can be hard-wired to 0. 0 = No error 1 = Error FW writes 1 to this bit to clear. This bit is set to 1 when soft strap pull request has been completed with completion without data (for both successful and unsuccessful completion status) or completion with data but with unsuccessful completion status. This bit will also set to 1 if there is any failure on the security and error checking in the fuse puller such as invalid SAI and etc. Fuse puller will assert puller_error in this case and this will set this bit to 1.
2	0h RW/1C/V	**Soft strap re-pull done bit (SSTRAPPULLDONE):** Indication if the soft strap pull has finished the operation 0 = operation is not done. Either not started or in progress 1 = operation is done/finish. FW writes 1 to this bit to clear.
1	0h RW	**Soft strap re-pull request bit (SSTRAPREPULLREQ):** Specify if fuse puller need to re-pull the soft strap. The SoC/PMC/FW can set this bit to request the community fuse puller to re-pull the soft strap. 0 to 1 transition = soft strap re-pull request trigger. A soft strap re-pull request will not trigger IP_READY message sent as the IP_READY message shall be sent during the initial soft strap pull by HW as part of the reset sequences. The SSTRAPREPULLREQ, SSTRAPPULLDONE and SSTRAPPULLSTAT are only meaningful for community with soft strap pull capability.
0	0h RW	**Event Trigger IOSF-SB Message Initiation Disable (SBTRIGDIS):** This bit disables the following list of IOSF-SB Message initiation. It does not disable the event trigger. When this bit is cleared to '0', any pending message due to event trigger while this bit is '1' shall be sent on IOSF-SB. Event list: 'Virtual Wire' message IRQ GPE/SCI NMI SMI
