29.1077 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_23)—Offset 770h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	42h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1083 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_24)—Offset 788h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1085 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_25)—Offset 790h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1093 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_27)—Offset 7B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1101 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_29)—Offset 7D0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1113 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_32)—Offset 800h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	4Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1121 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_34)—Offset 820h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1129 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_36)—Offset 840h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44001B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	6h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	4Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1135 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_37)—Offset 858h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1137 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_38)—Offset 860h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1142 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_39)—Offset 874h

Access Method

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1145 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_40)—Offset 880h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1153 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_42)—Offset 8A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved (RSVD_1):** Reserved
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	55h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1165 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_45)—Offset 8D0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	57h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1173 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_47)—Offset 8F0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	9h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	5Ah RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1179 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_48)—Offset 908h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1181 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_49)—Offset 910h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	5Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1187 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_50)—Offset 928h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1188 Pad Configuration DW3 (PAD_CFG_DW3_GPIO_50)—Offset 92Ch

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1189 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_51)—Offset 930h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1197 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_53)—Offset 950h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1205 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_55)—Offset 970h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1217 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_58)—Offset 9A0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	64h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1225 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_60)—Offset 9C0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	67h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1233 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_62)—Offset 9E0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	69h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1239 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_63)—Offset 9F8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1241 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_64)—Offset A00h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1249 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_66)—Offset A20h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1257 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_68)—Offset A40h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

29.1261 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_69)—Offset A50h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Default: 306Fh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1263 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_69)—Offset A58h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1269 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_71)—Offset A70h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	71h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1285 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_75)—Offset AB0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	74h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1293 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_212)—Offset AD0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1301 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_214)—Offset AF0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved

The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	1h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1309 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_1)—Offset B10h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved

29.1321 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_4)—Offset B40h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	76h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1329 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_6)—Offset B60h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1337 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_8)—Offset B80h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1345 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_10)—Offset BA0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	2h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1353 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_12)—Offset BC0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000B00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	2h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1361 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_14)—Offset BE0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1373 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_17)—Offset C10h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1381 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_19)—Offset C30h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1389 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_21)—Offset C50h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1397 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_23)—Offset C70h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1405 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_25)—Offset C90h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1413 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_27)—Offset CB0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.

This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1425 Pad Configuration DW0 (PAD_CFG_DW0_vGPIO_30)—Offset CE0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RO	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1426 Pad Configuration DW1 (PAD_CFG_DW1_vGPIO_30)—Offset CE4h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 77h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	0h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	77h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1427 Pad Configuration DW2 (PAD_CFG_DW2_vGPIO_30)—Offset CE8h

Access Method

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_206):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_205):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_199):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_180):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_179):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_187):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_178):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_177):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_176):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.1461 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_scc_0)—Offset 84h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_206):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_205):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_204):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_203):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_202):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_201):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_200):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_199):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_198):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_197):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_196):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_195):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_194):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_193):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_192):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
16	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_191):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_190):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_178):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_177):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_176):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.1462 Pad Configuration Lock (PADCFGLOCK_scc_1)—Offset 88h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_209):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
1	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_208):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_207):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.1463 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_scc_1)—Offset 8Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_209):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_208):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_207):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1C	**GPI SMI Status (GPI_SMI_STS_GPIO_176):** This bit is set to '1' by hardware when a level event (See RxEdCfg, RxInv) is detected, and all the following conditions are true: The corresponding pad is used in GPIO input mode (PMode) The corresponding PAD_OWN[2:0] is '000' (i.e. ACPI GPIO Mode). If the following conditions are true, then an SMI will be generated if the GPI_SMI_STS bit is set: 1. The corresponding bit in the GPI_SMI_EN register is set 2. The corresponding pad's GPIROUTSMI is set Writing a value of '1' will clear the bit while writing a value of '0' has no effect. 0 = There is no SMI event 1 = There is an SMI event The state of GPI_SMI_EN[x] does not prevent the setting of GPI_SMI_STS[x]. Bit assignment: Bit0 = Pad 0 Bit1 = Pad 1 Bit2 = Pad 2 ... Bit N-1 = Pad N-1 Defaults for these bits are dependent on the state of the GPI pads.

29.1586 RCOMP Control Register (RCOMP_CTL_SMBUS_3P3)—Offset 480h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 94087903h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**RCOMP FSM Enable (RFSMEN):** 0 = state machine disabled (clock gated) 1 = state machine enabled It is important to have this bit enabled in order for all internal clocks inside the RCOMP FSM to run.
30	0h RW	**RCOMP Calibration Start (RCALSTART):** When set to 1 this bit triggers the RCOMP FSM to start hunting for the correct values for strength and slew. This bit should be cleared after calibration has finished. Before setting the RcalStart bit RFSMEn must have been asserted for at least 5 clock cycles. The first calibration takes 10us to complete and subsequent calibrations take 3us. Details of this process are in the CFIP RCOMP Aspec.
29:28	1h RW	**RCOMP FSM Stop Condition (RFSMSTOP):** RCOMP FSM Stop calibration condition. RCOMP FSM (pullup & pulldown) will finish calibrating once orcpupen/orcpdnen toggles. The toggling indicates the compensation value has been reached. This option is programmable for toggle once (single edge), toggle twice (double edge), toggle thrice (triple edge) or forcing it to finish after a certain cycle (defined by RFSMStopCyc). 00b = single edge detect (10 or 01) 01b = double edge detect (101 or 010) (default) 10b = triple edge detect (1010 or 0101) 11b = stop after x cycles (depending on ircstpcyc[3:0] value -- This is meant for debug)
27:24	4h RW	**RCOMP FSM Stop Cycles (RFSMSTOPCYC):** Number of cycles to stop RCOMP FSM from searching for strength and slew settings. RFSMStop must be set to 11b for this option to take effect. 0000b = 0 cycle (illegal option) 0001b = 1 cycle (illegal option) 0010b = 2 cycles (illegal option) 0011b = 3 cycles (illegal option) 0100b = 4 cycles 1110b = 14 cycles 1111b = 15 cycles (maximum allowed) This is meant for debug.
23:20	0h RO	**Reserved (RSVD_0):** Reserved
19:11	10Fh RW	**Initial Pull Up Calibration Value (INITPUCALVAL):** Initial pleg and nleg calibration values. RCOMP FSM will always start with these values for pullup and pulldown calibration. [8:0] Initial Pull Down Value (nleg) [10:9] Reserved [19:11] Initial Pull Up Value (pleg) [21:20] Reserved
10:9	0h RO	**Reserved (RSVD_1):** Reserved
8:0	103h RW	**Initial Pull Down Calibration Value (INITPDCALVAL):** Initial pleg and nleg calibration values. RCOMP FSM will always start with these values for pullup and pulldown calibration. [8:0] Initial Pull Down Value (nleg) [10:9] Reserved [19:11] Initial Pull Up Value (pleg) [21:20] Reserved

29.1609 RCOMP Reserved Register (RCOMP_RSVD_SD_CLK_1P8)—Offset 4DCh

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** RCOMP reserved register

29.1610 RCOMP Control Register (RCOMP_CTL_EMMC_1P8)—Offset 4E0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 94087903h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**RCOMP FSM Enable (RFSMEN):** 0 = state machine disabled (clock gated) 1 = state machine enabled It is important to have this bit enabled in order for all internal clocks inside the RCOMP FSM to run.
30	0h RW	**RCOMP Calibration Start (RCALSTART):** When set to 1 this bit triggers the RCOMP FSM to start hunting for the correct values for strength and slew. This bit should be cleared after calibration has finished. Before setting the RcalStart bit RFSMEn must have been asserted for at least 5 clock cycles. The first calibration takes 10us to complete and subsequent calibrations take 3us. Details of this process are in the CFIP RCOMP Aspec.
29:28	1h RW	**RCOMP FSM Stop Condition (RFSMSTOP):** RCOMP FSM Stop calibration condition. RCOMP FSM (pullup & pulldown) will finish calibrating once orcpupen/orcpdnen toggles. The toggling indicates the compensation value has been reached. This option is programmable for toggle once (single edge), toggle twice (double edge), toggle thrice (triple edge) or forcing it to finish after a certain cycle (defined by RFSMStopCyc). 00b = single edge detect (10 or 01) 01b = double edge detect (101 or 010) (default) 10b = triple edge detect (1010 or 0101) 11b = stop after x cycles (depending on ircstpcyc[3:0] value -- This is meant for debug)
27:24	4h RW	**RCOMP FSM Stop Cycles (RFSMSTOPCYC):** Number of cycles to stop RCOMP FSM from searching for strength and slew settings. RFSMStop must be set to 11b for this option to take effect. 0000b = 0 cycle (illegal option) 0001b = 1 cycle (illegal option) 0010b = 2 cycles (illegal option) 0011b = 3 cycles (illegal option) 0100b = 4 cycles 1110b = 14 cycles 1111b = 15 cycles (maximum allowed) This is meant for debug.
23:20	0h RO	**Reserved (RSVD_0):** Reserved
19:11	10Fh RW	**Initial Pull Up Calibration Value (INITPUCALVAL):** Initial pleg and nleg calibration values. RCOMP FSM will always start with these values for pullup and pulldown calibration. [8:0] Initial Pull Down Value (nleg) [10:9] Reserved [19:11] Initial Pull Up Value (pleg) [21:20] Reserved
10:9	0h RO	**Reserved (RSVD_1):** Reserved

(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** RCOMP reserved register

29.1618 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_176)—Offset 600h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1619 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_176)—Offset 604h

Access Method

29.1622 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_177)—Offset 610h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1630 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_187)—Offset 630h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1636 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_179)—Offset 648h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

29.1638 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_180)—Offset 650h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad
