29.737 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_144)—Offset A40h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved (RSVD_1):** Reserved
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.745 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_146)—Offset A60h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved (RSVD_1):** Reserved
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.753 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_148)—Offset A80h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.761 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_150)—Offset AA0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.

This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.773 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_153)—Offset AD0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:12	0h RO	**Reserved (RSVD_1):** Reserved
11:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	70h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	71h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.779 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_154)—Offset AE8h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	1h RO/V	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.781 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_155)—Offset AF0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved (RSVD_1):** Reserved
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.782 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_155)—Offset AF4h

Access Method

29.793 Pad Ownership (PAD_OWN_northwest_0)—Offset 20h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (RSVD_0):** Reserved
29:28	0h RW	**Pad Ownership (PAD_OWN_GPIO_7):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: o GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or o Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, IE and ISH do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into nsuccessful Completionstatus. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = ISH GPIO Mode. Same description as CSME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. '11' = IE GPIO Mode. Same description as CSME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. There is no SAI restriction on register read. This bit is used to enable the generation of IOSF-SB Virtual Wire (VW) message corresponding to pad input event. When either an edge or a level event is detected (refer to RxEdCfg, RxInv) on pad configured to GPIO Mode (PMode) input and the corresponding pad is under CSME, ISH or IE ownership (PAD_OWN), a VM message is delivered to the pad owner. This only has effect when the corresponding pad is under CSME, ISH or IE ownership (PAD_OWN). 0 = disable VM message generation 1 = enable VM message generation Bit assignment: Bit0 = Pad0 Bit1 = Pad1 Bit2 = Pad2 ... Bit N-1= Pad N-1

31	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_31):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_30):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
20	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_20):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

1	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_1):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_0):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.818 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_northwest_0)—Offset 84h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_31):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_30):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_29):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_28):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_27):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_26):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_25):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_24):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_19):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_18):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_17):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
16	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_16):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_15):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
14	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_14):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_13):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
12	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_12):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_11):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
10	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_10):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_9):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
8	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_8):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_7):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
6	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_6):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_5):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_4):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_3):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_2):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_1):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.819 Pad Configuration Lock (PADCFGLOCK_northwest_1)—Offset 88h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_63):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_62):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_61):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_60):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_59):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_58):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_57):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_56):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_36):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_35):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_34):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_33):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_32):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.820 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_northwest_1)—Offset 8Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_63):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_62):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_61):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_60):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_59):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_58):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_57):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_56):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_55):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_54):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_53):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_52):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_51):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_50):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_49):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
16	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_48):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_47):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
14	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_46):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_37):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_36):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_35):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_34):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_33):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_32):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.821 Pad Configuration Lock (PADCFGLOCK_northwest_2)—Offset 90h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock (PADCFGLOCK_vGPIO_15):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock (PADCFGLOCK_vGPIO_14):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock (PADCFGLOCK_vGPIO_13):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock (PADCFGLOCK_vGPIO_12):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
8	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_72):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_71):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
6	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_70):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_69):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock (PADCFGLOCK_GPIO_68):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. 29.822 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_northwest_2)—Offset 94h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_15):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
30	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_14):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
29	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_13):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
28	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_12):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_11):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
26	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_10):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_9):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
24	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_8):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_7):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_6):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_5):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_4):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_3):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_2):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_1):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
16	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_214):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
6	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_70):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_69):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_68):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_67):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
2	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_66):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_65):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPIO_64):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

29.823 Pad Configuration Lock (PADCFGLOCK_northwest_3)—Offset 98h

Access Method

Type: MSG Register
(Size: 32 bits)

29.824 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_northwest_3)—Offset 9Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved (RSVD_0):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_30):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
13	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_29):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_28):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
11	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_27):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_26):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.
9	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_25):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Note to BIOS: The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h. Refer to P2SB Cspec chapter ideband Message Interface Accesssection.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_vGPIO_24):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS[i] bit is set: If the system is in an S3-S5 state, the event will also wake the system. Refer to Cspec Chapter 16 Power Management. If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN[i] does not prevent the setting of GPI_GPE_STS[i]. Each bit position correspond to 1 pad in the Community: Bit0 = Pad0 Bit1 = Pad1 Bit2 = Pad2 ... Bit N-1= Pad N-1

29.925 Family Configuration Register (FAM_CFG_JTAGITP_1P8)—Offset 310h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: C00000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**drvmode (DRVMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
29:28	0h RO	**i2cen (I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
27	0h RO	**csen (CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
26	0h RO	**parkmodeen_b (PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
25:24	0h RO	**hysctl (HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
23	1h RO	**AZAMODELVHB (AZAMODELVHB):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
22	1h RO	**clinkenb (CLINKENB):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**v1p8mode (V1P8MODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**v1p5mode (V1P5MODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**hsmode (HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**odtupdn (ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
17	0h RO	**odten (ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
16	0h RO	**analogmuxen (ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the Pad Register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are family specific. Bits that aren't implemented or output of the CFIO are read only.
15	0h RO	**padtol (PADTOL):** PAD voltage tolerance: When padtol=0, v1p8mode = PAD and VCCIO both .3Vtolerance. v1p8mode = PAD and VCCIO both .8Vtolerance. When padtol=1, v1p8mode = PAD 1.8V tolerance and VCCIO .3Vtolerance.
14:12	0h RO	**strsel (STRSEL):** Pad driver impedance selection
11	0h RO	**Weak Leaker Pull-up (WEAKLEVEL):** v1p8mode = 0, Weak leaker Pull up to 0: vcca3p3_uhv 1: (vcca3p3_uhv - vtp). v1p8mode = 1, Weak pullup is always vcca1p8
10	0h RO	**floating ESD (FLOATINGESD):** If set to 1, the ESD supply will float between 3.3 and 1.8v to reduce power and provide isolation during ESD events. If set to 0, the ESD supply is shorted to 3.3v. During DFx mode like BSCAN, SCAN and etc, the ESD control shall be constrained to 0

29.985 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_0)—Offset 600h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.986 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_0)—Offset 604h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: C01000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RW	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	3h RW	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.989 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_1)—Offset 610h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	0h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.995 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_2)—Offset 628h

Access Method

Type: MSG Register

29.997 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_3)—Offset 630h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1005 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_5)—Offset 650h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1013 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_7)—Offset 670h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RO	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved (RSVD_1):** Reserved
10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1021 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_9)—Offset 690h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1033 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_12)—Offset 6C0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	4h RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	36h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1041 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_14)—Offset 6E0h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1049 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_16)—Offset 700h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1057 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_18)—Offset 720h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1065 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_20)—Offset 740h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

29.1070 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_21)—Offset 754h

Access Method

Type: MSG Register
(Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RO	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved
13:10	Ch RW	**Termination (TERM):** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0 000: none 0 010: 5k wpd 0 100: 20k wpd 1 000: none 1 001: 1k wpu 1 011: 2k wpu 1 010: 5k wpu 1 100: 20k wpu 1 101: 1k & 2k wpu 1 111: (optional) Native controller selected by Pad Mode controls the Termination All others reserved. If a reserved value is programmed, pad may malfunction. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in sw/fw in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, wpu/wpd settings should be programmed first to ensure the input does not float momentarily.
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	3Fh RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported

29.1071 Pad Configuration DW2 (PAD_CFG_DW2_GPIO_21)—Offset 758h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Reserved (RSVD_0):** Reserved
10	0h RO	**Bus Hold Enable (BUSHLDEN):** 1 = enable bus hold 0 = disable bus hold
9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: low voltage 1: high voltage
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4:1	0h RW	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RW	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

31:0	0h RO	**rsvd (RSVD):** PAD CFG reserved register DW3

29.1073 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_22)—Offset 760h

Access Method

Type: MSG Register
(Size: 32 bits)

Default: 44000100h

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b Note: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Reserved (RSVD_0):** Reserved
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller . 0h = Level 1h = Edge 2h = Drive '0' 3h = Either rising edge or failing edge
24	0h RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0h RW	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:14	0h RO	**Reserved (RSVD_1):** Reserved
13:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15 control the Pad
9	0h RW	**GPIO RX Disable (GPIORXDIS):** 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved (RSVD_2):** Reserved
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and hardware debouncer (if any) and is not affected by PMode and RXINV settings.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad
