3	1h RW	**SMB_ALERT_DISABLE (SMB_ALERT_DISABLE):** Disables GP/SMBALERT# as an alert source for the heartbeats and the SMBus slave. At reset (RSMRST# pin assertion only), this bit is set and the muxed GP/SMBALERT# are disabled.

Bit Range	Default & Access	Field Name (ID): Description
2:1	0h RW	**INTRD_SEL (INTRD_SEL):** Selects the action to take if the INTRUDER# signal goes active. 11 Reserved 01 Interrupt (as selected by TCO_INT_SEL). 10 SMI# 00 INTRUDER# doesn't cause SMI# or interrupt
0	0h RO	**Reserved (RSVD_1)**

7.46 TCO_MESSAGE1 and TCO_MESSAGE2 (TMSG)—Offset Ch

BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress TCOBASE+0Ch (MSG1) TCOBASE+0Dh (MSG2) BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**TCO_MESSAGE2 (MSG2):** BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress.
7:0	0h RW	**TCO_MESSAGE1 (MSG1):** BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress.

7.47 TCO_WDSTATUS Register (TWDS)—Offset Eh

The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external microcontroller can read this register to monitor boot progress.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**TCO_WDSTATUS Register (TWDS):** The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external microcontroller can read this register to monitor boot progress.

7.48 Reserved_1 (RSV_1)—Offset Fh

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Reserved (RSVD)**

7.49 LEGACY_ELIM Register (LE)—Offset 10h

Contains the IRQ1_CAUSE and IRQ2_CAUSE bits.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RO	**Reserved (RSVD)**
1	1h RW	**IRQ12_CAUSE (IRQ12_CAUSE):** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1.
0	1h RW	**IRQ1_CAUSE (IRQ1_CAUSE):** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1.

7.50 Reserved_2 (RSV_2)—Offset 11h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Reserved (RSVD)**

7.51 TCO_TMR Register (TTMR)—Offset 12h

Value that is loaded into the timer each time the TCO_RLD register is written. The values in this register have no effects on the TCO Timer hardware.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved (RSVD)**
9:0	4h RW	**TCOTMR (TCOTMR):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. Note: The timer has an error of +/- 1 tick (0.6s).

7.52 Reserved_3 (RSV_3)—Offset 14h

Access Method

Type: IO Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0h RO	**Reserved (RSVD)**

7.53 Reserved_4 (RSV_4)—Offset 1Ch

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD)**

§ §

8 LPC Registers

This chapter documents the registers in Bus: 0, Device 31, Function 0.

8.1 ID — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO/V	**Device Identification 6 (DID_6):** Device Identification 6 is hardware reset to 9'b000000000. It can be overridden by the SetID IOSF-SB Message.
22:21	0h RO/V	**Device Identification 5 (DID_5):** Device Identification 5 is hardwired to 2'b11.
20	0h RO/V	**Device Identification 4 (DID_4):** Device Identification 4 is set by the dtfus_core_lpcdid[4] fuse.
19	0h RO/V	**Device Identification 3 (DID_3):** Device Identification 3 is set by the dtfus_core_lpcdid[3] fuse.
18	0h RO/V	**Device Identification 2 (DID_2):** Device Identification 2 is set by the dtfus_core_lpcdid[2] fuse.
17	0h RO/V	**Device Identification 1 (DID_1):** Device Identification 1 is set by the dtfus_core_lpcdid[1] fuse.
16	0h RO/V	**Device Identification 0 (DID_0):** Device Identification 0 is set by the dtfus_core_lpcdid[0] fuse.
15:0	0h RO	**Vendor Identification (VID):** Indicates Intel.

8.2 Device Command (CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RO	**Interrupt Disable (ID):** The LPC bridge has no interrupts to disable.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0 per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0 per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected on backbone interface.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved as 0 per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved as 0 per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0 per PCI-Express spec.
2	0h RO	**Bus Master Enable (BME):** Bus Masters cannot be disabled.
1	0h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	0h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

8.3 Status (STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:0] + 6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
14	0h RW/1C	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
13	0h RO	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone. LPC is a target only controller.
12	0h RO	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone. LPC is a target only controller.
11	0h RW/1C	**Signalled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
10:9	0h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.
8	0h RW/1C	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
7	0h RO	**Fast Back to Back Capable (FBC):** Reserved - bit has no meaning on internal backbone.
6	0h RO	**Reserved (RSVD):** Reserved
5	0h RO	**66 MHz Capable (C66):** Reserved - bit has no meaning on internal backbone.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
3	0h RO	**Interrupt Status (IS):** The LPC bridge does not generate interrupts.
2:0	0h RO	**Reserved (RSVD_1):** Reserved

8.4 Revision ID (RID) — Offset 8h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but is expected to be overridden by the SetID IOSF-SB message.

8.5 Class Code (CC) — Offset 9h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 9h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:16	0h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
15:8	0h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
7:0	0h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.

8.6 Primary Latency Timer (PLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Master Latency Count (MLC):** Reserved per 3GIO spec.
2:0	0h RO	**Reserved (RSVD):** Reserved

8.7 Header Type (HTYPE) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** This bit is 1 to indicate a multifunction device.
6:0	0h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.

8.8 Sub System Identifiers (SS) — Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

8.9 Capability List Pointer (CAPP) — Offset 34h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

8.10 Serial IRQ Control (SCNT) — Offset 64h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EN:** When set, serial IRQs will be recognized.
6	0h RW	**Mode (MD):** When set, the serial IRQ machine will be in continuous mode. When cleared, the serial IRQ machine will be in quiet mode. When setting the EN bit, this bit must also be written as a one to guarantee that the first action of the serial IRQ machine will be a start frame.
5:2	0h RO	**Frame Size (FS):** Fixed field that indicates the size of the SERIRQ frame as 21 frames.
1:0	0h RW	**Start Frame Pulse Width (SFPW):** This is the number of 33 MHz clocks that the SERIRQ pin will be driven low by the Serial IRQ controller to signal a start frame. In continuous mode, the controller will drive the start frame for the number of clocks specified. In quiet mode, the controller will drive the start frame for the number of clocks specified minus one, as the first clock was driven by the peripheral. Bits Clocks • 00: 4 • 01: 6 • 10: 8 • 11: Reserved

8.11 B-Unit Copy of the I/O Decode Ranges Register for LPC (B_CR_IOD_IOE_LPC) — Offset 80h

Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW/V	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
24	0h RW/V	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RO	**Reserved (RSVD):** Reserved
19	0h RW/V	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE.
18	0h RW/V	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
17	0h RW/V	**Com Port B Enable (CBE):** Enables decoding of the ComB range to LPC. Range is selected LIOD.CB.
16	0h RW/V	**Com Port A Enable (CAE):** Enables decoding of the ComA range to LPC. Range is selected LIOD.CA.
15:13	0h RO	**Reserved (RSVD):** Reserved
12	0h RW/V	**FDD:** The following table describes which range to decode for the FDD Port. • 0 => 3F0h-3F5h, 3F7h (Primary) • 1 => 370h-375h, 377h (Secondary)
11:10	0h RO	**Reserved (RSVD):** Reserved
9:8	0h RW/V	**LPT:** The following table describes which range to decode for the LPT Port. • 00: 378h-37Fh and 778h-77Fh • 01: 278h-27Fh (port 279h is read only) and 678h-67Fh • 10: 3BCh-3BEh and 7BCh-7BEh • 11: Reserved
7	0h RO	**Reserved (RSVD):** Reserved
6:4	0h RW/V	**ComB Range (CB):** The following table describes which range to decode for the ComB Port. • 000: 3F8h-3FFh (COM 1) • 001: 2F8h-2FFh (COM 2) • 010: 220h-227h • 011: 228h-22Fh • 100: 238h-23Fh • 101: 2E8h-2EFh (COM 4) • 110: 338h-33Fh • 111: 3E8h-3EFh (COM 3)
3	0h RO	**Reserved (RSVD):** Reserved
2:0	0h RW/V	**ComA Range (CA):** The following table describes which range to decode for the ComA Port. • 000: 3F8h-3FFh (COM 1) • 001: 2F8h-2FFh (COM 2) • 010: 220h-227h • 011: 228h-22Fh • 100: 238h-23Fh • 101: 2E8h-2EFh (COM 4) • 110: 338h-33Fh • 111: 3E8h-3EFh (COM 3)

8.12 I/O Enables (IOE) — Offset 82h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:0] + 82h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
12	0h RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
11	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
10	0h RW	**KE:** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
9	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE
2	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
1	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB.
0	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA.

8.13 B_LGIR1_LPC (B_CR_LGIR1_LPC) — Offset 84h

B-Unit copy of the LPC Generic I/O Range #1 register for LPC. Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

8.14 B_LGIR2_LPC (B_CR_LGIR2_LPC) — Offset 88h

B-Unit copy of the LPC Generic I/O Range #2 register for LPC. Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

8.15 B_LGIR3_LPC (B_CR_LGIR3_LPC) — Offset 8Ch

B-Unit copy of the LPC Generic I/O Range #3 register for LPC. Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 8Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

8.16 B_LGIR4_LPC (B_CR_LGIR4_LPC) — Offset 90h

B-Unit copy of the LPC Generic I/O Range #4 register for LPC. Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW/V	**Address [15:2] (ADDR_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

8.17 USB Legacy Keyboard/Mouse Control (ULKMC) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW/1C	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14	0h RO	**Reserved (RSVD_1):** Reserved
13	0h RW	**Reserved (RSVD_2):** Reserved
12	0h RO	**Reserved (RSVD_3):** Reserved
11	0h RW/1C	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.
10	0h RW/1C	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0h RW/1C	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.
8	0h RW/1C	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0h RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0h RO	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.
5	0h RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function. When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.
4	0h RW	**Reserved (RSVD_4):** Reserved
3	0h RW	**SMI on Port 64 Writes Enable (S64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0h RW	**SMI on Port 64 Reads Enable (S64REN):** When set, a 1 in bit 10 will cause an SMI event.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**SMI on Port 60 Writes Enable (S60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (S60REN):** When set, a 1 in bit 8 will cause an SMI event.

8.18 B-Unit Copy of the LPC Generic Memory Range Register for LPC (B_CR_LGMR_LPC) — Offset 98h

Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/V	**Memory Address [31:16] (ADDR_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Memory Range Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC.

8.19 Reserved (RSVD) — Offset 9Ch

Reserved.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

8.20 B-Unit Copy of the eSPI CS1# Generic I/O Range #1 (B_CR_PCCS1GIR1_ESPI) — Offset A4h

Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:18	0h RW/V	**Address [7:2] Mask (ADDR_MASK_7_2):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW/V	**Address[15:2] (ADDR_15_2):** DWord-aligned address. Note: PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC (eSPI).

8.21 B-Unit Copy of the eSPI CS1# Generic Memory Range #1 Register (B_CR_PCCS1GMR1_ESPI) — Offset A8h

Affects B-Unit SAD for LPC regions.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/V	**Memory Address [31:16] (ADDR_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC (eSPI) as standard LPC Memory Cycle, if enabled.
15:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW/V	**LPC Memory Range Decode Enable (EN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to LPC (eSPI).

8.22 FWH ID Select #1 (FS1) — Offset D0h

This register contains the IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**F8-FF IDSEL (IF8):** IDSEL to use in FWH cycle for range enabled by BDE.EF8.
27:24	0h RW	**F0-F7 IDSEL (IF0):** IDSEL to use in FWH cycle for range enabled by BDE.EF0.
23:20	0h RW	**E8-EF IDSEL (IE8):** IDSEL to use in FWH cycle for range enabled by BDE.EE8.
19:16	0h RW	**E0-E7 IDSEL (IE0):** IDSEL to use in FWH cycle for range enabled by BDE.EE0.
15:12	0h RW	**D8-DF IDSEL (ID8):** IDSEL to use in FWH cycle for range enabled by BDE.ED8.
11:8	0h RW	**D0-D7 IDSEL (ID0):** IDSEL to use in FWH cycle for range enabled by BDE.ED0.
7:4	0h RW	**C8-CF IDSEL (IC8):** IDSEL to use in FWH cycle for range enabled by BDE.EC8.
3:0	0h RW	**C0-C7 IDSEL (IC0):** IDSEL to use in FWH cycle for range enabled by BDE.EC0.

8.23 FWH ID Select #2 (FS2) — Offset D4h

This register contains the additional IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:31, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**70-7F IDSEL (I70):** IDSEL to use in FWH cycle for range enabled by BDE.E70.
11:8	0h RW	**60-6F IDSEL (I60):** IDSEL to use in FWH cycle for range enabled by BDE.E60.
7:4	0h RW	**50-5F IDSEL (I50):** IDSEL to use in FWH cycle for range enabled by BDE.E50.
3:0	0h RW	**40-4F IDSEL (I40):** IDSEL to use in FWH cycle for range enabled by BDE.E40.

8.24 B-Unit Copy of the BIOS Decode Enable Register for LPC (B_CR_BDE_LPC) — Offset D8h

Affects B-Unit SAD for BIOS regions only when BIOS is resident in LPC.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + D8h	FFCF h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RESERVED_0):** Reserved
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS ranges: FFF80000h-FFFFFFFFh and FFB80000h-FFBFFFFFh.
14	1h RW/V	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS ranges: FFF00000h-FFF7FFFFh and FFB00000h-FFB7FFFFh.
13	1h RW/V	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS ranges: FFE80000h-FFEFFFFFh and FFA80000h-FFAFFFFFh.
12	1h RW/V	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS ranges: FFE00000h-FFE7FFFFh and FFA00000h-FFA7FFFFh.
11	1h RW/V	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS ranges: FFD80000h-FFDFFFFFh and FF980000h-FF9FFFFFh.
10	1h RW/V	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS ranges: FFD00000h-FFD7FFFFh and FF900000h-FF97FFFFh.
9	1h RW/V	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS ranges: FFC80000h-FFCFFFFFh and FF880000h-FF8FFFFFh.
8	1h RW/V	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS ranges: FFC00000h-FFC7FFFFh and FF800000h-FF87FFFFh.
7	1h RW/V	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h-FFFFFh.
6	1h RW/V	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h-EFFFFh.
5:4	0h RO	**Reserved (RESERVED_1):** Reserved
3	1h RW/V	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS ranges: FF700000h-FF7FFFFFh and FF300000h-FF3FFFFFh.
2	1h RW/V	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS ranges: FF600000h-FF6FFFFFh and FF200000h-FF2FFFFFh.
1	1h RW/V	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS ranges: FF500000h-FF5FFFFFh and FF100000h-FF1FFFFFh.
0	1h RW/V	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS ranges: FF400000h-FF4FFFFFh and FF000000h-FF0FFFFFh.

8.25 BIOS Control (BC) — Offset DCh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:31, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. BIOS Note: This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0h RW/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. • 0: SPI • 1: LPC When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.
5	0h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit [5] is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880[0]) must be 1 also. If this bit [5] is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care.
4	0h RO	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH), then the Boot Block size is 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. *If PCH is strapped for Top-Swap (GNT[3]# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. BIOS Note: [list=1]

8.26 RBR (RBR)—Offset 0h

Receive Buffer Register

Access Method

Type: MEM Register

8.33 LCR (LCR)—Offset Ch

Line Control Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW	**DLAB (DLAB):** Divisor Latch Access Bit. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART. This bit must be cleared after initial baud rate setup in order to access other registers. Reset Value: 0x0
6	0h RW	**Break (Break):** Break Control Bit.This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low. Reset Value: 0x0
5	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**EPS (EPS):** Even Parity Select. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked. Reset Value: 0x0
3	0h RW	**PEN (PEN):** Parity Enable. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively. 0 = parity disabled 1 = parity enabled Reset Value: 0x0
2	0h RW	**STOP (STOP):** Number of stop bits. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit. 0 = 1 stop bit 1 = 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit Reset Value: 0x0
1:0	0h RW	**DLS (DLS):** Data Length Select. If UART_16550_COMPATIBLE == NO, then writeable only when UART is not busy (USR[0] is zero); otherwise always writable, always readable. This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows: 00 = 5 bits 01 = 6 bits 10 = 7 bits 11 = 8 bits Reset Value: 0x0

8.34 MCR (MCR)—Offset 10h

Modem Control Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**AFCE (AFCE):** Auto Flow Control Enable. Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in Auto Flow Control on page 37. 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled Reset Value: 0x0
4	0h RW	**LoopBack (LoopBack):** LoopBack Bit. This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line. Reset Value: 0x0
3	0h RW	**OUT2 (OUT2):** OUT2. This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: 0 = out2_n de-asserted (logic 1) 1 = out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
2	0h RW	**OUT1 (OUT1):** OUT1. This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: 0 = out1_n de-asserted (logic 1) 1 = out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0
1	0h RW	**RTS (RTS):** Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high.In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**DTR (DTR):** Data Terminal Ready. This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: 0 = dtr_n de-asserted (logic 1) 1 = dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0

8.35 LSR (LSR)—Offset 14h

Line Status Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW	**RFE (RFE):** Receiver FIFO Error bit. This bit is only relevant when FIFO_MODE != NONE AND FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO. Reset Value: 0x0
6	1h RW	**TEMT (TEMT):** Transmitter Empty bit. If in FIFO mode (FIFO_MODE != NONE) and FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**THRE (THRE):** Transmit Holding Register Empty bit. If THRE_MODE_USER == Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. For more details, see Programmable THRE Interrupt on page 40. Reset Value: 0x1
4	0h RW	**BI (BI):** Break Interrupt bit. This is used to indicate the detection of a break sequence on the serial input data. If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. Reset Value: 0x0
3	0h RW	**FE (FE):** Framing Error bit. This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no framing error 1 = framing error Reading the LSR clears the FE bit. Reset Value: 0x0
2	0h RW	**PE (PE):** Parity Error bit. This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). 0 = no parity error 1 = parity error Reading the LSR clears the PE bit. Reset Value: 0x0

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**OE (OE):** Overrun error bit. This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. 0 = no overrun error 1 = overrun error Reading the LSR clears the OE bit. Reset Value: 0x0
0	0h RW	**DR (DR):** Data Ready bit. This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. 0 = no data ready 1 = data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode. Reset Value: 0x0

8.36 MSR (MSR)—Offset 18h

Modem Status Register

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**scr (scr):** This register is for programmers to use as a temporary storage space. It has no defined purpose in the DW_apb_uart. Reset Value: 0x0

8.38 SRBR_STHR0 (SRBR_STHR0)—Offset 30h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 0

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**srbr_sthr0 (srbr_sthr0):** This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If in non-FIFO mode (FIFO_MODE == NONE) or FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error. If in FIFO mode (FIFO_MODE != NONE) and FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data is lost. An overrun error also occurs. Reset Value: 0x0

8.39 SRBR_STHR1 (SRBR_STHR1)—Offset 34h

Shadow Receive Buffer Register and Shadow Transmit Holding Register 1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.

8.54 FAR (FAR)—Offset 70h

FIFO Access Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**srbr_sthr (srbr_sthr):** Writes have no effect when FIFO_ACCESS == No, always readable. This register is use to enable a FIFO access mode for testing, so that the receive FIFO can be written by the master and the transmit FIFO can be read by the master when FIFOs are implemented and enabled. When FIFOs are not implemented or not enabled it allows the RBR to be written by the master and the THR to be read by the master. 0 = FIFO access mode disabled 1 = FIFO access mode enabled Note, that when the FIFO access mode is enabled/disabled, the control portion of the receive FIFO and transmit FIFO is reset and the FIFOs are treated as empty. Reset Value: 0x0

8.55 TFR (TFR)—Offset 74h

Transmit FIFO Read

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**tfr (tfr):** Transmit FIFO Read. These bits are only valid when FIFO access mode is enabled (FAR[0] is set to one). When FIFOs are implemented and enabled, reading this register gives the data at the top of the transmit FIFO. Each consecutive read pops the transmit FIFO and gives the next data value that is currently at the top of the FIFO. When FIFOs are not implemented or not enabled, reading this register gives the data in the THR. Reset Value: 0x0

8.56 RFW (RFW)—Offset 78h

Receive FIFO Write

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h NA	**Reserved (Res_31_10)**
9	0h WO	**RFFE (RFFE)**
8	0h WO	**RFPE (RFPE)**
7:0	0h WO	**RFWD (RFWD)**

8.57 USR (USR)—Offset 7Ch

UART Status Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RO	**RFF (RFF):** Receive FIFO Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO is completely full. 0 = Receive FIFO not full 1 = Receive FIFO Full This bit is cleared when the RX FIFO is no longer full. Reset Value: 0x0
3	0h RO	**RFNE (RFNE):** Receive FIFO Not Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the receive FIFO contains one or more entries. 0 = Receive FIFO is empty 1 = Receive FIFO is not empty This bit is cleared when the RX FIFO is empty. Reset Value: 0x0
2	1h RO	**TFE (TFE):** Transmit FIFO Empty. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO is completely empty. 0 = Transmit FIFO is not empty 1 = Transmit FIFO is empty This bit is cleared when the TX FIFO is no longer empty. Reset Value: 0x1

Bit Range	Default & Access	Field Name (ID): Description
1	1h RO	**TFNF (TFNF):** Transmit FIFO Not Full. This bit is only valid when FIFO_STAT == YES. This is used to indicate that the transmit FIFO in not full. 0 = Transmit FIFO is full 1 = Transmit FIFO is not full This bit is cleared when the TX FIFO is full. Reset Value: 0x1
0	0h RO	**BUSY (BUSY):** UART Busy. This bit is valid only when UART_16550_COMPATIBLE == NO and indicates that a serial transfer is in progress, ; when cleared, indicates that the DW_apb_uart is idle or inactive. 0 = DW_apb_uart is idle or inactive 1 = DW_apb_uart is busy (actively transferring data) NOTE: It is possible for the UART Busy bit to be cleared even though a new character may have been sent from another device. That is, if the DW_apb_uart has no data in THR and RBR and there is no transmission in progress and a start bit of a new character has just reached the DW_apb_uart. This is due to the fact that a valid start is not seen until the middle of the bit period and this duration is dependent on the baud divisor that has been programmed. If a second system clock has been implemented (CLOCK_MODE == Enabled), the assertion of this bit is also delayed by several cycles of the slower clock. Reset Value: 0x0

8.58 TFL (TFL)—Offset 80h

Transmit FIFO Level

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO	**tfl (tfl):** Transmit FIFO Level. This is indicates the number of data entries in the transmit FIFO. Reset Value: 0x0

8.59 RFL (RFL)—Offset 84h

Receive FIFO Level

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO	**rfl (rfl):** Receive FIFO Level. This is indicates the number of data entries in the receive FIFO. Reset Value: 0x0

8.60 SRR (SRR)—Offset 88h

Software Reset Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW	**XFR (XFR):** XMIT FIFO Reset. This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.
1	0h RW	**RFR (RFR):** RCVR FIFO Reset. This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.
0	0h RW	**UR (UR):** UART Reset. This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0

8.61 SRTS (SRTS)—Offset 8Ch

Shadow Request to Send

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**srts (srts):** Shadow Request to Send. This is a shadow register for the RTS bit (MCR[1]), this can be used to remove the burden of having to performing a read-modify-write on the MCR. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the DW_apb_uart is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] = 0), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] = 1) and FIFOs enable (FCR[0] = 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). Note that in Loopback mode (MCR[4] = 1), the rts_n output is held inactive-high while the value of this location is internally looped back to an input. Reset Value: 0x0

8.62 SBCR (SBCR)—Offset 90h

Shadow Break Control Bit. This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE == Enabled and active (MCR[6] = 1) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver. Reset Value: 0x0

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**sbcb (sbcb):** Shadow Break Control Register

8.63 SDMAM (SDMAM)—Offset 94h

Shadow DMA Mode

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**sdmam (sdmam):** Shadow DMA Mode. This is a shadow register for the DMA mode bit (FCR[3]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the DMA Mode bit gets updated. This determines the DMA signalling mode used for the dma_tx_req_n and dma_rx_req_n output signals when additional DMA handshaking signals are not selected (DMA_EXTRA == NO). 0 = mode 0 1 = mode 1 Reset Value: 0x0

8.64 SFE (SFE)—Offset 98h

Shadow FIFO Enable

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**sfe (sfe):** Shadow FIFO Enable. This is a shadow register for the FIFO enable bit (FCR[0]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the FIFO enable bit gets updated.This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. If this bit is set to zero (disabled) after being enabled then both the XMIT and RCVR controller portion of FIFOs are reset. Reset Value: 0x0

8.65 SRT (SRT)—Offset 9Ch

Shadow RCVR Trigger

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RW	**srt (srt):** Shadow RCVR Trigger. This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO full 10 = FIFO full 11 = FIFO 2 less than full Reset Value: 0x0

8.66 STET (STET)—Offset A0h

Shadow TX Empty Trigger. This is a shadow register for the TX empty trigger bits (FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO full 11 = FIFO full Reset Value: 0x0 Dependencies: Writes have no effect when THRE_MODE_USER == Disabled.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RW	**stet (stet):** Shadow TX Empty Trigger

8.67 HTX (HTX)—Offset A4h

Halt TX

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**htx (htx):** This register is use to halt transmissions for testing, so that the transmit FIFO can be filled by the master when FIFOs are implemented and enabled. 0 = Halt TX disabled 1 = Halt TX enabled Note, if FIFOs are implemented and not enabled, the setting of the halt TX register has no effect on operation. Reset Value: 0x0 Dependencies: Writes have no effect when FIFO_MODE == None.

8.68 DMASA (DMASA)—Offset A8h

DMA Software Acknowledge

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h WO	**dmasa (dmasa):** This register is use to perform a DMA software acknowledge if a transfer needs to be terminated due to an error condition. For example, if the DMA disables the channel, then the DW_apb_uart should clear its request. This causes the TX request, TX single, RX request and RX single signals to de-assert. Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 Dependencies: Writes have no effect when DMA_EXTRA == No.

8.69 CPR (CPR)—Offset F4h

Component Parameter Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 43F32h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	4h RO	**FIFO_MODE (FIFO_MODE):** 0x00 = 0 0x01 = 16 0x02 = 32 to 0x80 = 2048 0x81- 0xff = reserved
15:14	0h RO	Reserved.
13	1h RO	**DMA_EXTRA (DMA_EXTRA):** 0 = FALSE, 1 = TRUE
12	1h RO	**UART_ADD_ENCODED_PARAMS (UART_ADD_ENCODED_PARAMS):** 0 = FALSE, 1 = TRUE
11	1h RO	**SHADOW (SHADOW):** 0 = FALSE, 1 = TRUE
10	1h RO	**FIFO_STAT (FIFO_STAT):** 0 = FALSE, 1 = TRUE
9	1h RO	**FIFO_ACCESS (FIFO_ACCESS):** 0 = FALSE, 1 = TRUE
8	1h RO	**ADDITIONAL_FEAT (ADDITIONAL_FEAT):** 0 = FALSE, 1 = TRUE
7	0h RO	**SIR_LP_MODE (SIR_LP_MODE):** 0 = FALSE, 1 = TRUE
6	0h RO	**SIR_MODE (SIR_MODE):** 0 = FALSE, 1 = TRUE
5	1h RO	**THRE_MODE (THRE_MODE):** 0 = FALSE, 1 = TRUE
4	1h RO	**AFCE_MODE (AFCE_MODE):** 0 = FALSE, 1 = TRUE
3:2	0h RO	Reserved.
1:0	2h RO	**APB_DATA_WIDTH (APB_DATA_WIDTH):** 00 = 8 bits 01 = 16 bits 10 = 32 bits 11 = reserved

8.70 UCV (UCV)—Offset F8h

UART Component Version

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 3331342Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	3331342Ah RO	**UART (UART):** ASCII value for each number in the version, followed by *. For example 32_30_31_2A represents the version 2.01* Reset Value: See the releases table in the AMBA 2 release notes.

8.71 CTR (CTR)—Offset FCh

Component Type Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 44570110h

Bit Range	Default & Access	Field Name (ID): Description
31:0	44570110h RO	**PeripheralID (PeripheralID):** This register contains the peripherals identification code. Reset Value: 0x44570110

8.72 RID - Bridge revision ID Register (RID)—Offset 30h

register contains the Bridge Revision ID

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	0h RO	**RID:** Revision ID of the Bridge.

8.73 GEN_REGRW1 - General Purpose register (GEN_REGRW1)—Offset 600h

General Purpose PRV RW Register 1.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:** This register value is brought out as oob_gen_prv_rw_reg1 out of band signal

8.74 GEN_REGRW2 - General Purpose register (GEN_REGRW2)—Offset 604h

General Purpose PRV RW Register 2.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:** This register value is brought out as oob_gen_prv_rw_reg2 out of band signal

8.75 GEN_REGRW3 - General Purpose register (GEN_REGRW3)—Offset 608h

General Purpose PRV RW Register 3.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:** This register value is brought out as oob_gen_prv_rw_reg3 out of band signal

8.76 GEN_REGRW4 - General Purpose register (GEN_REGRW4)—Offset 60Ch

General Purpose PRV RW Register 4.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:** This register value is brought out as oob_gen_prv_rw_reg4 out of band signal

8.77 Identifiers (ID)—Offset 0h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 608086h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO/V	**Device Identification 6 (DID_6):** Device Identification 6 is hardware reset to 9'b000000000. It can be overridden by the SetID IOSF-SB Message. Note: Refer to chapter 6s global DevID table for details.
22:21	3h RO/V	**Device Identification 5 (DID_5):** Device Identification 5 is hardwired to 2'b11.
20	0h RO/V	**Device Identification 4 (DID_4):** Device Identification 4 is set by the dtfus_core_lpcdid[4] fuse. Note: Refer to chapter 6s global DevID table for details.
19	0h RO/V	**Device Identification 3 (DID_3):** Device Identification 3 is set by the dtfus_core_lpcdid[3] fuse. Note: Refer to chapter 6s global DevID table for details.
18	0h RO/V	**Device Identification 2 (DID_2):** Device Identification 2 is set by the dtfus_core_lpcdid[2] fuse. Note: Refer to chapter 6s global DevID table for details.
17	0h RO/V	**Device Identification 1 (DID_1):** Device Identification 1 is set by the dtfus_core_lpcdid[1] fuse. Note: Refer to chapter 6s global DevID table for details.
16	0h RO/V	**Device Identification 0 (DID_0):** Device Identification 0 is set by the dtfus_core_lpcdid[0] fuse. Note: Refer to chapter 6s global DevID table for details.
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel.

8.78 Device Command (CMD)—Offset 4h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 31
Function: 0

Default: 7h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved.
10	0h RO	**Interrupt Disable (ID):** The LPC bridge has no interrupts to disable.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0 per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0 per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected on backbone interface.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved as 0 per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved as 0 per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0 per PCI-Express spec.
2	1h RO	**Bus Master Enable (BME):** Bus Masters cannot be disabled.
1	1h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	1h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

8.79 Status (STS)—Offset 6h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 31
Function: 0

Default: 200h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
14	0h RW/1C	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone. LPC is a target only controller.
12	0h RO	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone. LPC is a target only controller.
11	0h RW/1C	**Signalled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
10:9	1h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.
8	0h RW/1C	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
7	0h RO	**Fast Back to Back Capable (FBC):** Reserved - bit has no meaning on internal backbone.
6	0h RO	**Reserved (RSVD):** Reserved.
5	0h RO	**66 MHz Capable (C66):** Reserved - bit has no meaning on internal backbone.
4	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
3	0h RO	**Interrupt Status (IS):** The LPC bridge does not generate interrupts.
2:0	0h RO	**Reserved (RSVD_1):** Reserved.

8.80 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but is expected to be overridden by the SetID IOSF-SB message.

8.81 Class Code (CC)—Offset 9h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 60100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
15:8	1h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
7:0	0h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.

8.82 Primary Latency Timer (PLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	**Master Latency Count (MLC):** Reserved per 3GIO spec.
2:0	0h RO	**Reserved (RSVD):** Reserved.

8.83 Header Type (HTYPE)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate a multifunction device.
6:0	0h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.

8.84 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

8.85 Capability List Pointer (CAPP)—Offset 34h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

8.86 Serial IRQ Control (SCNT)—Offset 64h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 31
Function: 0

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Enable (EN):** When set, serial IRQs will be recognized.
6	0h RW	**Mode (MD):** When set, the serial IRQ machine will be in continuous mode. When cleared, the serial IRQ machine will be in quiet mode. When setting the EN bit, this bit must also be written as a one to guarantee that the first action of the serial IRQ machine will be a start frame.

Bit Range	Default & Access	Field Name (ID): Description
5:2	4h RO	**Frame Size (FS):** Fixed field that indicates the size of the SERIRQ frame as 21 frames.
1:0	0h RW	**Start Frame Pulse Width (SFPW):** This is the number of 33 MHz clocks that the SERIRQ pin will be driven low by the Serial IRQ controller to signal a start frame. In continuous mode, the controller will drive the start frame for the number of clocks specified. In quiet mode, the controller will drive the start frame for the number of clocks specified minus one, as the first clock was driven by the peripheral. Bits Clocks • 00: 4 • 01: 6 • 10: 8 • 11: Reserved

8.87 I/O Decode Ranges (IOD)—Offset 80h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Reserved (RSVD):** Reserved.
12	0h RW	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port. Bits Decode Range • 0 3F0h - 3F5h, 3F7h (Primary) • 1 370h - 375h, 377h (Secondary)
11:10	0h RO	**Reserved (RSVD_1):** Reserved.
9:8	0h RW	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port: Bits Decode Range • 00 378h - 37Fh and 778h - 77Fh • 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh • 10 3BCh - 3BEh and 7BCh - 7BEh • 11 Reserved
7	0h RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
6:4	0h RW	**ComB Range (CB):** The following table describes which range to decode for the COMB Port. Bits Decode Range • 000 3F8h - 3FFh (COM 1) • 001 2F8h - 2FFh (COM 2) • 010 220h - 227h • 011 228h - 22Fh • 100 238h - 23Fh • 101 2E8h - 2EFh (COM 4) • 110 338h - 33Fh • 111 3E8h - 3EFh (COM 3)
3	0h RO	**Reserved (RSVD_3):** Reserved.
2:0	0h RW	**ComA Range (CA):** The following table describes which range to decode for the COMA Port. Bits Decode Range • 000 3F8h - 3FFh (COM 1) • 001 2F8h - 2FFh (COM 2) • 010 220h - 227h • 011 228h - 22Fh • 100 238h - 23Fh • 101 2E8h - 2EFh (COM 4) • 110 338h - 33Fh • 111 3E8h - 3EFh (COM 3)

8.88 I/O Enables (IOE)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Reserved (RSVD):** Reserved.
13	0h RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
12	0h RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
11	0h RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
10	0h RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0h RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by LIOD.FDE
2	0h RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by LIOD.LPT.
1	0h RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected LIOD.CB.
0	0h RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected LIOD.CA.

8.89 LPC Generic I/O Range #1 (LGIR1)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved.
23:18	0h RW	**Address[7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD_1):** Reserved.
15:2	0h RW	**Address[15:2] (Address_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD_2):** Reserved.
0	0h RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

8.90 LPC Generic I/O Range #2 (LGIR2)—Offset 88h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved.
23:18	0h RW	**Address[7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD_1):** Reserved.
15:2	0h RW	**Address[15:2] (Address_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD_2):** Reserved.
0	0h RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

8.91 LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved.
23:18	0h RW	**Address[7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD_1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RW	**Address[15:2] (Address_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD_2):** Reserved.
0	0h RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

8.92 LPC Generic I/O Range #4 (LGIR4)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved.
23:18	0h RW	**Address[7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0h RO	**Reserved (RSVD_1):** Reserved.
15:2	0h RW	**Address[15:2] (Address_15_2):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level.
1	0h RO	**Reserved (RSVD_2):** Reserved.
0	0h RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

8.93 USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved.
15	0h RW/1C	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14	0h RO	**Reserved (RSVD_1):** Reserved.
13	0h RW	**Reserved (RSVD_2):** Reserved.
12	0h RO	**Reserved (RSVD_3):** Reserved.
11	0h RW/1C	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.
10	0h RW/1C	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0h RW/1C	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. Note that the A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.
8	0h RW/1C	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. Note that even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0h RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0h RO	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function. When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.
4	0h RW	**Reserved (RSVD_4):** Reserved.
3	0h RW	**SMI on Port 64 Writes Enable (s64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0h RW	**SMI on Port 64 Reads Enable (s64REN):** When set, a 1 in bit 10 will cause an SMI event.
1	0h RW	**SMI on Port 60 Writes Enable (s60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (s60REN):** When set, a 1 in bit 8 will cause an SMI event.

8.94 LPC Generic Memory Range (LGMR)—Offset 98h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Memory Address[31:16] (MA_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	**Reserved (RSVD):** Reserved.
0	0h RW	**LPC Memory Range Decode Enable (LMRD_En):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

8.95 Reserved (RSVD)—Offset 9Ch

Reserved.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved.

8.96 FWH ID Select #1 (FS1)—Offset D0h

This register contains the IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 31
Function: 0

Default: 112233h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**F8-FF IDSEL (IF8):** IDSEL to use in FWH cycle for range enabled by BDE.EF8.
27:24	0h RW	**F0-F7 IDSEL (IF0):** IDSEL to use in FWH cycle for range enabled by BDE.EF0.
23:20	1h RW	**E8-EF IDSEL (IE8):** IDSEL to use in FWH cycle for range enabled by BDE.EE8.
19:16	1h RW	**E0-E7 IDSEL (IE0):** IDSEL to use in FWH cycle for range enabled by BDE.EE0.
15:12	2h RW	**D8-DF IDSEL (ID8):** IDSEL to use in FWH cycle for range enabled by BDE.ED8.
11:8	2h RW	**D0-D7 IDSEL (ID0):** IDSEL to use in FWH cycle for range enabled by BDE.ED0.
7:4	3h RW	**C8-CF IDSEL (IC8):** IDSEL to use in FWH cycle for range enabled by BDE.EC8.
3:0	3h RW	**C0-C7 IDSEL (IC0):** IDSEL to use in FWH cycle for range enabled by BDE.EC0.

8.97 FWH ID Select #2 (FS2)—Offset D4h

This register contains the additional IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 31
Function: 0

Default: 4567h

Bit Range	Default & Access	Field Name (ID): Description
15:12	4h RW	**70-7F IDSEL (I70):** IDSEL to use in FWH cycle for range enabled by BDE.E70.
11:8	5h RW	**60-6F IDSEL (I60):** IDSEL to use in FWH cycle for range enabled by BDE.E60.
7:4	6h RW	**50-5F IDSEL (I50):** IDSEL to use in FWH cycle for range enabled by BDE.E50.
3:0	7h RW	**40-4F IDSEL (I40):** IDSEL to use in FWH cycle for range enabled by BDE.E40.

8.98 BIOS Decode Enable (BDE)—Offset D8h

Note that this register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCH simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Access Method

Type: CFG Register (Size: 16 bits)
Device: 31
Function: 0

Default: FFCFh

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following: BIOS range: • Data space: FFF80000h - FFFFFFFFh • Feature space: FFB80000h - FFBFFFFFh
14	1h RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following: BIOS range: • Data space: FFF00000h - FFF7FFFFh • Feature space: FFB00000h - FFB7FFFFh
13	1h RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following: BIOS range: • Data space: FFE80000h - FFEFFFFFh • Feature space: FFA80000h - FFAFFFFFh
12	1h RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following: BIOS range: • Data space: FFE00000h - FFE7FFFFh • Feature Space: FFA00000h - FFA7FFFFh
11	1h RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following: BIOS range: • Data space: FFD80000h - FFDFFFFFh • Feature space: FF980000h - FF9FFFFFh
10	1h RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following: BIOS range: • Data space: FFD00000h - FFD7FFFFh • Feature space: FF900000h - FF97FFFFh

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following: BIOS range: • Data space: FFC80000h - FFCFFFFFh • Feature space: FF880000h - FF8FFFFFh
8	1h RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following: BIOS range: • Data space: FFC00000h - FFC7FFFFh • Feature space: FF800000h - FF87FFFFh
7	1h RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh. Note that decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	1h RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh. Note that decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0h RO	**Reserved (RSVD):** Reserved.
3	1h RW	**70-7F Enable (E70):** Enables decoding of 1MB of the following: BIOS range: • Data space: FF700000h - FF7FFFFFh • Feature space: FF300000h - FF3FFFFFh
2	1h RW	**60-6F Enable (E60):** Enables decoding of 1MB of the following: BIOS range: • Data space: FF600000h - FF6FFFFFh • Feature Space: FF200000h - FF2FFFFFh
1	1h RW	**50-5F Enable (E50):** Enables decoding of 1MB of the following: BIOS range: • Data space: FF500000h - FF5FFFFFh • Feature space: FF100000h - FF1FFFFFh
0	1h RW	**40-4F Enable (E40):** Enables decoding of 1MB of the following: BIOS range: • Data space: FF400000h - FF4FFFFFh • Feature space: FF000000h - FF0FFFFFh

8.99 BIOS Control (BC)—Offset DCh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 31
Function: 0

Default: 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. BIOS Note: This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0h RW/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. Bits Description • 0: SPI • 1: LPC When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit [5] is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880[0]) must be 1 also. If this bit [5] is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care.
4	0h RO	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH), then the Boot Block size is 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. *If PCH is strapped for Top-Swap (GNT[3]# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. BIOS Note: 1. This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. Bios will need to program the corresponding register in the RTC Controller (in RTC well), which will be reflected in this register. 2. The Register portion of the Top Swap is lockable by the Bios Interface Lockdown Bit (BC.BILD) but unlockable by SPI Flash Protected Range and Top Swap Override (uCode.PRR_TS_OVR).

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**SPI Read Configuration (SRC):** This 2-bit field controls two policies related to BIOS reads on the SPI interface: 1. Bit 3: Prefetch Enable 2. Bit 2: Cache Disable Settings are summarized below: • Bits 3:2 Description • 00: No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with valid data, allowing repeated reads to the same range to complete quickly. • 01: No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. • 10: Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing) • 11: Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism.
1	0h RW/1L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

8.100 PCI Clock Control (PCCTL)—Offset E0h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD):** Reserved.
9	0h RO/V	**CLKRUN# Buffer Enable Override (CLKRUN_EN_OVR):** When set to '1', SW is in control of the CLKRUN# buffer enable and the value in CLKRUN_EN_VAL will be propagated to the output buffer enable. When this bit is '0', HW will determine the value of the buffer enable.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO/V	**CLKRUN# Override (CLKRUN_OVR):** When set to '1', SW is in control of the CLKRUN# pin and the value in CLKRUN_VAL will be propagated to the output pin. When this bit is '0', HW will determine the value of the pin.
7	0h RO/V	**CLKRUN# Buffer Enable Value (CLKRUN_EN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the active low CLKRUN# buffer enable if CLKRUN_EN_OVR is set to '1'.
6	0h RO/V	**CLKRUN# Pin Output Value (CLKRUN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the pin if CLKRUN_OVR is set to '1'.
5	0h RO/V	**Stop PCI# Value (STP_PCI_VAL):** Either Hardware or Software may own control of the internal STP_PCI#. This bit provides the value to drive on the STP_PCI# if STP_PCI_OVR is set to 1. Note: 1) SW cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value).
4	0h RO/V	**Stop PCI# Override (STP_PCI_OVR):** When set to 1, Firmware is in control of the STP_PCI# and the value in STP_PCI_VAL will be propagated to the internal STP_PCI#. When this bit is '0', HW will determine the value of the pin. Note: 1) Bios cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value).
3:2	0h RW	**PCI Clock Valid Configuration (PCLKVLD_CFG):** This field determines the relationship between the internally broadcast indication of the external PCI clock being valid vs. the STP_PCI# pin. Encodings: • 00: 1 flop stage of delay from STP_PCI# (Default) - Expected setting for Buffer Through or Full Integration Mode • 01: No delay (edges match STP_PCI#) - For CK505 legacy mode • 10: 2 flop stages of delay from STP_PCI# - Risk mitigation • 11: Tie high (indicate that PCI clock is always valid) - Risk mitigation
1	0h RW	**Reserved (RSVD_1):** Reserved.
0	0h RW	**Clock Run Enable (CLKRUN_EN):** Enables the CLKRUN# logic to stop the PCI clocks. If the SLP_EN bit is set, then the Intel PCH will drive CLKRUN# low. This will keep the PCI and LPC clocks running on the way to the sleeping state. This is required to meet an LPC specification. This does not necessarily mean that the CLKRUN_EN bit is forced low when SLP_EN is set. Even though the CLKRUN# signal will be low when SLP_EN is set, the state of the CLKRUN_EN bit is ignored when SLP_EN bit is set. This gives flexibility in the implementation.

8.101 Manufacturer's ID (MANID)—Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message. See Chapter 33 (DFT) for more information on the values that will be assigned in the fuse block for this component.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 31
Function: 0

Default: F00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved.
27:24	0h RO/V	**Dot portion of Process ID: (PD):** Indicates the dot process
23:16	0h RO/V	**Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Stepping Revision ID may not change.
15:8	Fh RO/V	**Manufacturing Identifier (MID):** 0Fh = Intel
7:0	0h RO/V	**Process portion of process ID (PID):** Indicates the process. The dot portion of the process is reflected in bits [27:24].

§ §

9 eSPI Registers

This chapter documents the registers in Bus: 0, Device 31, Function 0.

9.1 Identifiers (ESPI_DID_VID) — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 0h	31978086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	3197h RO/V	**Device Identification (DID):** The default value of this is hardwired. The upper 8-bits of this field can be overridden by the SetID IOSF-SB Message. Note:Refer to chapter 6s global DevID table for details .
15:0	8086h RO	**Vendor Identification (VID):** Indicates Intel

9.2 Device Status and Command (ESPI_STS_CMD) — Offset 4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 4h	403 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the bridge detects a parity error on the internal backbone. This bit gets set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the LPC bridge signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the bridge receives a completion with unsupported request status from the backbone.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the bridge receives a completion with completer abort status from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the bridge generates a completion packet with target abort status on the backbone.
26:25	0h RO	**DEVSEL# Timing Status (DTS):** Indicates medium timing, although this has no meaning on the backbone.
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the bridge receives a completion packet from the backbone from a previous request, and detects a parity error, and CMD.PERE is set.
23	0h RO	**Fast Back to Back Capable (FBC):** Reserved - bit has no meaning on internal backbone.
22	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**66 MHz Capable (C66):** Reserved - bit has no meaning on internal backbone.
20	0h RO	**Capabilities List (CLIST):** There is a capabilities list in the LPC bridge.
19	0h RO	**Interrupt Status (IS):** The LPC bridge does not generate interrupts.
18:11	0h RO	**Reserved (RSVD):** Reserved
10	1h RO	**Interrupt Disable (ID):** The LPC bridge has no interrupts to disable
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved as 0 per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** The LPC bridge generates SERR# if this bit is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved as 0 per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** When this bit is set to 1, it enables the LPC bridge to response to parity errors detected on backbone interface.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved as 0 per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved as 0 per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved as 0 per PCI-Express spec.
2	0h RW	**Bus Master Enable (BME):** Bus Masters cannot be disabled.
1	1h RO	**Memory Space Enable (MSE):** Memory space cannot be disabled on LPC.
0	1h RO	**I/O Space Enable (IOSE):** I/O space cannot be disabled on LPC.

9.3 Class Code and Revision ID (ESPI_CC_RID) — Offset 8h

Writing to this register controls what is reported in all of the RID registers in the component. The value written does not get directly loaded in this register. However, the value is checked to determine which value to report. Once written, additional writes to this register must not have any effect until a core-well reset occurs. BIOS must always write to this register in order to guarantee that the functionality is locked.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 8h	6010000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	6h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.

Bit Range	Default & Access	Field Name (ID): Description
23:16	1h RO	**Sub-Class Code (SCC):** Indicates the device a PCI to ISA bridge.
15:8	0h RO	**Programming Interface (PI):** The LPC bridge has no programming interface.
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision This will reset to 0 but is expected to be overridden by the SetID IOSF-SB message.

9.4 Peripheral Channel Header Type and Primary Latency (ESPI_PCHT_PCPLT) — Offset Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + Ch	800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	1h RO	**Multi-function Device (MFD):** This bit is 1 to indicate that this PCI function is part of a multi-function device.
22:16	0h RO	**Header Type (HTYPE):** Identifies the header layout of the configuration space, which is a generic device.
15:11	0h RO	**Master Latency Count (MLC):** Reserved
10:0	0h RO	**Reserved (RSVD):** Reserved

9.5 CSXE BAR0 MMIO (CSXE_ESPI_MBAR) — Offset 10h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 10h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region
11:4	0h RO	**Memory Size (MEMSIZE):** Hard wired to 0 to indicate 4KB of memory space
3	1h RO	**PREFETCH:** Set to '1' to indicate there are no side-effects on reads
2:1	0h RO	**TYP:** Set to '00' to allow mapping anywhere in 32-bit address space

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Memory Space Indicator (MEMSPACE):** Set to 0 for Memory Space

9.6 Sub System Identifiers (ESPI_SS) — Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

9.7 Capability List Pointer (ESPI_CAPP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RO	**Capability Pointer (CP):** Indicates the offset of the first Capability Item.

9.8 Capabilities List Pointer (CSXE_ESPI_CAPP) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 40h	44 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	44h RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list

9.9 MSI Message Control, Next Pointer and Capability ID (CSXE_ESPI_MSIMC_MSINP_MSICID) — Offset 44h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 44h	5005 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RO	**Per Vector Masking Capable (PVMC):** This function does not support MSI per vector masking
23	0h RO	**64 bit address capable (XAC):** This function is not capable of sending 64 bit message address
22:20	0h RO	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. Value of zero indicates one vector.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors supported. Value of zero indicates one vector.
16	0h RW	**MSI Enable (MSIE):** If set (1) CXME MSI interrupt delivery is enabled. When this bit is cleared, prior to returning the configuration write completion, the device must send any pending MSI(s).
15:8	50h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list.
7:0	5h RO	**Capability ID (CAPID):** Hardwired to 05h to indicate the linked list item as being the MSI Capability registers

9.10 MSI Message Address (CSXE_ESPI_MSIMA) — Offset 48h

MSI format is DW memory write in CSME root space with 32-bit addressing, 16 bit of data (upper word of data is zeros). The FW will only know the source (based on the FW programmed data field or vector) and it will need to read the cause/status register in device to get reason for MSI. FW clears after reading it.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MADDR):** DW aligned MSI message address.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RO	**Reserved (RSVD):** Reserved

9.11 MSI Message Data (CSXE_ESPI_MSIMD) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**Message Data (MDAT):** MSI Message Data

9.12 PCI Power Management Capability (CSXE_ESPI_PMCAP_PMNP_PMCID) — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 50h	40030001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	8h RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(11) X XXX1b - PME# can be asserted from D0 bit(12) X XX1Xb - PME# can be asserted from D1 bit(13) X X1XXb - PME# can be asserted from D2 bit(14) X 1XXXb - PME# can be asserted from D3hot bit(15) 1 XXXXb - PME# can be asserted from D3cold
26	0h RO	**D2 Support (D2S):** This device does not support D2
25	0h RO	**D1 Support (D1S):** This device does not support D1
24:22	0h RO	**Aux Current (AUXC):** Not Applicable
21	0h RO	**Device Specific Initialization (DSI):** Indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 0 to indicate NO Device Specific Initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMECLK):** Not Applicable

Bit Range	Default & Access	Field Name (ID): Description
18:16	3h RO	**VER:** Value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	1h RO	**Capability ID (CAPP):** Hardwired to 01h to indicate the linked list item as being the PCI Power Management registers

9.13 PCI Power Management Control and Status (CSXE_ESPI_PMD_PMCSRBSE_PMCSR) — Offset 54h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 54h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**DATA:** Not implemented. Hardwired to 0.
23:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RW/1C/V/P	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded
14:13	0h RO	**Data Scale (DS):** Not Applicable
12:9	0h RO	**Data Select (DSEL):** Not Applicable
8	0h RW	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD1):** Reserved
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	**Reserved (RSVD2):** Reserved
1:0	0h RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below. 00b - D0 01b - D1 10b - D2 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

9.14 Peripheral Channel Serial IRQ Control (ESPI_PCSERIRQC) — Offset 64h

1	0h RW	**SMI on Port 60 Writes Enable (S60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0h RW	**SMI on Port 60 Reads Enable (S60REN):** When set, a 1 in bit 8 will cause an SMI event.

9.21 LPC Generic Memory Range (ESPI_LGMR) — Offset 98h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Memory Address[31:16] (MADDR):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW	**LPC Memory Range Decode Enable (LGMRD_EN):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

9.22 eSPI CS1# I/O Routing Enables (ESPI_CS1IORE) — Offset A0h

Note: This register is used to route fixed I/O transactions from the Host to the second Slave device (CS1#) over the Peripheral Channel on the eSPI bus. **Register Lock:** This register is locked in a single Slave configuration (soft-strap espi_cs1_en = 0b). All writes to this register must be dropped and reads to this register must return the default (reset) values. **Implementation / Usage Note:** PCIODE enables a given range if that is zero, all accesses to that range are U/R'd, irrespective of the settings for that range in this register. So PCIODE should be set/checked first. If a given range is enabled in PCIODE, then this register (PCCS1IORE) is used to select which eSPI Slave device to route the transactions to. When a second eSPI Slave device is not present, then PCCS1IORE is ignored and all IO transactions targeted to any range enabled in PCIODE are routed to CS0#.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description

CFG	32 bit	[B:0, D:31, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

9.27 BIOS Decode Enable (ESPI_BDE) — Offset D8h

Note that this register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCH simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + D8h	FFCF h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h - FFFFFFFFh Feature space: FFB80000h - FFBFFFFFh
14	1h RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h - FFF7FFFFh Feature space: FFB00000h - FFB7FFFFh
13	1h RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h - FFEFFFFFh Feature space: FFA80000h - FFAFFFFFh
12	1h RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h - FFE7FFFFh Feature Space: FFA00000h - FFA7FFFFh
11	1h RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h - FFDFFFFFh Feature space: FF980000h - FF9FFFFFh
10	1h RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h - FFD7FFFFh Feature space: FF900000h - FF97FFFFh
9	1h RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h - FFCFFFFFh Feature space: FF880000h - FF8FFFFFh
8	1h RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h - FFC7FFFFh Feature space: FF800000h - FF87FFFFh
7	1h RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh Note that decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	1h RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh Note that decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0h RO	**Reserved (RSVD):** Reserved
3	1h RW	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h - FF7FFFFFh Feature space: FF300000h - FF3FFFFFh
2	1h RW	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h - FF6FFFFFh Feature Space: FF200000h - FF2FFFFFh
1	1h RW	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h - FF5FFFFFh Feature space: FF100000h - FF1FFFFFh
0	1h RW	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h - FF4FFFFFh Feature space: FF000000h - FF0FFFFFh

9.28 BIOS Control (ESPI_BC) — Offset DCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + DCh	20 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW/L	**BIOS Write Reporting (Async-SMI) Enable (BWRE):** 1'b0: Disable reporting of BIOS Write event. 1'b1: Enable reporting of BIOS Write event (PCBC.BWRS = 1) using Async-SMI.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW/1C/V	**BIOS Write Status (BWRS):** HW sets this bit if a memory write access is detected to a protected BIOS range. 1'b0: Memory write to BIOS region not attempted or attempted with PCBC.WPD = 1. 1'b1: A memory write transaction to BIOS region has been received with PCBC.WPD = 0. Note: An Async-SMI message is generated to report this event if PCBC.BWRE is set. Note: SW must write a 1 to this bit to clear it, which will also deassert the Async-SMI, if PCBC.BWRE is set.
9	0h RO	**Reserved (RSVD_2):** Reserved
8	0h RW/1C/V	**BIOS Write Protect Disable Status (BWPDS):** HW sets this bit if configuration write access is detected to protected PCBC.WPD bit. 1'b0: No attempt has been made to set PCBC.WPD with PCBC.LE = 1. 1'b1: A configuration write request has been received to set PCBC.WPD (0 1) with PCBC.LE = 1. Note: An IOSF-SB Sync-SMI (Assert_SSMI) message is generated to report this event if HW sets this bit. The unsuccessful completion for the configuration write is returned upon receiving the SMI_Ack message response. Note: SW must write a 1 to this bit to clear it, which will also deassert the Sync-SMI (IOSF-SB Deassert_SSMI message is generated). Note: The Sync-SMI sets the PMC SMI_STS.TCO_STS register.
7	0h RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. BIOS Note: This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. Bits Description 0 SPI 1 LPC When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.
5	1h RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. Today BIOS Flash is writable if WPD is a 1. If this bit (5) is set, then WPD must be a 1 and InSMM.STS (0xFED3_0880(0)) must be 1 also. If this bit (5) is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a dont care.
4	0h RO/V	**Top Swap (TS):** When set, PCH will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the Feature space) in the FWH. When cleared, PCH will not invert A16. If booting from LPC (FWH) or eSPI, then the Boot Block Size is fixed at 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. Note: If the Top-Swap strap is asserted, then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. BIOS Note: This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. BIOS will need to program the corresponding register in the RTC well, which will be reflected in this register.
3	0h RO	**Reserved (RSVD):** Reserved
2	0h RO/V	**ESPI:** eSPI Enable Pin Strap (ESPI): This field determines the destination of accesses to the D31:F0 and related Fixed and Variable IO and Memory decode ranges, including BIOS memory range. 1'b0: LPC is the D31:F0 target. 1'b1: eSPI is the D31:F0 target. Note: This field, along with the PCBC.BBS strap setting, determines PCH configuration as specified in Table 11. Note: This field cannot be overwritten by software (unlike the PCBC.BBS field). Note: This bit is also reflected in the LPC (D31:F0) and SPI Flash (D31:F5) PCI Configuration register Offset DCh.
1	0h RW/L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit (5) of this register is locked down.
0	0h RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

9.29 Manufacturer's ID (ESPI_MANID) — Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message. See Chapter 33 (DFT) for more information on the values that will be assigned in the fuse block for this component.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:31, F:0] + F8h	F00 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD_1):** Reserved
27:24	0h RO/V	**Dot portion of Process ID: (PD):** Indicates the dot process
23:16	0h RO/V	**Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Stepping Revision ID may not change.
15:8	Fh RO/V	**Manufacturing Identifier (MID):** 0Fh = Intel
7:0	0h RO/V	**Process portion of process ID (PID):** Indicates the process. The dot portion of the process is reflected in bits (27:24)

§ §***<Enter text here>***

10 PMC Registers

This chapter documents the registers in Bus: 0, Device 13, Function 1.

10.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the particular Device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 0h	A948086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	A94h RO/V	**DEVICEVENDORID - Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO/V	**DEVICEVENDORID - Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

10.2 STATUSCOMMAND — Offset 4h

Command register to programme interrupt disable bus master enable and Memory space enable. Status register to read the errors and aborts

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved Field (RESERVED0):** Reserved
29	0h RW/1C/V	**STATUSCOMMAND- RMA Field (RMA):** Received Master Abort
28	0h RW/1C/V	**STATUSCOMMAND- RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved Field (RESERVED1):** Reserved
20	1h RO	**STATUSCOMMAND- Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**STATUSCOMMAND- Intrerrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**Reserved Field (RESERVED2):** Reserved
15:11	0h RO	**Reserved Field (RESERVED3):** Reserved
10	0h RW	**STATUSCOMMAND- Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved Field (RESERVED4):** Reserved
8	0h RW	**STATUSCOMMAND- SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved Field (RESERVED5):** Reserved
2	0h RW	**STATUSCOMMAND- BME Field (BME):** Bus Master Enable
1	0h RW	**STATUSCOMMAND- MSE Field (MSE):** Memory Space Enable
0	0h RW/V	**STATUSCOMMAND. IOSR FIELD (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

10.3 REVCLASSCODE — Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 8h	FF000000 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	FF0000h RO/V	**REVCLASSCODE - Class code Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	0h RO/V	**REVCLASSCODE - Revision ID Field (RID):** Revision ID identifies the revision of particular PCI device.

10.4 CLLATHEADERBIST — Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved Field (RESERVED0):** Reserved
23	0h RO	**CLLATHEADERBIST - MultiFunction Device Field (MULFNDEV):** Multi-Function Device
22:16	0h RO	**CLLATHEADERBIST - Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**CLLATHEADERBIST - Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CLLATHEADERBIST - Cache Line Size Field (CACHELINE_SIZE):** Cacheline Size

10.5 BAR — Offset 10h

Base Address Register low [31:2] type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR -Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**BAR -Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**BAR -Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**BAR -Type Field (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR - Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

10.6 BAR -Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR -Base Address High Field (BASEADDR_HIGH):** Base Address high - MSB

10.7 BAR1 — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR1 - Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**BAR1 -Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**BAR1 - Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**BAR1 -Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR1 - Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

10.8 BAR1 -Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR1 -Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

10.9 BAR2 — Offset 20h

BAR -Base Address Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR:**
1	0h RO	**RESERVED0:** Reserved
0	0h RO	**MESSAGE_SPACE:**

10.10 SUBSYSTEMID — Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMID -Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

10.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR) — Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

10.12 CAPABILITYPTR — Offset 34h

Capabilities Pointer register indicates what the next capability is

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved Field (RESERVED0):** Reserved
7:0	80h RO	**CAPABILITYPTR - Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

10.13 INTERRUPTREG — Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latenc

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**INTERRUPTREG - Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**INTERRUPTREG - Min Gnt Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved Field (RESERVED0):** Reserved
11:8	1h RO	**INTERRUPTREG - Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTERRUPTREG - Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

10.14 POWERCAPID — Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability with Power management capabilities register for PME support and version

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 80h	48030001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**POWERCAPID - PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved Field (RESERVED0):** Reserved
18:16	3h RO	**POWERCAPID - Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**POWERCAPID - Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWERCAPID - Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

10.15 PMECTRLSTATUS — Offset 84h

power management control and status register to set and read PME status PME enable No Soft reset and power state

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved Field (RESERVED0):** Reserved
15	0h RW/1C/V	**PMECTRLSTATUS - PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved Field (RESERVED1):** Reserved
8	0h RW	**PMECTRLSTATUS - PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved Field (RESERVED2):** Reserved
3	1h RO	**PMECTRLSTATUS - No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved Field (RESERVED3):** Reserved
1:0	0h RW	**PMECTRLSTATUS - Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

10.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**PCIDEVIDLE_CAP_REG - Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**PCIDEVIDLE_CAP_REG - Revision IDField (REVID):** Revision ID of capability structure
23:16	14h RO	**PCIDEVIDLE_CAP_REG - Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	0h RO	**PCIDEVIDLE_CAP_REG - Next Capability Field (NEXT_CAP):** Next Capability
7:0	9h RO	**PCIDEVIDLE_CAP_REG - Capability ID Field (CAPID):** Capability ID

10.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor capability register for VSEC Length revision and ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	10h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

10.18 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

10.19 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**DEVICE_IDLE_POINTER_REG - BAR NUM Field (BAR_NUM):** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

10.20 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + A0h	800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved Field (RESERVED0):** Reserved
21	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved Field (RESERVED1):** Reserved
19	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Sleep Enable Field (SLEEP_EN):** Sleep Enable

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If ?1? then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Device Idle En Field (I3_ENABLE):** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - PMC Request Enable Field (PMCRE):** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved Field (RESERVED2):** Reserved
12:10	2h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	0h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

10.21 GEN_REGRW1 - General Purpose Read Write Register1 (GEN_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW1 - General Purpose Read Write Field (GEN_REG_RW1):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

10.22 GEN_REGRW2 — Offset B4h

General Purpose PCI Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW2 - General Purpose Read Write Field (GEN_REG_RW2):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

10.23 GEN_REGRW3 — Offset B8h

General Purpose PCI Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW3 - General Purpose Read Write Field (GEN_REG_RW3):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

10.24 GEN_REGRW4 — Offset BCh

General Purpose PCI Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW4 - General Purpose Read Write Field (GEN_REG_RW4):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

10.25 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_INPUT_REG - General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

10.26 Manufacturers ID (MANID) — Offset F8h

MAN ID Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:1] + F8h	4000F1C h

Bit Range	Default & Access	Field Name (ID): Description
31:0	4000F1Ch RO/V	**Manufacturers ID - MAN ID (MANID):** Manufacturer ID: Default value comes from straps.

10.27 THREAD_STATUS (P_CR_GT_THREAD_STATUS_0_2_0_GTTMMADR)—Offset 805Ch

Per thread status register THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**THREAD_ACTIVE (THREAD_ACTIVE):** Tied to same value as CORE_STATUS.CORE_ACTIVE, updated by PMA.
30	0h RO/V	**VOTE_REQUEST (VOTE_REQUEST):** This bit will be set on TC0TC1 and cleared on TC1ETC7.
29:19	0h RO	**RESERVED_2 (RESERVED_2):** reserved
18:16	7h RO/V	**THREAD_WISH_ALLOW (THREAD_WISH_ALLOW):** This field contains the allowed core C-state limit. It is read by Ucode on C-state entry to clip its wish_state request. Pcode updates this field (via IO_CORE_DEMOTED_C1) based on demotion algorithm and: fuse, DFX, SW limits in PKG_C_STATE_LIMIT_REQ, probe mode and patch load (via Ucode Mbox).
15:12	Fh RW	**THREAD_WISH_SUB_STATE (THREAD_WISH_SUB_STATE):** Ucode updates this field with the desired Thread CState SubState.
11:8	Fh RW	**THREAD_WISH_STATE (THREAD_WISH_STATE):** Ucode updates this field with the parameters of the MWAIT instruction.
7	0h RO	**RESERVED_1 (RESERVED_1):** Reserved.
6:4	0h RW	**THREAD_TPD_STATE (THREAD_TPD_STATE):** Thread power down state
3	0h RO	**RESERVED_0 (RESERVED_0):** Reserved.
2:0	7h RW	**THREAD_STATE (THREAD_STATE):** Resolved thread_state updated by Ucode after it has completed entry/exit.

10.28 CORE_STATUS (P_CR_GT_CORE_STATUS_0_2_0_GTTMMADR)—Offset 8060h

Per core (including GT) status register.
Used by Ucode/GT and P-Unit/PMA HW to communicate core status to Pcode. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1100FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO/V	**CORE_ACTIVE (CORE_ACTIVE):** Virtual signal indicating core is active. Value is updated by writes to RCSM_CORE_RESPONSE.CORE_ACTIVE from GT/GLM PMA. When set to '1', Pcode ignores value in CORE_STATE field and assumes C0, additionally P-Unit HW will delay fast path due to CORE_STATE field to non-C0 values until CORE_ACTIVE is '0'
30	0h RO/V	**WAKEUP_REQUEST (WAKEUP_REQUEST):** WAKEUP_REQUEST is set by interrupt wakes from T-Unit (via T2P_INT_WAKE) or Pcode via IO_PCODE_WAKEUP_REQUEST. WAKEUP_REQUEST is cleared by T-Unit (via T2P_INT_WAKE) when INT_READY vector is set. Fastpath (IO_FASTPATH_CORE_C) is set on WAKEUP_REQUEST, or when WAKEUP_REQUEST is '1' and CORE_IN_C3_C6 asserts.
29	0h RO	**RESERVED_3 (RESERVED_3):** Reserved
28	1h RO/V	**CORE_IN_C3_C6 (CORE_IN_C3_C6):** Virtual signal indicating core is in electrical (post RCSM flow) C3/C6. Value is updated by writes to RCSM_CORE_RESPONSE.CORE_IN_C3C6 from GT/GLM PMA. Must be asserted for WAKEUP_REQUEST to trigger fastpath.
27	0h WO	**PROBE_MODE_DONE (PROBE_MODE_DONE):** Sent by Ucode to inform P-Unit that probe mode seqeunce is complete, used to clear pending probe mode request in P-Unit HW.
26	0h RW	**DISABLE_WAKEUP_REQ (DISABLE_WAKEUP_REQ):** Reserved.
25	0h RO/V	**S1_ACK (S1_ACK):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
24	1h RW/V	**PM_BLOCK_REQ (PM_BLOCK_REQ):** Controls the status of the Interrupt Ready mask in the T-Unit. Set by Ucode before Piclet setup during C6 entry. On assertion of this bit P-Unit will send P2T_INT_CONTROL_ADDR.INT_READY_CLEAR to T-Unit. Any interrupts received after this point will cause T-Unit to send a interrupt wake request via T2P_INT_WAKE.SET_CORE_MASK Cleared by Ucode after Piclet replay during C6 exit. On deassertion of this bit, P-Unit will send P2T_INT_CONTROL_ADDR.INT_READY_SET to T-Unit. This will cause T-Unit to clear any pending interrupt wakes via T2P_INT_WAKE.CLEAR_CORE_MASK.
23	0h RO/V	**RFO_EN (RFO_EN):** For GT this bit indicates the status of read-for ownership (RFOs). If it is '1' RFOs are enabled and if it is '0' RFOs are disabled. This field only has meaning for the GT register instance. It is a don't care for the IA register instances.
22:16	0h RO	**RESERVED_2 (RESERVED_2):** Reserved
15:12	Fh RW	**CORE_WISH_SUB_STATE (CORE_WISH_SUB_STATE):** Ucode updates this field with the desired Core CState SubState.
11:8	Fh RW	**CORE_WISH_STATE (CORE_WISH_STATE):** Ucode updates this field with the parameters of the MWAIT instruction.
7	0h RO	**RESERVED_1 (RESERVED_1):** Reserved.
6:4	0h RW	**CORE_CPD_STATE (CORE_CPD_STATE):** Updated by Ucode on Core Power Down (CPD) exit or entry. CPD is used during GV Flows to quiesce core.
3	0h RO	**RESERVED_0 (RESERVED_0):** Reserved.
2:0	7h RW/V	**CORE_STATE (CORE_STATE):** Updated with the current core C-state, by Ucode on C6 entry/exit, at the end of the respective flow.

10.29 GT_SLICE_INFO (P_CR_GT_SLICE_INFO_0_2_0_GTTMMADR)—Offset 8064h

Status register describing GT slice state.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10	0h RO/V	**UNSLICESTAT (UNSLICESTAT):** Status of GT unslice power plane • 0 = GT has unslice powered off • 1 = GT has unslice powered on
9:3	0h RO	Reserved.
2:0	0h RO/V	**SLICESTAT (SLICESTAT):** Status of GT power planes. • 000b = GT is powered off C6 or not yet booted • 001b = GT has slice 0 powered • 011b = GT has slices 0 and 1 powered • 111b = GT has slices 0, 1 and 2 powered

10.30 GT Hardware P-state Control Request (P_CR_GT_HWP_REQ_0_2_0_GTTMMADR)—Offset 8068h

This register is used as an interface for the graphics driver to communicate hardware managed P-state control requests and/or hints specific to the graphics domain. These requests are used by silicon power management firmware to implement SOC and platform level power and thermal control algorithms.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Reserved3 (RSVD3):** This field is reserved for future use
23:16	0h RW	**Reserved2 (RSVD2):** This field is reserved for future use
15:8	0h RW	**Reserved1 (RSVD1):** This field is reserved for future use
7:0	0h RW	**Quality of Service P-state (QOS_RATIO):** GT Quality of Service P-state request. The GT driver programs this to define a desired performance floor. This floor is useful as a hint to power and thermal control algorithms to balance system resources appropriately in order to ensure a minimum graphics performance floor. Described in 16.67MHz reference clock units, e.g., a ratio of 24 results in a clock frequency of 400MHz.

10.31 GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR (P_CR_GT_MEM_BOUND_COUNTER_0_2_0_GTTMMADR)—Offset 8070h

GT memory bound counter. Holds the accumulated number of CS clks that GT has been waiting for memory grants.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated cycles GT has been waiting for memory grants.

10.32 GT_SQ_OCCUPANCY_0_2_0_GTTMMADR (P_CR_GT_SQ_OCCUPANCY_0_2_0_GTTMMADR)—Offset 8074h

Accumulated GT super queue (SQ) occupancy. This is accumulated by GT and pushed to P-Unit from the GT PMA.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated SQ occupancy.

10.33 GT_RW_DRAM_0_2_0_GTTMMADR (P_CR_GT_RW_DRAM_0_2_0_GTTMMADR)—Offset 8078h

This register contains the the sum of the cycles GT has read or written DRAM. It contains a 32-bit accumulation of data sent via the Pushbus. Values exceeding 32 bits will wrap around.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** RW GT cycles to DRAM

10.34 GT_P_REQ (P_CR_GT_THREAD_P_REQ_0_2_0_GTTMMADR)—Offset 807Ch

GT Pstate request. This register is written by driver/GT with the desired P-State request. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**UNSLICE_RATIO (UNSLICE_RATIO):** UnSlice Ratio Multiple of 33.33MHz 2xclk 16 MHz 1xclk
22:14	0h RW	**SLICE_RATIO (SLICE_RATIO):** Slice Ratio Multiple of 33.33MHz 2xclk 16 MHz 1xclk
13:4	0h RO	**RESERVED_1 (RESERVED_1):** Reserved
3:0	0h RW	**SLICE_UNSLICE_POLICY (SLICE_UNSLICE_POLICY):** Specifies policy of slice and unslice ratios: • 0x0 = Use unslice ratio for slice also ignore slice ratio field • 0x1 = Maintain ratio between slice/unslice • 0x2 = Attempt to throttle slice only maintain unslice ratio

10.35 GT_ARAT_TTT (P_CR_GT_ARAT_TTT_0_2_0_GTTMMADR)—Offset 8080h

Always Running APIC Timer 'Timer Target Time' (TTT) value. This is an absolute desired wakeup time. GT copies the local TTT to the P-Unit on RC6 entry. Pcode will wake GT via IO_PCODE_WAKEUP_REQUEST, such that the wake is finished when the URT reaches the value in this register.
To account for wake delay, Pcode will also take into account the prewake value that can be written via driver into GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR.
If ARAT is invalid, GT will write all 1's (infinity).
GT writes this register via the MMIO alias GT_ARAT_TTT_0_2_0_GTTMMADR THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 1FFFFFFFFFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
63:61	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
60:0	1FFFFFFFFFFFFFFFh RW	**DATA (DATA):** The 61 bits of the TTT. GT will update this field with TTT value before entering RC6.

10.36 GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR (P_CR_GTC6_PREWAKE_TIMER_0_2_0_GTTMMADR)—Offset 8088h

This register is used in conjuction with GT_ARAT_TTT. It contains the enable and value for a prewake offset that the GT driver can program to prewake GT from C6 with reference to its TTT.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
15	0h RW	**TMR_ENABLE (TMR_ENABLE):** Enable for the GT prewake, the driver sets this bit to 1 to enable the offset.
14:0	0h RW	**TMR_VALUE (TMR_VALUE):** Prewake timer value in microseconds, this will be subtracted from the GT_ARAT_TTT.

10.37 GT_DISP_PWRON_0_2_0_GTTMMADR (P_CR_GT_DISP_PWRON_0_2_0_GTTMMADR)—Offset 8090h

Used by GT driver to control aspects of PHY power-on (MIPIO, eDP, DDI).

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED_0 (RESERVED_0):** reserved
3	0h RW	**EDP_PWRREQ1P0_SUS (EDP_PWRREQ1P0_SUS):** GT Display EDP phy Power On. Written by GT driver to start EDP PHY initialization sequence.
2	0h RW	**MIPIO_RST_CTRL (MIPIO_RST_CTRL):** MIPIO reset control. Driver clears on reset exit which deasserts side_rst to MIPI PHY and starts periodic RCOMPS from P-Unit. Driver sets on PHY disabling, which should occur prior to dev2 D3.
1	0h RW	**CH1_PWRREQ1P0_SUS (CH1_PWRREQ1P0_SUS):** GT Display eDP Power On. Written by GT driver to start eDP PHY initialization sequence.
0	0h RW	**CH0_PWRREQ1P0_SUS (CH0_PWRREQ1P0_SUS):** GT Display DDI Power On. Written by GT driver to start DDI PHY initialization sequence.

10.38 GT_GFX_RC6_0_2_0_GTTMMADR (P_CR_GT_GFX_RC6_0_2_0_GTTMMADR)—Offset 8108h

Wrapping counter containing the total GT RC6 residency time since boot.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**RC6 (RC6):** GT RC6 residency, value is specified in 833.33ns increments. Counter will wrap around.

10.39 GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8124h

Control and Status register for the GFXDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GT Driver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_DATA_{HIGH and LOW}. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** SW may write to the two mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode. After setting this bit SW will poll this bit until it is cleared. Alternatively PCODE can generate an interrupt to SW via GTDRIVER_P2G_EVENTS. PCODE will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:16	0h RO	Reserved.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

10.40 GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_LOW_0_2_0_GTTMMADR)—Offset 8128h

Data register for lower 32b of data for the GTDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GTDriver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the lower 32b of data associated with specific commands.

10.41 GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR (P_CR_GTDRIVER_MAILBOX_DATA_HIGH_0_2_0_GTTMMADR)—Offset 812Ch

Data register for upper 32b of data for the GFXDRIVERtoPCODE mailbox. This mailbox is implemented as a means for the GT Driver running on the IA cores to tune parameters for specific GFX workloads. This register is used in conjunction with GTDRIVER_MAILBOX_INTERFACE. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the upper 32b of data associated with specific commands.

10.42 P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8130h

Control and status register for the P24CtoPCODE mailbox. This mailbox is implemented as a way for the GT P24C to contact the P-unit and is accessible via MMIO. This register is used in conjunction with P24C_PCODE_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**RUN_BUSY (RUN_BUSY):** Software may write to the mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a fastpath even to Pcode. After setting this bit software polls until it is cleared. Pcode clears the bit after updating the mailbox registers with the result and error code.
30:24	0h RO	Reserved.
23:16	0h RW/V	**PARAM2 (PARAM2):** This field is used to specify a second additional parameter to extend the command when needed.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the SW request command or the PCODE response code depending on the setting of RUN_BUSY.

10.43 P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_P24C_PCODE_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 8134h

Data register for the P24CtoPCODE mailbox. This register is used in conjunction with P24C_PCODE_MAILBOX_INTERFACE THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

10.44 PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_INTERFACE_0_2_0_GTTMMADR)—Offset 8138h

Control and status register for the PCODEtoP24C mailbox. This mailbox is implemented as a way for pcode to sendi commands to the P24C GT microcontroller. This register is used in conjunction with PCODE_P24C_MAILBOX_DATA. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**RUN_BUSY (RUN_BUSY):** Pcode may write to the mailbox registers only when RUN_BUSY is clear(0). After setting RUN_BUSY to 1 PCode generates a PMLink command to shift in an uncore trap message to the GT P24C uC. GT P24C clears the RUN_BUSY bit after updating the mailbox registers with the result and error code. This clear of RUN_BUSY creates pends a fast path event to pcode.
30:24	0h RO	Reserved.
23:16	0h RW/V	**PARAM2 (PARAM2):** This field is used to specify a second additional parameter to extend the command when needed.
15:8	0h RW/V	**PARAM1 (PARAM1):** This field is used to specify an additional parameter to extend the command when needed.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/V	**COMMAND (COMMAND):** This field contains the PCODE request command or the GT P24C response code depending on the setting of RUN_BUSY. Command Encodings: 01h Cstate GoRequest for Duty Cycle Throttling Error Code Encodings

10.45 PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR (P_CR_PCODE_P24C_MAILBOX_DATA_0_2_0_GTTMMADR)—Offset 813Ch

Data register for the PCODEtoP24C mailbox. This register is used in conjunction with PCODE_P24C_MAILBOX_INTERFACE. This register is duplicated in the PCU IO space, XML changes must be made in both places

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA (DATA):** This field contains the data associated with specific commands.

10.46 GT_PM_CONFIG_0_2_0_GTTMMADR (P_CR_GT_PM_CONFIG_0_2_0_GTTMMADR)—Offset 8140h

Interface for GT driver to configure power management.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED_0 (RESERVED_0):** Reserved
0	0h RW	**DOORBELL_EN (DOORBELL_EN):** Set by driver to enable doorbell mode. This must be set after GT is in and held in RC0 (force-wake). This field must be cleared prior to dev2 D3.

10.47 Graphics Interrupt Response Latency Tolerance (P_CR_GRAPHICS_INTERRUPT_RESPONSE_TIME_0_2_0_GTTMMADR)—Offset 8150h

This register is used by the graphics driver to communicate any interrupt latency tolerance (IRT/IRTL) requirements from the software. The P-unit is responsible for ensuring that the graphics worst-case interrupt response latency is always lower than what is programmed in this register.
Some components of worst-case exit latency for the graphics domain are outside the control of the P-unit, and therefore there is a physical floor below which the interrupt response tolerance may not be guaranteed. That floor is usually in the 100us range, but the number will vary by product and stepping.
IRT is used only for S0i3 entry if Dev2 is not in D3. If Dev2 is in D3, its assumed latency tolerance is infinity.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**VALID (VALID):** This field qualifies the validity of the Value field in this register. If the valid bit is zero, then it is assumed that software has no constraints on wake latency (i.e., it supports infinity).
14:13	0h RO	Reserved.
12:10	0h RW	**Multiplier (MULTIPLIER):** This field indicates the unit of measurement that is defined for the Value field in this register. The units are 2^(5*multiplier) • 000b = 1ns (2^0) • 001b = 32ns (2^5) • 010b = 1024ns (2^10) • 011b = 32.768us (2^15) • 100b = 1.048ms (2^20) • 101b = 33.55ms (2^25)
9:0	0h RW	**VALUE (VALUE):** This scalar is multiplied by the multiplier field to calculate the net latency tolerance. Ex., with a MULTIPLIER of 2 and a VALUE of 20, the net latency tolerance is 20 * (2^10) = 20480ns or 20.48us

10.48 GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_P2G_EVENTS_0_2_0_GTTMMADR)—Offset 8160h

This extended capability allows PCODE to send an interrupt notification upon completion of a mailbox command received from the GTDRIVER. It is enabled via the GTDriver Mailbox. PCODE will set the appropriate bit in this register to 1 and will then write to 0.2.0.GTTMMADR.PIM[PCU_MBOXE]. The GFX Driver will clear the appropriate bit in this register by writing a 1 to the bit. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

1	0h RW/1C/V	**EVENT1 (EVENT1):** Placeholder for Event
0	0h RW/1C/V	**EVENT0 (EVENT0):** This event indicates that the command previously sent by the GTDriver via the Mailbox mechanism is complete.

10.49 GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR (P_CR_GTDRIVER_G2P_EVENTS_0_2_0_GTTMMADR)—Offset 8164h

This extended capability allows the GTDriver to send a request to PCODE. The GTDriver will set the appropriate bit in this register to 1 when it wants to generate an event to PCODE. This will pend a Fast Path event to pcode. PCODE will clear the appropriate bit in this register after servicing the request. THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Access Method

10.50 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 816Ch

PUNIT_MMIO: Core Frequency Capabilities
This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.

10.51 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8170h

PUNIT_MMIO: Graphics Engine Frequency Capabilities
This register describes the frequency capabilities of the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.
Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_FREQ (LAST_RESOLVED_FREQ):** Last resolved ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0h RO/V	**MAX_SUPPORTED_FREQ (MAX_SUPPORTED_FREQ):** Maximum supported ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.
15:8	0h RO/V	**EFFICIENT_FREQ (EFFICIENT_FREQ):** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.
7:0	0h RO/V	**MIN_SUPPORTED_FREQ (MIN_SUPPORTED_FREQ):** Minimum supported ratio for the integrated graphics engine. Units are 16.67MHz multiplied by the ratio.

10.52 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR

(P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_2_0_GTTMMADR)—Offset 8174h

PUNIT_MMIO: System Agent Frequency Capabilities
This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio.
Last resolved ratio is updated upon changes to the System Agent frequency.

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**LAST_RESOLVED_RATIO (LAST_RESOLVED_RATIO):** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0h RO/V	**MAX_RATIO (MAX_RATIO):** max ratio
15:8	0h RO/V	**RESERVED_1 (RESERVED_1):** Reserved

10.54 GT_PERF_LIMIT_REASONS (P_CR_GT_PERF_LIMIT_REASONS_0_2_0_GTTMMADR)—Offset 8184h

This register reports reasons for performance limitations on the integrated graphics engine. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/0C/V	**QOS_LOG (QOS_LOG):** Logged indication that frequency was clamped below the software-defined quality-of-service floor. This bit is set by firmware, and is clearable by software.
30	0h RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG (MAX_EFFICIENCY_FREQ_LOG):** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency. This bit is set by firmware, and is clearable by software.
29	0h RW/0C/V	**SPARE13_LOG (SPARE13_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
28	0h RW/0C/V	**EDP_LOG (EDP_LOG):** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint. This bit is set by firmware, and is clearable by software.
27	0h RW/0C/V	**SPARE11_LOG (SPARE11_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
26	0h RW/0C/V	**VR_THERMALERT_LOG (VR_THERMALERT_LOG):** Logged indication that frequency was clamped due to a voltage regulator thermal excursion. This bit is set by firmware, and is clearable by software.
25	0h RW/0C/V	**SPARE9_LOG (SPARE9_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
24	0h RW/0C/V	**SPARE8_LOG (SPARE8_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
23	0h RW/0C/V	**SPARE7_LOG (SPARE7_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW/0C/V	**SPARE6_LOG (SPARE6_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
21	0h RW/0C/V	**SPARE5_LOG (SPARE5_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
20	0h RW/0C/V	**SPARE4_LOG (SPARE4_LOG):** Spare log bit. This bit is set by firmware, and is clearable by software.
19	0h RW/0C/V	**PL2_LOG (PL2_LOG):** Logged indication that frequency was clamped due to a package-level PL2 excursion. This bit is set by firmware, and is clearable by software.
18	0h RW/0C/V	**PL1_LOG (PL1_LOG):** Logged indication that frequency was clamped due to a package-level PL1 excursion. This bit is set by firmware, and is clearable by software.
17	0h RW/0C/V	**THERMAL_LOG (THERMAL_LOG):** Logged indication that frequency was clamped due to a thermal excursion. This bit is set by firmware, and is clearable by software.
16	0h RW/0C/V	**PROCHOT_LOG (PROCHOT_LOG):** Logged indication that frequency was clamped due to PROCHOT assertion. This bit is set by firmware, and is clearable by software.
15	0h RO/V	**QOS_STATUS (QOS_STATUS):** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	0h RO/V	**MAX_EFFICIENCY_FREQ_STATUS (MAX_EFFICIENCY_FREQ_STATUS):** Frequency is limited below the maximum efficiency frequency.
13	0h RO/V	**SPARE13_STATUS (SPARE13_STATUS):** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit).
12	0h RO/V	**EDP_STATUS (EDP_STATUS):** Frequency is limited due to a package-level EDP constraint.
11	0h RO/V	**SPARE11_STATUS (SPARE11_STATUS):** Spare status bit.
10	0h RO/V	**VR_THERMALERT_STATUS (VR_THERMALERT_STATUS):** Frequency is limited due to a voltage regulator thermal excursion.
9	0h RO/V	**SPARE9_STATUS (SPARE9_STATUS):** Spare status bit.
8	0h RO/V	**SPARE8_STATUS (SPARE8_STATUS):** Spare status bit.
7	0h RO/V	**SPARE7_STATUS (SPARE7_STATUS):** Spare status bit.
6	0h RO/V	**SPARE6_STATUS (SPARE6_STATUS):** Spare status bit.
5	0h RO/V	**SPARE5_STATUS (SPARE5_STATUS):** Spare status bit.
4	0h RO/V	**SPARE4_STATUS (SPARE4_STATUS):** Spare status bit.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	**PL2_STATUS (PL2_STATUS):** Frequency is limited due to a package-level PL2 excursion.
2	0h RO/V	**PL1_STATUS (PL1_STATUS):** Frequency is limited due to a package-level PL1 excursion.
1	0h RO/V	**THERMAL_STATUS (THERMAL_STATUS):** Frequency is limited due to thermal excursion.
0	0h RO/V	**PROCHOT_STATUS (PROCHOT_STATUS):** Frequency is limited due to external PROCHOT assertion.

10.55 GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR (P_CR_GTDRIVER_HWP_REQUEST_0_2_0_GTTMMADR)—Offset 8190h

PUNIT_MMIO: GTDRIVER_HWP_REQUEST
This register allows the graphics driver to dictate the minimum and maximum performance of the IA cores. The driver may also change the behavior of any autonomous IA P-state controller, if supported by firmware. Non-zero values override default firmware behavior.

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:42	0h RW	**RESERVED_0 (RESERVED_0):** Reserved
41:32	0h RW	**ACTIVITY_WINDOW (ACTIVITY_WINDOW):** This field defines the time window over which the autonomous IA P-state controller (if supported) will manage IA core frequency. Units are microseconds.
31:24	0h RW	**AGGRESSIVENESS (AGGRESSIVENESS):** This field defines the performance/energy bias for the autonomous IA P-state controller, if supported.
23:16	0h RW	**MULTIPLIER (MULTIPLIER):** This field defines the IA frequency target: IA ratio = MULTIPLER * GT ratio. The format is U8.3.5 (e.g. 1.0 is 8h'20). The IA ratio is described in 100MHz units and GT ratio is in 16.67MHz units. E.g., to achieve IA 1.6GHz (ratio 16) at GT 400MHz (ratio 24), the desired multiplier would be 0.67 (0x15).
15:8	0h RW	**MAX_PERF (MAX_PERF):** Maximum IA core frequency allowed by the graphics driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**MIN_PERF (MIN_PERF):** Minimum IA core frequency allowed by the graphics driver. The field is defined as a ratio, multiply by 100MHz to convert to IA core frequency.

10.56 GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR (P_CR_GT_VIDEO_BUSYNESS_0_2_0_GTTMMADR)—Offset 819Ch

GT video busy counter. Holds the accumulated number of CS clks that GT video functions have been busy.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**DATA (DATA):** Accumulated cycles GT video functions have been busy.

RID - Bridge revision ID Register (RID)—Offset 30h

register contains the Bridge Revision ID

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved Field (Reserved0):** Reserved
7:0	0h RO	**RID - Bridge revision ID Field (RID):** Revision ID of the Bridge.

10.57 GEN_REGRW1 - General Purpose register (GEN_REGRW1)—Offset 600h

General Purpose PRV RW Register 1

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW1 - General Purpose Field (GEN_REG_RW1):** This register value is brought out as oob_gen_prv_rw_reg1 out of band signal

10.58 GEN_REGRW2 - General Purpose register (GEN_REGRW2)—Offset 604h

General Purpose PRV RW Register 2

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW2 - General Purpose Field (GEN_REG_RW2):** This register value is brought out as oob_gen_prv_rw_reg2 out of band signal

10.59 GEN_REGRW3 - General Purpose register (GEN_REGRW3)—Offset 608h

General Purpose PRV RW Register 3

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW3- General Purpose Field (GEN_REG_RW3):** This register value is brought out as oob_gen_prv_rw_reg3 out of band signal

10.60 GEN_REGRW4 - General Purpose register (GEN_REGRW4)—Offset 60Ch

General Purpose PRV RW Register 4

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW4 - General Purpose Field (GEN_REG_RW4):** This register value is brought out as oob_gen_prv_rw_reg4 out of band signal

Power Management 1 Status and Enable (PM1_STS_EN)—Offset 0h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (reserved4):** Reserved.
30	0h RW	**PCI Express Wake Disable (pciexp_wake_dis):** This bit is a scratchbit. The value written can be read back but there is not functionality behind the bit. Windows and Linux have confirmed that they dont use this bit but require it to save and return the written state. Historical reference only: This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit
29	0h RO	**Reserved: USB Clockless Wake Enable (rsvd_usb_clkless_en):** Reference only: This bit enables the inputs to the USB_CLKLESS_STS bit in the PM1 Status register to wake the system. Modification of this bit has no impact on the value of the USB_CLKLESS_STS bit. On some prior platforms, this field is reset on RSMRST_B, a reset signal based on a RSMRST# pin that indicates the suspend/resume voltages are stable.
28:27	0h RO	**Reserved (reserved5):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/V	**RTC Alarm Enable (rtc_en):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit: RTC_EN | SCI_EN | Effect when RTC_STS is set 0 | x | No SMI# or SCI. If system was in S1-S5, no wake even occurs. 1 | 0 | SMI#. If system was in S1-S5, then a wake event occurs before the SMI#. 1 | 1 | SCI. If system was in S1-S5, then a wake event occurs before the SCI. Note: To clarify, If rtc_en is set and and RTC_STS gets set during S0/S0ix and SCI/SMI will be sent depending on the state of SCI_EN and GBL_SMI_EN. In addition to its normal reset conditions, PMC also clears this bit due to emergency shutdown events: - Power button override - CPU thermal trip.
25	0h RO	**Reserved (reserved6):** Reserved.
24	0h RW/V	**Power Button Enable (pwrbtn_en):** This bit is the power button enable. It works in conjunction with these bits: PWRBTN_EN | SCI_EN | Effect when PWRBTN_STS is set 0 | x | No SMI#, SCI or S0ix wake. 1 | 0 | SMI# and an S0ix wake. 1 | 1 | SCI and an S0ix wake. Note: PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as an SX Wake event.
23:22	0h RO	**Reserved (reserved7):** Reserved.
21	0h RW	**Global Enable (gbl_en):** The global enable bit. When both the GBL_EN and the GBL_STS are set, PMC generates an SCI.
20:17	0h RO	**Reserved (reserved8):** Reserved.
16	0h RO	**Reserved: Timer Overflow Interrupt Enable (rsvd_tmrof_en):** Reference only: This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit: TMROF_EN | SCI_EN | Effect when TMROF_STS is set. 0 | x | No SMI# or SCI 1 | 0 | SMI# 1 | 1 | SCI

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**Wake Status (wak_sts):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Wake event occurs. Upon setting this bit, the PMC will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case. According to ACPI spec 5.0 If the system does not support the S1 sleeping state, the WAK_STS bit can always return zero.
14	0h RO	**Reserved: PCI Express Wake Status (rsvd_pciexp_wake_sts):** Reference only: This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pins (PMU_WAKE_B, PCI_WAKE1_B, PCI_WAKE2_B, PCI_WAKE3_B) being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If one of the WAKE# pins is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain Power Management active (i.e. all inputs to this bit are level sensitive). Note: This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake.
13	0h RO	**Reserved: USB clockless Wake Status (rsvd_usb_clkless_sts):** Reference only: This bit is set by hardware to indicate that the system woke due to change in USB serial lines. This bit is set independent of the USB_CLKLESS_EN bit. Software writes a 1 to clear this bit.
12	0h RO	**Reserved (rsvd):** Reserved.
11	0h RW/1C/V	**Power Button Override (pwrbtnor_sts):** This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds- These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. Note that this bit is preserved through power failures. If it is still asserted when the global SCI_EN is set to '1' then an SCI will be generated.
10	0h RW/1C/V	**RTC Status (rtc_sts):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**Reserved (reserved1):** Reserved.
8	0h RW/1C/V	**Power Button Status (pwrbtn_sts):** This bit is set when the PMU_PWRBTN_B signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. If the PMU_PWRBTN_B signal is held low for more than 4 seconds, the PMC clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PMU_PWRBTN_B is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PMU_PWRBTN_B pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PMU_PWRBTN_B signal must go inactive and active again to set the PWRBTN_STS bit. Note that the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Power Button Override, which includes clearing this bit.
7:6	0h RO	**Reserved (reserved2):** Reserved.
5	0h RW/1C/V	**Global Status (gbl_sts):** This bit is set when an SCI is generated due to the BIOS wanting the attention of theSCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
4:1	0h RO	**Reserved (rserved3):** Reserved.
0	0h RO	**Reserved: Timer Overflow Status (rsvd_tmrof_sts):** Reference only: This is the timer overflow status bit. This bit gets set anytime bit 22 of the 24 bit timer goes low (bits are counted from 0 to 23). This will occur every 2.3435 seconds. See TMROF_EN for the effect when TMROF_STS goes active. Software clears this bit by writing a 1 to it.

10.61 Power Management 1 Control (PM1_CNT)—Offset 4h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (rsvd):** Reserved.
13	0h WO	**Sleep Enable (slp_en):** This is a write-only bit and reads to it always return a zero. Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field.
12:10	0h RW/V	**Sleep Type (slp_typ):** This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. Bits | Mode | Typical Mapping 000 | ON | S0 001 | Reserved 010 | Reserved 011 | Reserved 100 | Reserved 101 | Suspend-To-RAM | S3 110 | Suspend-To-Disk | S4 111 | Soft Off | S5
9:3	0h RO	**Reserved (reserved1):** Reserved.
2	0h WO	**Global RLS (gbl_rls):** This bit is used by the ACPI software to raise an event to the BIOS software. BIOS software has a corresponding enable and status bits to control its ability to receive ACPI events. This bit always reads as 0.
1	0h RW	**BM RLD (bm_rld):** This bit is treated as a scratch pad bit.
0	0h RW	**SCI Enable (sci_en):** Selects the SCI interrupt or the SMI# for various events. When this bit is 1, then the events will generate an SCI interrupt. When this bit is 0, these events will generate an SMI#.

10.62 Power Management 1 Timer (PM1_TMR)—Offset 8h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:0	0h RO	**Reserved: Timer Value (rsvd_tmr_val):** Reference only: This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a Platform reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect.

10.63 General Purpose Event 0 Status (GPE0a_STS)—Offset 20h

Note: This register is symmetrical to the General Purpose Event 0a Enable Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the PMC will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the PMC will also generate an SCI if the SCI_EN bit is set, or an SMI# if the SCI_EN bit is not set.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (rsvd31):** Reserved.
21	0h RW/1C/V	**CSE SCI Status (cse_sci_sts):** This bit will be set to 1 by the PMC when CSE sends an Assert_SCI message to the PMC. Additionally, if the CSE_SCI_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the CSE_SCI_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
20	0h RW/1C/V	**eSPI SCI Status (espi_sci_sts):** This bit will be set when an agent attached to eSPI is requesting an SCI via an Assert_SCI message with tag 001b. Note: This source is not able to cause a SX wake event.
19	0h RW/1C/V	**SPI PME Status (spi_pme_sts):** This bit will be set to 1 by the PMC when eSPI sends a PME Virtual Wire message to the PMC with VWIDX==12h, VWVLD[3]==1, VWLVL[3]==0 (PME#). Additionally, if the SPI_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the SPI _PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW/1C/V	**CNV PME Status (cnv_pme_sts):** This bit will be set to 1 by the PMC when CNV sends Assert_PME message to PMC as a result of a wake event from Wi-Fi in D3. Additionally, if the CNV_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the CNV_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
17	0h RW/1C/V	**SATA PME Status (sata_pme_sts):** This bit will be set to 1 by the PMC when SATA asserts its PME wire signal. Additionally, if the SATA_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the SATA _PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
16	0h RW/1C/V	**SMBUS Wake Status (smb_wak_sts):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the PCH's SMBus logic (SMBALERT# signal going active). Notes: 1. The SMBus controller will independently cause an SMI message so this bit does not need to do so (unlike the other bits in this register). 2. This bit is set by the SMBus slave command 01h (Wake/SMI#) even when the system is in the S0 state. Therefore, to avoid an instant wake on subsequent transitions to sleep states, software must clear this bit after each reception of the Wake/SMI# command or just prior to entering the sleep state. 3. The SMBALERT_STS bit (D31:F3:I/O Offset 00h:bit 5) should be cleared.
15	0h RW/1C/V	**GPIO Tier1 SCI Status (gpio_tier1_sci_sts):** This bit is a logical OR of sci_wake wires from tier 1 GPIO's. Additionally, if the GPIO_TIER1_SCI_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the GPIO_TIER1_SCI_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. If the GPIO_TIER1_SCI_EN is set this bit is a SX and S0ix wake source. There may be additional PMU wake mask bits for SX and SOix wakes.
14	0h RW/1C/V	**AVS PME Status (avs_pme_sts):** This bit will be set to 1 by the PMC when AVS asserts its PME wire signal. Additionally, if the AVS_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the AVS_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
13	0h RW/1C/V	**USB XHCI PME Status (xhci_pme_sts):** This bit will be set to 1 by the PMC when USB XHCI asserts its PME wire signal. Additionally, if the XHCI_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the XHCI_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/1C/V	**USB XDCI PME Status (xdci_pme_sts):** This bit will be set to 1 by the PMC when USB XDCI asserts its PME wire signal. Additionally, if the XDCI_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the XDCI_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
11	0h RW/1C/V	**CSE PME Status (cse_pme_sts):** This bit will be set to 1 by the PMC when CSE sends Assert_PME message to PMC. Additionally, if the CSE_PME_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the CSE_PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'.
10	0h RW/1C/V	**Battery Low Status (batlow_sts):** This bit will be set to 1 by hardware when the PMU_BATLOW_B signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved.
9	0h RW/1C/V	**PCIE GPE Status (pcie_gpe_sts):** This bit will be set to 1 by hardware to indicate that the PMC received an Assert_GPE message from one or more of the PCI-Express Ports. The GPE messages represents a PME event message from one or more of the PCI-Express Ports. Software attempts to clear this bit by writing a 1 to this bit position. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the level triggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds.
8	0h RW/1C/V	**PCI Express Wake3 Status (pcie_wake3_sts):** This bit is set by hardware to indicate that the pci_wake3_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake3_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive).
7	0h RW/1C/V	**PCI Express Wake2 Status (pcie_wake2_sts):** This bit is set by hardware to indicate that the pci_wake2_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake2_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive).
6	0h RW/1C/V	**PCI Express Wake1 Status (pcie_wake1_sts):** This bit is set by hardware to indicate that the pci_wake1_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake1_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive).
5	0h RO	**Reserved (rsvd5):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1C/V	**PUNIT SCI status (punit_sci_sts):** This bit will be set if the Power Management Unit requests SCI or and SMI if PUNIT_SCI_EN and !SCI_EN and GBL_SMI_EN is set. This bit is cleared by writing a 1 to this bit position.
3	0h RW/1C/V	**PCI Express Wake0 Status (pcie_wake0_sts):** This bit is set by hardware to indicate that the pci_wake0_b pin was asserted. Software writes a 1 to clear this bit. If pci_wake0_b pin is still active during the write, then the bit will remain active (i.e. input to this bit is level sensitive).
2	0h RW/1C/V	**Software GPE Status (swgpe_sts):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit.
1	0h RO	**Reserved (rsvd):** Reserved.
0	0h RW/1C/V	**PCIE SCI (pcie_sci_sts):** This bit will be set to 1 by the PMC when Pcie sends Assert_SCI message to PMC. Additionally, if the pcie_sci_en and sci_en bits are set, and the system is in an S0 state, then the setting of the pcie_sci_sts bit will generate an SCI (or SMI# if sci_en is not set but GLB_SMI_EN is). This bit is cleared by a software write of '1'. Note: TAG field of Assert_SCI message is ignored.

10.64 General Purpose Event 0 Status (GPE0b_STS)—Offset 24h

Note: This register is symmetrical to the General Purpose Event 0b Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw1 register configuration.

Access Method

Type: IO Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 1 (gpe0b_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw1.

10.65 General Purpose Event 0 Status (GPE0c_STS)—Offset 28h

Note: This register is symmetrical to the General Purpose Event 0c Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw2 register configuration.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 2 (gpe0c_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw2.

10.66 General Purpose Event 0 Status (GPE0d_STS)—Offset 2Ch

Note: This register is symmetrical to the General Purpose Event 0d Enable Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw3 register configuration.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Status Dword 3 (gpe0d_sts):** Shadow of the general purpose event status from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw3.

10.67 General Purpose Event 0 Enables (GPE0a_EN)—Offset 30h

Note: This register is symmetrical to the General Purpose Event 0a Status Register.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (rsvd31):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**CSE SCI Enable (cse_sci_en):** Enables the setting of the CSE_SCI STS bit to generate a wake event and/or an SCI or SMI#.
20	0h RW	**eSPI SCI Enable (espi_sci_en):** Enables the setting of the ESPI_SCI STS bit to generate a wake event and/or an SCI or SMI#.
19	0h RW	**SPI PME Enable (spi_pme_en):** Enables the setting of the SPI_PME_STS bit to generate a wake event and/or an SCI or SMI#. Additionally on those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip
18	0h RW	**CNV PME Enable (cnv_pme_en):** Enables the setting of the CNV_PME_STS bit to generate a wake event and/or an SCI or SMI#.
17	0h RW	**SATA PME Enable (sata_pme_en):** Enables the setting of the SATA_PME_STS bit to generate a wake event and/or an SCI or SMI#.
16	0h RW/V	**SMBUS WAKE Enable (smb_wak_en):** Enables the setting of the SMB_WAK_STS bit to generate a wake event BUT NOT an SCI or SMI#. SMB_WAK is a special case in that it cannot cause an SCI or SMI. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
15	0h RW	**GPIO Tier1 SCI Enable (gpio_tier1_sci_en):** Enables the setting of the GPIO_TIER1_SCI_STS bit to generate a wake event and/or an SCI or SMI#. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
14	0h RW	**AVS PME Enable (avs_pme_en):** Enables the setting of the AVS PME STS bit to generate a wake event and/or an SCI or SMI#. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
13	0h RW	**USB XHCI PME Enable (xhci_pme_en):** Enables the setting of the XHCI_PME_STS bit to generate a wake event and/or an SCI or SMI#.
12	0h RW	**USB XDCI PME Enable (xdci_pme_en):** Enables the setting of the XDCI_PME_STS bit to generate a wake event and/or an SCI or SMI#.
11	0h RW	**CSE PME Enable (cse_pme_en):** Enables the setting of the CSE_PME_EN bit to generate a wake event and/or an SCI or SMI#.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Battery Low Enable (batlow_en):** This bit enables the PMU_BATLOW_B signal to cause an SMI# or SCI (depending on the SCI_EN bit) when it goes low.This bit does not prevent the PMU_BATLOW_B signal from inhibiting the wake event. On desktop platforms this pin should be tied high to ensure proper functionality. In addition to its normal reset conditions, the PMC also clears this bit on emergency shutdowns like power button override and CPU thermal trip.
9	0h RW	**PCIE GPE Enable (pcie_gpe_en):** Enables the PMC to cause an SCI or SMI when the PCIE_GPE_STS bit is set. This is used to allow the PCI Express ports to cause an SCI or SMI due to pmc receiving an Assert_GPE from PCIE0 or PCIE1.
8	0h RW/V	**PCI Express Wake3 Enable (pcie_wake3_en):** This bit, when set to 1, enables the PCIE_WAKE3_STS to to cause an SCI. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
7	0h RW/V	**PCI Express Wake2 Enable (pcie_wake2_en):** This bit, when set to 1, enables the PCIE_WAKE2_STS to to cause an SCI. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
6	0h RW/V	**PCI Express Wake1 Enable (pcie_wake1_en):** This bit, when set to 1, enables the PCIE_WAKE1_STS to to cause an SCI. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
5	0h RO	**Reserved (rsvd5):** Reserved.
4	0h RW	**PUnit SCI Enable (punit_sci_en):** This bit enables the corresponding PUNIT_SCI_STS bit being set to cause an SCI and/or wake event.
3	0h RW/V	**PCI Express Wake0 Enable (pcie_wake0_en):** This bit, when set to 1, enables the PCIE_WAKE0_STS to to cause an SCI. On those platforms where this bit affects SX wake events, the PMC must clear this field on emergency shutdowns like powerbutton override and CPU thermal trip.
2	0h RW	**Software GPE Enable (swgpe_en):** This bit, when set to 1, enables the SW GPE function. If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input). If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated. If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1 then an SMI# will be generated.
1	0h RO	**Reserved (rsvd):** Reserved.
0	0h RW	**PCIE SCI Enable (pcie_sci_en):** Enables the setting of the PCIE_SCI_EN bit to generate a wake event and/or an SCI or SMI#.

10.68 General Purpose Event 0 Enable (GPE0b_EN)—Offset 34h

Note: This register is symmetrical to the General Purpose Event 0b Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw1 register configuration.

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 1 (gpe0b_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw1.

10.69 General Purpose Event 0 Enable (GPE0c_EN)—Offset 38h

Note: This register is symmetrical to the General Purpose Event 0c Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw2 register configuration.

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 2 (gpe0c_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw2.

10.70 General Purpose Event 0 Enable (GPE0d_EN)—Offset 3Ch

Note: This register is symmetrical to the General Purpose Event 0d Status Register. Reads/writes to this register will result in the transaction being forwarded to the corresponding GPIO community based on the GPIO_GPE_CFG.gpe0_dw3 register configuration.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**General Purpose Event 0 Enable Dword 3 (gpe0d_en):** Shadow of the general purpose event enable from the corresponding GPIO community specified in GPIO_GPE_CFG.gpe0_dw3.

10.71 SMI Control and Enable (SMI_EN)—Offset 40h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (rsvd):** Reserved.
29	0h RW	**CSE SMI Enable (cse_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
28	0h RW/L	**eSPI SMI Enable (espi_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set. Software sets this bit to enable eSPI SMI events. NOTE: When the GCR.LOCK.ESPI_SMI bit is set, this bit cannot be changed.
27	0h RW	**PMC OCP Fabric SMI Enable (ocp_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
26	0h RW	**SPI SMI Enable (spi_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
25	0h RO	**Reserved (rsvd25):** Reserved.
24:22	0h RO	**Reserved (reserved24_22):** Reserved.
21	0h RW	**SCC2 SMI Enable (scc2_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
20	0h RW	**PCIE SMI Enable (pcie_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
19	0h RW	**SCS SMI Enable (scs_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
18	0h RW	**Host SMBUS SMI Enable (host_smbus_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**XHCI SMI Enable (xhci_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
16	0h RW	**SMBUS SMI Enable (smbus_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
15	0h RW	**SERIRQ SMI Enable (serirq_smi_en):** Enables SMI logic to cause Sync SMI if gbl_smi_en is set.
14	0h RW	**Periodic Enable (periodic_en):** Setting this bit will cause the PMC to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register.
13	0h RW/L	**TCO Enable (tco_en):** When set, enables the TCO logic to generate SMI#. When cleared, disables TCO logic generating an SMI#. Note: This bit cannot be written once the TCO_LOCK bit is set. This prevents unauthorized software from disabling the generation of TCO-based SMIs.
12	0h RW	**MCSMI Enable (mcsmi_en):** Software sets this bit to 1 to enables Intel PCH to trap access to the microcontroller range (62h or 66h). A 'trapped' cycles will be claimed by Intel PCH, but not forwarded to LPC/eSPI. An SMI# will also be generated.
11	0h RW/1S	**GPIO Unlock SSMI EN (gpio_unlock_ssmi_en):** Enables SSMI logic to cause SSMI if gbl_smi_en is set and parallel STS bit is set. Once written to '1', this bit can only be cleared by the reset condition for this bit.
10	0h RW	**GPIO SMI Enable (gpio_smi_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
9:8	0h RO	**Reserved (reserved5):** Reserved.
7	0h WO	**BIOS RLS (bios_rls):** Enables the generation of an SCI interrupt for ACPI software when a one is written to this bit position by BIOS software. This bit always reads a zero. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
6	0h RW	**Software SMI Timer Enable (swsmi_tmr_en):** Software sets this bit to a 1 to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0.
5	0h RW	**APMC Enable (apmc_en):** If set, this enables writes to the APM register to cause an SMI#.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**SMI On Sleep Enable (smi_on_slp_en):** If this bit is set, the PMC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the PMC will not put the system to a sleep state. This allows the SMI# handler work around chip-level bugs. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.
3	0h RW	**Legacy USB Enable (legacy_usb_en):** Enables SMI logic to cause SMI if gbl_smi_en is set.
2	0h RW	**BIOS Enable (bios_en):** Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.
1	1h RW/1S/V	**End of SMI (eos):** SMI handler sets this bit when it finishes handling the SMI. Setting this bit will force the PMC internal SMI request to zero for 1 clock.Thus if the internal SMI request is still asserted due to new SMI trigger and SMI_ACK was received for the previous SMI, a new SMI will be sent. Hardware clears this bit, SW/FW sets.
0	0h RW/L	**Global SMI Enable (gbl_smi_en):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. If this bit is not set, no SMI# will be generated. Note: When the SMI_LOCK bit is set, this bit cannot be changed.

10.72 SMI Status Register (SMI_STS)—Offset 44h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved (rsvd):** Reserved.
29	0h RW/1C/V	**CSE SMI Status (cse_smi_sts):** This bit will be set if CSE is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
28	0h RW/1C/V	**eSPI SMI Status (espi_smi_sts):** This bit is set if an eSPI agent is requesting an SMI# via an Assert_SMI message with tag 100b. This bit is set by hardware and cleared by software writing a 1 to its bit position.
27	0h RW/1C/V	**PMC OCP Fabric Status (ocp_smi_sts):** This bit will be set if PMC OCP fabric (via PMC IOSF2OCP bridge) requests an SMI#. Writing a '1' to this bit position clears this bit to '0'.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/1C/V	**SPI SMI Status (spi_smi_sts):** This bit will be set when the SPI logic is requesting an SMI# via a message sent from SPI to PMC# with tag 111b.
25	0h RO	**Reserved (rsvd25):** Reserved.
24:22	0h RO	**Reserved (reserved2):** Reserved.
21	0h RW/1C/V	**SCC2 SMI Status (scc2_smi_sts):** This bit will be set if SCC2 unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
20	0h RW/1C/V	**PCIE_SMI Status (pcie_smi_sts):** PCIE SMI event occurred. Set with Assert_SMI from PCIE0 or PCIE1. Writing a '1' to this bit position clears this bit to '0'
19	0h RW/1C/V	**SCS SMI Status (scs_smi_sts):** This bit will be set if SCS unit is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
18	0h RW/1C/V	**Host SMBUS SMI Status (host_smbus_smi_sts):** The PMC sets this bit to 1 to indicate that the SMI# was triggered when Host initiated SMBUS transaction encounters failure such as device error or bus collision or upon the completion of a valid transaction on the bus but with SMBUS SIP SMB_SMI_EN = 1. Further clarification of the cause of this SMI should be queried from SMBUS IPs HOST STATUS register. PMC sets this bit on receiving an SMI message with tag 0x1.
17	0h RW/1C/V	**USB XHCI SMI Status (xhci_smi_sts):** This bit will be set when the USB logic is requesting an SMI#.
16	0h RW/1C/V	**SMBUS SMI Status (smbus_smi_sts):** The PMC sets this bit to 1 to indicate that the SMI# was caused by: 1. The SMBUS Slave receiving a message that an SMI# should be caused. This implies that the PMC received an SMI message from SMBUS with tag 0x3. 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared. This implies that the PMC received an SMI message from SMBUS with tag 0x2. 3. The SMBUS Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set. Where HOST_NOTIFY_INTREN is available via the SMBUS IP not in the PMC. This implies that the PMC received an SMI message from SMBUS with tag 0x2. 4. The SMBUS Slave receiving a SMI in S0 message. This implies that the PMC received an SMI message from SMBUS with tag 0x2. This bit is sticky. It is cleared by writing a 1 to this bit position. Note that this bit is set from the 64 KHz clock domain used by the SMBUS. Software must wait at least 15.63 microseconds

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**SERIRQ SMI Status (serirq_smi_sts):** 1: Indicates the SMI# was caused by the SERIRQ decoder. This implies that the PMC received an SMI message with tag 011b from eSPI or an SMI message with any tag from LPC. 0: SMI# not caused by SERIRQ decoder. This bit will remain 1 until the software writes a 1 to this bit.
14	0h RW/1C/V	**Periodic Status (periodic_sts):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the PMC will generate an SMI#. This bit is cleared by writing a 1 to this bit position.
13	0h RW/1C/V	**TCO Status (tco_sts):** Indicates SMI was caused by the TCO logic. This bit is cleared by writing a 1 to this bit position, Causes would be: 1. Century rollover from SMBUS. This functionality comes from the RTC IP. 2. TCO_TMR 1st & 2nd expiration in PMC. 3. OS writes to TCO_DAT_IN register. Sent to PMC as a SMI message with tag 0x0 from SMBUS. 4. NMI occurred and mapped to SMI. Sent to PMC as a SMI message with not tag from ITSS. 5. INTRUDER# signal goes active. Wire to the PMC from SMBUS. 6. Illegal attempt to write to BIOS located in the FWH accessed over LPC. Sent to PMC as a SMI msg with tag 0x0 from SMBUS. 7. Changes of BC.WPD (Write Protect Disable) bit from 0 to 1. Sent to PMC as an SyncSMI message with tag 0x1 from LPC or eSPI. 8. BIOS Write Protect Disable (SPI_BC.WPD) set if BIOS Lock Enable (SPI_BC.LE) = 1 Sent to PMC as an SyncSMI message with tag 0x5 from SPI
12	0h RW/1C/V	**Microcontroller SMI Status (mcsmi_sts):** This bit is set if there is an access to the power management microcontroller range (62h or 66h). If this bit is set, and the MCSMI_EN bit is also set, the Intel PCH will generate an SMI#. This bit is set by hardware and cleared by software writing a 1 to its bit position. This bit will be set when the eSPI/LPC logic is requesting an Sync SMI# with tag 0x0. The FW controlled ACPI_CTL.MCSMI_CTRL bit acts as a rising edge input to this bit.
11	0h RW/1C/V	**GPIO Unlock SSMI STS (gpio_unlock_ssmi_sts):** This bit will be set if the GIO registers lockdown logic is requested an SSMI. Writing a '1' to this bit position clears this bit to '0'.
10	0h RW/1C/V	**GPIO SMI STS (gpio_smi_sts):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted. GPIOs that are not routed to cause an SMI will have no effect on this bit.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**Reserved (rsvd_gpe0_sts):** GPE0a Status Register. Historically GPE0a_STS could only generate SCI and never an SMI. Reference only: There are several status/enable bit pairs in GPE0a_STS/EN that are capable of triggering SMI. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. Note: The setting of this bit does not cause the SMI#.
8	0h RO	**Reserved (rsvd_pm1_sts_reg):** PM1 Status Register. Historically, PM1_STS_EN could only generate SCI and never an SMI. Reference only: This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1_STS_EN Status Reg. Not sticky. Writes to this bit have no effect. Note: The setting of this bit does not cause the SMI#.
7	0h RO	**Reserved (reserved4):** Reserved. No corresponding status bit to BIOS_RLS.
6	0h RW/1C/V	**Software SMI Timer Status (swsmi_tmr_sts):** This bit will be set to 1 by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a 1 to this bit.
5	0h RW/1C/V	**Advanced Power Management Status (apm_sts):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position.
4	0h RW/1C/V	**SMI ON SLP EN Status (smi_on_slp_en_sts):** This bit will be set by the PMC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a 1 to this bit position.
3	0h RW/1C/V	**Legacy USB Status (legacy_usb_sts):** Logical OR of each of the SMI status bits in the USB Legacy Keybd Register in the eSPI or LPC IP ANDed with the corresponding enable bits in the LPC IP. SMI_EN.LEGACY_USB_EN must be set for this bit to cause an SMI. This bit is cleared by writing a 1 to this bit position. This bit will be set when the eSPI or LPC logic is requesting a Sync SMI# with tag 0x2. The FW controlled ACPI_CTL.LEGACY_USB_CTRL bit acts as a rising edge input to this bit.
2	0h RW/1C/V	**BIOS Status (bios_sts):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a 1 to this bit position.
1:0	0h RO	**Reserved (reserved7):** Reserved.

10.73 Device Trap Status (DEVTRAP_STS)—Offset 4Ch

Each bit indicates if an access has occurred to the corresponding device's trap range or for bits 6:9 if the corresponding PCI interrupt is active. Write 1 to the same bit position to clear it. This register is used by APM power management software to see if there has been system activity. The periodic SMI# timer indicates if it is the right time to read the DEVTRAP_STS register.

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd16):** Reserved.
15:13	0h RO	**Reserved (rsvd15):** Reserved.
12	0h RW/1C/V	**Device Trap Status Bit 12 (d12_trp_sts):** KBC (60/64h)
11:6	0h RO	**Reserved (rsvd11):** Reserved.
5	0h RW/1C/V	**Device Trap Status Bit 5 (d5_trp_sts):** This will be set if any of the following are accessed (as determined by the I/O ranges in the LPC decoder (even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC.
4:0	0h RO	**Reserved (rsvd4):** Reserved.

10.74 General Purpose Event Control (GPE_CTRL)—Offset 50h

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Software General Purpose Event Control (swgpe_ctrl):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0a_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of 1 will clear SWGPE_STS to 0.
16:0	0h RO	**Reserved (reserved1):** Reserved.

10.75 TCO Reload Register (TCO_RLD)—Offset 60h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (rsvd):** Reserved.
9:0	0h RO/V	**TCO Timer Value (tco_val):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

10.76 TCO Timer Status (TCO_STS)—Offset 64h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (reserved2):** Reserved.
17	0h RW/1C/V	**Second Timeout Status (second_to_sts):** PMC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the PMC will reboot the system after the second timeout. The reboot is done by interrupting the Arc and starting a reset flow based on the OS_POLICY. This bit is only cleared by writing a 1 to this bit or by a reset.

Bit Range	Default & Access	Field Name (ID): Description
16:4	0h RO	**Reserved (reserved1):** Reserved.
3	0h RW/1C/V	**TCO Timeout (tco_timeout):** Bit set to 1 by PMC to indicate that the SMI was caused by TCO timer reaching 0.
2:0	0h RO	**Reserved (rsvd):** Reserved.

10.77 TCO Timer Control (TCO1_CNT)—Offset 68h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (rsvd):** Reserved.
21:20	0h RW	**OS Policy (os_policy):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00: Boot normally 01: Shut down 10: Don't load OS. Hold in pre-boot state and use LAN to determine next step. 11: Reserved
19:13	0h RO	**Reserved (reserved2):** Reserved.
12	0h RW/L	**TCO Lock (tco_lock):** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it cannot be cleared by software writing a 0 to this bit location. Reset is required to change this bit from 1 to 0. This bit defaults to 0. On some prior platforms, this field is reset on cold reset.
11	0h RW	**TCO Timer Halt (tco_tmr_halt):** 1: The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0: The TCO timer is enabled to count. This is the default.
10:0	0h RO	**Reserved (reserved1):** Reserved.

10.78 TCO Timer Register (TCO_TMR)—Offset 70h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 40000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (reserved1):** Reserved.
25:16	4h RW	**TCO Timer Reload Value (tco_trld_val):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. Note: The timer has an error of +/- 1 tick (0.6s). The TCO Timer will only count down in the S0 and S0IX state.
15:0	0h RO	**Reserved (rsvd):** Reserved.

10.79 Advanced Power Management Status (APM_STS)—Offset 74h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Advanced Power Management Status Port (apm_sts):** Used to pass data between the OS and the SMI handler. Basically, this is a scratch pad register and is not effected by any other register or function (other reset). Writes can come through ACPI register writes or from IO Port write to port 0xB3.
23:0	0h RO	**Reserved (rsvd):** Reserved.

10.80 Advanced Power Management Control Port (APM_CNT)—Offset 78h

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (reserved0):** Reserved.
23:16	0h RW	**Advanced Power Management Control Port (apm_cnt):** Used to pass an APM command between the OS and the SMI handler. Writes to this bit field not only store data in the APMC register, but also generates an SMI# when the APMC_EN bit is set. Writes can come through ACPI register writes or from IO Port write to port 0xB2.
15:0	0h RO	**Reserved (reserved1):** Reserved.

10.81 Direct IRQ Enables (DIRECT_IRQ_EN)—Offset 7Ch

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (reserved0):** Reserved.
9	0h RW	**Direct IRQ Enable for PMIC (pmic_en):** This bit enables generation of De/AssertIRQn message based on SVID's interrupt signal (which reflects PMIC's alert signal). The resulting De/AssertIRQn will have an IRQ vector, as programmed in the corresponding GCR.IRQ_SEL_0/1/2 field.
8	0h RW	**Direct IRQ Enable for XHCI (xhci_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on XHCI's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
7	0h RW	**Direct IRQ Enable for XDCI (xdci_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on XDCI's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
6	0h RW	**Direct IRQ Enable for SCC (sdio_d1_en):** This bit enables wake from S0ix and there is no De/AssertIRQn message for SDIO_D1 only a wake.
5	0h RW	**Direct IRQ Enable for SCC (sdcard_cd_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on SCC's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Direct IRQ Enable for SCC (sdcard_d1_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on SCC's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
3	0h RW	**Direct IRQ Enable for UART[3] (uart3_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
2	0h RW	**Direct IRQ Enable for UART[2] (uart2_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
1	0h RW	**Direct IRQ Enable for UART[1] (uart1_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.
0	0h RW	**Direct IRQ Enable for UART[0] (uart0_en):** This bit enables wake from S0ix and generation of De/AssertIRQn message based on UART's PME & D0i3 signals. The resulting De/AssertIRQn will have vector. as programmed in the corresponding GCR.IRQ_SEL_0/1 field.

10.82 Power and Reset Status (PRSTS)—Offset 1000h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well is down, they are marked as suspend well bits. All suspend well bits in this register are reset by global reset#.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (rsvd_pmc_prodid):** PMC Product ID. Reserved: This field communicates the Product Family of the power management functionality.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO	**Reserved (rsvd_pmc_revid):** PMC Revision ID. Power Management Controller Revision ID. Reference only: This field communicates the implementation revision of the power management functionality.
15	0h RO	**Reserved (rsvd_pmc_wdt_sts):** PMC Watch Dog Timer Status. Reserved: This bit will be set to '1' when the PMC Watch Dog Timer triggers a reset. It will be cleared by a write of '1' by software.
14:8	0h RO	**Reserved (reserved2):** Reserved.
7	0h RW/1C/V	**CSE Clear Reset Status (cse_cldrst_sts):** This bit will be set to '1' when the CSE FW triggers a reset. It will be cleared by a write of '1' by software. BIOS should read GEN_PMCON1 to determine what type of reset CSE requested. Reset by pwrgood.
6	0h RO	**Reserved (rsvd_cse_wdt_sts):** CSE Watch Dog Timer Status. Reserved: This bit will be set to '1' when the CSE Watch Dog Timer triggers a reset. It will be cleared by a write of '1' by software.
5:0	0h RO	**Reserved (reserved1):** Reserved.

10.83 PM CFG - Power Management Configuration (PMC_CFG)—Offset 1008h

This register contains misc. fields used to configure the SOC's power management behavior.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (reserved4):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Reserved (rsvd_slp_sus_min_asst_wdth):** SLP_SUS# Minimum Assertion Width. Reference only - This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS Well power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 2'b00: 0 ms (i.e. stretching disabled - default) 2'b01: 500 ms 2'b10: 1 s 2'b11: 4 s This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. This field is ignored when exiting a G3 state if the Disable SLP_X Stretching After SUS Power Failure bit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit. Programming Note: For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_LAN#, or SLP_A#). This bit is only fully cleared by the RTEST# pin.
17:16	0h RO	**Reserved (rsvd_slp_sus_a_asst_wdth):** SLP_A# Minimum Assertion Width. Reference only - This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 2'b00: 0 ms (i.e. stretching disabled - default) 2'b01: 4 s 2'b10: 98 ms 2'b11: 2 s This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. This field is ignored when exiting a G3 state if the Disable SLP_X Stretching After SUS Power Failure bit is set.
15:10	0h RO	**Reserved (reserved3):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW/V/L	**Reset Power Cycle Duration (pwr_cyc_dur):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_LAN# asserted if applicable) during a host partition reset (if applicable) with power cycle or a global reset. The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. Valid values are: 2'b11: 1-2 seconds 2'b10: 2-3 seconds 2'b01: 3-4 seconds 2'b00: 4-5 seconds (default) This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set. Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers: GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH GEN_PMCON_3.S4MAW PM_CFG.SLP_A_MIN_ASST_WDTH (if applicable) PM_CFG_SLP_LAN_MIN_ASST_WDTH (if applicable) These bits are fully cleared by RTCRST# assertion
7:6	0h RO	**Reserved (reserved2):** Reserved.
5	0h RO	**Reserved (rsvd_sps):** Shutdown Policy Select. ITSS is the recipient of CF9 I/O writes. Reference only: When cleared (default) the SOC will drive INIT# in response to the shutdown Message. When set to 1, SOC will treat the shutdown message similar to receiving a CF9h I/O write, and will drive PMU_PLTRST active. This register is reset any time HOST_RST asserts.
4	0h RW	**No Reboot (no_reboot):** FW will set this bit when TCO_NO_REBOOT SMIP is set.SW might also set this bit.When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout.
3	0h RW	**S1/3/4/5 Entry Timeout Enable (sx_ent_to_en):** This policy bit determines whether the SOC will apply a timeout to the S3/S4/S5 entry flow. If this timeout is enabled and the entry flow appears to be hung, the SOC will trigger a global reset. Encodings: 0: Timeout Disabled (default) 1: Timeout Enabled Note: The active SMIP value to continue will override timeout bit for S4/S5 only. Note: BXT0 and BXT1 only support S4 and S5 (as cold off states).
2:0	0h RO	**Reserved (reserved1):** Reserved.

10.84 Power Management Configuration (PMC_CFG2)—Offset 100Ch

This register contains misc. fields used to configure the SOC's power management behavior.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**Power Button Override Period (pwrbtn_ovr_per):** This field determines, while the power button remains asserted, how long the PMC will wait before initiating a global reset. Encoding: 3'b000: 4 seconds 3'b001: 6 seconds 3'b010: 8 seconds 3'b011: 10 seconds 3'b100: 12 seconds 3'b101: 14 seconds Others: Reserved
28	0h RW/V/L	**Power Button Native Mode Disable (pwrbtn_dis):** When this bit is '0' (default), the PMC's power button logic will act upon the input value from the GPIO unit, as normal. When this bit is set to '1', the PMC must force its internal version of the power button pin to '1'. This will result in the PMC logic constantly seeing the pin as de-asserted.
27:11	0h RO	**Reserved (reserved0):** Reserved.
10	0h RW/V	**Power Button Debounce Mode (pwrbtn_db_mode):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PWRBTN# pin. This bit's values cause the following behavior: 0: The 16 ms debounce period applies to all usages of the PWRBTN# pin (legacy behavior). 1: When a falling edge occurs on the PWRBTN# pin, an interrupt is generated and the 16 ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running. Note: Power button override logic always samples the post-debounce version of the pin.
9:0	0h RO	**Reserved (reserved1):** Reserved.

10.85 SOC Power Management Status (SOC_PM_STS)—Offset 1010h

This register contains misc. fields used to record events pertaining to SOC power management. Unless otherwise indicated, all RWC bits are cleared with a write of 1 by software.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (rsvd):** Reserved.
2	0h RO	**Reserved (rsvd_hpr_ent_to):** Host Partition Reset Entry Timeout. This bit is set to '1' to record that a global reset was triggered by a timeout during Host partition reset entry sequence.
1	0h RO	**Reserved (rsvd_sx_ent_to):** S3/4/5 Entry Timeout. Reset cause information is available via Shared SRAM Reserved: This bit is set to '1' to record that a global reset was triggered by a timeout during an S3, S4, or S5 entry sequence.
0	0h RO	**Reserved (reserved1):** Reserved.

10.86 General PM Configuration 1 (GEN_PMCON1)—Offset 1020h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 4004h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (reserved6):** Reserved.
27	0h RW/1C/V	**Cold Boot Status (cold_boot_sts):** FW will populate this BIOS visible bit based on a COLD BOOT. This bit acts as notification to BIOS of the type of boot/reset.
26	0h RW/1C/V	**Cold Reset Status (cold_reset_sts):** FW will populate this BIOS visible bit based on a COLD RESET. This bit acts as notification to BIOS of the type of boot/reset.
25	0h RW/1C/V	**Warm Reset Status (warm_reset_sts):** FW will populate this BIOS visible bit based on a WARM RESET. This bit acts as notification to BIOS of the type of boot/reset.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C/V	**Global Reset Status (global_reset_sts):** FW will populate this BIOS visible bit based on a GLOBAL RESET. This bit acts as notification to BIOS of the type of boot/reset.
23	0h RW	**DRAM Initialization Scratchpad Bit (disb):** This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted.
22	0h RO	**Reserved (reserved5):** Reserved.
21	0h RO	**Reserved (rsvd_mem_sr):** Memory Placed in Self-Refresh. Reference only: This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: Successful S3 entry & exit Successful Host partition reset without power cycle This bit will be cleared whenever the SOC begins a transition out of S0. Note: This bit should not be consulted upon wake from S1, as that state does not involve the same type of handshake or placing memory into Self-Refresh. It is assumed that software is already aware that memory context is not impacted by S1 and therefore does not need to check this bit.
20	0h RW/1C/V	**System Reset Status (srs):** This bit will be set based on an asserting edge of the PMU_RESETBUTTON_B pin (post 16 ms HW debounce if PMU_RESETBUTTON_B Debounce Disable SMIP is 0) BIOS is expected to read this bit and clear it if it is set.
19	0h RO	**Reserved (rsvd_cts):** CPU Thermal Trip Status. Reference only: This bit is set when the SOC thermal trip active while the system is in a valid state to honor the pin. This bit is also reset by RSMRST_B and CF9h resets. It is not reset by the shutdown and reboot associated with the thermal trip event. RSMRST_B is a reset signal based on a RSMRST# pin present on some PCH platforms that indicates the suspend/resume voltages are stable. Note: This bit is must for no PMIC platform. In platforms with PMIC - PMIC handles the thermal trip. Hence, actual Thermal Trip Status bit should be part of PMIC registers, while PMC could mirror it to this bit.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW/1C/V	**Minimum PMU SLP S4 B Assertion Width Violation Status (ms4v):** Hardware sets this bit when the PMU_SLP_S4_B assertion width is less than the time programmed in the PMU_SLP_S4_B Minimum Assertion Width field. The SOC begins the timer when PMU_SLP_S4_B pin is asserted during S4/S5 entry, or when the RSMRST_B input is deasserted during SUS well power-up. The status bit is cleared by software writing a 1 to the bit. Note that this bit is functional regardless of the value in the PMU_SLP_S4_B Assertion Stretch Enable and the Disable-SLP_X-Stretching-After-SUS-Power-Failure bits. This bit is reset by the assertion of the RSMRST_B pin, but can be set in some cases before the default value is readable. Note: Relevant only for no PMIC mode.
17	0h RO	**Reserved (reserved4):** Reserved
16	0h RO	**Reserved (rsvd_pwr_flr):** VNNPWROK Failure. Reference only: Intel SOC sets this bit any time COREPWROK goes low if the system was in an S0 state. The bit will be cleared only by software writing a 1 back to the bit or by SUS well power loss. Note: This bit is must for no PMIC platform. In platforms with PMIC - PMIC handles Vnn failures. Hence, actual VNNPWROK Failure bit should be part of PMIC registers, while PMC could mirror it to this bit.
15	0h RW/V/L	**PME B0 S5 Disable (pme_b0_s5_dis):** When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. It has a separate STS and EN for each source. Therefore this bit affects GPE0a_STS/EN PME bits for: XDCI, XHCI, CNV, and AVS.
14	1h RO	**Reserved (rsvd_aon_pwr_flr):** VNNAON Well Power Failure. This bit is set to '1' whenever SUS well power is lost, as indicated by RSMRST_B assertion. Software writes a 1 to this bit to clear it. This bit is in the SUS well, and defaults to '1' based on RSMRST_B assertion (not cleared by any type of reset). Note: This bit is must for no PMIC platform. In platforms with PMIC - PMIC handles VnnAON failures. Hence, actual VNNAON Well Power Failure bit should be part of PMIC registers, while PMC could mirror it to this bit.
13:10	0h RO	**Reserved (Reserved3):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	**Reserved (rsvd_gen_rst_sts):** General Reset Status. Reference only: This bit is set by hardware whenever HOST_RST asserts for any reason other than going into a software-entered sleep state (via PM1_CNT.SLP_EN write). This bit is an optional tool to help BIOS determine when a reset might have collided with a wake from a valid sleep state. A possible usage model would be to consult and then write a '1' to clear this bit during the boot flow before determining what action to take based on reading PM1_STS.WAK_STS = '1'. If GEN_RST_STS = '1', the cold reset boot path could be followed rather than the resume path, regardless of the setting of WAK_STS. This bit does not affect SOC operation in any way, and can therefore be left set if BIOS chooses not to use it. This bit is set by global reset.
8	0h RO	**Reserved (Reserved2):** Reserved.
7:6	0h RW	**SWSMI Rate Select (swsmi_ratesel):** This 2-bit value indicates when the SWSMI timer will time out. Valid values are: 00 1.5 ms +/- 0.6 ms 01 16 ms +/- 4 ms 10 32 ms +/- 4 ms 11 64 ms +/- 4 ms
5:3	0h RO	**Reserved (reserved1):** Reserved.
2	1h RW/V	**RTC Power Status (rps):** Intel SOC will set this bit to 1 when RTEST_B indicates a weak or missing battery. The bit will remain set until the software clears it by writing a 0 back to this bit position. This bit is not cleared by any type of reset because a cleared shadowed value will be restored prior to this bit being visible. Note: Relevant only for no PMIC mode while SoC includes RTC well.
1	0h RO	**Reserved (reserved0):** Reserved.
0	0h RW/V/L	**After G3 Enable (ag3e):** Determines what state to go to when power is reapplied after a power failure (G3 state). 0: System will return to an S0 state (boot) after power is re-applied. 1: System will return to the S5 state (except if it was in S4, in which case it will return to S4-like state). In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. Note: Relevant only for no PMIC mode.

10.87 General PM Configuration 2 (GEN_PMCON2)—Offset 1024h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 3800h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (reserved1):** Reserved.
13:11	7h RW/L	**LPC Loopback Clock Control (lpc_lpb_clk_ctrl):** Delay for LPC loopback clock (to match board latency to and from the embedded controller. 000: RESERVED (This setting is not supported and may lead to inconsistent behavior on silicon) 001: 1.25 ns 010: 3.75 ns 011: 6.25 ns 100: 8.75 ns 101: 11.25 ns 110: 12.50 ns 111: 13.75 ns
10	0h RO	**Reserved (rsvd_bios_pci_exp_en):** BIOS PCI Express Enable. Reference only: This bit acts as a global enable for the SCI associated with the PCI express ports. If this bit is not set, then the various PCI Express ports cannot cause the PCI_EXP_STS bit to go active.
9	0h RO/V	**Power Button Level (pwrbtn_lvl):** This read-only bit indicates the current state of the PWRBTN# signal. 1: High 0: Low The value reflected in this bit is dependent upon PMC_CFG2.pwrbtn_db_mode
8:5	0h RO	**Reserved (reserved3):** Reserved.
4	0h RW/L	**SMI Lock (smi_lock):** When this bit is set, writes to the GBL_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by reset).
3:2	0h RO	**Reserved (reserved4):** Reserved.
1:0	0h RW/L	**Period SMI Select (per_smi_sel):** Software sets these bits to control the rate at which the periodic SMI# is generated: 00: 64 seconds (default) 01 = 32 seconds 10 = 16 seconds 11 = 8 seconds Tolerance for the timer is +/- 1 second.

10.88 General PM Configuration 3 (GEN_PMCON3)—Offset 1028h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (reserved1):** Reserved.
12	0h RO	**Reserved (rsvd_dis_slp_x_strch_sus_up):** Disable SLP_X Stretching After SUS Well Power Up. Reference only: When this bit is set to 1, all SLP_* pin stretching is disabled when powering up after a SUS well power loss. When this bit is left at 0, SLP_* stretching will be performed after SUS power failure as enabled in various other fields. Note that if this bit is a 0, SLP_* stretch timers start on SUS well power up (the SOC has no ability to count stretch time while the SUS well is powered down). Setting this bit can therefore prevent long delays after SUS power loss which may be common in mobile platforms and in manufacturing flow testing, while still allowing for the full power cycling during S3, S4 and S5 states. If the platform guarantees minimum SUS power down residence in other ways, an additional SOC-induced delay is not needed or wanted. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the SRTCRST_B pin. Note: Relevant only for no PMIC mode.
11:10	0h RW/L	**PMU SLP S3 B Minimum Assertion Width (slp_s3_min_asst_wdth):** Reference only: This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_B signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. Note: Relevant only for no PMIC mode.
9:6	0h RO	**Reserved (reserved2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RW/V/L	**PMU SLP S4 B Minimum Assertion Width (s4maw):** This 2-bit value indicates the minimum assertion width of the PMU_SLP_S4_B signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: 11: 1 second 10: 2 seconds 01: 3 seconds 00: 4 seconds This value is used in two ways: If the PMU_SLP_S4_B assertion width is ever shorter than this time, a status bit is set for BIOS to read when S0 is entered. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S4_B signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the suspend power well. Therefore, when leaving a G3 state, the minimum time is measured from the deassertion of the internal suspend well reset (unless the Disable SLP_X Stretching After SUS Power Failure bit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. SRTCRST_B forces this field to the conservative default state (00b). Note: Relevant only for no PMIC mode.
3	0h RW/V/L	**PMU SLP S4 B Assertion Stretch Enable (s4ase):** When set to 1, the PMU_SLP_S4_B pin will minimally assert for the time specified in bits 5:4 of this register. When 0, the reset flow still includes the SLP_S3_MIN_ASST_WDTH but no additional time is included for S4ASE. This bit is provided so that all DIMMs in the system can deterministically detect a power-cycle event for proper initialization. Note that there are behavioral changes that may be noticeable to the end-user when this bit is set. Resume times from S4 and S5 and power-up times from G3 may be delayed by several seconds. Cases in which this feature may not be desirable and therefore keeping the bit cleared are: A customer decides the user confusion due to the hardware delay is a bigger issue than the potential DRAM issue A customer decides the software status bit solution is adequate A different DRAM type is used or the platform provides an external solution to solve the power-cycling issue Validation regressions are impacted by the delay (especially after RSMRST_B deassertion) Avoid potential resume time WHQL violations This bit is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by SRTCRST_B. Note: Relevant only for no PMIC mode.
2:0	0h RO	**Reserved (reserved3):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd31):** Reserved.
15:12	6h RW	**GPIO Group to General Purpose Event Dword 3 (gpe0_dw3):** This register assigns a specific GPIO Group to the ACPI GPE0d (i.e. GPE0[127:96]). The value in this field determines which GPIO group is assigned to dword 3 (gpe0d).
11:8	3h RW	**GPIO Group to General Purpose Event Dword 2 (gpe0_dw2):** This register assigns a specific GPIO Group to the ACPI GPE0c (i.e. GPE0[95:64]). The value in this field determines which GPIO group is assigned to dword 2 (gpe0c).
7:4	0h RW	**GPIO Group to General Purpose Event Dword 1 (gpe0_dw1):** This register assigns a specific GPIO Group to the ACPI GPE0b (i.e. GPE0[63:32]). The value in this field determines which GPIO group is assigned to dword 1 (gpe0b).
3:0	0h RO	**Reserved (rsvd_gpe0_dw0):** GPIO Group to General Purpose Event Dword 0. This register assigns a specific GPIO Group to the ACPI GPE0a (i.e. GPE0[31:0]). The value in this field determines which GPIO group is assigned to dword 0 (gpe0a). This register is reserved / unused, because gpe0a is a local ACPI register.

10.94 UART IRQ Configuration (IRQ_CFG_UART)—Offset 1060h

Configuration for UART Direct IRQ logic to allow inversion or disabling of the CTS or RXD interrupts.
Configured by IAFW to allow for wake support for a variety of UART devices without requiring runtime driver configuration of GPIOs.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FF00h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd31):** Reserved.
15	1h RW/L	**UART3 RXD Direct IRQ Enable (uart3_rxd_int_en):** If set, enables RXD wire to cause Direct IRQ.
14	1h RW/L	**UART2 RXD Direct IRQ Enable (uart2_rxd_int_en):** If set, enables RXD wire to cause Direct IRQ.
13	1h RW/L	**UART1 RXD Direct IRQ Enable (uart1_rxd_int_en):** If set, enables RXD wire to cause Direct IRQ.
12	1h RW/L	**UART0 RXD Direct IRQ Enable (uart0_rxd_int_en):** If set, enables RXD wire to cause Direct IRQ.
11	1h RW/L	**UART3 CTS Direct IRQ Enable (uart3_cts_int_en):** If set, enables CTS wire to cause Direct IRQ.
10	1h RW/L	**UART2 CTS Direct IRQ Enable (uart2_cts_int_en):** If set, enables CTS wire to cause Direct IRQ.
9	1h RW/L	**UART1 CTS Direct IRQ Enable (uart1_cts_int_en):** If set, enables CTS wire to cause Direct IRQ.
8	1h RW/L	**UART0 CTS Direct IRQ Enable (uart0_cts_int_en):** If set, enables CTS wire to cause Direct IRQ.
7	0h RW/L	**UART3 RXD invert (uart3_rxd_inv):** If set, inverts RXD wire at the input of the PMC Direct IRQ logic.
6	0h RW/L	**UART2 RXD invert (uart2_rxd_inv):** If set, inverts RXD wire at the input of the PMC Direct IRQ logic.
5	0h RW/L	**UART1 RXD invert (uart1_rxd_inv):** If set, inverts RXD wire at the input of the PMC Direct IRQ logic.
4	0h RW/L	**UART0 RXD invert (uart0_rxd_inv):** If set, inverts RXD wire at the input of the PMC Direct IRQ logic.
3	0h RW/L	**UART3 CTS invert (uart3_cts_inv):** If set, inverts CTS wire at the input of the PMC Direct IRQ logic.
2	0h RW/L	**UART2 CTS invert (uart2_cts_inv):** If set, inverts CTS wire at the input of the PMC Direct IRQ logic.
1	0h RW/L	**UART1 CTS invert (uart1_cts_inv):** If set, inverts CTS wire at the input of the PMC Direct IRQ logic.
0	0h RW/L	**UART0 CTS invert (uart0_cts_inv):** If set, inverts CTS wire at the input of the PMC Direct IRQ logic.

10.95 IRQ Select 0 (IRQ_SEL_0)—Offset 1064h

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**IRQ Vector For UART 3 (dir_irq_sel_uart3)**
23:16	0h RW/L	**IRQ Vector For UART 2 (dir_irq_sel_uart2)**
15:8	0h RW/L	**IRQ Vector For UART 1 (dir_irq_sel_uart1)**
7:0	0h RW/L	**IRQ Vector For UART 0 (dir_irq_sel_uart0)**

10.96 IRQ Select 1 (IRQ_SEL_1)—Offset 1068h

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**IRQ Vector For XHCI (dir_irq_sel_xhci)**
23:16	0h RW/L	**IRQ Vector For XDCI (dir_irq_sel_xdci)**
15:8	0h RW/L	**IRQ Vector For SDCARD CD (dir_irq_sel_sdcard_cd)**
7:0	0h RW/L	**IRQ Vector For SDCARD D1 (dir_irq_sel_sdcard_d1)**

10.97 IRQ Select 2 (IRQ_SEL_2)—Offset 106Ch

ACPI uses these fields to fill the IRQ vector of the De/Assert_IRQn message for Direct IRQs.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/L	**SCI IRQ Select (scis):** Specifies on which IRQ the SCI will internally appear. ACPI uses this field to fill the IRQ vector of the De/Assert_IRQn message for IOAPIC IRQ for PMIC interrupts. If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not shareable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts. This field fully defines the IRQ number to be sent. When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.
23:16	0h RW/L	**PMIC Direct IRQ Select (dir_irq_sel_pmic):** ACPI uses this field to fill the IRQ vector of the De/Assert_IRQn message for IOAPIC IRQ for PMIC interrupts.
15:0	0h RO	**Reserved (rsvd):** Reserved.

10.98 Function ACPI Enumeration 0 (FUNC_ACPI_ENUM_0)—Offset 1070h

BIOS uses this register to enumerate ACPI functions.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved Enable (rsvd31):** Reserved.
30	0h RW	**SPI Enable (spi):** If set by BIOS the named function is exposed to the OS via ACPI.
29	0h RW	**SSRAM Enable (ssram):** If set by BIOS the named function is exposed to the OS via ACPI.
28	0h RW	**AVS Enable (avs):** If set by BIOS the named function is exposed to the OS via ACPI.
27	0h RW	**CSE HECI1 Enable (cse_heci1):** If set by BIOS the named function is exposed to the OS via ACPI.
26	0h RW	**CSE HECI2 Enable (cse_heci2):** If set by BIOS the named function is exposed to the OS via ACPI.
25	0h RW	**CSE HECI3 Enable (cse_heci3):** If set by BIOS the named function is exposed to the OS via ACPI.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**ISH Enable (ish):** If set by BIOS the named function is exposed to the OS via ACPI.
23	0h RO	**Reserved (rsvd23):** Reserved.
22	0h RO	**Reserved (rsvd22):** Reserved.
21	0h RW	**LPSS I2C0 Enable (lpss_i2c0):** If set by BIOS the named function is exposed to the OS via ACPI.
20	0h RW	**LPSS I2C1 Enable (lpss_i2c1):** If set by BIOS the named function is exposed to the OS via ACPI.
19	0h RW	**LPSS I2C2 Enable (lpss_i2c2):** If set by BIOS the named function is exposed to the OS via ACPI.
18	0h RW	**LPSS I2C3 Enable (lpss_i2c3):** If set by BIOS the named function is exposed to the OS via ACPI.
17	0h RW	**LPSS I2C4 Enable (lpss_i2c4):** If set by BIOS the named function is exposed to the OS via ACPI.
16	0h RW	**LPSS I2C5 Enable (lpss_i2c5):** If set by BIOS the named function is exposed to the OS via ACPI.
15	0h RW	**LPSS I2C6 Enable (lpss_i2c6):** If set by BIOS the named function is exposed to the OS via ACPI.
14	0h RW	**LPSS I2C7 Enable (lpss_i2c7):** If set by BIOS the named function is exposed to the OS via ACPI.
13	0h RW	**LPSS UART0 Enable (lpss_uart0):** If set by BIOS the named function is exposed to the OS via ACPI.
12	0h RW	**LPSS UART1 Enable (lpss_uart1):** If set by BIOS the named function is exposed to the OS via ACPI.
11	0h RW	**LPSS UART2 Enable (lpss_uart2):** If set by BIOS the named function is exposed to the OS via ACPI.
10	0h RW	**LPSS UART3 Enable (lpss_uart3):** If set by BIOS the named function is exposed to the OS via ACPI.
9	0h RW	**LPSS SPI0 Enable (lpss_spi0):** If set by BIOS the named function is exposed to the OS via ACPI.
8	0h RW	**LPSS SPI1 Enable (lpss_spi1):** If set by BIOS the named function is exposed to the OS via ACPI.
7	0h RW	**LPSS SPI2 Enable (lpss_spi2):** If set by BIOS the named function is exposed to the OS via ACPI.
6	0h RW	**PWM Enable (pwm):** If set by BIOS the named function is exposed to the OS via ACPI.
5	0h RW	**SDCARD Enable (sdcard):** If set by BIOS the named function is exposed to the OS via ACPI.
4	0h RW	**SDIO Enable (sdio):** If set by BIOS the named function is exposed to the OS via ACPI.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**eMMC Enable (emmc):** If set by BIOS the named function is exposed to the OS via ACPI.
2	0h RW	**UFS Enable (ufs):** If set by BIOS the named function is exposed to the OS via ACPI.
1	0h RO	**Reserved (rsvd1):** Reserved.
0	0h RW	**xDCI Enable (xdci):** If set by BIOS the named function is exposed to the OS via ACPI.

10.99 Function ACPI Enumeration 1 (FUNC_ACPI_ENUM_1)—Offset 1074h

BIOS uses this register to enumerate ACPI functions.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (rsvd31):** Reserved.
2	0h RW	**USF2 Enable (ufs2):** If set by BIOS the named function (3rd lane UFS) is exposed to the OS via ACPI
1	0h RW	**PMC PCI Enable (pmc_pci):** If set by BIOS the named function is exposed to the OS via ACPI.
0	0h RW	**P2SB Enable (p2sb):** If set by BIOS the named function is exposed to the OS via ACPI.

10.100 Fixed Deep S0Ix Counter Lower 32 Bits (TELEM_DEEP_S0IX_LO_HOST)—Offset 1078h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Deep S0Ix Counter (telem_deep_s0ix_lo_host)**

10.101 Fixed Deep S0Ix Counter Upper 32 Bits (TELEM_DEEP_S0IX_HI_HOST)—Offset 107Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Deep S0Ix Counter Upper 32 Bits (telem_deep_s0ix_hi_host)**

10.102 Fixed Shallow S0Ix Counter Lower 32 Bits (TELEM_SHALLOW_S0IX_LO_HOST)—Offset 1080h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Shallow S0Ix Counter (telem_shallow_s0ix_lo_host)**

10.103 Fixed Shallow S0Ix Counter Upper 32 Bits (TELEM_SHALLOW_S0IX_HI_HOST)—Offset 1084h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Fixed Shallow S0Ix Counter (telem_shallow_s0ix_hi_host)**

10.104 Reserved (TELEM_MISC_FIXED_LO_HOST)—Offset 1088h

Register for sharing data with software lower 32 bits.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Reserved (telem_misc_fixed_lo_host):** Reserved register for sharing data with software.

10.105 Reserved register for sharing data with software upper 32 bits (TELEM_MISC_FIXED_HI_HOST)—Offset 108Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**Reserved (telem_misc_fixed_hi_host):** Reserved register for sharing data with software.

10.106 BIOS scratchpad (BIOS_SCRATCHPAD)—Offset 1090h

Scratchpad for sharing data between BIOS and PMC Firmware

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/V	**Scratchpad 31 (scratchpad31):** Scratchpad bit
30	0h RW/V	**Scratchpad 30 (scratchpad30):** Scratchpad bit
29	0h RW/V	**Scratchpad 29 (scratchpad29):** Scratchpad bit
28	0h RW/V	**Scratchpad 28 (scratchpad28):** Scratchpad bit
27	0h RW	**Scratchpad 27 (scratchpad27):** Scratchpad bit
26	0h RW	**Scratchpad 26 (scratchpad26):** Scratchpad bit

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**Scratchpad 25 (scratchpad25):** Scratchpad bit
24	0h RW	**Scratchpad 24 (scratchpad24):** Scratchpad bit
23	0h RW	**Scratchpad 23 (scratchpad23):** Scratchpad bit
22	0h RW	**Scratchpad 22 (scratchpad22):** Scratchpad bit
21	0h RW	**Scratchpad 21 (scratchpad21):** Scratchpad bit
20	0h RW	**Scratchpad 20 (scratchpad20):** Scratchpad bit
19	0h RW	**Scratchpad 19 (scratchpad19):** Scratchpad bit
18	0h RW	**Scratchpad 18 (scratchpad18):** Scratchpad bit
17	0h RW	**Scratchpad 17 (scratchpad17):** Scratchpad bit
16	0h RW	**Scratchpad 16 (scratchpad16):** Scratchpad bit
15	0h RW	**Scratchpad 15 (scratchpad15):** Scratchpad bit
14	0h RW	**Scratchpad 14 (scratchpad14):** Scratchpad bit
13	0h RW	**Scratchpad 13 (scratchpad13):** Scratchpad bit
12	0h RW	**Scratchpad 12 (scratchpad12):** Scratchpad bit
11	0h RW	**Scratchpad 11 (scratchpad11):** Scratchpad bit
10	0h RW	**Scratchpad 10 (scratchpad10):** Scratchpad bit
9	0h RW	**Scratchpad 9 (scratchpad9):** Scratchpad bit
8	0h RW	**Scratchpad 8 (scratchpad8):** Scratchpad bit
7	0h RW	**Scratchpad 7 (scratchpad7):** Scratchpad bit
6	0h RW	**Scratchpad 6 (scratchpad6):** Scratchpad bit
5	0h RW	**Scratchpad 5 (scratchpad5):** Scratchpad bit
4	0h RW	**U2U Drive Host Bypass Clock Ready Gate Enable (scratchpad4):** Used to prevent the clk_in_ready from U_DWC_U2UB_clk_mux_host from enabling U_DWC_U2UB_clkgate_cell_hostclk_in clock gating cell

Bit Range	Default & Access	Field Name (ID): Description
3	1h RW	**U2U Drive Dev Bypass Clock Ready Gate Enable (scratchpad3):** Used to prevent the clk_in_ready from U_DWC_U2UB_clk_mux_dev from enabling U_DWC_U2UB_clkgate_cell_devclk_in clock gating cell
2	0h RW	**Disable CNVI SX Wake (scratchpad2):** When set, PMC FW will send ForcePwrGatePOK and assert cnv_pgcb_rst on SX Entry
1	0h RW	**S0IX Inhibit (s0ix_inhibit):** Scratchpad bit used by PCIE ASL code
0	0h RW	**MOT Enable (mot_enable):** Indicates that MOT is enabled. When set to '1', PMC firmware will only switch ART to RTC after receiving the VnnOffPrepAck from pcode. This ensures proper time sync handling all the way until PCS is down.

10.107 Display Hot Plug Detect Control (DISPLAY_HPD_CTL)—Offset 1094h

Controls for PMC display hot plug detect logic. Hot plug detect is offloaded from display during S0ix, is used to gate S0ix entry, is an S0ix wake condition, and may result in notification to display controller. PMC implements a simplified hot plug detect, where the input is deglitched and edges are detected.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: F0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (rsvd):** Reserved.
15:13	0h RW	**Edge Rising (edge_rising):** Enable detection of rising edges. One bit per GPIO HPD wire. More than one GPIO can be enabled. One or both edges may be of interest, and the edge of interest may change based on polarity of GPIO HPD wire. edge_rising = 3'b001: ddi0 rising edges enabled edge_rising = 3'b010: ddi1 rising edges enabled ... edge_rising = 3'b111: ddi2, ddi1 and ddi0 rising edges enabled
12:10	0h RW	**Edge Falling (edge_falling):** Enable detection of falling edges. One bit per GPIO HPD wire. More than one GPIO can be enabled. One or both edges may be of interest, and the edge of interest may change based on polarity of GPIO HPD wire. edge_falling = 3'b001: ddi0 falling edges enabled edge_falling = 3'b010: ddi1 falling edges enabled ... edge_falling = 3'b111: ddi2, ddi1 and ddi0 falling edges enabled

Bit Range	Default & Access	Field Name (ID): Description
9:5	7h RW	**Deglitch (deglitch):** Deglitch time, in 60 us steps. HPD logic will ignore any pulses shorter than the deglitch time. A transition which is held longer than the deglitch time will be considered an edge, and will result in an HPD event, which may prevent S0ix entry or wake from S0ix and notify display controller. All settings have an error of +/- 1 tick (60 us). 4'd0: 000 us (invalid configuration) 5'd1: 60 us (invalid configuration) 5'd2: 120 us ... 5'd7: 420 us (default) ... 5'd31: 1.86 ms
4:0	10h RW	**Recent Edge Detect (edge_det_rcnt):** Recent event time, in 10 ms steps. HPD logic will hold a wire asserted for a programmable period of time after an enabled edge has been detected, in order to prevent S0ix entry for this period of time. All settings have an error of +/- 1 tick (10 ms). Default: 160 ms Max: 310 ms

10.108 U2U Bridge Survivability Register 1 (U2UB_SR_1)—Offset 10A0h

This register contains survivability bits for the U2U bridge IP. The bits are read and writeable by BIOS, and their values are sent by direct wire to the U2U.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**rsvd:** RESERVED
29:28	0h RW	**force_host_opmode_value:** Override value for UTMI host opmode when corresponding override enable bit is set
27	0h RW	**force_host_opmode:** Override enable for UTMI host opmode
26:25	0h RW	**drive_host_linestate_value:** Override value for UTMI host line-state when corresponding override enable bit is set
24	0h RW	**drive_host_linestate:** Override enable for UTMI host line-state
23	0h RW	**clr_host_fifo:** Override bit to clear the host Tx fifo
22	0h RW	**drive_utmiclk_req_host_value:** Override value for host utmiclk request when corresponding override enable bit is set

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**drive_utmiclk_req_host:** Override enable for host utmiclk request
20	0h RW	**assert_dev_u2u_utmi_reset:** Override the device to U2U UTMI reset
19	0h RW	**drive_dev_clk_mux_sel_value:** Override value for device clock mux select when corresponding override enable bit is set. 1 indicates aux clock, and 0 indicates utmi clock.
18	0h RW	**drive_dev_clk_mux_sel:** Override enable for device clock mux select to choose between aux clock and device utmi clock
17	0h RW	**drive_gate_dev_clk_value:** Override value for device clock gating when corresponding override enable bit is set. 1 indicates CG enabled, and 0 indicates CG disabled.
16	0h RW	**drive_gate_dev_clk:** Override enable for device clock gating
15:14	0h RW	**force_dev_xcvrsel_value:** Override value for UTMI device xcvrselect when corresponding override enable bit is set
13	0h RW	**force_dev_xcvrsel:** Override enable for UTMI device xcvrselect
12:11	0h RW	**force_dev_opmode_value:** Override value for UTMI device opmode when corresponding override enable bit is set
10	0h RW	**force_dev_opmode:** Override enable for UTMI device opmode
9:8	0h RW	**drive_dev_linestate_value:** Override value for UTMI device line-state when corresponding override enable bit is set
7	0h RW	**drive_dev_linestate:** Override enable for UTMI device line-state
6	0h RW	**clr_dev_fifo:** Override bit to clear the device Tx fifo
5	0h RW	**drive_utmiclk_req_dev_value:** Override value for device utmiclk request when corresponding override enable bit is set
4	0h RW	**drive_utmiclk_req_dev:** Override enable for device utmiclk request
3	0h RW	**drive_dev_vbusvalid_value:** Override value for device vbusvalid when corresponding override enable bit is set
2	0h RW	**drive_dev_vbusvalid:** Override enable for device vbusvalid
1	0h RW	**drive_auxclk_req_value:** Override value for auxclk request when corresponding override enable bit is set
0	0h RW	**drive_auxclk_req:** Override enable for auxclk request

10.109 U2U Bridge Survivability Register 2 (U2UB_SR_2)—Offset 10A4h

This register contains survivability bits for the U2U bridge IP. The bits are read and writeable by BIOS, and their values are sent by direct wire to the U2U.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**rsvd:** RESERVED
15	0h RW	**drive_hrx_pe_rx_sync_eop_val:** Override value for host rx packet emulator FSM control signal (rx_sync_eop) when corresponding override enable bit is set
14	0h RW	**drive_hrx_pe_rx_sync_eop:** Override enable for host rx packet emulator FSM control signal (rx_sync_eop)
13	0h RW	**drive_dtx_pe_utmi_txvalid_val:** Override value for device tx packet emulator FSM control signal (utmi_txvalid) when corresponding override enable bit is set
12	0h RW	**drive_dtx_pe_utmi_txvalid:** Override enable for device tx packet emulator FSM control signal (utmi_txvalid)
11	0h RW	**drive_drx_pe_rx_sync_eop_val:** Override value for device rx packet emulator FSM control signal (rx_sync_eop) when corresponding override enable bit is set
10	0h RW	**drive_drx_pe_rx_sync_eop:** Override enable for device rx packet emulator FSM control signal (rx_sync_eop)
9	0h RW	**drive_htx_pe_utmi_txvalid_val:** Override value for host tx packet emulator FSM control signal (utmi_txvalid) when corresponding override enable bit is set
8	0h RW	**drive_htx_pe_utmi_txvalid:** Override enable for host tx packet emulator FSM control signal (utmi_txvalid)
7	0h RW	**assert_host_u2u_utmi_reset:** Override the host to U2U UTMI reset
6	0h RW	**drive_host_clk_mux_sel_value:** Override value for host clock mux select when corresponding override enable bit is set. 1 indicates aux clock, and 0 indicates utmi clock.
5	0h RW	**drive_host_clk_mux_sel:** Override enable for host clock mux select to choose between aux clock and host utmi clock
4	1h RW	**drive_gate_host_clk_value:** Override value for host clock gating when corresponding override enable bit is set. 1 indicates CG enabled, and 0 indicates CG disabled.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**drive_gate_host_clk:** Override enable for host clock gating
2:1	0h RW	**force_host_xcvrsel_value:** Override value for UTMI host xcvrselect when corresponding enable bit is set
0	0h RW	**force_host_xcvrsel:** Override enable for UTMI host xcvrselect

10.110 OBFF Control and Status (OBFF_CTL_STS)—Offset 10C8h

Through this register, BIOS controls the External OBFF feature through this register and, PMC indicates that it is currently processing an OBFF state change. The timing parameters for GPIO WAKE pin indication are also present in this register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 6450280Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	64h RW/L	**Tobff3 (Tobff3):** Minimum time between two consecutive state changes (to avoid misinterpretation of pattern). Programmable timer to control Tobff3. Timer counts 10 ns clock cycles. Tobff3(min) = 700 ns Default = 0x64 = 100 clocks = 1000 ns
23:16	50h RW/L	**Tobff2 (Tobff2):** Time between two falling WAKE# edges when signaling CPU Active. Programmable timer to control Tobff2. Timer counts 10 ns clock cycles. Tobff2(min) = 700 ns Tobff2(max) = 1000 ns Default = 0x50 = 80 clocks = 800 ns Note: Tobff2 must be programmed to a value at least 2x of Tobff1.
15:8	28h RW/L	**Tobff1 (Tobff1):** Minimum/Maximum WAKE# pulse width; applies to both active-inactive-active and inactive-active-inactive cases. Programmable timer to control Tobff1. Timer counts 10 ns clock cycles. Tobff1(min) = 300 ns Tobff1(max) = 500 ns Default = 0x28 = 40 clocks = 400 ns
7	0h RO/V	**PORT3 OBFF Status (PORT3_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO/V	**PORT2 OBFF Status (PORT2_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
5	0h RO/V	**PORT1 OBFF Status (PORT1_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
4	0h RO/V	**PORT0 OBFF Status (PORT0_OBFF_STATUS):** OBFF Status: Indicates if PMC is currently processing an OBFF state change. ASL code will read this bit on RTD3 Entry to ensure no conflicts on WAKE# GPIO as part of RTD3 flows.
3	1h RW/L	**PORT3 OBFF Disable (PORT3_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI
2	1h RW/L	**PORT2 OBFF Disable (PORT2_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI
1	1h RW/L	**PORT1 OBFF Disable (PORT1_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI
0	1h RW/L	**PORT0 OBFF Disable (PORT0_OBFF_DISABLE):** OBFF Disable: When set, disables PMC from driving external OBFF signaling to the PCIe devices through the WAKE GPIO#.OBFF must only be driven to PCIe device when in D0. ASL code will provide this control by setting and clearing this bit on RTD3 Entry/Exit FlowsIf set by BIOS the named function is exposed to the OS via ACPI

10.111 Lock Register (LOCK)—Offset 10CCh

Register | Field | Lock bit ACPI.SMI_EN | espi_smi_en | LOCK.espi_smi
OBFF_CTL_STS | See description | LOCK.obff
PMC_CFG2 | pwrbtn_dis | LOCK.pwrbtn
GEN_PMCON2 | lpc_lpb_clk_ctrl | LOCK.lpc_lpb_clk_ctrl
GEN_PMCON3 | See description | LOCK.slpsx_str_pol_lock
PM_CFG | See description | LOCK.slpsx_str_pol_lock
IRQ_SEL_0 | All | LOCK.irq_sel
IRQ_SEL_1 | All | LOCK.irq_sel
IRQ_SEL_2 | All | LOCK.irq_sel
CRID | All | LOCK.crid

GEN_PMCON1 | pme_b0_s5_dis | LOCK.sx_wake
GEN_PMCON1 | ag3e | LOCK.sx_wake
RSVD[GEN_PMCON2] | bios_pci_exp_en | LOCK.pcie
GEN_PMCON2 | per_smi_sel | LOCK.per_smi
FUNC_DIS_0 | All | LOCK.func_dis
FUNC_DIS_1 | All | LOCK.func_dis
S0IX_WAKE_EN | All | LOCK.s0ix
ETR | MAX_S0IX | LOCK.s0ix
IRQ_CFG_UART | All | LOCK.irq_cfg_uart

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (rsvd):** Reserved.
13	0h RW/L	**ESPI SMI Lock (espi_smi):** When this bit is set, writes to the acpi.smi_en.ESPI_SMI_EN bit will have no effect. Once the LOCK.ESPI_SMI bit is set, writes of 0 to the LOCK.ESPI_SMI bit will have no effect.
12	0h RW/L	**OBFF Lock (obff):** Locks GCR.OBFF_CTL_STS.Tobff1, Tobff2, Tobff3, PORT0_OBFF_DISABLE, PORT1_OBFF_DISABLE, PORT2_OBFF_DISABLE, PORT3_OBFF_DISABLE. This field is also self-locking.
11	0h RW/L	**Power Button Lock (pwrbtn):** Locks GCR.PMC_CFG2.pwrbtn_dis. This field is also self-locking.
10	0h RW/L	**LPC Loopback Clock Control Lock (lpc_lpb_clk_ctrl):** Locks GCR.GEN_PMCON2.lpc_lpb_clk_ctrl. This field is also self-locking.
9	0h RW/L	**ASLP Sx# Stretching Policy Lock-Down (slpsx_str_pol_lock):** When set to 1, this bit locks down the following fields: GEN_PMCON3.DIS_SLP_X_STRCH_SUSPF GEN_PMCON3.SLP_S3_MIN_ASST_WDTH GEN_PMCON3.S4MAW GEN_PMCON3.S4ASE PM_CFG.SLP_A_MIN_ASST_WDTH (if applicable) PM_CFG.SLP_LAN_MIN_ASST_WDTH (if applicable) PM_CFG.PWR_CYC_DUR Those bits become read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset. This lockdown bit is available in both desktop and mobile. Note: Relevant only for no PMIC mode.
8	0h RW/L	**IRQ Select Lock (irq_sel)**

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/L	**CRID Lock (crid)**
6	0h RW/L	**SX Wake Lock (sx_wake)**
5	0h RO	**Reserved (rsvd_pcie):** Reserved: PCIE lock.
4	0h RW/L	**Periodic SMI Lock (per_smi)**
3	0h RW/L	**Func Dis Lock (func_dis)**
2	0h RW/L	**Reserved (s0ix):** Reserved.
1	0h RW/L	**UART IRQ Configuration Lock (irq_cfg_uart):** Locks the IRQ_CFG_UART register
0	0h RO	**Reserved (reserved0):** Reserved.

IPC Command (IPC_CMD)—Offset 0h

The IPC CMD register is used for conveying the type of commands to the IPC block. This is a special kind of register and a write to this register always results in Interrupt to the ARC and Setting of the busy bit in the IPC_STS register. The setting of busy bit in the IPC_STS register results in blocking of all transaction from the IA host. The ARC FW is expected to read the IPC_CMD register, whenever interrupted, interpret it and follow the instructions as ordered by the IA host. The IA host may optionally prefer to be interrupted, when the command is complete by sending an MSI. When the ARC FW is done with the command, it is expected to update the IPC_STS register and clear the busy bit.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Reserved (Reserved0):** Reserved.
23:16	0h RW	**Size (size):** Size of the transaction in bytes. This 8-bit field can potentially specify 256 Bytes, but the hardware based write_buffer and read_buffer are both only 16 bytes deep. So the size should not be greater than 16bytes for normal reads and normal write operation. However, larger sizes can be used for indirect operations.
15:12	0h RW	**Command ID (cmd_ID):** ID or Tag associated with this command. When the IPC command is completed, this value is copied in the IPC_STS register by the hardware.

Bit Range	Default & Access	Field Name (ID): Description
11:9	0h RW	**Reserved (rsvd):** Reserved.
8	0h RW	**MSI (msi):** Send an MSI once the command is executed.
7:0	0h RW	**Command (Command):** Following are defined commands: • 00h: Normal Write • 01h: Message Write • 02h: Indirect Read • 03h: Reserved • 04h: Read DMA • 05h: Indirect write • 06h: FFh - Reserved

10.112 IPC Status (IPC_STS)—Offset 4h

The IPC status register provides information related to the status of the IPC block and also some information related to the last executed command.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (rsvd):** Reserved.
23:16	0h RW/V	**Error Code (error_code):** If the err bit is set, this field may contain some error code. ARC FW is responsible for updating this value.
15:8	0h RO/V	**Initiator ID (Initiator_ID):** ID of the initiator, whose command was executed last. The initiator_ID information is available through the CONNID OCP. This bits are captured by the IPC hardware and placed in this field. This information could be used by the ARC FW to figure out the initiator for any particular IPC command and whether to service it or not. It may also be used for debug purpose, when the ARC FW is unable to service some IPC command and sets the error bit in the IPC_STC register.
7:4	0h RO/V	**Command ID (cmd_ID):** ID of the last command. The PMU Hardware copies this same field from the IPC_CMD register and places it in this reg.
3	0h RO/V	**Reserved (rsvd1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C/V	**IRQ (irq):** This bit is set when FW clears IPC_STS.Busy if IPC_CMD.msi is set.
1	0h RW/V	**Error (Error):** There was some error in executing the last command. This value is written by the ARC FW.
0	0h RW/V	**Busy (Busy):** IPC block is busy executing some command. When done, this bit would be unset. This bit is set, whenever the IPC hardware receives a new command on IPC_CMD register. ARC FW is responsible for unsetting this bit. For IPC2, the IPC hardware blocks any new transactions from cDMI, to the IPC block until this bit is cleared.

10.113 IPC Source Pointer (IPC_SPTR)—Offset 8h

This is a 32-bit register containing the address of the read transaction. The IPC Source Pointer Register is used by the IA host to perform indirect reads. The IA host would first write to this IPC_SPTR register and specify the read address location. Next, the IA host would issue an Indirect Read command on the IPC_CMD register. The ARC FW is responsible to decode this transaction and issue a read on the address specified by the IPC_SPTR register.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Source Pointer (SPTR):** Read transaction source address.

10.114 IPC Destination Pointer (IPC_DPTR)—Offset Ch

This register contains the destination address of indirect read or indirect write transaction. Please refer to IPC_CMD register for detailed usage of this register.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Destination Pointer (DPTR):** Read or write transaction destination address.

10.115 IPC Write Buffer (IPC_WBUF0)—Offset 80h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

10.116 IPC Write Buffer (IPC_WBUF1)—Offset 84h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

10.117 IPC Write Buffer (IPC_WBUF2)—Offset 88h

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

10.118 IPC Write Buffer (IPC_WBUF3)—Offset 8Ch

The write buffer is 16 byte deep and is used by the IA host to write any data for ARC. This buffer is also used for writing Lincroft Msg and MsgD to system controller.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Write Buffer (WBUF)**

10.119 IPC Read Buffer (IPC_RBUF0)—Offset 90h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

10.120 IPC Read Buffer (IPC_RBUF1)—Offset 94h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

10.121 IPC Read Buffer (IPC_RBUF2)—Offset 98h

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

10.122 IPC Read Buffer (IPC_RBUF3)—Offset 9Ch

This 16-byte deep read buffer is used by the IA host for gathering some data from the system controller. In the normal read mode, the IA host can ask the ARC to gather some information and store it in this IPC_RBUF buffer. Later on, the IA host can access this information.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Read Buffer (RBUF)**

PWM Control Register (PWMCTRL_0)—Offset 0h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Enable the PWM Output by setting PWM Enable.

4. Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256)

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

10.123 PWM D0i3 Control Register (PWMD0i3C)—Offset 100h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Rsvd):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3	1h RW/1C/V	**Restore Required (rr)**
2	0h RW	**D0i3 (i3)**
1	0h RO	**Interrupt Request (ir)**
0	0h RO	**Command in Progress (cip)**

10.124 PWM Control Register (PWMCTRL_1)—Offset 400h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Enable the PWM Output by setting PWM Enable.
4. Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256)

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)

Bit Range	Default & Access	Field Name (ID): Description
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

10.125 PWM Control Register (PWMCTRL_2)—Offset 800h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Enable the PWM Output by setting PWM Enable.
4. Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256)

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)

Bit Range	Default & Access	Field Name (ID): Description
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

10.126 PWM Control Register (PWMCTRL_3)—Offset C00h

PWMCTRL controls the PWM and needs to be accessed in particular order to prevent any blips. Below is the recommended flow for programming the PWMCTRL registers. Initial Enable or First Activation:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Enable the PWM Output by setting PWM Enable.
4. Repeat the above steps for the next PWM Module.

Dynamic update while PWM is Enabled:

1. Program the Base Unit and On Time Divisor values.
2. Set the Software Update Bit.
3. Repeat the above steps for the next PWM module.

PWM output frequency = 19.2MHz * (Base_Unit / 256)

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 400000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable (ENABLE):** Enable PWM output.
30	0h RW/V	**Software Update (SW_UPDATE):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the Base Unit (Integer or Fraction) On-time Divisor. The PWM module will apply the new settings at the end of the current cycle and clear this bit.
29:22	1h RW	**Base Unit Integer (BASE_UNIT_INT):** Integer portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base_Unit = base_unit_int + (base_unit_frac / 16384)

Bit Range	Default & Access	Field Name (ID): Description
21:8	0h RW	**Base Unit Frac (BASE_UNIT_FRAC):** Fractional portion of Base Unit (Unsigned 8 integer bits and 14 fraction bits). Base Unit = base_unit_int + (base_unit_frac / 16384)
7:0	0h RW	**On Time Divisor (ON_TIME_DIVISOR):** The On-time Divisor determines the PWM duty cycle. It is the number used to compare with the output of the base_unit counter.

§ §

11 Primary to Sideband Bridge Registers

This chapter documents the registers in Bus: 0, Device 13, Function 0.

11.1 PCI Identifier (PCIID) — Offset 0h

PCI header registers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification (DID):** The upper 8-bits of this field can be overridden by the SetID IOSF-SB Message.
15:0	0h RO	**Vendor Identification (VID):** Indicates Intel

11.2 PCI Command (PCICMD) — Offset 4h

PCI header registers

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RO	**Interrupt Disable (INTD):** P2SB does not issue any interrupts on its own behalf
9	0h RO	**Fast Back to Back Enable (FB2BE):** Not applicable
8	0h RW	**SERR# Enable (SEE):** this will enable parity error reporting to IEH
7	0h RO	**Reserved (RSVD_1):** Reserved
6	0h RW	**Parity Error Response Enable (PEE):** This bit controls the device's response to parity error.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RO	**VGA:** Not applicable.
4	0h RO	**Memory Write & Invalidate Enable (MWIE):** Not applicable.
3	0h RO	**Special Cycle Enable (SCE):** Not applicable.
2	0h RO	**Bus Master Enable (BME):** Bus mastering cannot be disabled as this device acts as a proxy for non-PCI devices.
1	0h RW	**Memory Space Enable (MSE):** Will control the P2SB acceptance of PCI MMIO BARs only. Other legacy regions are unaffected by this bit.
0	0h RW	**I/O Space Enable (IOSE):** Legacy regions are unaffected by this bit.

11.3 PCI Status (PCISTS) — Offset 6h

The P2SB does not issue any interrupts, signal any errors or provide any additional capability structures, so this register has no functionality.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** This register bit is set when parity error is detected.
14	0h RO	**Signaled System Error (SSE):** This register will set when PCICMD.SE bit and PCISTS.DPE bit is set
13:0	0h RO	**Reserved (RSVD):** Reserved

11.4 Revision ID (PCIRID) — Offset 8h

PCI header registers

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:13, F:0] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but will overridden by the SetID IOSFSB message during the power-up sequence

11.5 Class Code (PCICC) — Offset 9h

PCI header registers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 9h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:16	0h RO	**Base Class Code (BCC):** Indicates a memory controller device class.
15:8	0h RO	**Sub-Class Code (SCC):** Indicates an unspecified other memory controller.
7:0	0h RO	**Programming Interface (PI):** No programming interface.

11.6 PCI Master Latency Timer (PCIMLT) — Offset Dh

PCI header registers

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:13, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Reserved (RSVD):** Reserved

11.7 PCI Header Type (PCIHTYPE) — Offset Eh

PCI header registers

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:13, F:0] + Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-Function Device (MFD):** Indicates that this is part of a multi-function device.
6:0	0h RO	**Header Type (HTYPE):** Indicates a generic device header.

11.8 Sideband Register Access BAR (SBREG_BAR) — Offset 10h

PCI header registers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Register Base Address (RBA):** Lower DWORD of the base address for the sideband register access BAR.
23:4	0h RO	**Hardwired to 0 to request a BAR of 16MB (HW202RB16MB):** Hardwired to 0 to request a BAR of 16MB
3	0h RO	**PREF:** Indicates this is not prefetchable.
2:1	0h RO	**Address Type (ATYPE):** Indicates that this can be placed anywhere in 64b space.
0	0h RO	**Space Type (STYPE):** Indicates memory space

11.9 Sideband Register BAR High DWORD (SBREG_BARH) — Offset 14h

PCI header registers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Register Base Address (RBAH):** Upper DWORD of the base address for the sideband register access BAR.

11.10 PCI Subsystem Identifiers (PCIHSS) — Offset 2Ch

PCI header registers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Written by BIOS. Not used by hardware.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware.

11.11 VLW Bus:Device:Function (VBDF) — Offset 50h

This register specifies the bus:device:function ID that the VLW VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**BUS:** VLW Bus Number
7:3	0h RW	**DEV:** VLW Device Number
2:0	0h RW	**FUNC:** VLW Function Number

11.12 ERROR Bus:Device:Function (EBDF) — Offset 52h

This register specifies the bus:device:function ID that the Error Signalling messages VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 52h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**BUS:** ERROR Bus Number
7:3	0h RW	**DEV:** ERROR Device Number
2:0	0h RW	**FUNC:** ERROR Function Number

11.13 Routing Configuration (RCFG) — Offset 54h

This register contains information used for routing transactions between primary and sideband interfaces.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD):** Reserved
15:8	0h RW	**Reserved Page Register Destination ID (RPRID):** Specifies the IOSF-SB destination ID for sending Reserved Page Register cycles (e.g. Port 80h). By default this will load to the ID of the LPC or eSPI device depending on which has been strapped active in the system.
7:1	0h RW	**Reserved (RSVD_1):** Reserved
0	0h RW	**RTC Shadow Enable (RSE):** When set, all IO writes to the RTC will be also sent to the PMC. This allows cases where the battery backed storage is in an external PMIC.

11.14 High Performance Event Timer Configuration (HPTC) — Offset 60h

HPET configuration register

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:13, F:0] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Address Enable (AE):** When set, the P2SB will decode the High Performance Timer memory address range selected by bits 1:0 below.
6:2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**Address Select (AS):** This 2-bit field selects 1 of 4 possible memory address ranges for the High Performance Timer functionality. The encodings are: 00 : FED0_0000h - FED0_03FFFh 01 : FED0_1000h - FED0_13FFFh 10 : FED0_2000h - FED0_23FFFh 11 : FED0_3000h - FED0_33FFFh

11.15 IOxAPIC Configuration (IOAC) — Offset 64h

IOAPIC configuration register

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**Address Enable (AE):** When set, the P2SB will decode the IOxAPIC memory address range selected by bits 7:0 below.
7:0	0h RW	**APIC Range Select (ASEL):** These bits define address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior products as an initial value. This value must not be changed unless the IOxAPIC Enable bit is cleared.

11.16 IOxAPIC Bus:Device:Function (IBDF) — Offset 6Ch

This register specifies the bus:device:function ID that the IOxAPIC will use in the following : As the Requester ID when initiating Interrupt Messages to the CPU As the Completer ID when responding to the reads targeting the IOxAPICs Memory-Mapped I/O registers This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the internal IOxAPIC.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**BUS:** IOxAPIC Bus Number
7:3	0h RW	**DEV:** IOxAPIC Device Number
2:0	0h RW	**FUNC:** IOxAPIC Function Number

11.17 HPET Bus:Device:Function (HBDF) — Offset 70h

This register specifies the bus:device:function ID that the HPET device will use in the following : As the Requester ID when initiating Interrupt Messages to the CPU As the Completer ID when responding to the reads targeting the corresponding HPETs Memory-Mapped I/O registers This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the corresponding HPET.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**BUS:** HPET Bus Number
7:3	0h RO	**DEV:** HPET Device Number
2:0	0h RO	**FUNC:** HPET Function Number

11.18 Sideband Register posted 0 (SBREGPOSTED0) — Offset 80h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 0 (SBREGPOSTED0):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 31-0.

11.19 Sideband Register posted 1 (SBREGPOSTED1) — Offset 84h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 1 (SBREGPOSTED1):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 63-32.

11.20 Sideband Register posted 2 (SBREGPOSTED2) — Offset 88h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 0 (SBREGPOSTED2):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 95-64.

11.21 Sideband Register posted 3 (SBREGPOSTED3) — Offset 8Ch

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 8Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 3 (SBREGPOSTED3):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 127-96.

11.22 Sideband Register posted 4 (SBREGPOSTED4) — Offset 90h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 4 (SBREGPOSTED4):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 159-128.

11.23 Sideband Register posted 5 (SBREGPOSTED5) — Offset 94h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 5 (SBREGPOSTED5):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 191-160.

11.24 Sideband Register posted 6 (SBREGPOSTED6) — Offset 98h

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 6 (SBREGPOSTED6):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 223-192.

11.25 Sideband Register posted 7 (SBREGPOSTED7) — Offset 9Ch

provides an mechanism to send MMIO writes as posted writes on the IOSFSB space

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Sideband Register posted 7 (SBREGPOSTED7):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 255-224.

11.26 Display Bus:Device:Function (DISPBDF) — Offset A0h

This register specifies the bus:device:function ID that the Display initiated upstream RAVDMs will use for its Requester ID. This will also be used for the claiming these Route-by-ID RAVDMs downstream.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Reserved (RSVD):** Reserved
18:16	0h RW	**Display Target Block (DTBLK):** This register contains the Target BLK field that will be used when sending RAVDM messages to the CPU Complex North Display.
15:8	0h RW	**BUS:** The bus number of the Display in the CPU Complex.
7:3	0h RW	**DEV:** The bus number of the Display in the CPU Complex.
2:0	0h RW	**FUNC:** The function number of the Display in the CPU Complex

11.27 ICC Register Offsets (ICCOS) — Offset A4h

This register contains the offsets to be used when sending RAVDMs to the Integrated Clock Controller. Each of the two spaces decoded for the ICC have a separate base address that will be used when sending those transactions on IOSF-SB to the ICC.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Modulator Control Address Offset (MODBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Modulator Control range of the ICC (FFF00h - FFFFFh).
7:0	0h RW	**Buffer Address Offset (BUFBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Buffer range of the ICC (FFE00h - FFEFFh).

11.28 Endpoint Mask 0 (EPMASK0) — Offset B0h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 0 (EPMASK0):** One hot masks for disabling IOSF-SB endpoint IDs 31-0.

11.29 Endpoint Mask 1 (EPMASK1) — Offset B4h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 1 (EPMASK1):** One hot masks for disabling IOSF-SB endpoint IDs 63-32.

11.30 Endpoint Mask 2 (EPMASK2) — Offset B8h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 2 (EPMASK2):** One hot masks for disabling IOSF-SB endpoint IDs 95-64

11.31 Endpoint Mask 3 (EPMASK3) — Offset BCh

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 3 (EPMASK3):** One hot masks for disabling IOSF-SB endpoint IDs 127-96

11.32 Endpoint Mask 4 (EPMASK4) — Offset C0h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 4 (EPMASK4):** One hot masks for disabling IOSF-SB endpoint IDs 128-159

11.33 Endpoint Mask 5 (EPMASK5) — Offset C4h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + C4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 5 (EPMASK5):** One hot masks for disabling IOSF-SB endpoint IDs 191-160

11.34 Endpoint Mask 6 (EPMASK6) — Offset C8h

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + C8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 6 (EPMASK6):** One hot masks for disabling IOSF-SB endpoint IDs 223-192

11.35 Endpoint Mask 7 (EPMASK7) — Offset CCh

provide a mechanism for disabling particular IOSF-SB endpoints from being allowed to targeted by transactions from the P2SB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + CCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**Endpoint Mask 7 (EPMASK7):** One hot masks for disabling IOSF-SB endpoint IDs 255-224

11.36 SBI Address (SBIADDR) — Offset D0h

Provides mechanism to send message on IOSFSB;The SAI check is only required on RS field but due to tool limitation, the SAI check is applied in RDL on whole register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Destination Port ID (DESTID):** The content of this register field is sent in the IOSF Sideband Message Register Access dest field.
23:20	0h RO	**Reserved (RSVD):** Reserved
19:16	0h RW	**Root Space (RS):** Destination IOSF-SB Root Space. *Note: This register may only be written during manufacturing test. P2SB will only accept writes to this register from transactions with a SAI equal to the SBI_RS_ACCESS_SAI parameter. This should be assigned to the SAI used by the functional test module (typically TAM) that will perform this register write on IOSF-P.
15:0	0h RW	**Address Offset (OFFSET):** Register address offset. The content of this register field is sent in the IOSF Sideband Message Register Access address(15:0) field.

11.37 SBI Data (SBIDATA) — Offset D4h

Provides mechanism to send message on IOSFSB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**DATA:** The content of this register field is sent on the IOSF sideband Message Register Access data(31:0) field.

11.38 SBI Status (SBISTAT) — Offset D8h

Provides mechanism to send message on IOSFSB

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**OPCODE:** This is the Opcode sent in the IOSF sideband message.
7	0h RW	**POSTED:** When set to 1, the message will be send as a posted message instead of non-posted. This should only be used if the receiver is known to support posted operations for the specified operation.
6:3	0h RO	**Reserved (RSVD):** Reserved
2:1	0h RW/V	**RESPONSE:** 00 - Successful 01 - Unsuccessful / Not Supported 10 - Powered Down 11 - Multi-cast Mixed This register reflects the response status for the previously completed transaction. The value of this register is only meaningful if SBISTAT.INITRDY is zero.
0	0h RW/1S	**Initiate/ Ready# (INITRDY):** 0: The IOSF sideband interface is ready for a new transaction 1: The IOSF sideband interface is busy with the previous transaction. A write to set this register bit to 1 will trigger an IOSF sideband message on the private IOSF sideband interface. The message will be formed based on the values programmed in the Sideband Message Interface Register Access registers. Software needs to ensure that the interface is not busy (SBISTAT.INITRDY is clear) before writing to this register.

11.39 SBI Routing Identification (SBIRID) — Offset DAh

Provides mechanism to send message on IOSFSB

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + DAh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**First Byte Enable (FBE):** The content of this field is sent in the IOSF Sideband Register Access FBE field.
11	0h RO	**Reserved (RSVD):** Reserved
10:8	0h RW	**Base Address Register (BAR):** The contents of this field are sent in the IOSF Sideband Register Access BAR field. This should be zero performing a Memory Mapped operation to a PCI compliant device.
7:0	0h RW	**Function ID (FID):** The contents of this field are sent in the IOSF Sideband Register access FID field. This field should generally remain at zero unless specifically required by a particular application.

11.40 SBI Extended Address (SBIEXTADDR) — Offset DCh

Provides mechanism to send message on IOSFSB

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + DCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Extended Address (ADDR):** The content of this register field is sent on the IOSF sideband Message Register Access address(48:32) field. This must be set to all 0 if 16b addressing is desired.

11.41 P2SB Control (P2SBC) — Offset E0h

P2SB general configuration register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + E0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**SBI register Lock (SBILOCK):** Once written, it will not be writeable until module reset. Write once (1 or 0) to lock the Lock Bit. SBISTAT.INITRDY Register bit only lock if SBILOCK Bit = 1
30:27	0h RW	**Reserved (RSVD):** Reserved
26	0h RW	**Data Parity Error Enable (DPEE):** IOSFP data parity error handling(EP bit) enabling bit
25	0h RW	**Command Parity Error Enable (CPEE):** IOSFP command parity error handling enabling bit
24	0h RW	**Data Phase Parity Error Enable (DPPEE):** IOSFP data phase parity error handling enabling bit
23:18	0h RW	**Reserved (RSVD_3):** Reserved
17	0h RW/O	**Endpoint Mask Lock (MASKLOCK):** Locks the value of the EPMASK[0-7] registers. Once this value is written to a one it may only be cleared by a reset.
16	0h RW	**PGCB Clock Gating Enable (PGCBCGE):** When asserted the P2SB can de-assert the clock request to disable the PGCB clock dynamically when it reaches the power down idle state.
15:9	0h RW	**Reserved: (RSVD_1):** Reserved
8	0h RW	**HIDE:** When this bit is set, the P2SB will return 1s on any PCI Configuration Read on IOSF-P. All other transactions including PCI Configuration Writes are unaffected by this. This does not affect reads performed on the IOSF-SB interface.
7:3	0h RW	**Reserved (RSVD_2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Max Writes Pending (MAXW):** This controls the max number of outstanding writes on IOSF-SB initiated by MMIO writes to the SBREG_BAR. Once the number of SBREG_BAR writes issued but not completed on IOSF-SB is equal to this value no new requests will be forwarded until completions are received. A value of zero will have the same behavior as the value of one (single write outstanding).

11.42 Power Control Enable (PCE) — Offset E4h

Power Control Enable register

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:13, F:0] + E4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**Reserved (RSVD):** Reserved
5	0h RW	**Hardware Autonomous Enable (HAE):** When set, the P2SB will automatically engage power gating when it has reached its idle condition.
4:3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RO	**D3-Hot Enable (D3HE):** No support for D3 Hot power gating.
1	0h RO	**I3 Enable (I3E):** No support for S0i3 power gating.
0	0h RW	**PMC Power Gating Enable (PMCPG_EN):** When set to 1, the P2SB will engage power gating if it is idle and the pmc_p2sb_sw_pg_req_b signal is asserted.

11.43 Power Gate Control Block Timing (PGCBT) — Offset E6h

PGCB configuration register

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + E6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**Reserved (RSVD):** Reserved
11:10	0h RW	**Primary Reset De-assert to Next State Time (TIRSTUP):** Value representing the number of delay clocks required between the deassertion of pgcb_force_prim_rst_b and the next state in the FSM (varies). 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks
9:8	0h RW	**Isolation Deassertion Time (TDEISOLATE):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_en_b until the restore flow begins. 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**Sleep De-assert to ISM Unlock Time (TSLPINACTV):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of either pgcb_ip_*_lock_req_b from state retention or pgcb_isol_en_b from a non-retention state. 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks
5:4	0h RW	**Reset to Power Down Request Time (TRESETACT):** Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b (and pgcb_force_rst_b) to either the assertion of pgcb_pmc_pg_req_b for state retention or pgcb_sleep for non-retention. 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks
3:2	0h RW	**Isolation Active to Reset Time (TISOLATE):** alue representing the minimum number of pgcb_clk cyles required between the assertion of pgcb_isol_en_b to the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b. 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks
1:0	0h RW	**Sleep to Isolation Active Time (TSLEEPACT):** Value representing the minimum number of pgcb_clk cyles required between the assertion of pgcb_sleep (and the deassertion of pgcb_isol_latchen) to the assertion of pgcb_isol_en_b. 00: 1 clock 01: 2 clocks (default) 10: 8 clocks 11: 256 clocks

11.44 Primary Clock Domain Controls (PDOMAIN) — Offset E8h

Primary CDC configuration register

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**Primary CLKREQ Hold-On (CKREQHO):** Defines the amount of idle time required between locking for power gate preparation and deassertion of the prim_clkreq signal. This field defines the exponent such that the actual delay = 2^ CKREQHO.
11:8	0h RW	**Primary Domain Lock Hold-Off (LOCKHO):** Defines the amount of idle time required between local clock gating and locking for power gate preparation (if power gating is enabled). This field defines the exponent such that the actual delay = 2^ LOCKHO.
7:4	0h RW	**Primary Clock Gating Hold-Off (CGATEHO):** Defines the amount of idle time required before local clock gating will be engaged (if enabled). This field defines the exponent such that the actual delay = 2^ CGATEHO.
3:2	0h RW	**Reserved (RSVD):** Reserved
1	0h RW	**Primary CLKREQ DISABLE (CKREQD):** Primary CLKREQ DISABLE
0	0h RW	**Primary Clock Gating Disable (CGD):** When set to 1, the local clock gating for the IOSF-P clock domain within the P2SB will be disabled.

11.45 Sideband Clock Domain Controls (SDOMAIN) — Offset EAh

Sideband CDC configuration register

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:13, F:0] + EAh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RW	**Sideband CLKREQ Hold-On (CKREQHO):** Defines the amount of idle time required between locking for power gate preparation and deassertion of the prim_clkreq signal. This field defines the exponent such that the actual delay = 2^ SCKREQHO.
11:8	0h RW	**Sideband Domain Lock Hold-Off (LOCKHO):** Defines the amount of idle time required between local clock gating and locking for power gate preparation (if power gating is enabled). This field defines the exponent such that the actual delay = 2^ PLOCKHO.
7:4	0h RW	**Sideband Clock Gating Hold-Off (CGATEHO):** Defines the amount of idle time required before local clock gating will be engaged (if enabled). This field defines the exponent such that the actual delay = 2^ CGATEHO.
3:2	0h RW	**Reserved (RSVD):** Reserved
1	0h RW	**Sideband CLKREQ DISABLE (CKREQD):** Sideband CLKREQ DISABLE
0	0h RW	**Sideband Clock Gating Disable (CGD):** When set to 1, the local clock gating for the IOSF-P clock domain within the P2SB will be disabled.

11.46 Unsupported Request Error Status (URES) — Offset F0h

This register is only reset by a loss of core power

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + F0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unspported Request on IOSF Primary interface that is not considered Advisory Non-Fatal Used only when ENABLE_IEH is set
7:2	0h RO	**Reserved (RSVD_1):** Reserved
1	0h RW/1C/P	**Unsupported Non-Posted Request Error Status (UNPE):** When set, indicates that P2SB has received unsupported non-posted request;Used only when ENABLE_AER is set
0	0h RW/1C/P	**Unsupported Posted Request Error Status (UPE):** When set, indicates that P2SB has received unsupported posted request;Used only when ENABLE_AER is set

11.47 Unsupported Request Error Control (UREC) — Offset F4h

This register is only reset by a loss of core power

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + F4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system erro
7:1	0h RO	**Reserved (RSVD_1):** Reserved
0	0h RW/P	**Error Reporting Enable (ERE):** When set, error logged in UES register will trigger error reporting flow in P2SB; Used only when ENABLE_AER is set

11.48 Manufacturers ID (MANID) — Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27:24	0h RO/V	**DOT:** Indicates the dot process
23:16	0h RO/V	**Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Stepping Revision ID may not change.
15:8	0h RO	**Manufacturing Identifier (MID):** 0Fh = Intel
7:0	0h RO/V	**PROC:** Indicates the process. The dot portion of the process is reflected in bits (27:24)

11.49 SAI Policy Control (SAIPOLCTRL0) — Offset 240h

Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 240h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**SAI Policy Control 0 (SAIPOLCTRL0):** SAI policy control register bits[31:0]

11.50 SAI Policy Control (SAIPOLCTRL1) — Offset 244h

Bit wise register where each bit represent the 6-bit SAI Index that mapped to a particular 8-bit SAI value or values

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 244h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**SAI Policy Control 1 (SAIPOLCTRL1):** SAI policy control register bits[63:32]

11.51 SAI Policy Access Control (SAIPOLAC0) — Offset 248h

A value '1 in this register bit means that a Config Cycle with SAI value that match the mapped 8-bit SAI value or values has both the read and write access to the four doublesowrd register for Sideband Message Interface Access

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 248h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**SAI Policy Access Control 0 (SAIPOLAC0):** SAI policy Access control register bits[31:0]

11.52 SAI Policy Access Control (SAIPOLAC1) — Offset 24Ch

A value '1 in this register bit means that a Config Cycle with SAI value that match the mapped 8-bit SAI value or values has both the read and write access to the four doublesowrd register for Sideband Message Interface Access

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:13, F:0] + 24Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**SAI Policy Access Control 1 (SAIPOLAC1):** SAI policy Access control register bits[63:32]

§ §

12 PWM Registers

This chapter documents the registers in Bus: 0, Device 26, Function 0.

12.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the particular Device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 0h	AC88086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AC8h RO/V	**DEVICEVENDORID - Device ID Field (DEVICEID):** Device ID identifies the particular PCI device
15:0	8086h RO/V	**DEVICEVENDORID - Vendor ID Field (VENDORID):** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

12.2 STATUSCOMMAND — Offset 4h

Command register to programme interrupt disable bus master enable and Memory space enable. Status register to read the errors and aborts

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved Field (RESERVED0):** Reserved
29	0h RW/1C/V	**STATUSCOMMAND- RMA Field (RMA):** Received Master Abort
28	0h RW/1C/V	**STATUSCOMMAND- RTA Field (RTA):** Received Target Abort
27:21	0h RO	**Reserved Field (RESERVED1):** Reserved
20	1h RO	**STATUSCOMMAND- Cap List Field (CAPLIST):** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**STATUSCOMMAND- Intrerrupt Status Field (INTR_STATUS):** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**Reserved Field (RESERVED2):** Reserved
15:11	0h RO	**Reserved Field (RESERVED3):** Reserved
10	0h RW	**STATUSCOMMAND- Interrupt Disable Field (INTR_DISABLE):** Interrupt Disable
9	0h RO	**Reserved Field (RESERVED4):** Reserved
8	0h RW	**STATUSCOMMAND- SERR Enable Field (SERR_ENABLE):** SERR Enable Not implemented
7:3	0h RO	**Reserved Field (RESERVED5):** Reserved
2	0h RW	**STATUSCOMMAND- BME Field (BME):** Bus Master Enable
1	0h RW	**STATUSCOMMAND- MSE Field (MSE):** Memory Space Enable
0	0h RW/V	**STATUSCOMMAND. IOSR FIELD (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. NOTE: This bit does not exist in the PMC IOSF2OCP bridge. It is shadowed in the PSF3 fabric. Using /V in AccessType so PMC cluster validation does not assume this bit will read back what was written.

12.3 REVCLASSCODE — Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 8h	C800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C8000h RO/V	**REVCLASSCODE - Class code Field (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	0h RO/V	**REVCLASSCODE - Revision ID Field (RID):** Revision ID identifies the revision of particular PCI device.

12.4 CLLATHEADERBIST — Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved Field (RESERVED0):** Reserved
23	0h RO	**CLLATHEADERBIST - MultiFunction Device Field (MULFNDEV):** Multi-Function Device
22:16	0h RO	**CLLATHEADERBIST - Header Type Field (HEADERTYPE):** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**CLLATHEADERBIST - Latency Timer Field (LATTIMER):** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CLLATHEADERBIST - Cache Line Size Field (CACHELINE_SIZE):** Cacheline Size

12.5 BAR — Offset 10h

Base Address Register low [31:2] type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR -Base Address Field (BASEADDR):** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**BAR -Size Field (SIZEINDICATOR):** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**BAR -Prefetchable Field (PREFETCHABLE):** Prefetchable: Indicates that this BAR is not prefetchable
2:1	0h RO	**BAR -Type Field (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR - Message Space Field (MESSAGE_SPACE):** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

12.6 BAR -Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR -Base Address High Field (BASEADDR_HIGH):** Base Address high - MSB

12.7 BAR1 — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BAR1 - Base Address Field (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**BAR1 -Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**BAR1 - Prefetchable Field (PREFETCHABLE1):** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	0h RO	**BAR1 -Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**BAR1 - Message Space Field (MESSAGE_SPACE1):** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

12.8 BAR1 -Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BAR1 -Base Address High Field (BASEADDR1_HIGH):** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

12.9 BAR2 — Offset 20h

BAR -Base Address Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**BASEADDR:**
1	0h RO	**RESERVED0:** Reserved
0	0h RO	**MESSAGE_SPACE:**

12.10 SUBSYSTEMID — Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMID -Subsystem Vendor Field (SUBSYSTEMVENDORID):** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

12.11 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR) — Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION ROM base address field (EXPANSION_ROM_BASE):** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

12.12 CAPABILITYPTR — Offset 34h

Capabilities Pointer register indicates what the next capability is

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved Field (RESERVED0):** Reserved
7:0	80h RO	**CAPABILITYPTR - Capabilities Pointer Field (CAPPTR_POWER):** Capabilities Pointer: Indicates what the next capability is.

12.13 INTERRUPTREG — Offset 3Ch

Interrupt line Register isn't used in Bridge directly Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latenc

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**INTERRUPTREG - Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**INTERRUPTREG - Min Gnt Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	**Reserved Field (RESERVED0):** Reserved
11:8	1h RO	**INTERRUPTREG - Interrupt Pin Field (INTPIN):** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTERRUPTREG - Int Line Field (INTLINE):** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

12.14 POWERCAPID — Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability with Power management capabilities register for PME support and version

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 80h	48030001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**POWERCAPID - PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved Field (RESERVED0):** Reserved
18:16	3h RO	**POWERCAPID - Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**POWERCAPID - Next Cap Field (NXTCAP):** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWERCAPID - Power Capability ID Field (POWER_CAP):** Power Management Capability: Indicates this is power management capability

12.15 PMECTRLSTATUS — Offset 84h

power management control and status register to set and read PME status PME enable No Soft reset and power state

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved Field (RESERVED0):** Reserved
15	0h RW/1C/V	**PMECTRLSTATUS - PME Status Field (PMESTATUS):** PME Status
14:9	0h RO	**Reserved Field (RESERVED1):** Reserved
8	0h RW	**PMECTRLSTATUS - PME Enable Field (PMEENABLE):** PME Enable
7:4	0h RO	**Reserved Field (RESERVED2):** Reserved
3	1h RO	**PMECTRLSTATUS - No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved Field (RESERVED3):** Reserved
1:0	0h RW	**PMECTRLSTATUS - Power State Field (POWERSTATE):** Power State: This field is used both to determine the current power state and to set a new power state

12.16 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**PCIDEVIDLE_CAP_REG - Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**PCIDEVIDLE_CAP_REG - Revision IDField (REVID):** Revision ID of capability structure
23:16	14h RO	**PCIDEVIDLE_CAP_REG - Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	0h RO	**PCIDEVIDLE_CAP_REG - Next Capability Field (NEXT_CAP):** Next Capability
7:0	9h RO	**PCIDEVIDLE_CAP_REG - Capability ID Field (CAPID):** Capability ID

12.17 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor capability register for VSEC Length revision and ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific ID Field (VSEC_LENGTH):** Vendor Specific Extended Capability Length
19:16	0h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Revision Field (VSEC_REV):** Vendor specific Extended Capability revision
15:0	10h RO	**DEVID VENDOR SPECIFIC REG - Vendor Specific Length Field (VSECID):** Vendor Specific Extended Capability ID

12.18 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**D0I3_CONTROL_SW_LTR_MMIO_REG - SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

12.19 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**DEVICE_IDLE_POINTER_REG - BAR NUM Field (BAR_NUM):** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	0h RO	**DEVICE_IDLE_POINTER_REG - D0i3 Valid Field (VALID):** Valid: This value is reflected from the D0i3 valid strap at the top level.

12.20 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + A0h	800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved Field (RESERVED0):** Reserved
21	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	**Reserved Field (RESERVED1):** Reserved
19	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Sleep Enable Field (SLEEP_EN):** Sleep Enable

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - D3 Hen Field (PGE):** DEVIDLE Enable (DEVIDLEN): If ?1? then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - Device Idle En Field (I3_ENABLE):** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RW	**D0I3_MAX_POW_LAT_PG_CONFIG - PMC Request Enable Field (PMCRE):** PMCRE: PMC Request Enable
15:13	0h RO	**Reserved Field (RESERVED2):** Reserved
12:10	2h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	0h RW/O	**D0I3_MAX_POW_LAT_PG_CONFIG - Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

12.21 GEN_REGRW1 - General Purpose Read Write Register1 (GEN_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW1 - General Purpose Read Write Field (GEN_REG_RW1):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

12.22 GEN_REGRW2 — Offset B4h

General Purpose PCI Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW2 - General Purpose Read Write Field (GEN_REG_RW2):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

12.23 GEN_REGRW3 — Offset B8h

General Purpose PCI Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW3 - General Purpose Read Write Field (GEN_REG_RW3):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

12.24 GEN_REGRW4 — Offset BCh

General Purpose PCI Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REGRW4 - General Purpose Read Write Field (GEN_REG_RW4):** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

12.25 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_INPUT_REG - General Purpose Input Field (GEN_REG_INPUT_RW):** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

12.26 Manufacturers ID (MANID) — Offset F8h

MAN ID Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:26, F:0] + F8h	4000F1C h

Bit Range	Default & Access	Field Name (ID): Description
31:0	4000F1Ch RO/V	**Manufacturers ID - MAN ID (MANID):** Manufacturer ID: Default value comes from straps.

§ §

13 SD and MMC Registers

This chapter documents the registers of the LPIO controller devices. The processor contains multiple PCIe controller devices:

- Bus: 0, Device: 28, Function: 0 (SDMMC0)
- Bus: 0, Device: 30, Function: 0 (SDMMC1)
- Bus: 0, Device: 27, Function: 0 (SDMMC2)

NOTE: Register default values are taken from device SDMMC0 only. Refer Vol1 for Device IDs.

13.1 DEVVENDID — Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID:**
15:0	8086h RO	**VENDORID:**

13.2 STATUSCOMMAND — Offset 4h

STATUSCOMMAND- Status and Command

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED0:** Reserved
29	0h RW/1C	**RMA:**
28	0h RW/1C	**RTA:**
27:21	0h RO	**RESERVED1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
20	1h RO	**CAPLIST:**
19	0h RO	**INTR_STATUS:**
18:16	0h RO	**RESERVED2:** Reserved
15:11	0h RO	**RESERVED3:** Reserved
10	0h RW	**INTR_DISABLE:**
9	0h RO	**RESERVED4:** Reserved
8	0h RW	**SERR_ENABLE:**
7:3	0h RO	**RESERVED5:** Reserved
2	0h RW	**BME:**
1	0h RW	**MSE:**
0	0h RO	**RESERVED6:** Reserved

13.3 REVCLASSCODE — Offset 8h

REVCLASSCODE - Revision ID and Class Code

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 8h	8050100 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	80501h RO	**CLASS_CODES:**
7:0	0h RO	**RID:**

13.4 CLLATHEADERBIST — Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED0:** Reserved
23	0h RO	**MULFNDEV:**
22:16	0h RO	**HEADERTYPE:**
15:8	0h RO	**LATTIMER:**
7:0	0h RW	**CACHELINE_SIZE:**

13.5 BAR — Offset 10h

BAR -Base Address Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:**
11:4	0h RO	**SIZEINDICATOR:**
3	0h RO	**PREFETCHABLE:**
2:1	2h RO	**TYPE:**
0	0h RO	**MESSAGE_SPACE:**

13.6 BAR_HIGH — Offset 14h

BAR -Base Address Register High

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:**

13.7 BAR1 — Offset 18h

BAR1 -Base Address Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:**
11:4	0h RO	**SIZEINDICATOR1:**
3	0h RO	**PREFETCHABLE1:**
2:1	2h RO	**TYPE1:**
0	0h RO	**MESSAGE_SPACE1:**

13.8 BAR1_HIGH — Offset 1Ch

BAR1 -Base Address Register1 High

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:**

13.9 SUBSYSTEMID — Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:**

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**SUBSYSTEMVENDORID:**

13.10 EXPANSION_ROM_BASEADDR — Offset 30h

EXPANSION ROM base address

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:**

13.11 CAPABILITYPTR — Offset 34h

CAPABILITYPTR - Capabilities Pointer

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	80h RO	**CAPPTR_POWER:**

13.12 INTERRUPTREG — Offset 3Ch

INTERRUPTREG - Interrupt Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:**

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO	**MIN_GNT:**
15:12	0h RO	**RESERVED0:** Reserved
11:8	0h RO	**INTPIN:**
7:0	0h RW	**INTLINE:**

13.13 POWERCAPID — Offset 80h

POWERCAPID - PowerManagement Capability ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 80h	39001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT:**
26:19	0h RO	**RESERVED0:** Reserved
18:16	3h RO	**VERSION:**
15:8	90h RO	**NXTCAP:**
7:0	1h RO	**POWER_CAP:**

13.14 PMECTRLSTATUS — Offset 84h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED0:** Reserved
15	0h RW/1C	**PMESTATUS:**
14:9	0h RO	**RESERVED1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**PMEENABLE:**
7:4	0h RO	**RESERVED2:** Reserved
3	1h RO	**NO_SOFT_RESET:**
2	0h RO	**RESERVED3:** Reserved
1:0	0h RW	**POWERSTATE:**

13.15 PCIDEVIDLE_CAP_RECORD — Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:**
27:24	0h RO	**REVID:**
23:16	14h RO	**CAP_LENGTH:**
15:8	0h RO	**NEXT_CAP:**
7:0	9h RO	**CAPID:**

13.16 DEVID_VEND_SPECIFIC_REG — Offset 94h

DEVID VENDOR SPECIFIC REG

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:**

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RO	**VSEC_REV:**
15:0	10h RO	**VSECID:**

13.17 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 98h	8041 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	804h RO	**SW_LAT_DWORD_OFFSET:**
3:1	0h RO	**SW_LAT_BAR_NUM:**
0	1h RO	**SW_LAT_VALID:**

13.18 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + 9Ch	81C1 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	81Ch RO	**DWORD_OFFSET:**
3:1	0h RO	**BAR_NUM:**
0	1h RO	**VALID:**

13.19 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

DEVICE PG CONFIG

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + A0h	290800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED0:** Reserved
21	1h RW	**HAE:**
20	0h RO	**RESERVED1:** Reserved
19	1h RW	**SLEEP_EN:**
18	0h RW	**PGE:**
17	0h RW	**I3_ENABLE:**
16	1h RW	**PMCRE:**
15:13	0h RO	**RESERVED2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:**
9:0	0h RW/O	**POW_LAT_VALUE:**

13.20 GEN_REGRW1 — Offset B0h

General Purpose Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:**

13.21 GEN_REGRW2 — Offset B4h

General Purpose Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:**

13.22 GEN_REGRW3 — Offset B8h

General Purpose Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:**

13.23 GEN_REGRW4 — Offset BCh

General Purpose Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:**

13.24 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_REG_INPUT_RW:**

13.25 MANID — Offset F8h

Manufacturers ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:27, F:0] + F8h	F h

Bit Range	Default & Access	Field Name (ID): Description
31:0	Fh RO	**MANID**

13.26 SW_LTR_Value (SW_LTR_val)—Offset 804h

Sets the Software Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirment (Snoop_Requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop_latency_scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value (Snoop_value):** 10-bit latency value

13.27 Auto LTR Value (Auto_LTR_val)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirment (Snoop_Requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved_low field (Reserved_low):** Reserved_low
12:10	2h RW	**Snoop_latency_scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value (Snoop_value):** 10-bit latency value

13.28 Capabilities Bypass Control (Cap_byps)—Offset 810h

Capabilities Bypass Control register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable Cap Bypass (Enable_Cap_Bypass):** 8h5A Enable Capabilities Bypass. All other Capabilities Bypass Disable (using default values)

13.29 emmc Capabilities Bypass Register I (Cap_byps_reg1)—Offset 814h

eMMC Capabilities Bypass register 1

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 3041EF3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400 support (hs400_support):** 1: HS400 Mode Supported. 0: HS400 Mode NOT Supported
28	1h RW	**timeout clock unit (timeout_clock_unit):** 1b1 - to Select MHz Clock ,1b0 - to Select KHz Clock
27:22	1h RW	**timeout clock freq (timeout_clock_freq):** Timeout clock frequency
21	0h RW	**SPI mode support (SPI_mode_support):** SPI Mode Support 1b1 SPI Mode Supported ,1b0 SPI Mode Not Supported
20:17	0h RW	**timer count (timer_count):** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4b0 disables Re-Tuning Timer
16	1h RW	**tuning for SDR50 (tuning_for_SDR50):** Use Tuning for SDR50 1b1 Use Tuning 1b0 Dont use Tuning
15	1h RW	**ddr50 support (ddr50_support):** 1: DDR50 Mode Supported. 0: DDR50 Mode NOT Supported
14	1h RW	**sdr104 support (sdr104_support):** 1: SDR104 Mode Supported. 0: SDR104 Mode NOT Supported
13	1h RW	**sdr50 support (sdr50_support):** 1: SDR50 Mode Supported. 0: SDR50 Mode NOT Supported
12:11	1h RW	**Slot Type (Slot_Type):** 00 - Removable SD Card Slot. 01 - Embedded Slot for One Device. 10 - Shared Bus Slot. 11 - Reserved
10	1h RW	**Async Interrupt Support (Async_Interrupt_Support):** 1: Asynchronous Interrupt Supported. 0: Asynchronous Interrupt NOT Supported
9	1h RW	**Sys Addr 64bit Support (Sys_Addr_64bit_Support):** 1 - Core supports 64-bit System Address Bus. 0 - Core supports only 32-bit System Address Bus
8	1h RW	**Voltage Support 1_8V (Voltage_Support_1_8V):** 1: 1.8V Supported. 0: 1.8V NOT Supported
7	0h RW	**Voltage Support 3V (Voltage_Support_3V):** 1: 3.0V Supported. 0: 3.0V NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Voltage Support 3_3V (Voltage_Support_3_3V):** 1: 3.3V Supported. 0: 3.3V NOT Supported
5	1h RW	**Suspend Resume Support (Suspend_Resume_Support):** 1: Suspend/Resume Supported. 0: Suspend/Resume NOT Supported
4	1h RW	**SDMA Support (SDMA_Support):** 1: SDMA mode Supported. 0: SDMA mode NOT Supported
3	1h RW	**High Speed Support (High_Speed_Support):** 1: HIGH_SPEED mode Supported. 0: HIGH_SPEED mode NOT Supported
2	1h RW	**ADMA2 Support (ADMA2_Support):** 1: ADMA2 mode Supported. 0: ADMA2 mode NOT Supported
1:0	0h RW	**Max Burst Length (Max_Burst_Length):** Maximum Block Length supported by the Core/Device. 00: 512 (Bytes). 01: 1024. 10: 2048. 11: Reserved

13.30 emmc Capabilities Bypass Register 2 (Cap_byps_reg2)—Offset 818h

eMMC Capabilities Bypass register 2

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**tuning count val (tuning_count_val):** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0h RW	**tuning dis (tuning_dis):** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0h RW	**driver type 4 (driver_type_4):** Driver Type 4 Support 1b1 Supported 1b0 NOT Supported
18	0h RW	**driver type D (driver_type_D):** Driver Type D Support 1b1 Supported 1b0 NOT Supported
17	0h RW	**driver type C (driver_type_C):** Driver Type C Support 1b1 Supported 1b0 NOT Supported
16	0h RW	**driver type A (driver_type_A):** Driver Type A Support 1b1 Supported 1b0 NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14	1h RW	**support 8-bit embedded (support_8_bit_embedded):** 8-bit Support for Embedded Device 1b1 Supported 1b0 NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**base sd clock (base_sd_clock):** Base Clock Frequency for SD Clock

13.31 D0i3 (reg_D0i3)—Offset 81Ch

D0i3 Control register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RW/1C	**Restore Required (RestoreRequired):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3 (D0i3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**Interrupt Request (Interrupt_Request):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0h RO	**Cmd In Progress (Cmd_In_Progress):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

13.32 Tx CMD Delay Control (Tx_CMD_dly)—Offset 820h

Front end module Tx Command Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 500h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	5h RW	**ddr mode (ddr_mode):** Tx CMD Delay (DDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr mode (sdr_mode):** Tx CMD Delay (SDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 - Reserved

13.33 Tx DATA Delay Control 1 (Tx_DATA_dly_1)—Offset 824h

Front end module Tx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: A18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**hs400 mode (hs400_mode):** Tx Data Delay (HS400 Mode). 0 78 Select number of active delay elements. Each = 125pSec. 79 127 - Reserved
7	0h RO	Reserved.
6:0	18h RW	**sdr104 hs200 (sdr104_hs200):** Tx Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.34 Tx DATA Delay Control 2 (Tx_DATA_dly_2)—Offset 828h

Front end module Tx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1C2A1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**sdr50 mode (sdr50_mode):** Tx Data Delay (SDR50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 127 Reserved

15	0h RO	Reserved.
14:8	1Ch RW	**sdr25 hs50 mode (sdr25_hs50_mode):** Tx Data Delay (SDR25/ HS50 Mode)0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12 comp mode (sdr12_comp_mode):** Tx Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.35 Rx CMD Data Delay Control 1 (Rx_CMD_Data_dly_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: E0000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**sdr50 mode (sdr50_mode):** Rx CMD + Data Delay (SDR50 Mode). 0 79 Select the required delay, as a multiple of 125pSec.80 127 Reserved
23	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
22:16	Eh RW	**ddr50 mode (ddr50_mode):** Rx CMD + Data Delay (DDR50 Mode). 0 78 Select number of active delay elements. Each = 125pSec. 79 127 - Reserved
15	0h RO	Reserved.
14:8	0h RW	**sdr25 hs50 (sdr25_hs50):** Rx CMD + Data Delay (SDR25/HS50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12 comp (sdr12_comp):** Rx CMD + Data Delay (SDR12/ Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.36 Rx Strobe Delay Control (Rx_Strobe_Ctrl_Path)—Offset 830h

Front end module Rx strobe Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**auto tuning (auto_tuning):** Enable Auto Tuning for HS400 Strobe Path 0 Auto Tuning Disabled 1 Auto Tuning Enabled
15	0h RO	Reserved.
14:8	0h RW	**hs400 mode1 (hs400_mode1):** Rx Strobe Delay DLL 1(HS400 Mode) 0 39 Select number of active delay elements. Each = 125pSec 0 63 - Reserved
7	0h RO	Reserved.
6:0	0h RW	**hs400 mode2 (hs400_mode2):** Rx Strobe Delay DLL 2(HS400 Mode) 0 39 Select number of active delay elements. Each = 125pSec 40 63 - Reserved

13.37 Rx CMD Data Delay Control 2 (Rx_CMD_Data_dly_2)—Offset 834h

Front end module Rx data Path Delay register 2

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	1h RW	**clk source (clk_source):** Clock Source for Rx Path 00 Rx Clock after Output Buffer 01 Rx Clock before Output Buffer 10 Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.
13:8	0h RW	**path pll (path_pll):** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39 - Select the required delay, as a multiple of 125pSec.40 63 Reserved
7	0h RO	Reserved.
6:0	0h RW	**cmd data sdr104 hs200 (cmd_data_sdr104_hs200):** Rx CMD + Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 127 Reserved

13.38 Master DLL Software Control (Master_Dll)—Offset 838h

Master DLL Software control register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**SW reset dll (SW_reset_dll):** SW reset for Master DLL 0 No SW Reset for Master DLL 1 Force Reset for Master DLL
23	0h RO	**DLL lock (DLL_lock):** Master DLL Lock Indication
22:8	0h RW	**coarse code (coarse_code):** Set coarse code to DLL. (only valid when Software control is Enabled)
7:4	0h RW	**fine code (fine_code):** Set fine code to DLL. (only valid when Software control is Enabled)

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	**less (less):** Phase Detection Less Indication
2	0h RO/V	**more (more):** Phase Detector More Indication
1	0h RW	**Master DLL Software Ctrl (Master_DLL_Software_Ctrl):** Master DLL Software Ctrl. 0 Master DLL Automatic Control (SW Control Disabled). 1 Master DLL Software Control Enabled
0	1h RW	**Ctrl of Mst DLL Ref Clk (Ctrl_of_Mst_DLL_Ref_Clk):** Ctrl of Master DLL Ref Clock. 0 - Clock is Disabled. 1 - Clock is Enabled

13.39 Auto_tuning_val (Auto_tuning)—Offset 840h

Auto Tuning Value

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto_tuning_val (Auto_tuning_val):** Auto tuning value

13.40 Root Space sel (emmc_Root_Space)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**root space (root_space):** Root Space Select Selects the Root Space in which the IP output its upstream accesses 0 Root Space 0 1 Root Space 1

13.41 SW_LTR_Value (SW_LTR_val)—Offset 804h

Sets the Software Latency Tolerance Reporting fields

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirment (Snoop_Requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop_latency_scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value (Snoop_value):** 10-bit latency value

13.42 Auto LTR Value (Auto_LTR_val)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop_Requirment (Snoop_Requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**Reserved_low field (Reserved_low):** Reserved_low
12:10	2h RW	**Snoop_latency_scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop_value (Snoop_value):** 10-bit latency value

13.43 Capabilities Bypass Control (Cap_byps)—Offset 810h

Capabilities Bypass Control register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable Cap Bypass (Enable_Cap_Bypass):** 8h5A Enable Capabilities Bypass. All other Capabilities Bypass Disable (using default values)

13.44 emmc Capabilities Bypass Register I (Cap_byps_reg1)—Offset 814h

eMMC Capabilities Bypass register 1

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 3041EF3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400 support (hs400_support):** 1: HS400 Mode Supported. 0: HS400 Mode NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
28	1h RW	**timeout clock unit (timeout_clock_unit):** 1b1 - to Select MHz Clock ,1b0 - to Select KHz Clock
27:22	1h RW	**timeout clock freq (timeout_clock_freq):** Timeout clock frequency
21	0h RW	**SPI mode support (SPI_mode_support):** SPI Mode Support 1b1 SPI Mode Supported ,1b0 SPI Mode Not Supported
20:17	0h RW	**timer count (timer_count):** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4b0 disables Re-Tuning Timer
16	1h RW	**tuning for SDR50 (tuning_for_SDR50):** Use Tuning for SDR50 1b1 Use Tuning 1b0 Dont use Tuning
15	1h RW	**ddr50 support (ddr50_support):** 1: DDR50 Mode Supported. 0: DDR50 Mode NOT Supported
14	1h RW	**sdr104 support (sdr104_support):** 1: SDR104 Mode Supported. 0: SDR104 Mode NOT Supported
13	1h RW	**sdr50 support (sdr50_support):** 1: SDR50 Mode Supported. 0: SDR50 Mode NOT Supported
12:11	1h RW	**Slot Type (Slot_Type):** 00 - Removable SD Card Slot. 01 - Embedded Slot for One Device. 10 - Shared Bus Slot. 11 - Reserved
10	1h RW	**Async Interrupt Support (Async_Interrupt_Support):** 1: Asynchronous Interrupt Supported. 0: Asynchronous Interrupt NOT Supported
9	1h RW	**Sys Addr 64bit Support (Sys_Addr_64bit_Support):** 1 - Core supports 64-bit System Address Bus. 0 - Core supports only 32-bit System Address Bus
8	1h RW	**Voltage Support 1_8V (Voltage_Support_1_8V):** 1: 1.8V Supported. 0: 1.8V NOT Supported
7	0h RW	**Voltage Support 3V (Voltage_Support_3V):** 1: 3.0V Supported. 0: 3.0V NOT Supported
6	0h RW	**Voltage Support 3_3V (Voltage_Support_3_3V):** 1: 3.3V Supported. 0: 3.3V NOT Supported
5	1h RW	**Suspend Resume Support (Suspend_Resume_Support):** 1: Suspend/Resume Supported. 0: Suspend/Resume NOT Supported
4	1h RW	**SDMA Support (SDMA_Support):** 1: SDMA mode Supported. 0: SDMA mode NOT Supported
3	1h RW	**High Speed Support (High_Speed_Support):** 1: HIGH_SPEED mode Supported. 0: HIGH_SPEED mode NOT Supported
2	1h RW	**ADMA2 Support (ADMA2_Support):** 1: ADMA2 mode Supported. 0: ADMA2 mode NOT Supported
1:0	0h RW	**Max Burst Length (Max_Burst_Length):** Maximum Block Length supported by the Core/Device. 00: 512 (Bytes). 01: 1024. 10: 2048. 11: Reserved

13.45 emmc Capabilities Bypass Register 2 (Cap_byps_reg2)—Offset 818h

eMMC Capabilities Bypass register 2

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**tuning count val (tuning_count_val):** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0h RW	**tuning dis (tuning_dis):** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0h RW	**driver type 4 (driver_type_4):** Driver Type 4 Support 1b1 Supported 1b0 NOT Supported
18	0h RW	**driver type D (driver_type_D):** Driver Type D Support 1b1 Supported 1b0 NOT Supported
17	0h RW	**driver type C (driver_type_C):** Driver Type C Support 1b1 Supported 1b0 NOT Supported
16	0h RW	**driver type A (driver_type_A):** Driver Type A Support 1b1 Supported 1b0 NOT Supported
15	0h RO	Reserved.
14	1h RW	**support 8-bit embedded (support_8_bit_embedded):** 8-bit Support for Embedded Device 1b1 Supported 1b0 NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**base sd clock (base_sd_clock):** Base Clock Frequency for SD Clock

13.46 D0i3 (reg_D0i3)—Offset 81Ch

D0i3 Control register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	1h RW/1C	**Restore Required (RestoreRequired):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3 (D0i3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**Interrupt Request (Interrupt_Request):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0h RO	**Cmd In Progress (Cmd_In_Progress):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

13.47 Tx CMD Delay Control (Tx_CMD_dly)—Offset 820h

Front end module Tx Command Path Delay register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 500h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	5h RW	**ddr mode (ddr_mode):** Tx CMD Delay (DDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr mode (sdr_mode):** Tx CMD Delay (SDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 - Reserved

13.48 Tx DATA Delay Control 1 (Tx_DATA_dly_1)—Offset 824h

Front end module Tx data Path Delay register 1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: A18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**hs400 mode (hs400_mode):** Tx Data Delay (HS400 Mode). 0 78 Select number of active delay elements. Each = 125pSec. 79 127 - Reserved
7	0h RO	Reserved.
6:0	18h RW	**sdr104 hs200 (sdr104_hs200):** Tx Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.49 Tx DATA Delay Control 2 (Tx_DATA_dly_2)—Offset 828h

Front end module Tx data Path Delay register 2

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1C2A1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**sdr50 mode (sdr50_mode):** Tx Data Delay (SDR50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 127 Reserved
23	0h RO	Reserved.
22:16	2Ah RW	**ddr50 mode (ddr50_mode):** Tx Data Delay (DDR50 Mode). 0 78 Select number of active delay elements. Each = 125pSec. 79 127 - Reserved
15	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
14:8	1Ch RW	**sdr25 hs50 mode (sdr25_hs50_mode):** Tx Data Delay (SDR25/ HS50 Mode)0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12 comp mode (sdr12_comp_mode):** Tx Data Delay (SDR12/Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.50 Rx CMD Data Delay Control 1 (Rx_CMD_Data_dly_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: E0000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	0h RW	**sdr50 mode (sdr50_mode):** Rx CMD + Data Delay (SDR50 Mode). 0 79 Select the required delay, as a multiple of 125pSec.80 127 Reserved
23	0h RO	Reserved.
22:16	Eh RW	**ddr50 mode (ddr50_mode):** Rx CMD + Data Delay (DDR50 Mode). 0 78 Select number of active delay elements. Each = 125pSec. 79 127 - Reserved
15	0h RO	Reserved.
14:8	0h RW	**sdr25 hs50 (sdr25_hs50):** Rx CMD + Data Delay (SDR25/HS50 Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved
7	0h RO	Reserved.
6:0	0h RW	**sdr12 comp (sdr12_comp):** Rx CMD + Data Delay (SDR12/ Compatibility Mode) 0-79 - Select the required delay, as a multiple of 125pSec.80 127 Reserved

13.51 Rx CMD Data Delay Control 2 (Rx_CMD_Data_dly_2)—Offset 834h

Front end module Rx data Path Delay register 2

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	1h RW	**clk source (clk_source):** Clock Source for Rx Path 00 Rx Clock after Output Buffer 01 Rx Clock before Output Buffer 10 Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.
13:8	0h RW	**path pll (path_pll):** Rx Path PLL #3 Delay value For Auto Tuning Mode 0-39 - Select the required delay, as a multiple of 125pSec.40 63 Reserved
7	0h RO	Reserved.
6:0	0h RW	**cmd data sdr104 hs200 (cmd_data_sdr104_hs200):** Rx CMD + Data Delay (SDR104/HS200 Mode) 0-79 - Select the required delay, as a multiple of 125pSec. 80 127 Reserved

13.52 Auto_tuning_val (Auto_tuning)—Offset 840h

Auto Tuning Value

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto_tuning_val (Auto_tuning_val):** Auto tuning value

13.53 SDMA System Address Register/Argument2 Register (sdmasysaddr)—Offset 0h

This register contains concatinates reg_sdmasysaddrlo and reg_sdmasysaddrhi

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**sdma_sysaddress (sdma_sysaddress):** refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi

13.54 BlockSize Register (blocksize)—Offset 4h

This register is used to configure the number of bytes in a data block

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14:12	0h RW	**sdma_bufboundary (sdma_bufboundary):** This Field specifies DMA Buffer Boundary
11:0	0h RW	**xfer_blocksize (xfer_blocksize):** This Field specifies Block Size for Data Transfers

13.55 BlockCount Register (blockcount)—Offset 6h

This register is used to configure the number of data blocks

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**xfer_blockcount (xfer_blockcount):** This Register specifies Block Size for Data Transfers

13.56 Argument1 Register (argument1)—Offset 8h

This register contains concatinates argument1lo and argument1hi registers to result SD Command Argument

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**command_argument1 (command_argument1):** refer t oreg_argument1lo and reg_argument1hi.

13.57 TransferMode Register (transfermode)—Offset Ch

This register is used to control the operations of data transfers

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h RW	**xfermode_multiblksel (xfermode_multiblksel):** This bit enables multiple block data transfers.
4	0h RW	**xfermode_dataxferdir (xfermode_dataxferdir):** This bit defines the direction of data transfers.
3:2	0h RW	**xfermode_autocmdena (xfermode_autocmdena):** This field determines use of auto command functions.
1	0h RW	**xfermode_blkcntena (xfermode_blkcntena):** This bit is used to enable the Block count register, which is only relevant for multiple block transfers
0	0h RW	**xfermode_dmaenable (xfermode_dmaenable):** '1' to enable DMA,

13.58 Command Register (command)—Offset Eh

This register is used to program the Command for host controller

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	0h RW	**command_cmdindex (command_cmdindex):** This bit shall be set to the command number (CMD0-63, ACMD0-63).
7:6	0h RW	**command_cmdtype (command_cmdtype):** This bit is used for select different command types.
5	0h RW	**command_datapresent (command_datapresent):** This bit is used to checking whether data present or not.
4	0h RW	**command_indexchkena (command_indexchkena):** This bit is used to enable/disable Command Index checking.
3	0h RW	**command_crcchkena (command_crcchkena):** This bit is used to enable/disable CRC checking.
2	0h RO	Reserved.
1:0	0h RW	**command_responsetype (command_responsetype):** Response Type Select.

13.59 Response Register (response01)—Offset 10h

This register is used to store responses from SD Cards (concatinates response0 & response1 registers)

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.60 Response Register (response2)—Offset 14h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.61 Response Register (response3)—Offset 16h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.62 Response Register (response4)—Offset 18h

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.63 Response Register (response5)—Offset 1Ah

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.64 Response Register (response6)—Offset 1Ch

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.65 Response Register (response7)—Offset 1Eh

This register is used to store responses from SD Cards

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command_response (command_response):** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

13.66 Buffer DataPort Register (dataport)—Offset 20h

This register is used to access internal buffer

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**sdhcdmactrl_piobufrddata (sdhcdmactrl_piobufrddata):** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

13.67 PresentState Register (presentstate)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read-only register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28	0h RO	**sdif_dat7in_dsync (sdif_dat7in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
27	0h RO	**sdif_dat6in_dsync (sdif_dat6in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
26	0h RO	**sdif_dat5in_dsync (sdif_dat5in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
25	0h RO	**sdif_dat4in_dsync (sdif_dat4in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
24	0h RO	**sdif_cmdin_dsync (sdif_cmdin_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
23	0h RO	**sdif_dat3in_dsync (sdif_dat3in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging. This is
22	0h RO	**sdif_dat2in_dsync (sdif_dat2in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging. This is

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**sdif_dat1in_dsync (sdif_dat1in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging. This is
20	0h RO	**sdif_dat0in_dsync (sdif_dat0in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging. This is
19	0h RO	**sdif_wp_dsync (sdif_wp_dsync):** The Write Protect Switch is supported for memory and combo cards.
18	0h RO	**sdif_cd_n_dsync (sdif_cd_n_dsync):** This bit reflects the inverse value of the SDCD# pin.
17	0h RO	**sdhccarddet_statestable_dsync (sdhccarddet_statestable_dsync):** This bit is used for testing.
16	0h RO	**sdhccarddet_inserted_dsync (sdhccarddet_inserted_dsync):** This bit indicates whether a card has been inserted.
15:12	0h RO	Reserved.
11	0h RO	**sdhcdmactrl_piobufrdena (sdhcdmactrl_piobufrdena):** This status is used for non-DMA read transfers. This read only flag indicates that valid data exists in the host side buffer status.
10	0h RO	**sdhcdmactrl_piobufwrena (sdhcdmactrl_piobufwrena):** This status is used for non-DMA write transfers.This read only flag indicates if space is available for write data.
9	0h RO	**sdhcdmactrl_rdxferactive (sdhcdmactrl_rdxferactive):** This status is used for detecting completion of a read transfer.
8	0h RO	**sdhcdmactrl_wrxferactive (sdhcdmactrl_wrxferactive):** This status indicates a write transfer is active.
7:4	0h RO	Reserved.
3	0h RO	**sdhcsdctrl_retuningreq_dsync (sdhcsdctrl_retuningreq_dsync):** Host Controller may request Host Driver to execute re-tuning sequence by setting this bit.
2	0h RO	**sdhcdmactrl_datalineactive (sdhcdmactrl_datalineactive):** This bit indicates whether one of the DAT line on SD bus is in use.
1	0h RO	**presentstate_inhibitdat (presentstate_inhibitdat):** This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1.
0	0h RO	**presentstate_inhibitcmd (presentstate_inhibitcmd):** If this bit is 0, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line. This bit is set immediately after the Command register (00Fh) is written. This bit is cleared when the command response is received.

13.68 HostControl1 Register (hostcontrol1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**hostctrl1_cdsigselect (hostctrl1_cdsigselect):** This bit selects source for card detection.
6	0h RW	**hostctrl1_cdtestlevel (hostctrl1_cdtestlevel):** This bit is used for indicating whether card is inserted or not.
5	0h RW	**hostctrl1_extdatawidth (hostctrl1_extdatawidth):** This bit controls 8-bit bus width mode for embedded device.
4:3	0h RW	**hostctrl1_dmaselect (hostctrl1_dmaselect):** One of supported DMA modes can be selected.
2	0h RW	**hostctrl1_highspeedena (hostctrl1_highspeedena):** This bit is used for setting speed mode.
1	0h RW	**hostctrl1_datawidth (hostctrl1_datawidth):** This bit selects the data width of the HC.
0	0h RW	**hostctrl1_ledcontrol (hostctrl1_ledcontrol):** This bit is used to caution the user not to remove the card while the SD card is being accessed.

13.69 PowerControl Register (powercontrol)—Offset 29h

This register is used to program the SD Bus power and voltage level

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h RW	**emmc_hwreset (emmc_hwreset):** Hardware reset signal is generated for eMMC card.
3:1	0h RW	**pwrctrl_sdbusvoltage (pwrctrl_sdbusvoltage):** By setting these bits, the HD selects the voltage level for the SD card.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**pwrctrl_sdbuspower (pwrctrl_sdbuspower):** This bit is used detect whether power is on or off.

13.70 BlockGapControl Register (blockgapcontrol)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**blkgapctrl_bootackena (blkgapctrl_bootackena):** To check for the boot acknowledge in boot operation.
6	0h RW	**blkgapctrl_altbootmode (blkgapctrl_altbootmode):** To start boot code access in alternative mode.
5	0h RW	**blkgapctrl_bootenable (blkgapctrl_bootenable):** To start boot code access. '0' To stop boot code access, '1' To start boot code access
4	0h RW	**blkgapctrl_spimode (blkgapctrl_spimode):** SPI mode enable bit. '0' SD Mode, '1' SPI Mode
3	0h RW	**blkgapctrl_interrupt (blkgapctrl_interrupt):** This bit is valid only in 4-bit mode of the SDIO card andselects a sample point in the interrupt cycle.
2	0h RW	**blkgapctrl_rdwaitctrl (blkgapctrl_rdwaitctrl):** The read wait function is optional for SDIO cards.
1	0h RW	**blkgapctrl_continue (blkgapctrl_continue):** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request.
0	0h RW	**blkgapctrl_stopatblkgap (blkgapctrl_stopatblkgap):** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers.

13.71 Wakeup Control Register (wakeupcontrol)—Offset 2Bh

This register is used to program the wakeup functionality

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW	**wkupctrl_cardremoval (wkupctrl_cardremoval):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
1	0h RW	**wkupctrl_cardinsertion (wkupctrl_cardinsertion):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
0	0h RW	**wkupctrl_cardinterrupt (wkupctrl_cardinterrupt):** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register.

13.72 Clock Control Register (clockcontrol)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**clkctrl_sdclkfreqsel (clkctrl_sdclkfreqsel):** This register is used to select the frequency of the SDCLK pin.
7:6	0h RW	**clkctrl_sdclkfreqsel_upperbits (clkctrl_sdclkfreqsel_upperbits):** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select
5	0h RW	**clkctrl_clkgensel (clkctrl_clkgensel):** This bit is used to select the clock generator mode in SDCLK Frequency Select.
4:3	0h RO	Reserved.
2	0h RW	**clkctrl_sdclkena (clkctrl_sdclkena):** This bit enables/disables SD Clock. '0' Disable, '1' Enable
1	0h RW	**sdhcclkgen_intclkstable_dsync (sdhcclkgen_intclkstable_dsync):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1.
0	0h RW	**clkctrl_intclkena (clkctrl_intclkena):** This bit enables setting of internal clock.'0' Stop, '1' Oscillate

13.73 Timeout Control Register (timeoutcontrol)—Offset 2Eh

The register sets the Data Timeout counter value

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h RW	**timeout_ctrvalue (timeout_ctrvalue):** This value determines the interval by which DAT line time-outs are detected.

13.74 Software Reset Register (softwarereset)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Access Method

Type: MEM Register (Size: 8 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW	**swreset_for_dat (swreset_for_dat):** Only part of data circuit is reset. '0' Work, '1' Reset
1	0h RW	**swreset_for_cmd (swreset_for_cmd):** Only part of command circuit is reset.'0' Work, '1' reset.
0	0h RW	**swreset_for_all (swreset_for_all):** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD.

13.75 Normal Interrupt Status Register (normalintrsts)—Offset 30h

This register gives the status of all the interrupts

Access Method

Type: MEM Register (Size: 16 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**reg_errorintrsts (reg_errorintrsts):** This bit is set If any of the bits in the Error Interrupt Status Register are set.
14	0h RW/1C	**normalintrsts_bootcomplete (normalintrsts_bootcomplete):** This status is set if the boot operation gets terminated.
13	0h RW/1C	**normalintrsts_rcvbootack (normalintrsts_rcvbootack):** This status is set if the boot acknowledge is received from device.
12	0h RO	**normalintrsts_retuningevent (normalintrsts_retuningevent):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h RO	**normalintrsts_intc (normalintrsts_intc):** This status is set if INT_C is enabled and INT_C# pin is in low level. It is cleared by resetting the INT_C interrupt factor.
10	0h RO	**normalintrsts_intb (normalintrsts_intb):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0h RW	**normalintrsts_inta (normalintrsts_inta):** This status is set if INT_A is enabled and INT_A# pin is in low level. It is cleared by resetting
8	0h RW	**normalintrsts_cardintsts (normalintrsts_cardintsts):** This status is set to generate Card Interrupt. '0' No Card Interrupt, '1' Generate Card Interrupt
7	0h RW/1C	**normalintrsts_cardremsts (normalintrsts_cardremsts):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h RW/1C	**normalintrsts_cardinssts (normalintrsts_cardinssts):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h RW/1C	**normalintrsts_bufrdready (normalintrsts_bufrdready):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h RW/1C	**normalintrsts_bufwrready (normalintrsts_bufwrready):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h RW/1C	**normalintrsts_dmainterrupt (normalintrsts_dmainterrupt):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h RW/1C	**normalintrsts_blkgapevent (normalintrsts_blkgapevent):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h RW/1C	**normalintrsts_xfercomplete (normalintrsts_xfercomplete):** This bit is set when a read / write transaction is completed.
0	0h RW/1C	**normalintrsts_cmdcomplete (normalintrsts_cmdcomplete):** This bit is set when we get the end bit of the command response.

13.76 ErrorInterruptStatus_Register (errorintrsts)—Offset 32h

This register gives the status of the error interrupts

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW/1C	**errorintrsts_hosterror (errorintrsts_hosterror):** Occurs when detecting Host ERROR
11:10	0h RO	Reserved.
9	0h RW/1C	**errorintrsts_admaerror (errorintrsts_admaerror):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h RW/1C	**errorintrsts_autocmderror (errorintrsts_autocmderror):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h RW/1C	**errorintrsts_currlimiterror (errorintrsts_currlimiterror):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h RW/1C	**errorintrsts_dataendbiterror (errorintrsts_dataendbiterror):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h RW/1C	**errorintrsts_datacrcerror (errorintrsts_datacrcerror):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h RW/1C	**errorintrsts_datatimeouterror (errorintrsts_datatimeouterror):** This status is set if Data Timeout error occurs.
3	0h RW/1C	**errorintrsts_cmdindexerror (errorintrsts_cmdindexerror):** Occurs if a Command Index error occurs in the Command Response.
2	0h RW/1C	**errorintrsts_cmdendbiterror (errorintrsts_cmdendbiterror):** Occurs when detecting that the end bit of a command response is 0.
1	0h RW/1C	**errorintrsts_cmdcrcerror (errorintrsts_cmdcrcerror):** This bit is set when Command CRC Error is generated. '0' No Error, '1' CRC Error

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1C	**errorintrsts_cmdtimeouterror (errorintrsts_cmdtimeouterror):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

13.77 Normal Interrupt Status Enable Register (normalintrstsena)—Offset 34h

This register is used to enable the normal interrupt status register fields

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HC shall control error Interrupts using the Error Interrupt Status Enable register.
14	0h RW	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** This status is set if the boot operation gets terminated.
13	0h RW	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** This status is set if the boot acknowledge is received from device.
12	0h RW	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0h RW	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
10	0h RW	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
9	0h RW	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
8	0h RW	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0h RW	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h RW	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h RW	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h RW	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0h RW	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h RW	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** This bit is set when a read / write transaction is completed.
0	0h RW	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** This bit is set when we get the end bit of the command response.

13.78 Error Interrupt Status Enable Register (errorintrstsena)—Offset 36h

This register is used to enable the Error Interrupt Status register fields

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW	**errorintrsts_enableregbit12 (errorintrsts_enableregbit12):** Occurs when detecting ERROR in m_hresp(dma transaction)
11	0h RO	Reserved.
10	0h RW	**errorintrsts_enableregbit10 (errorintrsts_enableregbit10):** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**errorintrsts_enableregbit9 (errorintrsts_enableregbit9):** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0h RW	**errorintrsts_enableregbit8 (errorintrsts_enableregbit8):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h RW	**errorintrsts_enableregbit7 (errorintrsts_enableregbit7):** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.Reading 0 means that the HC is supplying power and no error has occurred.
6	0h RW	**errorintrsts_enableregbit6 (errorintrsts_enableregbit6):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0h RW	**errorintrsts_enableregbit5 (errorintrsts_enableregbit5):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0h RW	**errorintrsts_enableregbit4 (errorintrsts_enableregbit4):** This status is set if Data Timeout error occurs.
3	0h RW	**errorintrsts_enableregbit3 (errorintrsts_enableregbit3):** Occurs if a Command Index error occurs in the Command Response.
2	0h RW	**errorintrsts_enableregbit2 (errorintrsts_enableregbit2):** Occurs when detecting that the end bit of a command response is 0.
1	0h RW	**errorintrsts_enableregbit1 (errorintrsts_enableregbit1):** This bit is set when Command CRC Error is generated.
0	0h RW	**errorintrsts_enableregbit0 (errorintrsts_enableregbit0):** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

13.79 Normal Interrupt Signal Enable Register (normalintrsigena)—Offset 38h

This register is used to enable the Normal Interrupt Signal register

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**normalintrsts_enableregbit15 (normalintrsts_enableregbit15):** The HD shall control error Interrupts using the Error Interrupt Signal Enable register.
14	0h RW	**normalintrsts_enableregbit14 (normalintrsts_enableregbit14):** Boot Terminate Interrupt Signal Enable
13	0h RW	**normalintrsts_enableregbit13 (normalintrsts_enableregbit13):** Boot ack rcv Signal Enable
12	0h RW	**normalintrsts_enableregbit12 (normalintrsts_enableregbit12):** Re-Tuning Event Signal Enable
11	0h RW	**normalintrsts_enableregbit11 (normalintrsts_enableregbit11):** INT_C Signal Enable
10	0h RW	**normalintrsts_enableregbit10 (normalintrsts_enableregbit10):** INT_B Signal Enable
9	0h RW	**normalintrsts_enableregbit9 (normalintrsts_enableregbit9):** INT_A Signal Enable
8	0h RW	**sdhcregset_cardintstsena (sdhcregset_cardintstsena):** Card Interrupt Signal Enable
7	0h RW	**sdhcregset_cardremstsena (sdhcregset_cardremstsena):** Card Removal Signal Enable
6	0h RW	**sdhcregset_cardinsstsena (sdhcregset_cardinsstsena):** Card Insertion Signal Enable
5	0h RW	**normalintrsts_enableregbit5 (normalintrsts_enableregbit5):** Buffer Read Ready Signal Enable
4	0h RW	**normalintrsts_enableregbit4 (normalintrsts_enableregbit4):** Buffer Write Ready Signal Enable
3	0h RW	**normalintrsts_enableregbit3 (normalintrsts_enableregbit3):** DMA Interrupt Signal Enable
2	0h RW	**normalintrsts_enableregbit2 (normalintrsts_enableregbit2):** Block Gap Event Signal Enable
1	0h RW	**normalintrsts_enableregbit1 (normalintrsts_enableregbit1):** Transfer Complete Signal Enable
0	0h RW	**normalintrsts_enableregbit0 (normalintrsts_enableregbit0):** Command Complete Signal Enable

13.80 Error Interrupt Signal Enable Register (errorintrsigena)—Offset 3Ah

This register is used to enable Error Interrupt Signal register

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RO	**errorintrsig_enableregbit12 (errorintrsig_enableregbit12):** Target Response Error Signal Enable
11	0h RO	Reserved.
10	0h RW	**errorintrsig_enableregbit10 (errorintrsig_enableregbit10):** Tuning Error Signal Enable
9	0h RW	**errorintrsig_enableregbit9 (errorintrsig_enableregbit9):** ADMA Error Signal Enable
8	0h RW	**errorintrsig_enableregbit8 (errorintrsig_enableregbit8):** Auto CMD Error Signal Enable
7	0h RW	**errorintrsig_enableregbit7 (errorintrsig_enableregbit7):** Current Limit Error Signal Enable
6	0h RW	**errorintrsig_enableregbit6 (errorintrsig_enableregbit6):** Data End Bit Error Signal Enable
5	0h RW	**errorintrsig_enableregbit5 (errorintrsig_enableregbit5):** Data CRC Error Signal Enable
4	0h RW	**errorintrsig_enableregbit4 (errorintrsig_enableregbit4):** Data Timeout Error Signal Enable
3	0h RW	**errorintrsig_enableregbit3 (errorintrsig_enableregbit3):** Command Index Error Signal Enable
2	0h RW	**errorintrsig_enableregbit2 (errorintrsig_enableregbit2):** Command End Bit Error Signal Enable
1	0h RW	**errorintrsig_enableregbit1 (errorintrsig_enableregbit1):** Command CRC Error Signal Enable
0	0h RW	**errorintrsig_enableregbit0 (errorintrsig_enableregbit0):** Command Timeout Error Signal Enable

13.81 Auto CMD12 Error Status Register (autocmderrsts)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**autocmderrsts_nexterror (autocmderrsts_nexterror):** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23
6:5	0h RO	Reserved.
4	0h RO	**autocmderrsts_indexerror (autocmderrsts_indexerror):** Occurs if the Command Index error occurs in response to a command.
3	0h RO	**autocmderrsts_endbiterror (autocmderrsts_endbiterror):** Occurs when detecting that the end bit of command response is 0.
2	0h RO	**autocmderrsts_crcerror (autocmderrsts_crcerror):** Occurs when detecting a CRC error in the command response.
1	0h RO	**autocmderrsts_timeouterror (autocmderrsts_timeouterror):** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command.
0	0h RO	**autocmderrsts_notexecerror (autocmderrsts_notexecerror):** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error.

13.82 Host Control2 Register (hostcontrol2)—Offset 3Eh

This register is used to program UHS Select Mode,UHS Select Mode,Driver Strength Select,Execute Tuning,Sampling Clock Select,Asynchronous Interrupt Enable and Preset value enable

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**hostctrl2_presetvalueenable (hostctrl2_presetvalueenable):** This bit enables the functions defined in the Preset Value registers.
14	0h RW	**hostctrl2_asynchintrenable (hostctrl2_asynchintrenable):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register.

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RO	Reserved.
9	0h RW	**hostctrl2_driverstrength_bit2 (hostctrl2_driverstrength_bit2):** This is the programmed Drive STrength output and Bit[2] of the sdhccore_drivestrength value.
8	0h RO	Reserved.
7	0h RW	**hostctrl2_samplingclkselect (hostctrl2_samplingclkselect):** This bit is set by tuning procedure when Execute Tuning is cleared.
6	0h RW	**hostctrl2_executetuning (hostctrl2_executetuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed.
5:4	0h RW	**hostctrl2_driverstrength (hostctrl2_driverstrength):** Host Controller output driver in 1.8V signaling is selected by this bit.
3	0h RW	**hostctrl2_1p8vsignallingena (hostctrl2_1p8vsignallingena):** This bit controls voltage regulator for I/O cell.
2:0	0h RW	**hostctrl2_uhsmodeselect (hostctrl2_uhsmodeselect):** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1.

13.83 Capabilities Register (capabilities)—Offset 40h

This register provides the host driver with information specific to the host controller implementation

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63	0h RO	**corecfg_hs400support (corecfg_hs400support):** This field indicates whether HS400 is supported or not.
62:58	0h RO	Reserved.
57	0h RO	**corecfg_spiblkmode (corecfg_spiblkmode):** This field indicates whether SPI Block Mode is supported or not.
56	0h RO	**corecfg_spisupport (corecfg_spisupport):** This field indicates whether SPI Mode is supported or not.
55:48	0h RO	**corecfg_clockmultiplier (corecfg_clockmultiplier):** This field indicates clock multiplier value of programmable clock generator.
47:46	0h RO	**corecfg_retuningmodes (corecfg_retuningmodes):** This field defines the re-tuning capability of a Host Controller.

Bit Range	Default & Access	Field Name (ID): Description
45	0h RO	**corecfg_tuningforsdr50 (corecfg_tuningforsdr50):** If this bit is set to 1, this Host Controller requires tuning to operate SDR50.
44	0h RO	Reserved.
43:40	0h RO	**corecfg_retuningtimercnt (corecfg_retuningtimercnt):** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3.
39	0h RO	**corecfg_type4support (corecfg_type4support):** This bit indicates support of Type 4 Driver.
38	0h RO	**corecfg_ddriversupport (corecfg_ddriversupport):** This bit indicates support of Driver Type D for 1.8 Signaling.
37	0h RO	**corecfg_cdriversupport (corecfg_cdriversupport):** This bit indicates support of Driver Type C for 1.8 Signaling.
36	0h RO	**corecfg_adriversupport (corecfg_adriversupport):** This bit indicates support of Driver Type A for 1.8 Signaling.
35	0h RO	Reserved.
34	0h RO	**corecfg_ddr50support (corecfg_ddr50support):** This bit indicates whether DDR50 is supported.
33	0h RO	**corecfg_sdr104support (corecfg_sdr104support):** This bit indicates whether SDR104 is supported.SDR104 requires tuning.
32	0h RO	**corecfg_sdr50support (corecfg_sdr50support):** This bit indicates whether SDR50 is supported.
31:30	0h RO	**corecfg_slottype (corecfg_slottype):** This field indicates usage of a slot by a specific Host System
29	0h RO	**corecfg_asynchintrsupport (corecfg_asynchintrsupport):** Asynchronous Interrupt Support
28	0h RO	**corecfg_64bitsupport (corecfg_64bitsupport):** This bit indicates whether the HC supports 64bit System Bus
27	0h RO	Reserved.
26	0h RO	**corecfg_1p8voltsupport (corecfg_1p8voltsupport):** This bit indicates whether the HC supports 1.8V.
25	0h RO	**corecfg_3p0voltsupport (corecfg_3p0voltsupport):** This bit indicates whether the HC supports 3.0V.
24	0h RO	**corecfg_3p3voltsupport (corecfg_3p3voltsupport):** This bit indicates whether the HC supports 3.3V.
23	0h RO	**corecfg_suspressupport (corecfg_suspressupport):** This bit indicates whether the HC supports Suspend/Resume functionality.
22	0h RO	**corecfg_sdmasupport (corecfg_sdmasupport):** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RO	**corecfg_highspeedsupport (corecfg_highspeedsupport):** This bit indicates whether the HC and the Host System support High Speed mode.
20	0h RO	Reserved.
19	0h RO	**corecfg_adma2support (corecfg_adma2support):** '0'ADMA2 Not Supported
18	0h RO	**corecfg_8bitsupport (corecfg_8bitsupport):** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode.
17:16	0h RO	**corecfg_maxblklength (corecfg_maxblklength):** This value indicates the maximum block size that the HD can read and write to the buffer in the HC.
15:8	0h RO	**corecfg_baseclkfreq (corecfg_baseclkfreq):** 6-bit Base Clock Frequency
7	0h RO	**corecfg_timeoutclkunit (corecfg_timeoutclkunit):** This bit shows the unit of base clock frequency used to detect Data Timeout Error.
6	0h RO	Reserved.
5:0	0h RO	**corecfg_timeoutclkfreq (corecfg_timeoutclkfreq):** This bit shows the base clock frequency used to detect Data Timeout Error.

13.84 Maximum Current Capabilities Register (maxcurrentcap)—Offset 48h

This register indicates maximum current capability for each voltage

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0h RO	Reserved.
23:16	0h RO	**corecfg_maxcurrent1p8v (corecfg_maxcurrent1p8v):** Maximum Current for 1.8V
15:8	0h RO	**corecfg_maxcurrent3p0v (corecfg_maxcurrent3p0v):** Maximum Current for 3.0V
7:0	0h RO	**corecfg_maxcurrent3p3v (corecfg_maxcurrent3p3v):** Maximum Current for 3.3V

13.85 Force Event REGISTER for AUTO CMD Error Status (ForceEventforAUTOCMDErrorStatus)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**forcecmdnotissuedbyautocmd12err (forcecmdnotissuedbyautocmd12err):** Force Event for Command Not Issued by AUTO CMD12 Error
6:5	0h RO	Reserved.
4	0h RO	**forceautocmdindexerr (forceautocmdindexerr):** Force Event for AUTO CMD Index Error
3	0h RO	**forceautocmdendbiterr (forceautocmdendbiterr):** Force Event for AUTO CMD End Bit Error
2	0h RO	**forceautocmdcrcerr (forceautocmdcrcerr):** Force Event for AUTO CMD Timeout Error
1	0h RO	**forceautocmdtimeouterr (forceautocmdtimeouterr):** Force Event for AUTO CMD Timeout Error
0	0h RO	**forceautocmdnotexec (forceautocmdnotexec):** Force Event for AUTO CMD12 Not Executed

13.86 Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RO	**forcetuningerr (forcetuningerr):** Force Event for Tuning Error
9	0h RO	**forceadmaerr (forceadmaerr):** Force Event for ADMA Error'0' no interrupt, '1' interrupt generated
8	0h RO	**forceautocmderr (forceautocmderr):** Force Event for Auto CMD Error '0' no interrupt, '1' interrupt generated
7	0h RO	**forcecurrlimerr (forcecurrlimerr):** Force Event for Current Limit Error '0' no interrupt, '1' interrupt generated
6	0h RO	**forcedatendbiterr (forcedatendbiterr):** Force Event for Data End Bit Error. '0' no interrupt, '1' interrupt generated
5	0h RO	**forcedatcrcerr (forcedatcrcerr):** Force Event for Data CRC Error
4	0h RO	**forcedattimeouterr (forcedattimeouterr):** Force Event for Data Timeout Error '0' no interrupt, '1' interrupt generated
3	0h RO	**forcecmdindexerr (forcecmdindexerr):** Force Event for Command Index Error
2	0h RO	**forcecmdendbiterr (forcecmdendbiterr):** Force Event for Command End Bit Error '0' no interrupt, '1' interrupt generated
1	0h RO	**forcecmdcrcerr (forcecmdcrcerr):** Force Event for Command CRC Error
0	0h RO	**forcecmdtimeouterr (forcecmdtimeouterr):** Force Event for CMD Timeout Error '0' No interrupt, '1' interrupt generated

13.87 ADMA Error Status Register (admaerrsts)—Offset 54h

When the ADMA Error interrupt occur, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor

Access Method

Type: MEM Register (Size: 8 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RO	**admaerrsts_admalenmismatcherr (admaerrsts_admalenmismatcherr):** ADMA Length Mismatch Error
1:0	0h RO	**admaerrsts_admaerrorstate (admaerrsts_admaerrorstate):** This field indicates the state of ADMA when error is occurred during ADMA data transfer.

13.88 ADMA System Address Register0&1 (admasysaddr01)—Offset 58h

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**adma_sysaddress0 (adma_sysaddress0):** This register holds byte address of executing command of the Descriptor table.

13.89 ADMA System Address Register1 (admasysaddr2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**adma_sysaddress2 (adma_sysaddress2):** This register holds byte address of executing command of the Descriptor table.

13.90 ADMA System Address Register1 (admasysaddr3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**adma_sysaddress3 (adma_sysaddress3):** This register holds byte address of executing command of the Descriptor table.

13.91 Preset Value Register for Initialization (presetvalue0)—Offset 60h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	4h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.92 Preset Value Register for Default Speed (presetvalue1)—Offset 62h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for Default Speed

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock

Bit Range	Default & Access	Field Name (ID): Description
9:0	4h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.93 Preset Value Register for High Speed (presetvalue2)—Offset 64h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for High Speed

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	2h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.94 Preset Value Register for SDR12 (presetvalue3)—Offset 66h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for SDR12

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	4h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.95 Preset Value Register for SDR25 (presetvalue4)—Offset 68h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value SDR25

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	2h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.96 Preset Value Register for SDR50 (presetvalue5)—Offset 6Ah

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for SDR50

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	1h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.97 Preset Value Register for SDR104 (presetvalue6)—Offset 6Ch

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for SDR 104

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	0h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.98 Preset Value Register for DDR50 (presetvalue7)—Offset 6Eh

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for DDR50

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	2h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.99 Boot Timeout Control Register (boottimeoutcnt)—Offset 70h

This is used to program the boot timeout value counter

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**boot_timeoutcnt (boot_timeoutcnt):** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card.

13.100 Preset Value Register for DDR50 (presetvalue8)—Offset 74h

This register is used to read the SDCLK Frequency Select Value,Clock Generator Select Value,Driver Strength Select Value for DDR50

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**DriverStrengthSelectValue (DriverStrengthSelectValue):** Driver Strength Select Value

Bit Range	Default & Access	Field Name (ID): Description
13:11	0h RO	Reserved.
10	0h RO	**ClockGeneratorSelectValue (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock
9:0	0h RO	**SDCLKFrequencySelectValue (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

13.101 Vendor Register (vendreg)—Offset 78h

Vendor Register

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0h RO	**RSVD (Reserved_15_1):** Reserved_15_1
0	0h RW	**The bit enables the enhanced strobe logic of the Host Controller (vendor_enhancedstrobe):** vendor_enhancedstrobe

13.102 Slot Interrupt Status Register (slotintrsts)—Offset FCh

This register is used to read the interrupt signal for each slot.

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7:0	0h RO	**sdhchostif_slotintrsts (sdhchostif_slotintrsts):** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot.

13.103 Host Controller Version Register (hostcontrollerver)—Offset FEh

This register is used to read the vendor version number and specification version number

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 1002h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h RO	**SDHC_VENVERNUM (SDHC_VENVERNUM):** This status is reserved for the vendor version number.
7:0	2h RO	**SpecificationVersionNumber (SpecificationVersionNumber):** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.

13.104 CQVER (CQVER)—Offset 200h

This register provides information about the version of the eMMC CQ standard which is 285 implemented by the CQE, in BCD format

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 510h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RSVD (Reserved_51):** Reserved_51
11:8	5h RO	**eMMC Major Version Number (eMMC_Major_Version_Number):** eMMC Major Version Number (digit left of decimal point), in BCD format
7:4	1h RO	**eMMC Minor Version Number (eMMC_Minor_Version_Number):** eMMC Minor Version Number (digit right of decimal point), in BCD format
3:0	0h RO	**eMMC Version Suffix (eMMC_Version_Suffix):** eMMC Version Suffix (2nd digit right of decimal point), in BCD format

13.105 CQCAP (CQCAP)—Offset 204h

Command Queueing Capabilities

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 30C0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RSVD (Reserved_52):** Reserved_52
15:12	3h RO	**Internal Timer Clock Frequency Multiplier (Internal_Timer_Clock_Frequency_Multiplier):** ITCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the SQS polling period. See ITCFVAL definition for details.
11:10	0h RO	**RSVD (Reserved_53):** Reserved_53
9:0	C0h RO	**Internal Timer Clock Frequency Value (Internal_Timer_Clock_Frequency_Value):** TCFMUL and ITCFVAL indicate the frequency of the clock used for interrupt coalescing timer and for determining the polling period when using periodic SEND_QUEUE_ STATUS (CMD13) polling.

13.106 CQCFG (CQCFG)—Offset 208h

Command Queueing Configuration

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**RSVD (Reserved_54):** Reserved_54
12	0h RW	**Direct Command Enable (Direct_Command_Enable):** This bit indicates to the hardware whether the Task Descriptor in slot #31 of the TDL is a Data Transfer Task Descriptor, or a Direct Command Task Descriptor.
11:9	0h RO	**RSVD (Reserved_11_9):** Reserved_11_9
8	0h RW	**Task Descriptor Size (Task_Descriptor_Size):** This bit indicates whether the task descriptor size is 128 bits or 64 bits. This bit can only be configured when Command Queueing Enable bit is ?0? (command queueing is disabled)
7:1	0h RO	**RSVD (Reserved_7_1):** Reserved_7_1

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Command Queueing Enable (Command_Queueing_Enable):** Software shall write ?1? this bit when in order to enable command queueing mode (i.e. enable CQE).

13.107 CQCTL (CQCTL)—Offset 20Ch

Command Queueing Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RSVD (Reserved_57):** Reserved_57
8	0h RW	**Clear_All_Tasks (Clear_All_Tasks):** Software shall write 1 this bit when it wants to clear all the tasks sent to the device.
7:1	0h RO	**RSVD (Reserved_58):** Reserved_58
0	0h RW	**Halt (Halt):** Host software shall write 1 to the bit when it wants to acquire software control over the eMMC bus and disable CQE from issuing commands on the bus.

13.108 Command Queueing Interrupt Status (CQIS)—Offset 210h

This register indicates pending interrupts that require service. Each bit in this registers is asserted 296 in response a specific event, only if the respective bit is set in CQISTE register.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RSVD (Reserved_59):** Reserved_59
3	0h RW/1C	**Task_Cleared (Task_Cleared):** Task_ClearedThis status bit is asserted (if CQISTE.TCL=1) when a task clear operation is completed by CQE. The completed task clear operation is either an individual task clear (CQTCLR) or clearing of all tasks (CQCTL).

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/1C	**Response_Error_Detected_Interrupt (Response_Error_Detected_Interrupt):** This status bit is asserted (if CQISTE.RED=1) when a response is received with an error bit set in the device status field.
1	0h RW/1C	**Task_Complete_Interrupt (Task_Complete_Interrupt):** This status bit is asserted (if CQISTE.TCC=1) when at least one of the following two conditions are met: (1) A task is completed and the INT bit is set in its Task Descriptor (2) Interrupt caused by Interrupt Coalescing logic
0	0h RW/1C	**Halt_Complete_Interrupt (Halt_Complete_Interrupt):** This status bit is asserted (if CQISTE.HAC=1) when halt bit in CQCTL register transitions from 0 to 1 indicating that host controller has completed its current ongoing task and has entered halt state.

13.109 Command Queueing Interrupt Status Enabled (CQISTE)—Offset 214h

This register enables and disables the reporting of the corresponding interrupt to host software in 299 CQIS register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RSVD (Reserved_60):** Reserved_60
3	0h RW	**Task_Cleared_Status_Enable (Task_Cleared_Status_Enable):** 1 = CQIS.TCL will be set when its interrupt condition is active 0 = CQIS.TCL is disabled
2	0h RW	**Response_Error_Detected_Status_Enable (Response_Error_Detected_Status_Enable):** 1 = CQIS.RED will be set when its interrupt condition is active 0 = CQIS.RED is disabled
1	0h RW	**Task_Complete_Status_Enable (Task_Complete_Status_Enable):** 1 = CQIS.TCC will be set when its interrupt condition is active 0 = CQIS.TCC is disabled
0	0h RW	**Halt_Complete_Status_Enable (Halt_Complete_Status_Enable):** 1 = CQIS.HAC will be set when its interrupt condition is active 0 = CQIS.HAC is disabled

13.110 Command Queueing Interrupt Status Enable (CQISGE)—Offset 218h

This register enables and disables the generation of interrupts to host software

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Reserved_61):** Reserved_61
3	0h RW	**Task_Cleared_Signal_Enable (Task_Cleared_Signal_Enable):** When set and CQIS.TCL is asserted, the CQE shall generate an interrupt
2	0h RW	**Response_Error_Detected_Signal_Enable (Response_Error_Detected_Signal_Enable):** When set and CQIS.RED is asserted, the CQE shall generate an interrupt
1	0h RW	**Task_Complete_Signal_Enable (Task_Complete_Signal_Enable):** When set and CQIS.TCC is asserted, the CQE shall generate an interrupt
0	0h RW	**Halt_Complete_Signal_Enable (Halt_Complete_Signal_Enable):** When set and CQIS.HAC is asserted, the CQE shall generate an interrupt

13.111 Interrupt Coalescing (CQIC)—Offset 21Ch

This register controls the interrupt coalescing feature.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**intrcoalescreg_enb (intrcoalescreg_enb):** When set to 0 by software, command responses are neither counted nor timed.When set to 1, the interrupt coalescing mechanism is enabled and coalesced interrupts are generated.
30:21	0h RO	**Reserved (Reserved_62):** Reserved_62

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**intrcoalescreg_icsb (intrcoalescreg_icsb):** This bit indicates to software whether any tasks (with INT=0) have completed and counted towards interrupt coalescing
19:17	0h RO	**Reserved (Reserved_63):** Reserved_63
16	0h WO	**intrcoalescreg_icctr (intrcoalescreg_icctr):** When host driver writes 1, the interrupt coalescing timer and counter are reset
15	0h WO	**intrcoalescreg_iccthwen (intrcoalescreg_iccthwen):** When software writes 1, the value ICCTH is updated with the contents written at the same cycle. When software writes 0, the value in ICCTH is not updated.
14:13	0h RO	**Reserved (Reserved_64):** Reserved_64
12:8	0h RW	**intrcoalescreg_iccth (intrcoalescreg_iccth):** Software uses this field to configure the number of task completions (only tasks with INT=0 in the Task Descriptor) which are required in order to generate an interrupt.
7	0h WO	**intrcoalescreg_ictovalwen (intrcoalescreg_ictovalwen):** When software writes 1, the value ICTOVAL is updated with the contents written at the same cycle. When software writes 0, the value in ICTOVAL is not updated.
6:0	0h RW	**intrcoalescreg_ictoval (intrcoalescreg_ictoval):** Software uses this field to configure the maximum time allowed between the completion of a task on the bus and the generation of an interrupt.

13.112 Command Queueing Task Descriptor List Base Address (CQTDLBA)—Offset 220h

This register is used for configuring the lower 32 bits of the byte address of the head of the Task 312 Descriptor List in the host memory.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**cmdquetaskdesclistbaseaddrreg_tdlba (cmdquetaskdesclistbaseaddrreg_tdlba):** This register stores the LSB bits (bits 31:0) of the byte address of the head of the Task Descriptor List in system memory.

13.113 Command Queueing Task Descriptor List Base Address Upper 32 Bits (CQTDLBAU)—Offset 224h

This register is used for configuring the upper 32 bits of the byte address of the head of the Task 316 Descriptor List in the host memory.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**cmdquetaskdesclistbaseadduprreg_tdlba (cmdquetaskdesclistbaseadduprreg_tdlba):** This register stores the MSB bits (bits 63:32) of the byte address of the head of the Task Descriptor List in system memory.

13.114 Command Queueing Taks Doorbell (CQTDRB)—Offset 228h

Using this register, software triggers CQE to process a new task.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**cmdquetaskdoorbellreg (cmdquetaskdoorbellreg):** Writing 1 to bit n of this register triggers CQE to start processing the task encoded in slot n of the TDL.

13.115 Command Queueing Taks Doorbell Notification (CQTCN)—Offset 22Ch

This register is used by CQE to notify software about completed tasks.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**cmdquetaskdoorbellnotifyreg_ntf (cmdquetaskdoorbellnotifyreg_ntf):** When receiving interrupt for task completion, software may read this register to know which tasks have finished. After reading this register, software may clear the relevant bit fields by writing 1 to the corresponding bits.

13.116 Command Queueing Device Queue Status (CQDQS)—Offset 230h

This register stores the most recent value of the device?s queue status.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**cmdquedevquestsreg_sts (cmdquedevquestsreg_sts):** Every time the Host controller receives a queue status register (QSR) from the device, it updates this register with the response of status command, i.e. the device?s queue status.

13.117 Command Queueing Device Pending Tasks (CQDPT)—Offset 234h

This register indicates to software which tasks are queued in the device, awaiting execution.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**cmdquedevpendtaskreg_pend (cmdquedevpendtaskreg_pend):** CQE shall set this bit after receiving a successful response for CMD45. CQE shall clear this bit after the task has completed execution.

13.118 Command Queueing Task Clear (CQTCLR)—Offset 238h

This register is used for removing an outstanding task in the CQE. 327. The register should be used only when CQE is in Halt state.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**cmdquequetaskclrreg_clr (cmdquequetaskclrreg_clr):** Writing 1 to bit n of this register orders CQE to clear a task which software has previously issued.

13.119 Send Status Timer Configuration 1 (CQSSC1)—Offset 240h

The register controls the when SEND_QUEUE_STATUS commands are sent.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 11000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (Reserved_65):** Reserved_65
19:16	1h RW	**sendststmrconfig1reg_blkcnt (sendststmrconfig1reg_blkcnt):** This field indicates to CQE when to send SEND_QUEUE_STATUS (CMD13) command to inquire the status of the device's task queue.
15:0	1000h RW	**sendststmrconfig1reg_idltmr (sendststmrconfig1reg_idltmr):** This field indicates to CQE the polling period to use when using periodic SEND_QUEUE_STATUS (CMD13) polling.

13.120 Send Status Configuration 2 (CQSSC2)—Offset 244h

This register is used for 333 configuring RCA field in SEND_QUEUE_STATUS command argument.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (Reserved_66):** Reserved_66
15:0	0h RW	**sendstsconfigreg_rca (sendstsconfigreg_rca):** This field provides CQE with the contents of the 16-bit RCA field in SEND_QUEUE_ STATUS (CMD13) command argument.

13.121 Command Response for Direct-Command Task (CQCRDCT)—Offset 248h

This register is used for passing the response of a DCMD task to software.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**cmdrespfordirectcmndtaskreg_lstresp (cmdrespfordirectcmndtaskreg_lstresp):** This register contains the response of the command generated by the last direct-command (DCMD) task which was sent.

13.122 Response Mode Error Mask (CQRMEM)—Offset 250h

This register controls the generation of Response Error Detection (RED) interrupt.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FDF9A080h

Bit Range	Default & Access	Field Name (ID): Description
31:0	FDF9A080h RW	**resmodeerrmaskreg_errmask (resmodeerrmaskreg_errmask):** This bit is used as in interrupt mask on the device status filed which is received in R1/R1b responses.

13.123 CQBASE+54h:CQTERRI - Task Error Information (CQTERRI)—Offset 254h

This register is updated by CQE when an error occurs on data or command related to a task activity. When such error is detected by CQE or indicated by the eMMC controller CQE stores in CQTERRI the task IDs and the command indices of the commands which were executed on the 343 command line and data lines when the error occurred.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**cqtaskerrinforreg_valid (cqtaskerrinforreg_valid):** This bit is updated when an error is detected by CQE, or indicated by eMMC controller.
30:29	0h RO	**Reserved (Reserved_67):** Reserved_67
28:24	0h RO	**cqtaskerrinforreg_tskID (cqtaskerrinforreg_tskID):** This field indicates the ID of the task which was executed on the data lines when an error occurred.
23:22	0h RO	**Reserved (Reserved_68):** Reserved_68
21:16	0h RO	**cqtaskerrinforreg_index (cqtaskerrinforreg_index):** This field indicates the index of the command which was executed on the data lines when an error occurred.
15	0h RO	**cqtaskerrinforreg_rspmode_errvalid (cqtaskerrinforreg_rspmode_errvalid):** This bit is updated when an error is detected by CQE, or indicated by eMMC controller.
14:13	0h RO	**Reserved (Reserved_69):** Reserved_69
12:8	0h RO	**cqtaskerrinforreg_resmodeerrtaskID (cqtaskerrinforreg_resmodeerrtaskID):** This field indicates the ID of the task which was executed on the command line when an error occurred.
7:6	0h RO	**Reserved (Reserved_70):** Reserved_70
5:0	0h RO	**cqtaskerrinforreg_resmoderrcmdindex (cqtaskerrinforreg_resmoderrcmdindex):** This field indicates the index of the command which was executed on the command line when an error occurred.

13.124 Command Response Index (CQCRI)—Offset 258h

This register stores the index of the last received command response.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Reserved (Reserved_71):** Reserved_71
5:0	0h RO	**cmdrespindexreg_lstcmdresindex (cmdrespindexreg_lstcmdresindex):** This field stores the index of the last received command response. CQE shall update the value every time a command response is received.

13.125 Command Response Argument (CQCRA)—Offset 25Ch

This register stores the index of the last received command response.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**cmdrespargument_lstcmdresarg (cmdrespargument_lstcmdresarg):** This field stores the argument of the last received command. CQE shall update the value every time a command response is received.

§ §

14 LPIO Registers

This chapter documents the registers of the LPIO controller devices. The processor contains multiple LPIO controller devices:

- Bus: 0, Device: 22, Function: 0 (LPIO0)
- Bus: 0, Device: 22, Function: 1 (LPIO1)
- Bus: 0, Device: 22, Function: 2 (LPIO2)
- Bus: 0, Device: 22, Function: 3 (LPIO3)
- Bus: 0, Device: 23, Function: 0 (LPIO4)
- Bus: 0, Device: 23, Function: 1 (LPIO5)
- Bus: 0, Device: 23, Function: 2 (LPIO6)
- Bus: 0, Device: 23, Function: 3 (LPIO7)
- Bus: 0, Device: 24, Function: 0 (LPIO8)
- Bus: 0, Device: 24, Function: 1 (LPIO9)
- Bus: 0, Device: 24, Function: 2 (LPIO10)
- Bus: 0, Device: 24, Function: 3 (LPIO11)
- Bus: 0, Device: 25, Function: 0 (LPIO12)
- Bus: 0, Device: 25, Function: 1 (LPIO13)
- Bus: 0, Device: 25, Function: 2 (LPIO14)

NOTE: Register default values are taken from device LPIO0 only. Refer Vol1 for Device IDs

14.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the particular Device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 0h	AAC8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AACh RO	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

14.2 STATUSCOMMAND — Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED0:** Reserved
29	0h RW/1C	**RMA:** Received Master Abort
28	0h RW/1C	**RTA:** Received Target Abort
27:21	0h RO	**RESERVED1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:16	0h RO	**RESERVED2:** Reserved
15:11	0h RO	**RESERVED3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**RESERVED4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**RESERVED5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RO	**RESERVED6:** Reserved

14.3 REVCLASSCODE — Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 8h	11800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	118000h RO	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	0h RO	**RID:** Revision ID identifies the revision of particular PCI device.

14.4 CLLATHEADERBIST — Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + Ch	800000 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED0:** Reserved
23	1h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

14.5 BAR — Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

14.6 BAR -Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

14.7 BAR1 — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

14.8 BAR1 -Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

14.9 SUBSYSTEMID — Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

14.10 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR) — Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

14.11 CAPABILITYPTR — Offset 34h

Capabilities Pointer register indicates what the next capability is

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

14.12 INTERRUPTREG — Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**RESERVED0:** Reserved
11:8	1h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

14.13 POWERCAPID — Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 80h	39001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**RESERVED0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

14.14 PMECTRLSTATUS — Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED0:** Reserved
15	0h RW/1C	**PMESTATUS:** PME Status
14:9	0h RO	**RESERVED1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**RESERVED2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**RESERVED3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

14.15 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

14.16 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

14.17 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 98h	2101 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	210h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

14.18 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + 9Ch	24C1 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	24Ch RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

14.19 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + A0h	F0800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED0:** Reserved
21	0h RO	**HAE:** Hardware Autonomous Enable - LPSS has RO instead of RW
20	0h RO	**RESERVED1:** Reserved
19	1h RW	**SLEEP_EN:** Sleep Enable
18	1h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	1h RW	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	1h RW	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**RESERVED2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

14.20 GEN_REGRW1 - General Purpose Read Write Register1 (GEN_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

14.21 GEN_REGRW2 — Offset B4h

General Purpose PCI Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

14.22 GEN_REGRW3 — Offset B8h

General Purpose PCI Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

14.23 GEN_REGRW4 — Offset BCh

General Purpose PCI Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

14.24 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_REG_INPUT_RW:** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

14.25 MANID — Offset F8h

Manufacturers ID register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:22, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MANID:** Manufacturer ID: Default value comes from straps.

§ §

15 LPIO BAR Registers

This chapter documents the LPIOBAR registers. Base address of these registers are defined in the BAR register of each LPIO device. The processor contains multiple LPIO controller devices:

- Bus: 0, Device: 22, Function: 0 (LPIO0)
- Bus: 0, Device: 22, Function: 1 (LPIO1)
- Bus: 0, Device: 22, Function: 2 (LPIO2)
- Bus: 0, Device: 22, Function: 3 (LPIO3)
- Bus: 0, Device: 23, Function: 0 (LPIO4)
- Bus: 0, Device: 23, Function: 1 (LPIO5)
- Bus: 0, Device: 23, Function: 2 (LPIO6)
- Bus: 0, Device: 23, Function: 3 (LPIO7)
- Bus: 0, Device: 24, Function: 0 (LPIO8)
- Bus: 0, Device: 24, Function: 1 (LPIO9)
- Bus: 0, Device: 24, Function: 2 (LPIO10)
- Bus: 0, Device: 24, Function: 3 (LPIO11)
- Bus: 0, Device: 25, Function: 0 (LPIO12)
- Bus: 0, Device: 25, Function: 1 (LPIO13)
- Bus: 0, Device: 25, Function: 2 (LPIO14)

NOTE: Register default values are taken from device LPIO0 only. Refer Vol1 for Device IDs

15.1 IC_CON — Offset 0h

I2C Control Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 0h	77 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h NA	**Reserved (RESERVED_31_9):** Reserved
8	0h RW	**TX_EMPTY_CTRL:**
7	0h NA	**RESERVED_7:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
6	1h RW	**IC_SLAVE_DISABLE:**
5	1h RW	**IC_RESTART_EN:**
4	1h RO	**IC_10BITADDR_MASTER (IC_10BITADDR_MASTER_RD_ONLY):**
3	0h NA	**RESERVED_3:** Reserved
2:1	3h RW	**SPEED:**
0	1h RW	**MASTER_MODE:**

15.2 IC_TAR — Offset 4h

I2C Target Address Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 4h	1055 h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h NA	**RESERVED_13_31:** Reserved
12	1h RW	**IC_10BITADDR_MASTER:**
11	0h RW	**SPECIAL:**
10	0h RW	**GC_OR_START:**
9:0	55h RW	**IC_TAR:**

15.3 IC_SAR — Offset 8h

I2C Slave Address Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 8h	55 h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h NA	**RESERVED_10_31:** Reserved
9:0	55h RW	**IC_SAR:**

15.4 IC_HS_MADDR — Offset Ch

I2C High Speed Master Mode Code Address Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + Ch	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h NA	**RESERVED_3_31:** Reserved
2:0	1h RW	**IC_HS_MAR:**

15.5 IC_DATA_CMD — Offset 10h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h NA	**RESERVED_11_31:** Reserved
10	0h RW	**RESTART:**
9	0h RW	**STOP:**
8	0h RW	**CMD:**
7:0	0h RW	**DAT:**

15.6 IC_SS_SCL_HCNT — Offset 14h

Standard Speed I2C Clock SCL High Count Register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 14h	1F4 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	1F4h RW	**IC_SS_SCL_HCNT:**

15.7 IC_SS_SCL_LCNT — Offset 18h

Standard Speed I2C Clock SCL Low Count Register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 18h	24C h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	24Ch RW	**IC_SS_SCL_LCNT:**

15.8 IC_FS_SCL_HCNT — Offset 1Ch

Fast Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 1Ch	4B h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	4Bh RW	**IC_FS_SCL_HCNT:**

15.9 IC_FS_SCL_LCNT — Offset 20h

Fast Speed I2C Clock SCL Low Count Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 20h	A3 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	A3h RW	**IC_FS_SCL_LCNT:**

15.10 IC_HS_SCL_HCNT — Offset 24h

High Speed I2C Clock SCL High Count Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 24h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	8h RW	**IC_HS_SCL_HCNT:**

15.11 IC_HS_SCL_LCNT — Offset 28h

High Speed I2C Clock SCL Low Count Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 28h	14 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	14h RW	**IC_HS_SCL_LCNT:**

15.12 IC_INTR_STAT — Offset 2Ch

I2C Interrupt Status Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h NA	**RESERVED_14_31:** Reserved
13	0h RO	**R_MST_ON_HOLD:**
12	0h RO	**R_RESTART_DET:**
11	0h RO	**R_GEN_CALL:**
10	0h RO	**R_START_DET:**
9	0h RO	**R_STOP_DET:**
8	0h RO	**R_ACTIVITY:**
7	0h RO	**R_RX_DONE:**
6	0h RO	**R_TX_ABRT:**
5	0h RO	**R_RD_REQ:**
4	0h RO	**R_TX_EMPTY:**
3	0h RO	**R_TX_OVER:**
2	0h RO	**R_RX_FULL:**
1	0h RO	**R_RX_OVER:**
0	0h RO	**R_RX_UNDER:**

15.13 IC_INTR_MASK — Offset 30h

I2C Interrupt Mask Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 30h	8FF h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h NA	**RESERVED_31_14:** Reserved
13	0h RW	**M_MST_ON_HOLD:**
12	0h RO	**M_RESTART_DET:**
11	1h RW	**M_GEN_CALL:**
10	0h RW	**M_START_DET:**
9	0h RW	**M_STOP_DET:**
8	0h RW	**M_ACTIVITY:**
7	1h RW	**M_RX_DONE:**
6	1h RW	**M_TX_ABRT:**
5	1h RW	**M_RD_REQ:**
4	1h RW	**M_TX_EMPTY:**
3	1h RW	**M_TX_OVER:**
2	1h RW	**M_RX_FULL:**
1	1h RW	**M_RX_OVER:**
0	1h RW	**M_RX_UNDER:**

15.14 IC_RAW_INTR_STAT — Offset 34h

I2C Raw Interrupt Status Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h NA	**RESERVED_14_31:** Reserved
13	0h RO	**MST_ON_HOLD:** Same as in reg_IC_INTR_STAT

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**RESTART_DET:** Same as in reg_IC_INTR_STAT
11	0h RO	**GEN_CALL:** Same as in reg_IC_INTR_STAT
10	0h RO	**START_DET:** Same as in reg_IC_INTR_STAT
9	0h RO	**STOP_DET:** Same as in reg_IC_INTR_STAT
8	0h RO	**ACTIVITY:** Same as in reg_IC_INTR_STAT
7	0h RO	**RX_DONE:** Same as in reg_IC_INTR_STAT
6	0h RO	**TX_ABRT:** Same as in reg_IC_INTR_STAT
5	0h RO	**RD_REQ:** Same as in reg_IC_INTR_STAT
4	0h RO	**TX_EMPTY:** Same as in reg_IC_INTR_STAT
3	0h RO	**TX_OVER:** Same as in reg_IC_INTR_STAT
2	0h RO	**RX_FULL:** Same as in reg_IC_INTR_STAT
1	0h RO	**RX_OVER:** Same as in reg_IC_INTR_STAT
0	0h RO	**RX_UNDER:** Same as in reg_IC_INTR_STAT

15.15 IC_RX_TL — Offset 38h

I2C Receive FIFO Threshold Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 38h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED_8_31:** Reserved
7:0	0h RW	**RX_TL:**

15.16 IC_TX_TL — Offset 3Ch

I2C Transmit FIFO Threshold Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	0h RW	**TX_TL:**

15.17 IC_CLR_INTR — Offset 40h

Clear Combined and Individual Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_INTR:**

15.18 IC_CLR_RX_UNDER — Offset 44h

Clear RX_UNDER Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 44h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_RX_UNDER:**

15.19 IC_CLR_RX_OVER — Offset 48h

Clear RX_OVER Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_RX_OVER:**

15.20 IC_CLR_TX_OVER — Offset 4Ch

Clear TX_OVER Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_TX_OVER:** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

15.21 IC_CLR_RD_REQ — Offset 50h

Clear RD_REQ Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_RD_REQ:**

15.22 IC_CLR_TX_ABRT — Offset 54h

Clear TX_ABRT Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_TX_ABRT:**

15.23 IC_CLR_RX_DONE — Offset 58h

Clear RX_DONE Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_RX_DONE:**

15.24 IC_CLR_ACTIVITY — Offset 5Ch

Clear ACTIVITY Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 5Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_ACTIVITY:**

15.25 IC_CLR_STOP_DET — Offset 60h

Clear STOP_DET Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_STOP_DET:**

15.26 IC_CLR_START_DET — Offset 64h

Clear START_DET Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_START_DET:**

15.27 IC_CLR_GEN_CALL — Offset 68h

Clear GEN_CALL Interrupt Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RO	**CLR_GEN_CALL:**

15.28 IC_ENABLE — Offset 6Ch

I2C Enable Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 6Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RESERVED_2_31:** Reserved
1	0h RW	**ABORT:**
0	0h RW	**ENABLE:**

15.29 IC_STATUS — Offset 70h

I2C Status Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 70h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h NA	**RESERVED_7_31:** Reserved
6	0h RO	**SLV_ACTIVITY:**
5	0h RO	**MST_ACTIVITY:**
4	0h RO	**RFF:**
3	0h RO	**RFNE:**
2	1h RO	**TFE:**
1	1h RO	**TFNF:**
0	0h RO	**ACTIVITY:** I2C Activity Status

15.30 IC_TXFLR — Offset 74h

I2C Transmit FIFO Level Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h NA	**RESERVED_9_31:** Reserved
8:0	0h RO	**TXFLR:**

15.31 IC_RXFLR — Offset 78h

I2C Receive FIFO Level Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 78h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h NA	**RESERVED_9_31:** Reserved
8:0	0h RO	**RXFLR:**

15.32 IC_SDA_HOLD — Offset 7Ch

I2C SDA Hold Time Length Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 7Ch	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RESERVED_16_31:** Reserved
15:0	1h RW	**IC_SDA_HOLD:** Sets the required SDA hold time in units of ic_clk period.

15.33 IC_TX_ABRT_SOURCE — Offset 80h

I2C Transmit Abort Source Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**TX_FLUSH_CNT:**
23:17	0h NA	**RESERVED_23_17:** Reserved
16	0h RO	**ABRT_USER_ABRT:**
15	0h RO	**ABRT_SLVRD_INTX:**
14	0h RO	**ABRT_SLV_ARBLOST:**
13	0h RO	**ABRT_SLVFLUSH_TXFIFO:**
12	0h RO	**ARB_LOST:**
11	0h RO	**ABRT_MASTER_DIS:**
10	0h RO	**ABRT_10B_RD_NORSTRT:**
9	0h RO	**ABRT_SBYTE_NORSTRT:**
8	0h RO	**ABRT_HS_NORSTRT:**
7	0h RO	**ABRT_SBYTE_ACKDET:**
6	0h RO	**ABRT_HS_ACKDET:**
5	0h RO	**ABRT_GCALL_READ:**
4	0h RO	**ABRT_GCALL_NOACK:**
3	0h RO	**ABRT_TXDATA_NOACK:**
2	0h RO	**ABRT_10ADDR2_NOACK:**
1	0h RO	**ABRT_10ADDR1_NOACK:**
0	0h RO	**ABRT_7B_ADDR_NOACK:**

15.34 IC_SLV_DATA_NACK_ONLY — Offset 84h

Generate Slave Data NACK Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	0h RW	**NACK:**

15.35 IC_DMA_CR — Offset 88h

DMA Control Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RESERVED_2_31:** Reserved
1	0h RW	**TDMAE:**
0	0h RW	**RDMAE:**

15.36 IC_DMA_TDLR — Offset 8Ch

DMA Transmit Data Level Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 8Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	0h RW	**DMATDL:**

15.37 IC_DMA_RDLR — Offset 90h

I2C Receive Data Level Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	0h RW	**DMARDL:**

15.38 IC_SDA_SETUP — Offset 94h

I2C SDA Setup Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 94h	64 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	64h RW	**SDA_SETUP:**

15.39 IC_ACK_GENERAL_CALL — Offset 98h

I2C ACK General Call Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 98h	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RESERVED_1_31:** Reserved
0	1h RW	**ACK_GEN_CALL:**

15.40 IC_ENABLE_STATUS — Offset 9Ch

I2C Enable Status Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h NA	**RESERVED_3_31:** Reserved
2	0h RO	**SLV_RX_DATA_LOST:**
1	0h RO	**SLV_DISABLED_WHILE_BUSY:**
0	0h RO	**IC_EN:**

15.41 IC_FS_SPKLEN — Offset A0h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + A0h	7 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	7h RW	**IC_FS_SPKLEN:**

15.42 IC_HS_SPKLEN — Offset A4h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + A4h	2 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h NA	**RESERVED_8_31:** Reserved
7:0	2h RW	**IC_HS_SPKLEN:**

15.43 IC_CLR_RESTART_DET (IC_CLR_RESTRART_DET) — Offset A8h

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description

15.67 SAR_LO0 — Offset 800h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 800h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.68 SAR_HI0 — Offset 804h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 804h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SAR_HI:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.69 DAR_LO0 — Offset 808h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 808h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DAR_LO:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.70 DAR_HI0 — Offset 80Ch

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 80Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DAR_HI:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.71 LLP_LO0 — Offset 810h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. If LLP.LOC is set to 0x0, then transfers using

linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 810h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h NA	**RSVD2:** Reserved

15.72 LLP_HI0 — Offset 814h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 814h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h NA	**RSVD2:** Reserved

15.73 CTL_LO0 — Offset 818h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 818h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h NA	**RSVD:** Reserved
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	**RSVD1:** Reserved
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h NA	**RSVD2:** Reserved
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h NA	**RSVD3:** Reserved
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. 7	0h NA	**RSVD4:** Reserved
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations). For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations). For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

15.74 CTL_HI0 — Offset 81Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 81Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below
28:18	0h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

15.75 SSTAT0 — Offset 820h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 820h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

15.76 DSTAT0 — Offset 828h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 828h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

15.77 SSTATAR_LO0 — Offset 830h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 830h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_LO:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

15.78 SSTATAR_HI0 — Offset 834h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 834h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_HI:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

15.79 DSTATAR_LO0 — Offset 838h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 838h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_LO:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

15.80 DSTATAR_HI0 — Offset 83Ch

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 83Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_HI:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

15.81 CFG_LO0 — Offset 840h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 840h	203 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h NA	**RESERVED_29_22:** Reserved
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17:11	0h NA	**RESERVED_17_11:** Reserved
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h NA	**RSVD_4_4:** Reserved
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

15.82 CFG_HI0 — Offset 844h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 844h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h NA	**RESERVED_31_28:** Reserved
27:18	0h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

15.83 SGR0 — Offset 848h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 848h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0h RW	**SGI:** Source gather interval.

15.84 DSR0 — Offset 850h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 850h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0h RW	**DSI:** Destination scatter interval.

15.85 SAR_LO1 — Offset 858h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 858h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SAR_LO:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.86 SAR_HI1 — Offset 85Ch

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 85Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SAR_HI:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.87 DAR_LO1 — Offset 860h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 860h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DAR_LO:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported

15.88 DAR_HI1 — Offset 864h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 864h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DAR_HI:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h NA	**RSVD2:** Reserved

15.91 CTL_LO1 — Offset 870h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 870h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h NA	**RSVD:** Reserved
28	0h RW	**LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	**RSVD1:** Reserved
21:20	0h RW	**TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA.
19	0h NA	**RSVD2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source.
13:11	0h RW	**DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h NA	**RSVD3:** Reserved
8	0h RW	**DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)
7	0h NA	**RSVD4:** Reserved
6:4	0h RW	**SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations). For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
3:1	0h RW	**DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations). For a non-memory peripheral, this is typically the peripheral (source) FIFO width.
0	0h RW	**INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

15.92 CTL_HI1 — Offset 874h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 874h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below

Bit Range	Default & Access	Field Name (ID): Description
28:18	0h RW	**CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement.
17	0h RW	**DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	**BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1).

15.93 SSTAT1 — Offset 878h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 878h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface.

15.94 DSTAT1 — Offset 880h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 880h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface.

15.95 SSTATAR_LO1 — Offset 888h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 888h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_LO:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

15.96 SSTATAR_HI1 — Offset 88Ch

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 88Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_HI:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block.

15.97 DSTATAR_LO1 — Offset 890h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 890h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_LO:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

15.98 DSTATAR_HI1 — Offset 894h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 894h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_HI:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

15.99 CFG_LO1 — Offset 898h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 898h	203 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
30	0h RW	**RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h NA	**RESERVED_29_22:** Reserved
21	0h RW	**SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled
20	0h RW	**DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 <= BL <= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled
19	0h RW	**SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low
17:11	0h NA	**RESERVED_17_11:** Reserved
10	0h RW	**CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
6	0h RW	**DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h NA	**RSVD_4_4:** Reserved
3	0h RW	**HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used.
1	1h RW	**SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary
0	1h RW	**DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

15.100 CFG_HI1 — Offset 89Ch

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 89Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h NA	**RESERVED_31_28:** Reserved
27:18	0h RW	**WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0h RW	**RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.
3:0	0h RW	**SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface.

15.101 SGR1 — Offset 8A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 8A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0h RW	**SGI:** Source gather interval.

15.102 DSR1 — Offset 8A8h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + 8A8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries.
19:0	0h RW	**DSI:** Destination scatter interval.

15.103 RAWTFR — Offset AC0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register

31:2	0h NA	**RSVD:** Reserved
1:0	0h RO	**STATUS:** Interrupt status

15.113 MASKTFR — Offset B10h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B10h	0 h

15.114 MASKBLOCK — Offset B18h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA

channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

15.115 MASKSRCTRAN — Offset B20h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RSVD2:** Reserved
15:10	0h NA	**RSVD1:** Reserved
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:2	0h NA	**RSVD0:** Reserved
1:0	0h RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

15.116 MASKDSTTRAN — Offset B28h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B28h	0 h

Bit Range	Default & Access	Field Name (ID): Description

15:10	0h NA	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h WO	**INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled
7:2	0h NA	**RSVD0:** Reserved
1:0	0h RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

15.117 MASKERR — Offset B30h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B30h	0 h

1:0	0h RW	**INT_MASK:** Interrupt mask 0-mask 1-unmask

15.118 CLEARTFR — Offset B38h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B38h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RSVD:** Reserved
1:0	0h WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

15.119 CLEARBLOCK — Offset B40h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RSVD:** Reserved
1:0	0h WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

15.120 CLEARSRCTRAN — Offset B48h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RSVD:** Reserved
1:0	0h WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

15.121 CLEARDSTTRAN — Offset B50h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RSVD:** Reserved
1:0	0h WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

15.122 CLEARERR — Offset B58h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h NA	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h WO	**CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt

15.123 STATUSINT — Offset B60h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran,StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h NA	**RSVD:** Reserved
4	0h RO	**ERR:** OR of the contents of StatusErr register.
3	0h RO	**DSTT:** OR of the contents of StatusDst register.
2	0h RO	**SRCT:** OR of the contents of StatusSrcTran register
1	0h RO	**BLOCK:** OR of the contents of StatusBlock register.
0	0h RO	**TFR:** OR of the contents of StatusTfr register.

15.124 DMACFGREG — Offset B98h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + B98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h NA	**RSVD:** Reserved
0	0h RW	**DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

15.125 CHENREG — Offset BA0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + BA0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h NA	**RSVD2:** Reserved
15:10	0h NA	**RSVD1:** Reserved
9:8	0h WO	**CH_EN_WE:** Channel enable write enable.
7:2	0h NA	**RSVD0:** Reserved
1:0	0h RW	**CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

15.126 RESERVED0_CPL — Offset BB8h

reserved

Type	Size	Offset	Default

15.135 GLOBAL_CFG — Offset C18h

GLOBAL_CFG: GLOBAL DMA Configuration Register

Type	Size	Offset	Default
MEM	32 bit	[B:0, D:22, F:0] LPIOBAR + C18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**SCRATCH_PAD:** This field will have all bits with R/W attribute to be used for future configuration and de-feature bits.
0	0h RW	**ERR_ILL_REG:** 0x1 : Issue ERR response on reading illegal (non-existing) registers 0x0 : Issue DVA response on reading illegal (non-existing) registers

§ §

16 USB-Host (xHCI) Registers

This chapter documents the registers in Bus: 0, Device 21, Function 0.

16.1 Vendor ID (VID) — Offset 0h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Vendor ID (VID):**

16.2 Device ID (DID) — Offset 2h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO/V	**Device ID (DID)**

16.3 Command (CMD) — Offset 4h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE):**
8	0h RW	**SERR:** When set to 1, the XHC is capable of generating (internally) SERR#.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Wait Cycle Control (WCC):**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS):**
4	0h RO	**Memory Write Invalidate (MWI):**
3	0h RO	**Special Cycle Enable (SCE):**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

16.4 Device Status (STS) — Offset 6h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 6h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	0h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	0h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	0h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD):** Reserved

16.5 Revision ID (RID) — Offset 8h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

16.6 Programming Interface (PI) — Offset 9h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 9h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

16.7 Sub Class Code (SCC) — Offset Ah

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + Ah	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

16.8 Base Class Code (BCC) — Offset Bh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + Bh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

16.9 Master Latency Timer (MLT) — Offset Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

16.10 Header Type (HT) — Offset Eh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.

Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

16.11 Memory Base Address (MBAR) — Offset 10h

Value in this register will be different after the enumeration process.

Type	Size	Offset	Default
CFG	64 bit	[B:0, D:21, F:0] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**BA:** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PREFETCHABLE:** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	0h RO	**TYPE:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

16.12 USB Subsystem Vendor ID (SSVID) — Offset 2Ch

This register is modified and maintained by BIOS

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

16.13 USB Subsystem ID (SSID) — Offset 2Eh

This register is modified and maintained by BIOS

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 2Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

16.14 Capabilities Pointer (CAP_PTR) — Offset 34h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

16.15 Interrupt Line (ILINE) — Offset 3Ch

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

16.16 Interrupt Pin (IPIN) — Offset 3Dh

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 3Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

16.17 XHC System Bus Configuration 1 (XHCC1) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**ECO1:** Reserved
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables.
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	0h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	0h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	0h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type

Bit Range	Default & Access	Field Name (ID): Description
3:2	0h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	0h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

16.18 XHC System Bus Configuration 2 (XHCC2) — Offset 44h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 44h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**ECO1:** Reserved
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	0h RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.

Bit Range	Default & Access	Field Name (ID): Description
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

16.19 Clock Gating (XHCLKGTEN) — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**RSVD2:** Reserved
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

16.20 Audio Time Synchronization (AUDSYNC) — Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RSVD2:** Reserved
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**RSVD1:** Reserved
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

16.21 Serial Bus Release Number (SBRN) — Offset 60h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

16.22 Frame Length Adjustment (FLADJ) — Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 61h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Reserved
6	0h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	0h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

16.23 Best Effort Service Latency (BESL) — Offset 62h

Bset Effort Service Latency.

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 62h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

16.24 PCI Power Management Capability ID (PM_CID) — Offset 70h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

16.25 Next Item Pointer #1 (PM_NEXT) — Offset 71h

This register is modified and maintained by BIOS

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 71h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

16.26 Power Management Capabilities (PM_CAP) — Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 72h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RW/L	**PME_SUPPORT:** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_SUPPORT:** The D2 state is not supported.
9	0h RW/L	**D1_SUPPORT:** The D1 state is not supported.
8:6	0h RW/L	**AUX_CURRENT:** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI:** The SoC reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/L	**PME Clock (PMECLOCK):** The SoC reports 0, indicating that no PCI clock is required to generate PME#.
2:0	0h RW/L	**VERSION:** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

16.27 Power Management Control/Status (PM_CS) — Offset 74h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_STATUS:** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**DATA_SCALE:** The SoC hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**DATA_SELECT:** The SoC hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_EN:** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2):** Reserved
1:0	0h RW	**POWERSTATE:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the SoC must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

16.28 Message Signaled Interrupt CID (MSI_CID) — Offset 80h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Capability ID (CID):** Indicates that this is an MSI capability

16.29 Next item pointer (MSI_NEXT) — Offset 81h

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:21, F:0] + 81h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**NEXT:** Indicates that this is the last item on the capability list

16.30 Message Signaled Interrupt Message Control (MSI_MCTL) — Offset 82h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 82h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	0h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	0h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

16.31 Message Signaled Interrupt Message Address (MSI_MAD) — Offset 84h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD):** Reserved

16.32 Message Signaled Interrupt Upper Address (MSI_MUAD) — Offset 88h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UPPERADDR):** Upper DW of system specified message address.

16.33 Message Signaled Interrupt Message Data (MSI_MD) — Offset 8Ch

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + 8Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

16.34 Device Idle Capability (DEVIDLE) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**VID:**
27:24	0h RO	**REV:**
23:16	0h RO	**LENGTH:** Indicates that this capability is 16 bytes long.
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	0h RO	**Capability ID (CID):**

16.35 Vendor Specific Header (VSHDR) — Offset 94h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	0h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

16.36 SW LTR POINTER (SWLTRPTR) — Offset 98h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**VALID:** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

16.37 Device Idle Pointer Register (DEVIDLEPTR) — Offset 9Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RW/L	**VALID:** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

16.38 Device Idle Power ON Latency (DEVIDLEPOL) — Offset A0h

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:21, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**RSVD1:** Reserved
12:10	0h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

16.39 High Speed Configuration 2 (HSCFG2) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**RSVD1:** Reserved
18	0h RW	**PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**EUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	0h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

16.40 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1) — Offset B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RSVD:** Reserved
8:0	0h RW/L	**OC Mapping (OCM):**

16.41 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2) — Offset B4h

Reserved

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RSVD:** Reserved
8:0	0h RW/L	**OC Mapping (OCM):**

16.42 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1) — Offset D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + D0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RSVD:** Reserved
6:0	0h RW/L	**OC Mapping (OCM)**

16.43 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2) — Offset D4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RSVD:** Reserved
6:0	0h RW/L	**OC Mapping (OCM):**

16.44 XHCC3 — Offset FCh

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:0] + FCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD1):** Reserved
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface
1	0h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

16.45 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)

Device:

Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH)**

16.46 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
15:0	100h RW/L	**Host Controller Interface Version Number (HCIVERSION)**

16.47 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10000820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	10h RW/L	**Number of Ports (MaxPorts)**
23:19	0h RW/L	**Rsvd1 (Rsvd1)**
18:8	8h RW/L	**Number of Interrupters (MaxIntrs)**
7:0	20h RW/L	**Number of Device Slots (MaxSlots)**

16.48 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 94000054h

Bit Range	Default & Access	Field Name (ID): Description
31:27	12h RW/L	**Max Scratchpad Buffers LO (MaxScratchpadBufs)**
26	1h RW/L	**Scratchpad Restore (SPR)**

Bit Range	Default & Access	Field Name (ID): Description
25:21	0h RW/L	**Max Scratchpad Buffers HI (MaxScratchpadBufs_HI)**
20:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax)**
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST)**

16.49 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4h RW/L	**U2 Device Exit Latency (U2DEL)**
15:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:0	1h RW/L	**U1 Device Exit Latency (U1DEL)**

16.50 Capability Parameters (HCCPARAMS)—Offset 10h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 200077C1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP)**
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize)**
11	0h RW/L	**Contiguous Frame ID Capability (CFC)**

Bit Range	Default & Access	Field Name (ID): Description
10	1h RW/L	**Stopped EDLTA Capabilty (SEC)**
9	1h RW/L	**Stopped - Short Packet Capability (SPC)**
8	1h RW/L	**Parst All Event Data (PAE)**
7	1h RW/L	**No Secondary SID Support (NSS)**
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC)**
5	0h RW/L	**Light HC Reset Capability (LHRC)**
4	0h RW/L	**Port Indicators (PIND)**
3	0h RW/L	**Port Power Control (PPC)**
2	0h RW/L	**Context Size (CSZ)**
1	0h RW/L	**BW Negotiation Capability (BNC)**
0	1h RW/L	**64-bit Addressing Capability (AC64)**

16.51 Doorbell Offset (DBOFF)—Offset 14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	C00h RO	**Doorbell Array Offset (DBAO)**
1:0	0h RO	**Rsvd1 (Rsvd1)**

16.52 Runtime Register Space Offset (RTSOFF)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	100h RO	**Runtime Register Space Offset (RTRSO)**
4:0	0h RO	**Rsvd1 (Rsvd1)**

16.53 USB Command (USBCMD)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Rsvd2 (Rsvd2)**
11	0h RW	**Enable U3 MFINDEX Stop (EU3S)**
10	0h RW	**Enable Wrap Event (EWE)**
9	0h RW	**Controller Restore State (CRS)**
8	0h RW	**Controller Save State (CSS)**
7	0h RW	**Light Host Controller Reset (LHCRST)**
6:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RW	**Host System Error Enable (HSEE)**
2	0h RW	**Interrupter Enable (INTE)**
1	0h RW	**Host Controller Reset (HCRST)**
0	0h RW	**Run/Stop (RS)**

16.54 USB Status (USBSTS)—Offset 84h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Rsvd3 (Rsvd3)**
12	0h RO	**Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.
11	0h RO	**Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.
10	0h RW/C	**Save/Restore Error (SRE)**
9	0h RO	**Restore State Status (RSS)**
8	0h RO	**Save State Status (SSS)**
7:5	0h RO	**Rsvd2 (Rsvd2)**
4	0h RW/C	**Port Change Detect (PCD)**
3	0h RW/C	**Event Interrupt (EINT)**
2	0h RW/C	**Host System Error (HSE)**
1	0h RO	**Rsvd1 (Rsvd1)**
0	1h RO	**HCHalted (HCH)**

16.55 Page Size (PAGESIZE)—Offset 88h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	1h RO	**Page Size (PAGESIZE)**

16.56 Device Notification Control (DNCTRL)—Offset 94h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Notification Enable (N0_N15)**

16.57 Command Ring Low (CRCR_LO)—Offset 98h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Command Ring Pointer (CRP)**
5:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RO	**Command Ring Running (CRR)**
2	0h RW/1S	**Command Abort (CA)**
1	0h RW/1S	**Command Stop (CS)**
0	0h RW	**Ring Cycle State (RCS)**

16.58 Command Ring High (CRCR_HI)—Offset 9Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Ring Pointer (CRP)**

16.59 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.60 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**

16.61 Configure (CONFIG)—Offset B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**Max Device Slots Enabled (MaxSlotsEn)**

16.62 Port Status and Control USB2 (PORTSC1)—Offset 480h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.

19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

16.63 Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.64 Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.65 Port Status and Control USB2 (PORTSC2)—Offset 490h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.

16.66 Port Power Management Status and Control USB2 (PORTPMSC2)—Offset 494h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.67 Port X Hardware LPM Control Register (PORTHLPMC2)—Offset 49Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.68 Port Status and Control USB2 (PORTSC3)—Offset 4A0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description

16.85 Port X Hardware LPM Control Register (PORTHLPMC8)—Offset 4FCh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**

7:0	0h RW/S	**U1 Timeout (U1T)**

16.109 USB3 Port Link Info (PORTLI16)—Offset 578h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RO	**Link Error Count (LEC)**

16.110 Microframe Index (RTMFINDEX)—Offset 2000h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd1 (Rsvd1)**
13:0	0h RO	**Microframe Index (IMAN0)**

16.111 Interrupter 1 Management (IMAN0)—Offset 2020h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.112 Interrupter 1 Moderation (IMOD0)—Offset 2024h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.113 Event Ring Segment Table Size 1 (ERSTSZ0)—Offset 2028h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.114 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO0)—Offset 2030h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.115 Event Ring Segment Table Base Address High 1 (ERSTBA_HI0)—Offset 2034h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.116 Event Ring Dequeue Pointer Low 1 (ERDP_LO0)—Offset 2038h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.117 Event Ring Dequeue Pointer High 1 (ERDP_HI0)—Offset 203Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.118 Interrupter 2 Management (IMAN1)—Offset 2040h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.119 Interrupter 2 Moderation (IMOD1)—Offset 2044h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.120 Event Ring Segment Table Size 2 (ERSTSZ1)—Offset 2048h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.121 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO1)—Offset 2050h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.122 Event Ring Segment Table Base Address High 2 (ERSTBA_HI1)—Offset 2054h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.123 Event Ring Dequeue Pointer Low 2 (ERDP_LO1)—Offset 2058h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.124 Event Ring Dequeue Pointer High 2 (ERDP_HI1)—Offset 205Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.125 Interrupter 3 Management (IMAN2)—Offset 2060h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.126 Interrupter 3 Moderation (IMOD2)—Offset 2064h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.127 Event Ring Segment Table Size 3 (ERSTSZ2)—Offset 2068h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.128 Event Ring Segment Table Base Address Low 3 (ERSTBA_LO2)—Offset 2070h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.129 Event Ring Segment Table Base Address High 3 (ERSTBA_HI2)—Offset 2074h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.130 Event Ring Dequeue Pointer Low 3 (ERDP_LO2)—Offset 2078h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.131 Event Ring Dequeue Pointer High 3 (ERDP_HI2)—Offset 207Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.132 Interrupter 4 Management (IMAN3)—Offset 2080h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.133 Interrupter 4 Moderation (IMOD3)—Offset 2084h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.134 Event Ring Segment Table Size 4 (ERSTSZ3)—Offset 2088h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.135 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO3)—Offset 2090h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.136 Event Ring Segment Table Base Address High 4 (ERSTBA_HI3)—Offset 2094h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.137 Event Ring Dequeue Pointer Low 4 (ERDP_LO3)—Offset 2098h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.138 Event Ring Dequeue Pointer High 4 (ERDP_HI3)—Offset 209Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.139 Interrupter 5 Management (IMAN4)—Offset 20A0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.140 Interrupter 5 Moderation (IMOD4)—Offset 20A4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.141 Event Ring Segment Table Size 5 (ERSTSZ4)—Offset 20A8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.142 Event Ring Segment Table Base Address Low 5 (ERSTBA_LO4)—Offset 20B0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.143 Event Ring Segment Table Base Address High 5 (ERSTBA_HI4)—Offset 20B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.144 Event Ring Dequeue Pointer Low 5 (ERDP_LO4)—Offset 20B8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.145 Event Ring Dequeue Pointer High 5 (ERDP_HI4)—Offset 20BCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.146 Interrupter 6 Management (IMAN5)—Offset 20C0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.147 Interrupter 6 Moderation (IMOD5)—Offset 20C4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.148 Event Ring Segment Table Size 6 (ERSTSZ5)—Offset 20C8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.149 Event Ring Segment Table Base Address Low 6 (ERSTBA_LO5)—Offset 20D0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.150 Event Ring Segment Table Base Address High 6 (ERSTBA_HI5)—Offset 20D4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.151 Event Ring Dequeue Pointer Low 6 (ERDP_LO5)—Offset 20D8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.152 Event Ring Dequeue Pointer High 6 (ERDP_HI5)—Offset 20DCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.153 Interrupter 7 Management (IMAN6)—Offset 20E0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.154 Interrupter 7 Moderation (IMOD6)—Offset 20E4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.155 Event Ring Segment Table Size 7 (ERSTSZ6)—Offset 20E8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.156 Event Ring Segment Table Base Address Low 7 (ERSTBA_LO6)—Offset 20F0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.157 Event Ring Segment Table Base Address High 7 (ERSTBA_HI6)—Offset 20F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.158 Event Ring Dequeue Pointer Low 7 (ERDP_LO6)—Offset 20F8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.159 Event Ring Dequeue Pointer High 7 (ERDP_HI6)—Offset 20FCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.160 Interrupter 8 Management (IMAN7)—Offset 2100h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.161 Interrupter 8 Moderation (IMOD7)—Offset 2104h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.162 Event Ring Segment Table Size 8 (ERSTSZ7)—Offset 2108h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.163 Event Ring Segment Table Base Address Low 8 (ERSTBA_LO7)—Offset 2110h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.164 Event Ring Segment Table Base Address High 8 (ERSTBA_HI7)—Offset 2114h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.165 Event Ring Dequeue Pointer Low 8 (ERDP_LO7)—Offset 2118h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.166 Event Ring Dequeue Pointer High 8 (ERDP_HI7)—Offset 211Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.167 Door Bell 1 (DB0)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.168 Door Bell 2 (DB1)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.169 Door Bell 3 (DB2)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.170 Door Bell 4 (DB3)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.171 Door Bell 5 (DB4)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.172 Door Bell 6 (DB5)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.173 Door Bell 7 (DB6)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.174 Door Bell 8 (DB7)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.175 Door Bell 9 (DB8)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.176 Door Bell 10 (DB9)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.177 Door Bell 11 (DB10)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.178 Door Bell 12 (DB11)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.179 Door Bell 13 (DB12)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.180 Door Bell 14 (DB13)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.181 Door Bell 15 (DB14)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.182 Door Bell 16 (DB15)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.183 Door Bell 17 (DB16)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.184 Door Bell 18 (DB17)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.185 Door Bell 19 (DB18)—Offset 3048h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.186 Door Bell 20 (DB19)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.187 Door Bell 21 (DB20)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.188 Door Bell 22 (DB21)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.189 Door Bell 23 (DB22)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.190 Door Bell 24 (DB23)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.191 Door Bell 25 (DB24)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**

16.216 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This is a register that describe the host controller the extended cap location. It includes the , XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192. This register is not subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 4DFFC0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	4Dh RW/L	**Valid Length (VALID_LENGTH):** Indicates the number of valid DWords in the capability, that need to be saved and restored. 47h -> 818Bh is the last valid byte
15:8	FFh RW/L	**Next Capability Pointer (XECP_HOST_NEXT_CAP_OFFSET)**
7:0	C0h RW/L	**Supported Protocol ID (VEND_DEF_HOST_CAP_ID)**

16.217 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP

16.218 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.

16.219 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP

16.220 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8100h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RW	**Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** 31:25 Reserved (24): disable marking overlap flag on all TT periodic INs. (23): disable async. scheduling while periodic active to same port (22): disable "level" method of USB2 port periodic done check (on by default) (21): enable "strobe" method of USB2 port periodic done check (off by default)
20:13	4h RW	**TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved
12:11	0h RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16
10:9	0h RW	**Maximum EP Per Slot (MAX_EP_SLOT):** 0: 32 1: 16 2: 8 3: 4
8	1h RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Scheduler Host Control Reg (SCHED_HOST_CTRL):** (0): disable poll delay (1): disable TRM active in EP valid check (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) (5:4) scheduler sort pattern 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 (6): disable 1 pack scheduling limit when ISO pending in present microframe (7): enable check to stop scheduling on port that are not connected

16.221 Global Port Control (HOST_CTRL_PORT_CTRL)—Offset 80A0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 380Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OVERFLOW ERROR DETECTION ENABLE (OVERFLOW_ERR_DETECT_EN)**
30:12	3h RW	**HBUF_WATER_MARK (HBUF_WATER_MARK)**
11	1h RW	**CPL Cut Thru Enable (CPL_CUT_THRU_EN)**
10:4	0h RW	**RESERVED (RSVD0)**
3:0	Fh RW	**RESERVED (RSVD1)**

16.222 Power Management Control (PMCTRL_REG)—Offset 80A4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 2DFF90h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.
30	0h RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in in reference to the source prior to the RTD3 changes.
29	0h RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate
28	0h RW	**CLR_PME_FLAG_PULSE_AUX_CCLK (CLR_PME_FLAG_PULSE_AUX_CCLK)**
27	0h RW	**RESERVED (RSVD)**
26	0h RW	**XLFPSCOUNTSRC (XLFPSCOUNTSRC):** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0h RW	**XELFPSRTC (XELFPSRTC):** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3
24	0h RW	**XMPHYSPGDD0I2 (XMPHYSPGDD0I2):** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
23	0h RW	**XMPHYSPGDD0I3 (XMPHYSPGDD0I3):** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
22	0h RW	**XMPHYSPGDRTD3 (XMPHYSPGDRTD3):** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
21:18	Bh RW	**XD3RTCPTTM (XD3RTCPTTM):** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining SSIC Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and SSIC H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms.
17	0h RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3/SSIC ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3/SSIC PHY SUS Well Power Gating is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD
15:8	FFh RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection.
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL (SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL):** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.
3	0h RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state.
2	0h RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.
1	0h RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0 RTD3 triggered 1 - Port Triggered when in L1, L2 or Disabled, Disconnected
0	0h RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled

16.223 PGCB Control (PGCBCTRL_REG)—Offset 80A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 315555h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:25	0h RW	**IP_INACCESSIBLE_HYSTERESIS_TIMER (IP_INACCESSIBLE_HYSTERESIS_TIMER):** 000 ? 50us 001 ? 100us 010 ? 150us 011 ? 200us 000 ? 250us 001 ? 300us 010 ? 350us 111 ? 400us
24	0h RW	**Override_Disable (OVERRIDE_DISABLE)**
23:20	3h RW	**CDH Aggregation Minimum Wait Time (CDH_MIN_WAIT_TIME):** This field controls the minimum time that we must wait for resets to propagate before allowing Power Up flow to complete. The Power Up flow requires special handling of clocks, reset and sleep signaling which requires the CDH to monitor reset propagation. This timer allow for flexibility on when we consider all resets propagated. 0h Disabled 1h 2 clocks 2h 4 clocks 3h 8 clocks 4h 16 clocks 5h 32 clocks 6h 64 clocks 7h 128 clocks
19	0h RW	**RESERVED (CDH_RST_PROPAGATION_CNTRL):** This bit will indicate the mode of operation for the CDH Reset Propagation Aggregator. It allows for a mode where the aggregation will wait for an indication from each CDH before proceeding OR ignore the CDH indication before proceeding. Regardless of the mode, the aggregator will enforce the CDH Aggregation Mini Wait Time. 0 Aggregate all the CDH indications before triggering the CDH Aggregation Mini Wait Time. Once the Min Wait Time is met a notification to the Power Sequencer/Control will be initiated 1 Trigger the CDH Aggregation Mini Wait Time w/o waiting for CDH indication. Once the Min Wait time is met a notification to the Power Sequencer/Control will be initiated.
18	0h RW	**MMP_PFET_REQ_OVRD (MMP_PFET_REQ_OVRD):** This bit will disable the MMP PFET request condition for PGCB control. 1 MMP PFET Request Ignored 0 Default
17:16	1h RW	**PGCB Clock Gate Request to PGCB Sleep (PGCB_CLK_GATE_REQ_2_PGCB_SLEEP):** Value representing the minimum number of delay clocks required between the assertion of pgcb_ip_clkgate_b to the deassertion of pgcb_sleep on PG exit. (This is only applicable for IP-Accessible PG with state-retention enabled.) Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
15:14	1h RW	**PGCB Sleep Deassertion to PGCB ISM Unlock Req (PGCB_SLEEP_DEASRTN_2_ISM_UNLOCK_REQ):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of gcb_sleepto the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
13:12	1h RW	**PGCB Prim Reset Deassertion to PGCB Next State (PGCB_PRIMRST_DEASRTN_2_NSTATE):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
11:10	1h RW	**PGCB Side Reset Deassertion to PGCB Prim Reset Deassertion (PGCB_SIDERST_DEASRTN_2_PRIMERST_DEASRTN):** Value representing the number of delay clocks required between the deassertion of gcb_force_rst_bto the deassertion of gcb_force_prim_rst_b (This is only applicable for IP-Accessible PG.) Please see the description of cfg_tsleepact for more details.
9:8	1h RW	**PGCB Latch Isolation High to PGCB Clock Ungate Request (PGCB_LATCH_ISO_HI_2_PGCB_CLK_UNGATE_REQ):** Value representing the number of delay clocks required between the assertion of pgcb_isol_latchen to the deassertion of pgcb_ip_clkgate_req_b. Please see the description of cfg_tsleepact for more details.
7:6	1h RW	**PGCB Isolation Deassertion to PGCB Latch Isolation High Count (PGCB_ISO_DEASRTN_2_PGCB_ISO_HI_CNT):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_en_b to the assertion of gcb_isol_latchen. Please see the description of cfg_tsleepact for more details.
5:4	1h RW	**PGCB Reset Assertion to PGCB Power Down Request Count (PGCB_RST_2_PGCB_PWRDOWN_REQCNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_pmc_pg_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_sleep. Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
3:2	1h RW	**PGCB Isolation Assertion to PGCB Reset Assertion Count (PGCB_ISO_ASRTN_2_PGCB_RST_ASRTN_CNT):** Value representing the minimum number of delay clocks required between the assertion of gcb_isol_en_bto the assertion of gcb_force_prim_rst_band gcb_force_rst_b Please see the description of [1:0] for more details.
1:0	1h RW	**PGCB Sleep Assertion to PGCB Isolation Enable Count (PGCB_SLEEP_ASRTN_2_PGCB_ISO_EN_CNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_sleep (and the deassertion of pgcb_isol_latchen) to the assertion of pgcb_isol_en_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_latchen to the assertion of pgcb_isol_en_b, as well as the minimum number of delay clocks required between the assertion of pgcb_sleep to the assertion of pgcb_pmc_pg_req_b. Common for all cfg_t* inputs: 0 1 clock 1 2 clocks 0 8 clocks 1 256 clocks For any of the cfg_t* inputs that an IP may feel are a don-care and the IP does not feel they will be useful for post-silicon debug, the recommendation is to tie the input to 201 (2 clocks). Otherwise, the inputs may be tied to another relevant value or connected to a configuration register. Note: These signals may only change while pgcb_pwrupidle is asserted, if pgcb_pwrupidle is deasserted it should be valid and stable. (It may change the same cycle that ip_pgcb_pg_rdy_req_b asserts.)

16.224 D0I3 Control (DOI3CTRL_REG)—Offset 80ACh

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3	1h RW/1C	**RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3 (D0I3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1:0	0h RO	**RESERVED (RSVD1)**

16.225 HOST_CTRL_MISC_REG (HOST_CTRL_MISC_REG)—Offset 80B0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 1037Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USB2_LTRUPDT_DIS (USB2_LTRUPDT_DIS)**
30	0h RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset.
29	0h RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected
28	0h RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling.
27	0h RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination.
26	0h RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk.
25	0h RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, we rely on gating of frame timer due to proper port state and idleness tracking from the pipeline.
24	0h RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**RESERVED (RSVD1)**
19	0h RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins.
18:16	1h RW	**Extra uFrame (EXTRA_UFRAME):** This register controls the extra number of uFrames added onto the advancing of late FID check.
15:0	37Fh RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in miliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error.

16.226 HOST_CTRL_MISC_REG2 (HOST_CTRL_MISC_REG2)—Offset 80B4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

16.228 (SSPITPE)—Offset 80BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RSVD (RSVD)**
6:0	7Fh RW	**ITP Transmit Enable (ITP_TRANSMIT_EN):** Width is scaled with USB3 Port Count PortCount=4

16.229 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 15FC0F0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. Write 1 to this register will issue a cold reset to USB3 ports.
30	0h RW	**RESERVED (RSVD)**
29	0h RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.
28	0h RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.
27	0h RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.
26	0h RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.
25	0h RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS
24	1h RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1 prevent a reset being generated due to the USB3 port link down condition.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1 ignore the main power up reset for USB3 PIPE PHY reset.
22	1h RW	**RESERVED (RSVD_1)**
21	0h RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1' ignore HC reset to reset the USB2 Port logic
20	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1' ignore HC reset to the USB PHY power-on reset
19	1h RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core.
18	1h RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1' enable EEPROM reload on every main power-up
17	1h RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1' ignore HC reset to the PCIe PHY PIPE reset
16	1h RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1' ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset
15	1h RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1' ignore warm reset the USB PHY power on reset
14	1h RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1' allow PCIe link down to cause a reset to the rest of the core
13	0h RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1' ignore hot reset to the USB3 port logic
12	0h RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1' ignore warm reset to the USB3 port logic
11	0h RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1' ignore main power up reset to USB3 port logic
10	0h RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1' ignore main power up reset to USB2 port logic
9	0h RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1' ignore main power up reset to PCIe core
8	0h RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1' ignore main power up reset to PCIe PHY
7	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1' ignore HC reset to the USB PHY
6	1h RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1' ignore warm reset to the USB PHY
5	1h RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function

Bit Range	Default & Access	Field Name (ID): Description
4	1h RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1' allow main power off condition to trigger a main power domain reset
3	0h RW	**Ignore Wait For PERST# During Power Show Down (IGN_PERST_PSD):** When set to '1' ignore waiting for PERST# deassertion during main power show down.
2	0h RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** When fundamental reset is asserted during AUX power up, if this bit is set, then we will ignore PERST# such that purely wait for timeout to deassert fundamental reset.
1:0	0h RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset

16.230 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 4A4008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	4A4h RW	**Max. TT BW Allowed (MAX_TT_BWA):** see white paper
11:0	8h RW	**Per Packet Overhead SS BW (PP_OVRH_SSBW):** BW calculation: Overhead per packet for SS BW calculations. see white paper.

16.231 High Speed TT Bandwidth Overload (HOST_BW_OV_HS_REG)—Offset 80C8h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1A01Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
23:12	1Ah RW	**Per Packet Overhead HS-TT BW (PP_OVRH_HSTTBW):** BW calculation: Overhead per packet for HS-TT BW calculations. see white paper.
11:0	1Fh RW	**Per Packet Overhead HS BW (PP_OVRH_HSBW):** BW calculation: Overhead per packet for HS BW calculations. see white paper.

16.232 Bandwidth Overload Full Low Speed (HOST_BW_OV_FS_LS_REG)—Offset 80CCh

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 14080h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	14h RW	**Per Packet Overhead FS BW (PP_OVRH_FSBW):** BW calculation: Overhead per packet for FS BW calculations. see white paper.
11:0	80h RW	**Per Packet Overhead LS BW (PP_OVRH_LSBW):** BW calculation: Overhead per packet for LS BW calculations. see white paper.

16.233 System Bandwidth Overload (HOST_BW_OV_SYS_REG)—Offset 80D0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 32010h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	32h RW	**Per TT Packet Overhead System BW (PTTP_OVRH_SBW):** BW calculation: Overhead per TT packet for System BW calculations. see white paper.

16.237 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 808DBCA0h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from pin input which is set 1. But we allow software to alter it if it is needed. 1: D3 hot enabled 0: D3 hot not abled.
30	0h RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.
29	0h RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.
28	0h RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.
27	0h RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset
26	0h RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.
25	0h RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.
24	0h RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.
23	1h RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.
22	0h RW	**RESERVED (RSVD_1)**
21	0h RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.
20	0h RW	**CFG DISABLE_WARM_RST_DET_specUpPorts (cfg_dis_WrstDet_specU)**
19	1h RW	**cfg iob drivestrength[1] (CIDS1)**

Bit Range	Default & Access	Field Name (ID): Description
18	1h RW	**cfg iob drivestrength[0] (CIDS0)**
17	0h RW	**Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2
16	1h RW	**cfg clk gate dis (CCGD)**
15	1h RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3
14	0h RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst
13	1h RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCIe PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states.
12	1h RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to whether or not eable this host engine to generate PME message.
11	1h RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation
10	1h RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function.
9	0h RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
8	0h RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle.
7	1h RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support
6	0h RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.
5	1h RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering
4:1	0h RW	**Forced PM State (FORCED_PM_STATE)**
0	0h RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1

16.238 Battery Charge (BATTERY_CHARGE_REG)—Offset 80E4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable DM_SRC Battery Charge (EN_DS_BC):** 1 - Always enable battery charge DM_SRC if not connected. Don't wait for portable device detect. (spec. ver. 1.2) 0 - Battery charge spec ver. 1.1.
30:4	0h RO	**RESERVED (RSVD)**
3	0h RW	**Enable Port 3 Battery Charging (EN_P3_BC):** 0 - Battery charging disabled (Physical Port #3) 1 - Battery charging enabled (Physical Port #3)
2	0h RW	**Enable Port 2 Battery Charging (EN_P2_BC):** 0 - Battery charging disabled (Physical Port #2) 1 - Battery charging enabled (Physical Port #2)
1	0h RW	**Enable Port 1 Battery Charging (EN_P1_BC):** 0 - Battery charging disabled (Physical Port #1) 1 - Battery charging enabled (Physical Port #1)
0	0h RW	**Enable Port 0 Battery Charging (EN_P0_BC):** 0 - Battery charging disabled (Physical Port #0) 1 - Battery charging enabled (Physical Port #0)

16.239 Port Watermark (HOST_CTRL_WATERMARK_REG)—Offset 80E8h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 800080h

Bit Range	Default & Access	Field Name (ID): Description
31:16	80h RW	**RBUF water mark (RBUF_WM)**
15:0	80h RW	**XBUF water mark (XBUF_WM)**

16.240 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 18010000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	3h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be force.
26	0h RW	**Direct Link LTSSM State (DL_LTSSM_ST):** 0: Normal operation mode 1: Direct link to a specific state specified by bit 31:27. It shall be written 0 in normal operation mode.
25	0h RW	**Direct Link To U0 (DL_U0):** 0: Normal operation mode 1: Direct link to U0. It shall be written 0 in normal operation mode.
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode.
20	0h RW	**Enable Link Error Slave Count (EN_LES_CNT):** 0: Disable link error slave count 1: Enable link error slave count
19:17	0h RW	**Debug Mode Select (DEBUG_MD_SEL)**
16:15	2h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode 0: 4 cycles 1: 8 cycles 2: 16 cycles 3: 32 cycles
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us.
11:9	0h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us.
8	0h RW	**Force Link Accept PM Command (FORCE_LA_PMC):** 0: Normal operation mode 1: Force link to accept power management command
7	0h RW	**Direct Link Recovery U0 (DL_REC_U0):** 0: Normal operation mode 1: Direct link to Recovery from U0
6	0h RW	**Link Fast Training Mode (LINK_FTM):** 0: Normal operation mode 1: Link fast training mode This bit should be written 0 in normal operation.
5	0h RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** 0: Enable link scrambler 1: Disable link scramber
4	0h RW	**Direct Link U3 From U0 (DL_U3_U0):** 0: Normal operation mode 1: Direct link to U3 from U0. It shall be written 0 in normal operation mode.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Direct Link U3 From U0 (DL_U2_U0):** 0: Normal operation mode 1: Direct link to U2 from U0 . It shall be written 0 in normal operation mode.
2	0h RW	**Direct Link U3 From U0 (DL_U1_U0):** 0: Normal operation mode 1: Direct link to U1 from U0 . It shall be written 0 in normal operation mode.
1	0h RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** 0: Disable link loopback master mode 1: Enable link loopback master mode
0	0h RW	**Disable Link Compliance Mode (DIS_LINK_CM):** 0: Enable link compliance mode 1: Disable link compliance mode

16.241 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 310803A0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.
23:21	0h RW	**Reserved (RSVD0)**
20	0h RW	**L1_EXIT_RECOVERY_MODE (L1_EXIT_RECOVERY_MODE):** Mode for extended L1 Exit recovery delay: 0: 12us 1: 50us
19	1h RW	**L1_TO_INCR_MODE (L1_TO_INCR_MODE):** Mode select for L1 Timeout increments: 0: time out increments are in 125us 1: L1 Timeout increments are in 256us. Refer to USB2 PORTHLPMC.L1 Timeout in XHCI Spec for additional details
18	0h RW	**Reserved (RSVD1)**
17	0h RW	**EN_DETECT_NOMINAL_PKT_EOP (EN_DETECT_NOMINAL_PKT_EOP):** 0: Detect minimal packet EOP. 1: Detect nominal packet EOP.
16	0h RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** 0: Normal 1: Force full speed on host ports (disable chirp response)

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** 0: Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. 1: Disable 192 byte limit check.
14	0h RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** 0: Internal FS/LS Disconnect from linestate(1:0) 1: External provided FS/LS Disconnect from hostdisconnect input
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL):** Select UTMI Reset Source (FRD UTMI Reset Only) 00: HCReset or Force PHY Reset or internal reset after disconnect/suspend for restart (default) 01,11: UTMI reset = ~UTMI suspendm 10: UTMI reset = ~UTMI suspendm and synchronization to port clk.
11	0h RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN):** 0: Enable HS Disconnect Window Function 1: Disable HS Disconnect Window Function
10	0h RW	**Disable Port Error Detection (DIS_PERR_DET):** 0: Enable Port Error Detection (default) 1: Disable Port Error Detection
9	1h RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT):** 0: Enable Peek function for ISO-OUT (default) 1: Disable Peek function for ISO-OUT
8	1h RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER):** 0: Drive Resume-K on parallel Interface 1: Drive Resume-K directly on FS/LS Serial Interface (default)
7	1h RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING):** 0: Disable Drop-Ping Function in USB2 Protocol (default) 1: Enable Drop-Ping Function in USB2 Protocol
6	0h RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING):** 0: Disable Force-Ping Function in USB2 Protocol (default) 1: Enable Force-Ping Function in USB2 Protocol
5	1h RW	**Enable USB2 Auto-Ping (EN_U2_AUTO_PING):** 0: Disable Auto-Ping Function 1: Enable Auto-Ping Function in USB2 Protocol (default)
4	0h RW	**Disable PHY SuspendM (DIS_PHY_SUSM):** 0: PHY is suspend=U3,U2,disconnect (default) 1: Disable PHY SuspendM in All States
3	0h RW	**UTMI Internal Clock Gate Disable (UTMI_INT_CG_DIS):** 0: Normal operation (internal clock gated in U2,U3,disconnect) 1: UTMI Internal Clock Gate Disable
2	0h RW	**Disable PHY SuspendM in Disconnect State (DIS_PSUSM_DS):** 0: PHY is suspendM=0 in Disconnect State (default) 1: Disable PHY SuspendM in Disconnect State
1	0h RW	**Force PHY Reset (FORCE_PHY_RST):** 0: Normal Operation (default) 1: Force PHY Reset
0	0h RW	**USB2 Accelerated Simulation Timing (U2_ACC_SIM_TIM):** 0: Normal Operation (default - FPGA/ASIC) 1: USB2 Accelerated Simulation Timing (default - simulation)

16.242 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 80C40620h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Total Reset Duration[0] (TOT_RST_DUR_0):** # of microseconds for total reset duration
30:18	31h RW	**Chirp-K Duration (CHIRPK_DUR):** # of microseconds of Chirp-K to register that a device is chirping
17:5	31h RW	**K/J Disconnect Connect Delay (KJ_DIS_CON_DEL):** # of microseconds of K/J in disconnected state to register connect has occurred.
4:0	0h RW	**FS/LS Mode SE0 Disconnect Delay[12:8] (FSLS_SE0_DIS_DEL_12_8):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.

16.243 USB2 Port Link Control 3 (USB2_LINK_MGR_CTRL_REG3)—Offset 80F8h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: F865EB6Bh

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW	**U2 Entry Ignore Linestate Changes Duration[3:0] (U2_IGN_LS_DUR_3_0):** # of microseconds after entering U2, linestate changes are ignored as bus settles
27:15	10CBh RW	**U3 Entry Ignore Linestate Changes Duration (U3_IGN_LS_DUR):** # of microseconds after entering U3, linestate changes are ignored as bus settles
14:0	6B6Bh RW	**Total Reset Duration[15:1] (TOT_RST_DUR_15_1):** # of microseconds for total reset duration

16.244 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8003h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED (RSVD)**
21:9	40h RW	**U2 Detect Remote Wake Delay (U2D_RWAKE_DEL):** #of microseconds after detecting U2 remote wake condition to reflect K
8:0	3h RW	**U2 Entry Ignore Linestate Changes Duration[12:4] (U2_IGN_LS_DUR_12_4):** # of microseconds after entering U2, linestate changes are ignored as bus settles

16.245 Bandwidth Calc Control (HOST_CTRL_BW_CTRL_REG)—Offset 8100h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:0	8008h RW	**Reserved (RSVD_1)**

16.246 Host Interface Control (HOST_IF_CTRL_REG)—Offset 8108h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**Rsvd1 (Rsvd1)**
0	1h RW	**Host IF (HOSTIF)**

16.247 Bandwidth Overload Burst (HOST_BW_OV_BURST_REG)—Offset 810Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	8h RW	**Per Burst Overhead System BW (PB_OVRH_SBW):** BW calculation: Overhead per burst for system BW calculations. see white paper.
11:0	20h RW	**Per Burst Overhead System BW (PB_OVRH_SSBW):** BW calculation: Overhead per burst for SS BW calculations. see white paper.

16.248 USB Max Bandwidth Control 4 (HOST_CTRL_BW_MAX_REG)—Offset 8128h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: F42528505647F42h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**Reserved (RSVD)**
59:48	F42h RW	**PCIe Max BW Units (PCIE_MAX_BW):** Max. Number of BW units for PCIe (system interface) (denominator in 90% calculation)
47:36	528h RW	**TT Max BW Units (TT_MAX_BW):** Max. Number of BW units for TTs. (denominator in 90% calculation)
35:24	505h RW	**FS/LS Max BW Units (FSLS_MAX_BW):** Max. Number of BW units for FS/LS ports. (denominator in 90% calculation)

Bit Range	Default & Access	Field Name (ID): Description
23:12	647h RW	**HS Max BW Units (HS_MAX_BW):** Max. Number of BW units for HS ports. (denominator in 80% calculation)
11:0	F42h RW	**SS Max BW Units (SS_MAX_BW):** Max. Number of BW units for SS ports. (denominator in 90% calculation)

16.249 USB2 Linestate Debug (LINESTATE_DEBUG_REG)—Offset 8130h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:26	0h RO	**Port 14 UTMI Linestate (P14_UTMI_LS)**
25:24	0h RO	**Port 13 UTMI Linestate (P13_UTMI_LS)**
23:22	0h RO	**Port 12 UTMI Linestate (P12_UTMI_LS)**
21:20	0h RO	**Port 11 UTMI Linestate (P11_UTMI_LS)**
19:18	0h RO	**Port 10 UTMI Linestate (P10_UTMI_LS)**
17:16	0h RO	**Port 9 UTMI Linestate (P9_UTMI_LS)**
15:14	0h RO	**Port 8 UTMI Linestate (P8_UTMI_LS)**
13:12	0h RO	**Port 7 UTMI Linestate (P7_UTMI_LS)**
11:10	0h RO	**Port 6 UTMI Linestate (P6_UTMI_LS)**
9:8	0h RO	**Port 5 UTMI Linestate (P5_UTMI_LS)**
7:6	0h RO	**Port 4 UTMI Linestate (P4_UTMI_LS)**
5:4	0h RO	**Port 3 UTMI Linestate (P3_UTMI_LS)**
3:2	0h RO	**Port 2 UTMI Linestate (P2_UTMI_LS)**
1:0	0h RO	**Port 1 UTMI Linestate (P1_UTMI_LS)**

16.250 USB2 Protocol Gap Timer (USB2_PROTOCOL_GAP_TIMER_REG)—Offset 8134h

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: C3C640C05140Ch

Bit Range	Default & Access	Field Name (ID): Description
63:56	0h RO	**Reserved (RSVD)**
55:48	Ch RW	**GAP time after LS TX thru FS hub (LSTX_GAP_TIME)**
47:40	3Ch RW	**GAP time after LS RX thru FS hub (LSRX_GAP_TIME)**
39:32	64h RW	**GAP timer after LS (LS_GAP_TIME)**
31:24	Ch RW	**GAP time after FS (FS_GAP_TIME)**
23:16	5h RW	**GAP time after HS RX (HSRX_GAP_TIME)**
15:8	14h RW	**GAP time after HS TX SOF (HSTXSOF_GAP_TIME)**
7:0	Ch RW	**GAP time HS TX Packet (HSTX_GAP_TIME)**

16.251 USB2 Protocol Bus Timeout Timer (USB2_PROTOCOL_BTO_TIMER_REG)—Offset 813Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8D4258B8h

Bit Range	Default & Access	Field Name (ID): Description
31:21	46Ah RW	**Bus timeout count for LS (LS_BUS_TO)**
20:10	96h RW	**Bus timeout count for FS (FS_BUS_TO)**
9:0	B8h RW	**Bus timeout count for HS (HS_BUS_TO)**

16.252 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: A019132h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ah RW	**Engine Idle Hysteresis (EIH):** This register controls the min. idle span that has to be observed from the engine idle indicators before the power state flags (xhc_*_idle) will indicate a 1.
23:12	19h RW	**Backbone PLL Shutdown Advance Wake (BPSAW):** This register controls the time before the next scheduled transaction where the Backbone PLL request will assert. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)
11:0	132h RW	**Backbone PLL Shutdown Min. Idle Duration (BPSMID):** The sum of this register plus the Backbone PLL Shutdown Advance Wake form to a Total Idle time. When the next scheduled periodic transaction is after present time + Total Idle, the Backbone PLL request will de-assert, allowing the PLL to shutdwon. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)

16.253 Power Scheduler Control-2 (PWR_SCHED_CTRL2)—Offset 8144h

These bit enable by EP type those EPs classes that are considered for determining next periodic active interval for pre-wake of the periodic_active signal. EP classes that are disabled may never be observed in setting of the periodic_active signal.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 33Fh

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD)**
9	1h RW	**HS Interrupt-OUT Alarm (HS_INT_OUT_ALRM)**
8	1h RW	**HS Interrupt-IN Alarm (HS_INT_IN_ALRM)**
7	0h RW	**SS Interrupt-OUT FC Alarm (SS_INT_OUT_FC_ALRM)**

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**SS Interrupt-IN Alarm (SS_INT_IN_FC_ALRM)**
5	1h RW	**SS Interrupt-OUT & not in FC Alarm (SS_INT_OUT_ALRM)**
4	1h RW	**SS Interrupt-IN & not in FC Alarm (SS_INT_IN_ALRM)**
3	1h RW	**HS ISO-OUT Alarm (HS_ISO_OUT_ALRM)**
2	1h RW	**HS ISO-IN Alarm (HS_ISO_IN_ALRM)**
1	1h RW	**SS ISO-OUT Alarm (SS_ISO_OUT_ALRM)**
0	1h RW	**SS ISO-IN Alarm (SS_ISO_IN_ALRM)**

16.254 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 81390206h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**DIS_L1P2_EXIT_ON_WAKE_EN (DIS_L1P2_EXIT_ON_WAKE_EN):** This bit disables the dependency on Wake Enables defined in PORTSC for L1P2 exit when in D0
30:28	0h RW	**RESERVED0 (RSVD0)**
27:25	0h RW	**RESERVED (RSVD)**
24	1h RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection
22	0h RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2 (TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2):** This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature.
21	1h RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if we are in D3Hot.
20	1h RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2
19	1h RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state
18	0h RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0 (EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0):** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature
17	0h RW	**U2_EXIT_LFPS_TIMER_VALUE (U2_EXIT_LFPS_TIMER_VALUE):** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain
16	1h RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP (EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP):** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.
15:14	0h RW	**P3_ENTRY_TIMEOUT (P3_ENTRY_TIMEOUT):** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us)

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL)**
10	0h RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
9	1h RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0
8:4	0h RW	**Debug Mode Select Register (DEB_MODE_SEL)**
3	0h RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition.
2	1h RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2.
1	1h RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed.
0	0h RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.

16.255 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: FCh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD)**
7	1h RW	**EN_CMDM_TXRXB (EN_CMDM_TXRXB):** Enable Command Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
6	1h RW	**EN_TTE_TXRXB (EN_TTE_TXRXB):** Enable TTE Active indication for Tx/Rx Bias circuit HS Phy PM Policy

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**EN_IDMA_TXRXB (EN_IDMA_TXRXB):** Enable IDMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
4	1h RW	**EN_ODMA_TXRXB (EN_ODMA_TXRXB):** Enable ODMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
3	1h RW	**EN_TRM_TXRXB (EN_TRM_TXRXB):** Enable Transfer Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
2	1h RW	**EN_SCH_TXRXB (EN_SCH_TXRXB):** Enable Scheduler Active indication for Tx/Rx Bias circuit HS Phy PM Policy
1	0h RW	**Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)
0	0h RW	**Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)

16.256 USB Power Gating Control (USB_PGC)—Offset 8168h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 282EEh

Bit Range	Default & Access	Field Name (ID): Description
31:1	14177h RO	**Reserved (RSVD)**
0	0h RW	**USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse.

16.257 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD)**
19	0h RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.
18	0h RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.
17	0h RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.
16	0h RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.
15	0h RO	**Reserved1 (RSVD1):** Reserved
14	0h RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.
11:8	4h RW	**U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. 0x0: 1us 0x1: 128us 0x2: 256us 0x3: 512us 0x4: 640us 0x5: 768us 0x6: 896us 0x7: 1024us Others: Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.
6	0h RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
4	0h RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
3	0h RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
2	0h RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
1	0h RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
0	0h RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

16.258 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 96090032h

Bit Range	Default & Access	Field Name (ID): Description
31:22	258h RW	**USB2_LPM_REG_RSM_U3_DET_NORM (USB2_LPM_REG_RSM_U3_DET_NORM)**
21:19	1h RW	**Min U3 Exit LFPS Duration (MIN_U3E_LFPS_D):** Min U3 Exit LFPS Duration This field defines the minimum duration of LFPS driven by Host Controller upon U3 exit LFPS handshake. Note that theres an uncertainty of +-16us in actual duration driven by the Host Controller. 0b000: 96us 0b001: 160us 0b010: 224us 0b011: 288us 0b100: 352us 0b101: 416us 0b110: 480us 0b111: 544us
18:16	1h RW	**Min U2 Exit LFPS Duration (MIN_U2_ELFPS_D):** Min U2 Exit LFPS Duration This field defines the minimum duration of LFPS driven by Host Controller upon U2 exit LFPS handshake. Note that theres an uncertainty of +-16us in actual duration driven by the Host Controller. 0b000: 96us 0b001: 160us 0b010: 224us 0b011: 288us 0b100: 352us 0b101: 416us 0b110: 480us 0b111: 544us
15	0h RW	**Max PING LFPS Rx Detection (XHCI_MAX_PING_LFPS):** This field defines the maximum timing for PING LFPS. If an incoming LFPS will be considered a PING if it has a timing such that it is less than or equal to the selected value. Otherwise it will be considered for the other types of LFPS. 0b Max PING LFPS timing set to 256 ns (32 link clocks) 1b Max PING LFPS timing set to 320 ns (40 link clocks)
14:10	0h RO	**Reserved (RSVD_1)**
9:0	32h RW	**xHCI BESL to HIRD Distance (XHCI_BESL_HIRD_DT):** This field defines the gap between BESL and duration of Resume signalling from Host upon Host Initiated Resume from USB2.0 LPM. Default value of this register corresponds to xHCI spec defined 50us value. Value BESL to HIRD Distance 000h 0us 001h 1us 002h 2us 3FFh 1023us

16.259 xHC Latency Tolerance Parameters - LTV Control (XLTP_LTV1)—Offset 8174h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40047Dh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR):** 0: (default) allow scheduler direct transition from IDLE to NO requirement 1: Disable scheduler direct transition from IDLE to NO requirement
30:26	0h RW	**Reserved (RSVD)**
25	0h RW	**XHCI LTR Transition Policy (XLTRTP):** When '0', LTR messaging state machine transitions from High, Medium, or Low LTR states to Active state upon the Alarm Timer timout and stays in Active until the next service boundary. When '1', the LTR messaging state machine transitions through High ? Med ? Low ? Active states assuming enough latency is available for each transition.
24	0h RW	**XHCI LTR Enable (XLTRE):** This bit must be set to enable LTV messaging from XHCI to the PMC.
23:12	400h RW	**Periodic Active LTV (PA_LTV):** 23:22 Latency Scale 00b : Reserved 01b : Latency Value to be multiplied by 1024 10b : Latency Value to be multiplied by 32,768 11b : Latency Value to be multiplied by 1,048,576 21:12 Latency Value (ns) Defaults to 0 micro seconds
11:0	47Dh RW	**USB2 Port L0 LTV (USB2_PL0_LTV):** 11:10 Latency Scale 00b : Reserved 01b : Latency Value to be multiplied by 1024 10b : Latency Value to be multiplied by 32,768 11b : Latency Value to be multiplied by 1,048,576 9:0 Latency Value (ns) Defaults to 128 Micro Seconds

16.260 xHC Latency Tolerance Parameters LTV Control 2 (XLTP_LTV2)—Offset 8178h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 17FFh

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
12:0	17FFh RW	**LTV Limit (LTV_LMT):** This register defines a maximum LTR value that is allowed to be advertised to the PMC. This is meant to be used as a workaround or mitigation if issues are discovered with the LTR values generated by the XHC using the defined algorithms. If the LTR value of the XHC is larger than the value in this register field, the value in this field is sent to the PMC instead. Default value is the highest possible - 101b 12:10: Latency Multiplier Field 000b - Value times 1 ns 001b - Value times 32 ns 010b - Value times 1,024 ns 011b - Value times 32,768 ns 100b - Value times 1,048,576 ns 101b - Value times 33,554,432 ns 110b-111b - Not Permitted 9:0: Latency Value Default = 3FFh

16.261 xHC Latency Tolerance Parameters - High Idle Time Control (XLTP_HITC)—Offset 817Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD)**
28:16	0h RW	**Minimum High Idle Time (MHIT):** This is the minimum schedule idle time that must be available before a "High" LTR value can be indicated. This value must be larger than HIWL 12:7 - Time value in # of 125 Micro Seconds Bus Intervals (0 - 8ms) 6:0 - Fractional BI Time value in Micro Seconds (0 - 124 Micro Seconds)
15:13	0h RO	**Reserved (RSVD_1)**
12:0	0h RW	**High Idle Wake Latency (HIWL):** This is the latency to access memory from the High Idle Latency state. This value must be larger than MIWL and LIWL 12:7 - Time value in # of 125 Micro Seconds Bus Intervals (0 - 8ms) 6:0 - Fractional BI Time value in Micro Seconds (0 - 124 Micro Seconds)

16.262 xHC Latency Tolerance Parameters - Medium Idle Time Control (XLTP_MITC)—Offset 8180h

Access Method

Type: MEM Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Rsvd (Rsvd)**
17:16	0h RW	**U2P3 LFPS Periodic Sampling Control (XU2P3LPSC):** This field controls the OFF time for the LFPS periodic sampling for SS and SSIC ports in U2P3. If LFPSPM for a port is 1, it will override the OFF time and LFPS receiver will remain OFF permanently. For Fast Sim mode, 500us will be equivalent to 5us. 0x0 Polling Disable. (RXDET Polling will become 100ms.) 0x1 500us OFF Time 0x2 1ms OFF Time 0x3 1.5ms OFF Time
15:10	8h RW	**XLFPSONCNTSSIC (XLFPSONCNTSSIC):** This time would describe the number of clocks SSIC LFPS will remain ON. SSIC LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 8.
9:0	C8h RW	**XLFPSONCNTSS (XLFPSONCNTSS):** This time would describe the number of clocks LFPS will remain ON. LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 200.

16.274 (USB2PMCTRL_REG)—Offset 81C4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD)**
11	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated. 0 Do not

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC):** This controls the amount of hysteresis time the controller will enforce after detecting the USB2 PHY SUS Power Gate entry condition. 0h 0 clocks 1h 32 clocks 2h 64 clocks 3h 128 clocks 4h 256 clocks 5h 512 clocks 6h 1024 clocks 7h 2048 clocks
7:4	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT):** This field represents the worst case latency for the USB2 Common Lane to enter and exit its power gate state. This fields is required to be compared to a ports HIRD/HIRD value for the ports that have allowed L1 to L2 mapping to determine if the Common Lane can be allowed to power off. If the power gate entry/ exit latency is greater than the HIRD/HIRDD then the common lane should not be allowed to power gate as this will result in a L1 exit violation. 0h 100 us 1h 200 us 2h 300 us Eh 1500us Fh 1600 us
3:2	0h RW	**USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP):** This field controls when to enable the USB2 PHY SUS Well Power Gating when the proper conditions are met. 00 USB2 PHY SUS Power Gating is Disabled. 01 USB2 PHY SUS Power Gating is Enabled in Only D0 (Excludes D0i3 and D3) 10 USB2 PHY SUS Power Gating is Eanabled in only in D0 and D0i3 (Excludes D3) 11 USB2 PHY SUS Power Gating is Eanabled in D0/D0i3/D3
1	0h RW	**USB2 Common Lane Power Gating Enable During L1 to L2 Mapping for USB2 PHY Power Gating (U2CLPGEL1L2):** This field when set enables the controller to allow for the common lane power gating to be enabled when all ports are exposed as in L2 to the USB2 PHY while at least 1 port has been mapped to L2 from L1. This field alone does not guarantee power gating since the L1 HIRD/HIRDD Value must be compared with the PHYs power gate exit latency (U2CLPGLAT) held in this register to ensure that L1 exit is not violated. 0 USB2 Common Lane Power Gating is disabled when any port has been mapped from L1 to L2. 1 USB2 Common Lane Power Gating is allowed when any port has been mapped to L2 from L1 with the additional condition that the HIRD/HIRDD is greater than the PHYs Power Gate exit latency.
0	0h RW	**USB2 Data Lane L1 to L2 Mapping Enable for USB2 PHY Power Gating (U2DLL1L2ME):** This field when set enables the controller to map an L1 entry directly to L2 to allow the USB2 PHY to trigger its Autonomous Power Gating. The USB2 PHY will trigger PG only when in L2 since it does not fully understand the requirements for L1. 0 USB2 L1 to L2 mapping is disabled for all ports 1 USB2 L1 to L2 mapping is enabled for all ports

16.276 ECC_POISONING_CTRL_REG (ECC_POISONING_CTRL_REG)—Offset 83FCh

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**ENGINE_RF_ECC_POISONING_VECTOR (ENGINE_RF_ECC_POISONING_VECTOR):** XHCI Engine RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width
22:14	0h RW	**USB3_RF_ECC_POISONING_VECTOR (USB3_RF_ECC_POISONING_VECTOR):** USB3 RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width

Bit Range	Default & Access	Field Name (ID): Description
13:5	0h RW	**USB2_RF_ECC_POISONING_VECTOR (USB2_RF_ECC_POISONING_VECTOR):** USB2 RFs ECC Poisoning Inversion bits for the 64b or 128bit based on RF width
4:3	0h RO	**RSVD (RSVD)**
2	0h RW	**ENGINE_RF_ECC_POISONING_EN (ENGINE_RF_ECC_POISONING_EN):** Enable ECC Poisoning for XHCI Engine related RFs that support ECC
1	0h RW	**USB3_RF_ECC_POISONING_EN (USB3_RF_ECC_POISONING_EN):** Enable ECC Poisoning for USB3 Port related RFs that support ECC. Setting this bit enables poisoning of USB3 Port related RFs. This applies to all USB3 ports
0	0h RW	**USB2_RF_ECC_POISONING_EN (USB2_RF_ECC_POISONING_EN):** Enable ECC Poisoning for USB2 Port related RFs that support ECC. Setting this bit enables poisoning of USB2 Port related RFs. This applies to all USB2 ports

16.277 USB2_PORT_STATE_REG (USB2_PORT_STATE_REG)—Offset 8400h

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:18	0h RO	**RSVD (RSVD)**
17:0	0h RO	**USB2_PORT_STATE_REG (USB2_PORT_STATE_REG):** Per USB2 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

16.278 USB3_PORT_STATE_REG (USB3_PORT_STATE_REG)—Offset 8408h

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:14	0h RO	**RSVD (RSVD)**
13:0	0h RO	**USB3_PORT_STATE_REG (USB3_PORT_STATE_REG):** Per USB3 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

16.279 FUS1_REG (FUS1_REG)—Offset 8410h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**RSVD (RSVD)**
20:18	0h RO	**DEV_ID (DEV_ID):** Provides a fuse over-ride for the lower 3 bits of device ID.
17	0h RO	**XHC_DPGDIS (XHC_DPGDIS):** When asserted, it indicates that the xHCI will not dynamically power gate the controller.
16	1h RO	**USBR_DIS (USBR_DIS):** When asserted, it indicates that xHCI does not support USBr
15	0h RO	**XHC_FXN_DIS (XHC_FXN_DIS):** When asserted, it indicates the xHCI is fused to function disabled.
14:10	0h RO	**USB2_PORT_COUNT (USB2_PORT_COUNT):** 0x0 = MAX USB2 Ports enabled 0x1 = Max USB2 Ports -1 enabled 0x1F = All ports disabled
9:5	0h RO	**USB3_PORT_COUNT (USB3_PORT_COUNT):** 0x0 = MAX USB3 Ports enabled 0x1 = Max USB3 Ports -1 enabled 0x1F = All ports disabled
4	0h RO	**DEBUG_MODE_ENABLE (DEBUG_MODE_ENABLE):** 0 = USB debug mode disabled 1 = USB debug mode enabled Not used for LPT.
3	0h RO	**XHC_DCGDIS (XHC_DCGDIS):** 0= USB3 (xHC) dynamic clock gating enabled 1= USB3 (xHC) dynamic clock gating disabled
2	0h RO	**REGFILE_DPGDIS (REGFILE_DPGDIS):** 0 = USB3 (xHC) dynamic RF power gating enabled 1 = USB3 (xHC) dynamic RF power gating disabled

Bit Range	Default & Access	Field Name (ID): Description

0	0h RO	**USB2_PLL_SHUTDOWN_DIS (USB2_PLL_SHUTDOWN_DIS):** 0= USB2 PLL Shutdown enabled 1= USB2 PLL Shutdown disabled

16.280 FUS2_REG (FUS2_REG)—Offset 8414h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RSVD (RSVD)**
11:0	0h RO	**PORT_MAP_FUS1 (PORT_MAP_FUS1):** 1:0 Port 1 3:2 Port 2 5:4 Port 3 31:30 Port 16 Bit Description: 00: Port assgned to USB3 01: Port assigned to non-XHCI controller 10: Port assigned to Flex IO mapping. Mapping is based on Soft Straps. 11: Reserved.

16.281 FUS3_REG (FUS3_REG)—Offset 8418h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RSVD (RSVD)**

16.282 STRAP1_REG (STRAP1_REG)—Offset 841Ch

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RSVD (RSVD)**
5:0	0h RO	**FlexIO mapping (FLEX_IO_MAPPING):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is owned by XHCI 1: Port is not owned by XHCI

16.283 STRAP2_REG (STRAP2_REG)—Offset 8420h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RSVD (RSVD)**
5:0	0h RO	**USB3_SSIC_MODE (USB3_SSIC_MODE):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is operated in USB3 mode 1: Port is operated in SSIC mode.

16.284 STRAP3_REG (STRAP3_REG)—Offset 8424h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**RSVD (RSVD)**
1:0	0h RO	**XHCI_PRI_CLK_FREQ_SEL (XHCI_PRI_CLK_FREQ_SEL):** Specifies the frequency of the Primary clock (iosf_prim_mux_clk) used by XHCI 00 : 200 MHz (default) 01 : 125 MHz 10 : 250 MHz

16.285 DFT_REG1 (DFT_REG1)—Offset 8430h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**SS/SSIC DFT CRC (SSDFTCRC):** These register bits contain the value of SS DFT CRC
15:12	0h RO	**RSVD0 (RSVD0):** RSVD0
11	0h RW	**DFTLFPSSEL (DFTLFPSSEL):** DFTLFPSSEL 0: Rxelecidle is driven from GPIO Pin 1: Rxelecidle is Driven as specified by Super Speed DFT LFPS Mode Select
10	0h RW	**Super Speed DFT LFPS Mode Select (SSDFTLMSEL):** This bit selects the Super Speed DFT LFPS mode, and will only take effect when Super Speed HBP mode is enabled. 0b: HBP logic will internally loopback TX LFPS as RX LFPS and AFE RX LFPS path to the controller is disconnected. 1b: RX LFPS path works normally
9:6	0h RW	**SS/SSIC DFT CRC Select (SSDFTCRCSEL):** These bits select which Super Speed DFT CRC value is reflected in SSDFTCRC bits. In addition, these bits also select which SuperSpeed DFT CRC MSB value is sent to GPIO monitor pin, i.e. sata3gp_gp37 to aid silicon debug. Live version of selected CRC's MSB will be- sent to GPIO monitor pin, i.e. sata3gp_gp37. 0h (default): No SuperSpeed DFT CRC is selected. 1h: Data Payload CRC 2h: Link Management Packet CRC 3h: Transaction Packet CRC 4h: Isochronous Timestamp Packet CRC 5h: Data Packet Header CRC 6h: Link Command Packet CRC 7h: RRAP Packet CRC 8h: Tx/Rx Cfg CRC Others: Reserved Note : CRC types 7 and 8 are onlyapplicable if Port is SSIC Port
5	0h RO	**RSVD1 (RSVD1):** RSVD1
4:0	0h RW	**SS/SSIC DFT CRC Port Select (SSICDFTCPS):** One CRC per packet type is shared for all the Super Speed ports. These bits select the Super Speed port for which CRC data will be updated. 000b: (default) No SuperSpeed Port is selected 001b: SS/SSIC Port 0 010b: SS/SSIC Port 1 011b: SS/SSIC Port 2 100b: SS/SSIC Port 3 101b: SS/SSIC PORT4 110b :SS/SSIC Port 5 others : Rsvd

16.286 DFT_REG2 (DFT_REG2)—Offset 8434h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**HS/HSIC TX CRC (TXCRC):** These register bits contain the value of TX CRC. This TX CRC is placed right after the 480MHz XCLKQ.
15:11	0h RW	**HSIC/UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved
10:7	0h RW	**Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) +E27
6:5	0h RW	**Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved
4	0h RW	**Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled
3:2	0h RW	**Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved
1:0	0h RW	**UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.

16.287 DFT_REG3 (DFT_REG3)—Offset 8438h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern
15:2	0h RW	**Loopback Lane Select (UTMILPBKSEL_13_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0
1	0h RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet
0	0h RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported

16.288 dft_reg4 (DFT_REG4)—Offset 843Ch

Access Method

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer Low (EREPL)**

16.295 XECP_CMDM_STS5 (XECP_CMDM_STS5)—Offset 845Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer High (EREPH)**

16.296 AUX Power PHY Reset (UPORTS_PON_RST_REG)—Offset 8460h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3:0	0h WO	**Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY

16.297 Latency Tolerance Control 0 (HOST_IF_LAT_TOL_CTRL_REG0)—Offset 8464h

The Latency Tolerance Control Register is used by SW to control which BELT is returned when this register is read. SW shall write to this register to program a Slot-ID, Port-ID and BELT Select to determine which BELT is selected. When this register is read the selected BELT is returned.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: D0000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h WO	**BELT Select (BELT_SEL):** This field determines what value will be selected to read back from SW when reading this register 0: Returns the SW programmed Latency Tolerance Value 1: Returns the Lowest BELT in the Host 2: Returns the BELT for the requested Slot-ID (Slot Select) 3: Returns the BELT for the requested Port-ID (Port Select)
29:20	0h RO	**Rsvd1 (Rsvd1)**
19:16	Dh WO	**Port Select (PORT_SEL):** Used to select the BELT for a given Port # when the BELT Select is programmed to select the Port-ID (this field is 0 based)
15:12	0h RO	**Rsvd (Rsvd)**
11:5	0h RO	**BELT Value (BELTV):** Value of selected BELT is return in this field
4:0	0h RW	**Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)

16.298 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 2201h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Rsvd2 (Rsvd2)**
24	0h RW	**HC OS Owned Semaphore (HCOSOS)**
23:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**HC BIOS Owned Semaphore (HCBIOSOS)**
15:8	22h RW/S	**Next Capability Pointer (NextCP)**
7:0	1h RW/L	**Capability ID (CID)**

16.299 USB Legacy Support Control Status (USBLEGCTLSTS)—Offset 8470h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/C	**SMI on BAR (SMIBAR)**
30	0h RW/C	**SMI on PCI Command (SMIPCIC)**
29	0h RW/C	**SMI on OS Ownership Change (SMIOSOC)**
28:21	0h RO	**Rsvd4 (Rsvd4)**
20	0h RO	**SMI on Host System Error (SMIHSE)**
19:17	0h RO	**Rsvd3 (Rsvd3)**
16	0h RO	**SMI on Event Interrupt (SMIEI)**
15	0h RW	**SMI on BAR Enable (SMIBARE)**
14	0h RW	**SMI on PCI Command Enable (SMIPCICE)**
13	0h RW	**SMI on OS Ownership Enable (SMIOSOE)**
12:5	0h RO	**Rsvd2 (Rsvd2)**
4	0h RW	**SMI on Host System Error Enable (SMIHSEE)**
3:1	0h RO	**Rsvd1 (Rsvd1)**
0	0h RW	**USB SMI Enable (USBSMIE)**

16.300 Port Disable Override capability register (PDO_CAPABILITY)—Offset 84F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3C6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	3h RO	**Next Capability Pointer (NCP)**
7:0	C6h RO	**Capability ID (CID)**

16.301 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd1 (Rsvd1)**
8:0	0h RW/O	**USB2PDO (USB2PDO)**

16.302 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd1 (Rsvd1)**
6:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** A '1' in a bit position prevents the corresponding USB3 port from reporting a Device Connection to the XHC.

16.303 HW state capability register (HW_STATE_CAPABILITY)—Offset 8500h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1F40C7h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Rsvd (Rsvd)**
23:16	1Fh RO	**Save Length (SAVE_LENGTH):** Indicates the number of DWords in this capability starting at offset 04h, that need to be saved and restored
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C7h RO	**Capability ID (CID)**

16.304 HW state register 1 (HW_STATE_REG1)—Offset 8504h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG1 (HW_STATE_REG1)**

16.305 HW state register 2 (HW_STATE_REG2)—Offset 8508h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG2 (HW_STATE_REG2)**

16.306 HW state register 3 (HW_STATE_REG3)—Offset 850Ch

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG3 (HW_STATE_REG3)**

16.307 HW state register 4 (HW_STATE_REG4)—Offset 8510h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG4 (HW_STATE_REG4)**

16.308 CONFIG mirror capability register (CONFIG_MIRROR_CAPABILITY)—Offset 8600h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40C2h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C2h RO	**Capability ID (CID)**

16.309 Command (CMD_MMIO)—Offset 8604h

Dummy register, mirror of physical register as CMD

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD)**
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

16.310 Device Status (STS_MMIO)—Offset 8606h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD)**

16.311 Revision ID (RID_MMIO)—Offset 8608h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

16.312 Programming Interface (PI_MMIO)—Offset 8609h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

16.313 Sub Class Code (SCC_MMIO)—Offset 860Ah

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

16.314 Base Class Code (BCC_MMIO)—Offset 860Bh

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

16.315 Master Latency Timer (MLT_MMIO)—Offset 860Dh

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

16.316 Header Type (HT_MMIO)—Offset 860Eh

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

16.317 Memory Base Address (MBAR_MMIO)—Offset 8610h

Dummy register, mirror of physical register as MBAR. Value in this register will be different after the enumeration process.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

16.318 USB Subsystem Vendor ID (SSVID_MMIO)—Offset 862Ch

Dummy register, mirror of physical register as SSVID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

16.319 USB Subsystem ID (SSID_MMIO)—Offset 862Eh

Dummy register, mirror of physical register as SSID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

16.320 Capabilities Pointer (CAP_PTR_MMIO)—Offset 8634h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

16.321 Interrupt Line (ILINE_MMIO)—Offset 863Ch

Dummy register, mirror of physical register as ILINE.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

16.322 Interrupt Pin (IPIN_MMIO)—Offset 863Dh

Dummy register, mirror of physical register as IPIN.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

16.323 XHC System Bus Configuration 1 (XHCC1_MMIO)—Offset 8640h

Dummy register, mirror of physical register as XHCC1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**ECO1 (ECO1):** Reserved
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables.

Bit Range	Default & Access	Field Name (ID): Description
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represents the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

16.324 XHC System Bus Configuration 2 (XHCC2_MMIO)—Offset 8644h

Dummy register, mirror of physical register as XHCC2

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 3C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**ECO1 (ECO1):** Reserved.
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

16.325 Clock Gating (XHCLKGTEN_MMIO)—Offset 8650h

Dummy register, mirror of physical register as XHCLKGTEN

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2 (Rsvd2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

16.326 Audio Time Synchronization (AUDSYNC_MMIO)—Offset 8658h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Rsvd2 (Rsvd2)**
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

16.327 Serial Bus Release Number (SBRN_MMIO)—Offset 8660h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

16.328 Frame Length Adjustment (FLADJ_MMIO)—Offset 8661h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Read-Only. These bits are reserved for future use and should read as "00".
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

16.329 Best Effort Service Latency (BESL_MMIO)—Offset 8662h

Dummy register, mirror of physical register as BESL. Bset Effort Service Latency.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

16.330 PCI Power Management Capability ID (PM_CID_MMIO)—Offset 8670h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

16.331 Next Item Pointer #1 (PM_NEXT_MMIO)—Offset 8671h

Dummy register, mirror of physical register as PM_NEXT. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

16.332 Power Management Capabilities (PM_CAP_MMIO)—Offset 8672h

Dummy register, mirror of physical register as PM_CAP. Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	2h RW/L	**Version (Version):** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

16.333 Power Management Control/Status (PM_CS_MMIO)—Offset 8674h

Dummy register, mirror of physical register as PM_CS

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD)**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2)**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

16.334 Message Signaled Interrupt CID (MSI_CID_MMIO)—Offset 8680h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

16.335 Next item pointer (MSI_NEXT_MMIO)—Offset 8681h

Dummy register, mirror of physical register as MSI_NEXT

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

16.336 Message Signaled Interrupt Message Control (MSI_MCTL_MMIO)—Offset 8682h

Dummy register, mirror of physical register as MSI_MCTL

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD)**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

16.337 Message Signaled Interrupt Message Address (MSI_MAD_MMIO)—Offset 8684h

Dummy register, mirror of physical register as MSI_MAD

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD)**

16.338 Message Signaled Interrupt Upper Address (MSI_MUAD_MMIO)—Offset 8688h

Dummy register, mirror of physical register as MSI_MUAD

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

16.339 Message Signaled Interrupt Message Data (MSI_MD_MMIO)—Offset 868Ch

Dummy register, mirror of physical register as MSI_MD

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

16.340 Device Idle Capability (DEVIDLE_MMIO)—Offset 8690h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VID (VID)**

Bit Range	Default & Access	Field Name (ID): Description
27:24	0h RO	**REV (REV)**
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long.
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CID)**

16.341 Vendor Specific Header (VSHDR_MMIO)—Offset 8694h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

16.342 SW LTR POINTER (SWLTRPTR_MMIO)—Offset 8698h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

16.343 Device Idle Pointer Register (DEVIDLEPTR_MMIO)—Offset 869Ch

Dummy register, mirror of physical register as DEVIDLEPTR

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 80AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	80ACh RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/L	**Valid (VALID):** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

16.344 Device Idle Power ON Latency (DEVIDLEPOL_MMIO)—Offset 86A0h

Dummy register, mirror of physical register as DEVIDLEPOL

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

16.345 High Speed Configuration 2 (HSCFG2_MMIO)—Offset 86A4h

Dummy register, mirror of physical register as HSCFG2

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd1 (Rsvd1)**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

16.346 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1_MMIO)—Offset 86B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.347 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2_MMIO)—Offset 86B4h

Reserved

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.348 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1_MMIO)—Offset 86D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.349 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2_MMIO)—Offset 86D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.350 XHCC3 (XHCC3_MMIO)—Offset 86FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (Rsvd1):** Reserved
4	0h RW	**Error Handing: Disable masking of extra read to completion collect buffer (SUPP_XTRA_RD_CPL_COLL_BUF):** When set to 1, the fix to supress extra read to completion collect buffer is disabled. The fix is relevent only when ECC checking is enabled
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

16.351 Debug Capability ID Register (DCID)—Offset 8700h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 5100Ah

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD)**
20:16	5h RW	**Debug Capability Event Ring Segment Table Max (DCERSTM):** Note: This register is sticky.
15:8	10h RW	**Next Capability Pointer (NCP):** Note: This register is sticky.
7:0	Ah RW	**Capability ID (CID):** Note: This register is sticky.

16.352 Debug Capability Doorbell Register (DCDB)—Offset 8704h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:8	0h RW	**Doorbell Target (DBTGT):** This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. Value Definition 0 Data EP 1 OUT Enqueue Pointer Update 1 Data EP 1 IN Enqueue Pointer Update 2:255 Reserved This field returns '0' when read and the value should be treated as undefined by software.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Reserved (RSVD_1)**

16.353 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8708h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Debug Capability Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the DCERST Max field in the DCID register Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.

16.354 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8710h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3:0	0h RW	**Reserved (RSVD)**

16.355 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8718h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3	0h RW	**Reserved (RSVD)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

16.356 Debug Capability Control Register (DCCTRL)—Offset 8720h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Debug Capability Enable (DCE)**
30:24	0h RO	**Device Address (DADDR)**
23:16	0h RO	**Debug Max Burst Size (DMBS):** LPT-LP USB Debug Device does not support bursting.
15:5	0h RO	**Reserved (RSVD)**
4	0h RW/C	**DbC Run Change (DRC)**
3	0h RW/1S	**Halt IN TR (HIT)**
2	0h RW/1S	**Halt OUT TR (HOT)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Status Event Enable (LSE)**
0	0h RO	**DbC Run (DCR)**

16.357 Debug Capability Status Register (DCST)—Offset 8724h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.
23:1	0h RO	**Reserved (RSVD)**
0	0h RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register.

16.358 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 8728h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23	0h RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1)**
17	0h RW/C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2)**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.
9	0h RO	**Reserved (RSVD_3)**
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

16.359 Debug Capability Context Pointer Register (DCCP)—Offset 8730h

Access Method

Type: MEM Register (Size: 64 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.
3:0	0h RO	**Reserved (RSVD)**

16.360 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 8738h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80870000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	8087h RW	**Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor idVendor field.
15:8	0h RO	**Reserved (RSVD)**
7:0	0h RW	**DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor bInterfaceProtocol field. Value Function 0 Debug Target vendor defined. 1 GNU Remote Debug Command Set supported. 2-255 Reserved.

16.361 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 873Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field.
15:0	0h RW	**Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field.

16.362 Debug Capability Descriptor Parameters (DCDP)—Offset 8740h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 30C3h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	0h RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.
15:8	30h RW/S	**NEXT CAPABILITY POINTER (NCP)**
7:0	C3h RW/S	**Capability ID (CID)**

16.363 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8748h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**Reserved (RSVD)**
18	0h RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
17:14	0h RW	**Reserved (RSVD_1)**
13	0h RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
12:9	0h RW	**Reserved (RSVD_2)**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines
7	0h RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports
6	0h RW	**Reserved (RSVD_3)**
5	0h RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state
4	0h RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state
3	0h RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state
2:0	0h RW	**Reserved (RSVD_4)**

16.364 DBC Control Register 1 (DBCCTL_REG)—Offset 8760h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** RSVD
7	0h RW	**SW_DCE_SEL (SW_DCE_SEL)**
6:3	0h RW	**DISC_RXD_CNT (DISC_RXD_CNT)**
2	0h RO	Reserved.
1	0h RW	**Force DCE Mode (FORCE_DCE_MODE):** 0: When DCE is set, the DbC switches to Mode 2 1: When DCE is set, the DbC switches to Mode 3

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Force Disconnect upon DCE (FORCE_DISCONNECT_ON_DCE):** If this bit is set by BIOS, the DbC will temporarily disconnect from the remote host if the DCE is set, and shortly thereafter re-connect. This allows the DbC to switch from Mode1 to Mode2 or Mode 3 operation upon DCE being set.

16.365 SSIC Policy and Implementation Specific Registers Capability ID register (SSIC_IMPLEMENTATION_CAPABILITY_ID_REG)—Offset 8800h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 40C4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C4h RO	**Supported Protocol ID (PID)**

16.366 SSIC global configuration control register (SSIC_GLOBAL_CONFIG_CONTROL_REG)—Offset 8804h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD)**
17:16	0h RW	**T_ACT_H8_MARGIN (T_ACT_H8_MARGIN):** Specifies the margin time added to the tActivate spec time of 100us in T_ACT_H8_TIME. 11: Reserved 10: 50us 01: 20us (default for ModPHY) 00: 10us (default for MIPI MPHY)
15:4	0h RO	**Reserved1 (RSVD1)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**BB_PLL_OVRD_DURING_PWM (BB_PLL_OVRD_DURING_PWM)**
2	0h RW	**CMN_LANE_PWRGATE_DIS (CMN_LANE_PWRGATE_DIS):** This will disable the MPHY common lane power gate.
1	0h RW	**HS_CLK_GATE_DIS (HS_CLK_GATE_DIS):** This will disable the HS Clock gate request from XHCI to MIPI PLL.
0	0h RW	**PWM_CLK_GATE_DIS (PWM_CLK_GATE_DIS):** This will disable the PWM Clock gate request from XHCI to MIPI PLL.

16.367 (PORT1_SSIC_CONFIG_REG1)—Offset 8808h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 82286010h

Bit Range	Default & Access	Field Name (ID): Description
31:30	2h RW	**NUM_RRAP_ATTEMPT (NUM_RRAP_ATTEMPT):** Specify the number of RRAP access attempt if there was tRRAPInitiatorResponse timeout.
29:22	8h RW	**TX_MIN_STALL (TX_MIN_STALL):** (TX_Min_STALL_NoConfig_Time_Capability in MIPI PHY Spec). PA will ensure TX_MIN_STALL time in STALL before entering HS-BURST or HIBERN8. Specifies minimum time in SI in STALL state.
21:17	14h RW	**PWM_EXIT_TIME (PWM_EXIT_TIME):** This will be max of RX_Min_ActivateTime_Capability and TX_Min_SAVE_Config_Time_Capability in MIPI PHY Specs) Specifies minimum activate time needed in 5us steps. PA will wait PWM_EXIT_TIME time after exiting PWM to start HS-BURST. SSIC spec requires it to be at 100us. For speedup mode this time would be in 1us steps.
16	0h RW	**DSP_DISC_BURST_CLOSE_RRAP (DSP_DISC_BURST_CLOSE_RRAP):** 0 - Send BURST Closure RRAP for DSP Disconnect 1 - Dont send Burst Closure RRAP for DSP Disconnect. For device PWM exit would be indication for DSP Disconnect.
15:13	3h RW	**TX_MIN_ACTIVATE (TX_MIN_ACTIVATE):** (TX_Min_ActivateTime in MIPI PHY Spec) Specifies minimum activate time needed in 100us steps. PA will wait TX_MIN_ACTIVATE time after H8 exit to start of PWM Burst. SSIC spec requires it to be at 1.5ms. For speedup mode this time would be 10us to 150us in steps of 10us.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**RRAP_BYPASS (RRAP_BYPASS):** Enables DFx Loopback test mode where RRAP command /response is bypassed for HS_CONFIG and PWM_BURST_CLOSURE. Host will still perform initial enter and exit PWM mode with no RRAP transfers.
11	0h RW	**Reserved (RSVD)**
10:8	0h RW	**T_ACT_H8_EXIT (T_ACT_H8_EXIT):** Specifies minimum time in 100us steps for T_ACTIVATE_TIME to exit H8. Val: Si Time / Fast Sim Time 000: 110us / 10us 001: 210us / 20us 110: 710us / 70us 111: 5ms / 500us Spec required timing is 100us.
7:5	0h RW	**MIN_HIBERN8_TIME (MIN_HIBERN8_TIME):** Minimum time in HIBERN8 state 0 110us 1 210us .. 7 810us PA will ensure MIN_HIBERN8_TIME in its TX HIBERN8. For speedup mode this time will be from 10us to 80us in steps of 10us.
4	1h RW	**SSICRATE (SSICRATE):** 0 B Series 1 A Series
3:2	0h RW	**HSGEAR (HSGEAR):** 0=HS-G1 1=HS-G2 2=HS-G3
1:0	0h RW	**SSICLANE (SSICLANE):** 0=Single lane 1=Bi-lane 2=Quad-lane

16.368 (PORT1_SSIC_CONFIG_REG2)—Offset 880Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4881F46h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**SSIC_PORT_UNUSED (SSIC_PORT_UNUSED):** This indicates that no SSIC device is connected to the port and PORTSC register would always reflect DISCONNECTED.
30	0h RW	**PROG_DONE (PROG_DONE):** BIOS will program this bit once SSIC profile programming is done. SSIC will enable the MPHY and local PLL once this bit is set.
29:26	1h RW	**NUM_OF_MK0 (NUM_OF_MK0):** Number of MK0 which transmitter will send before sending any data.
25	0h RW	**DISABLE_SCRAMBLING (DISABLE_SCRAMBLING):** This bit will disable scrambling in HS-BURST
24:21	4h RW	**RETRAIN_TIME (RETRAIN_TIME):** Corresponds to time in 10us to detect improper training of the local and remote M-RX as part of HS-BURST entry. SSIC Spec specific 40 to 50us
20:16	8h RW	**PHY_RESET_TIME (PHY_RESET_TIME):** Corresponds to time in 100ns, PA will drive PHY RESET for MIPI PHY.

Bit Range	Default & Access	Field Name (ID): Description
15:8	1Fh RW	**LRST_TIME (LRST_TIME):** Corresponds to time in 100us PA will drive DIF-P for line reset. MIPI PHY specifies 3.1 ms Minimum. For speedup mode this time will be in steps of 5us.
7:0	46h RW	**ACTIVATE_LRST_TIME (ACTIVATE_LRST_TIME):** (Corresponds to tResetDIFN) Specifies in step of 1ms period of time a DSP is required to drive a DIF-N prior to a LINE-RESET. SSIC spec defined range is 60-80ms. For speedup mode this time will be from 5us to 400us in steps of 5us.

16.369 (PORT1_SSIC_CONFIG_REG3)—Offset 8810h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 40400000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	4h RW	**U0_STALL_TO (U0_STALL_TO):** Time in 2^[U-STALL_TO] clock for U0 STALL entry. If there is no packet in arbiter for U0_STALL_TO time, PA will enable U0 STALL if DISABLE_U0_STALL is not set. 0000 0011 (Not recommended) 0100 16 SSIC HS CLK . 1111 32768 SSIC HS CLK
27	0h RW	**MPHY_TEST_MODE_EN (MPHY_TEST_MODE_EN):** When this bit is set, controller would not initiate any PWM once it enters PWM Mode. It will wait for tester to send Loopback RRAP Command.
26	0h RW	**DL_PWR_GATE_DIS (DL_PWR_GATE_DIS)**
25:21	2h RW	**HIBERN8_ENTER_TX (HIBERN8_ENTER_TX):** The time PA will drive DIF-N after last bit of Line-CFG before entering H8. In steps of 50ns. Legal range is 50 to 1000ns.
20:19	0h RW	**LUP_LDN_TIMER_MAX (LUP_LDN_TIMER_MAX):** 00: 10 us 01: 100 us 10: 1000us /1ms 11: (Timer is disable and dont transmit LDN)
18:3	0h RW	**RESERVED (RSVD):** rsvd
2	0h RW	**DISABLE_U0_STALL (DISABLE_U0_STALL):** This bit will disable the STALL entry in U0
1	0h RW	**SSIC_PG_U3_DIS (SSIC_PG_U3_DIS):** This disables MPHY DL PG during U3.
0	0h RW	**SSIC_PG_U2_DIS (SSIC_PG_U2_DIS):** This disables MPHY DL PG during U2.

16.370 (PORT1_SSIC_CONFIG_REG4)—Offset 8814h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 64796464h

Bit Range	Default & Access	Field Name (ID): Description
31:24	64h RW	**PM_LC_MAX_TIMER (PM_LC_MAX_TIMER):** In steps of 1us. Default 100us
23:16	79h RW	**PM_ENTRY_TIMER_MAX (PM_ENTRY_TIMER_MAX):** In steps of 1us. Default 100us
15:8	64h RW	**PEND_HP_TIMER_MAX (PEND_HP_TIMER_MAX):** In steps of 1us. Default 100us
7:0	64h RW	**CRD_PEND_TIMER_MAX (CRD_PEND_TIMER_MAX):** In steps of 1us. Default 100us

16.371 (PORT1_SSIC_LOOPBACK_CONFIG_REG)—Offset 8818h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED (RSVD)**
7:4	0h RW	**LOOPBACK_EN (LOOPBACK_EN):** This Register is used to enable Conformance Loopback in the Target in the specified PAIR.. Bit [0]: Writing 1b1 enables the loopback mode in PAIR0. Writing 1b0 shall have no effect. Bit [1]: Writing 1b1 enables the loopback mode in PAIR1. Writing 1b0 shall have no effect. Bit [2]: Writing 1b1 enables the loopback mode in PAIR2. Writing 1b0 shall have no effect. Bit [3]: Writing 1b1 enables the loopback mode in PAIR3. Writing 1b0 shall have no effect.
3:0	0h RW	**RX LOOPBACK CNTR RESET (RX_LOOPBACK_CNTR_RESET):** Reset RX_BURST_COUNT and RX_ERR_COUNT, write only, self-clearing. Bit [0] for PAIR0 Bit [1] for PAIR1 Bit [2] for PAIR2 Bit [3] for PAIR3

16.372 (PORT1_SSIC_LOOPBACK_BURST_COUNT_REG)—Offset 881Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RX_BURST_COUNT_LANE3 (RX_BURST_COUNT_LANE3):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.
23:16	0h RO	**RX_BURST_COUNT_LANE2 (RX_BURST_COUNT_LANE2):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.
15:8	0h RO	**RX_BURST_COUNT_LANE1 (RX_BURST_COUNT_LANE1):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.
7:0	0h RO	**RX_BURST_COUNT_LANE0 (RX_BURST_COUNT_LANE0):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.

16.373 (PORT1_SSIC_LOOPBACK_ERROR_COUNT_REG)—Offset 8820h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RX_ERR_COUNT_LANE3 (RX_ERR_COUNT_LANE3):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RO	**RX_ERR_COUNT_LANE2 (RX_ERR_COUNT_LANE2):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.
15:8	0h RO	**RX_ERR_COUNT_LANE1 (RX_ERR_COUNT_LANE1):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.
7:0	0h RO	**RX_ERR_COUNT_LANE0 (RX_ERR_COUNT_LANE0):** RX_BURST_COUNT shall increment each time the M-RX of the PAIR under test detects a prepare time DIF-P. This shall be reset when the DUT receives a Write Command with rx_count_reset set to one. These counters shall not be reset when the DUT receives a LINE-RESET.

16.374 SSIC Local and Remote Profile Registers Capability ID register (SSIC_PROFILE_CAPABILITY_ID_REG)—Offset 8900h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: FFC5h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:8	FFh RO	**Next Capability Pointer (NCP)**
7:0	C5h RO	**Supported Protocol ID (PID)**

16.375 SSIC Port N Register Access Control (PORT1_REGISTER_ACCESS_CONTROL)—Offset 8904h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: C00000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD)**
25	0h RW	**RRAP Register Bank Valid (RRAP_REG_BANK_VALID):** 0 = No valid Commands in the Lane N register bank. Host Controller can close the PWM burst once commands from this register are completed. 1 = Valid commands present in the Lane N register bank. Host controller must complete commands from the register bank before closing the burst.
24	0h RW	**Target Phy (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy Setting this bit to 1 allows the use of this command mechanism to write to local Phy profile and AFE tuning registers Primarily as a back up option.
23	1h RW	**HS_Config (HS_CONFIG):** When this bit is set to 1 the host controller will issue an RRAP write with HS_Config=1 once it sees Command Phase Done = 1
22	1h RW	**Command Phase Done (CPD):** When set to 1, this indicates that SW has completed performing RRAP cycles through the command register.
21	0h RW	**Command Valid (CMD_VALID):** When written to 1 indicates that the Attribute ID and Attribute Data for writes fields are valid.
20	0h RW	**Read_Write (READ_WRITE):** 0 = Write 1= Read
19:8	0h RW	**Attribute ID (ATT_ID):** Attribute ID that is being written or read
7:0	0h RW	**Attribute Write Data (ATT_WRITE_DATA):** Data byte that is required to be written to either the local phy or the remote phy

16.376 SSIC Port N Register Access Status (PORT1_REGISTER_ACCESS_STATUS)—Offset 8908h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD)**
9:8	0h RW	**Command Completion Status (CCS):** 00 = Command not complete 01 = Command complete with Success 10 = Command complete with Error These bits must be cleared before a new command is initiated.
7:0	0h RO	**Read data (READ_DATA):** Data read as a result of the RRAP operation

16.377 (PORT1_PROFILE_ATTRIBUTES_REG0)—Offset 890Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.438 (PORT1_PROFILE_ATTRIBUTES_REG61)—Offset 8A00h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.439 (PORT1_PROFILE_ATTRIBUTES_REG62)—Offset 8A04h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.440 (PORT1_PROFILE_ATTRIBUTES_REG63)—Offset 8A08h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.441 GLOBAL_TIME_SYNC_CAP_REG (GLOBAL_TIME_SYNC_CAP_REG)—Offset 8E10h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 12C9h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (RSVD)**
15:8	12h RO	**Next Capability pointer (NCP)**
7:0	C9h RO	**Capability ID (CID)**

16.442 GLOBAL_TIME_SYNC_CTRL_REG (GLOBAL_TIME_SYNC_CTRL_REG)—Offset 8E14h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED (RSVD)**
0	0h RW/1S	**Time Stamp Counter Capture Initiate (TIME_STAMP_CNTR_CAPTURE_INITIATE):** SW sets this bit to initiate a time capture. Once the time capture is complete and the time values are valid in the Local and Global time capture registers, HW clears the bit.

16.443 MICROFRAME_TIME_REG (MICROFRAME_TIME_REG)—Offset 8E18h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED (RSVD)**
29:16	0h RO	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits [29:16] reflect state of bits [13:0] of FRINDEX
15:13	0h RO	**RESERVED1 (RSVD1)**
12:0	0h RO	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done via Bus Interval Adjust (BIA).

16.444 GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW_REG)—Offset 8E20h

Global Time Value (Low):

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW):** Global Time Value (Low):

16.445 GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI_REG)—Offset 8E24h

Global Time Value (High):

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI):** Global Time Value (High):

16.446 Debug Status Capability Register (DEBUG_STATUS_CAPABILITY_REG)—Offset 8E58h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: CBh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	0h RO	**Next Capability Pointer (NCP)**
7:0	CBh RO	**Capability ID (CID)**

16.447 Host Ctrl USB3 Soft Error Count Register 1 (HOST_CTRL_USB3_ERR_COUNT_REG1)—Offset 8E5Ch

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.448 Host Ctrl USB3 Soft Error Count Register 2 (HOST_CTRL_USB3_ERR_COUNT_REG2)—Offset 8E60h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.449 Host Ctrl USB3 Soft Error Count Register 3 (HOST_CTRL_USB3_ERR_COUNT_REG3)—Offset 8E64h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.450 Host Ctrl USB3 Soft Error Count Register 4 (HOST_CTRL_USB3_ERR_COUNT_REG4)—Offset 8E68h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.451 Host Ctrl USB3 Soft Error Count Register 5 (HOST_CTRL_USB3_ERR_COUNT_REG5)—Offset 8E6Ch

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.452 Host Ctrl USB3 Soft Error Count Register 6 (HOST_CTRL_USB3_ERR_COUNT_REG6)—Offset 8E70h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.453 Host Ctrl USB3 Soft Error Count Register 7 (HOST_CTRL_USB3_ERR_COUNT_REG7)—Offset 8E74h

This register is updated by hardware and cleared by software

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (cfg_reserved)**
15:0	0h RO	**USB3_SOFT_ERR_CNT (cfg_usb3_soft_error_cnt)**

16.454 DBC_GP2_OUT_PAYLOAD_BP_LOW (DBC_GP2_OUT_PAYLOAD_BP_LOW)—Offset 0h

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_PAYLOAD_BP_LOW (DBC_GP2_OUT_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

16.455 DBC_GP2_OUT_PAYLOAD_BP_HI (DBC_GP2_OUT_PAYLOAD_BP_HI)—Offset 4h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_PAYLOAD_BP_HI (DBC_GP2_OUT_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

16.456 DBC_GP2_OUT_PAYLOAD_QUALIFIERS (DBC_GP2_OUT_PAYLOAD_QUALIFIERS)—Offset 8h

DbC GP2 OUT Payload Qualifiers

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

16.457 DBC_GP2_OUT_PAYLOAD_TRANSFER_LENGTH (DBC_GP2_OUT_PAYLOAD_TRANSFER_LENGTH)—Offset Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

16.458 DBC_GP2_OUT_STATUS_BP_LOW (DBC_GP2_OUT_STATUS_BP_LOW)—Offset 10h

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_STATUS_BP_LOW (DBC_GP2_OUT_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

16.459 DBC_GP2_OUT_STATUS_BP_HI (DBC_GP2_OUT_STATUS_BP_HI)—Offset 14h

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_OUT_STATUS_BP_HI (DBC_GP2_OUT_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

16.460 DBC_GP2_OUT_STATUS_QUALIFIERS (DBC_GP2_OUT_STATUS_QUALIFIERS)—Offset 18h

DbC GP2 OUT STATUS Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

16.461 DBC_GP2_IN_PAYLOAD_BP_LOW (DBC_GP2_IN_PAYLOAD_BP_LOW)—Offset 1Ch

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_PAYLOAD_BP_LOW (DBC_GP2_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

16.462 DBC_GP2_IN_PAYLOAD_BP_HI (DBC_GP2_IN_PAYLOAD_BP_HI)—Offset 20h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_PAYLOAD_BP_HI (DBC_GP2_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

16.463 DBC_GP2_IN_PAYLOAD_QUALIFIERS (DBC_GP2_IN_PAYLOAD_QUALIFIERS)—Offset 24h

DbC GP2 OUT Payload Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]

3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

16.464 DBC_GP2_IN_PAYLOAD_TRANSFER_LENGTH (DBC_GP2_IN_PAYLOAD_TRANSFER_LENGTH)—Offset 28h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

16.465 DBC_GP2_IN_STATUS_BP_LOW (DBC_GP2_IN_STATUS_BP_LOW)—Offset 2Ch

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_STATUS_BP_LOW (DBC_GP2_IN_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

16.466 DBC_GP2_IN_STATUS_BP_HI (DBC_GP2_IN_STATUS_BP_HI)—Offset 30h

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_GP2_IN_STATUS_BP_HI (DBC_GP2_IN_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

16.467 DBC_GP2_IN_STATUS_QUALIFIERS (DBC_GP2_IN_STATUS_QUALIFIERS)—Offset 34h

DbC GP2 OUT STATUS Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]
7:4	0h RO	**RESERVED1 (RSVD1)**
3:0	0h RW	**ROOT_SPACE (ROOT_SPACE)**

16.468 DBC_DFX_OUT_CONTROL (DBC_DFX_OUT_CONTROL)—Offset 38h

DBC_DFX_OUT_CONTROL

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RESERVED (RSVD)**
8	0h RW	**Credit De-allocate Update (CREDIT_DE_ALLOC_UPDATE):** This is sent by ExI Bridge to DbC whenever a packet is dispatched from the Inbound Buffer or in response to credit Init request. 1: 1 credit dispatched due to deallocation 0: Absolute value of credits in response to a Credit Init request from DbC
7:5	0h RO	**RESERVED (RSVD1)**
4:0	0h RW	**AVAILABLE_CREDITS (AVAILABLE_CREDITS):** ExI Bridge writes the absolute value of the available credit count into this register each time it drains an entry from its buffer. Each credit represents a 64 Byte ExI Packet. Also, coming out of reset, DbC will request for a Credit Init, and ExI Bridge will write the absolute value of available credit to this register.

16.469 DBC_DFX_IN_PAYLOAD_BP_LOW (DBC_DFX_IN_PAYLOAD_BP_LOW)—Offset 3Ch

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_PAYLOAD_BP_LOW (DBC_DFX_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

16.470 DBC_DFX_IN_PAYLOAD_BP_HI (DBC_DFX_IN_PAYLOAD_BP_HI)—Offset 40h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_PAYLOAD_BP_HI (DBC_DFX_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

16.471 DBC_DFX_IN_PAYLOAD_TRANSFER_LENGTH (DBC_DFX_IN_PAYLOAD_TRANSFER_LENGTH)—Offset 44h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**DATA_VALID (DATA_VALID):** This bit indicates the presence of a valid data buffer and is the doorbell that allows the DbC to initiate a DMA transaction. This bit is cleared by HW upon completion of the DMA upto either the specific transfer length, or thehost controller sending a short packet
30:0	0h RW	**PAYLOAD_TRANSFER_LENGTH (PAYLOAD_TRANSFER_LENGTH):** Length of payload buffer in Bytes (1 based count)

16.472 DBC_DFX_IN_STATUS_BP_LOW (DBC_DFX_IN_STATUS_BP_LOW)—Offset 48h

Lower DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_STATUS_BP_LOW (DBC_DFX_IN_STATUS_BP_LOW):** Lower DW of STATUS Address Pointer

16.473 DBC_DFX_IN_STATUS_BP_HI (DBC_DFX_IN_STATUS_BP_HI)—Offset 4Ch

Upper DW of STATUS Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_DFX_IN_STATUS_BP_HI (DBC_DFX_IN_STATUS_BP_HI):** Upper DW of STATUS Address Pointer

16.474 DBC_TRACE_IN_PAYLOAD_BP_LOW (DBC_TRACE_IN_PAYLOAD_BP_LOW)—Offset 50h

Lower DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_PAYLOAD_BP_LOW (DBC_TRACE_IN_PAYLOAD_BP_LOW):** Lower DW of Payload Address Pointer

16.475 DBC_TRACE_IN_PAYLOAD_BP_HI (DBC_TRACE_IN_PAYLOAD_BP_HI)—Offset 54h

Upper DW of Payload Address Pointer

Access Method

Type: MEM Register (Size: 32 bits)	**Device:** **Function:**

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_TRACE_IN_PAYLOAD_BP_HI (DBC_TRACE_IN_PAYLOAD_BP_HI):** Upper DW of Payload Address Pointer

16.476 DBC_TRACE_IN_PAYLOAD_QUALIFIERS (DBC_TRACE_IN_PAYLOAD_QUALIFIERS)—Offset 58h

DbC TRACE OUT Payload Qualifiers

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD)**
21:8	0h RW	**DESTN_ID (DESTN_ID):** Decode_Mode[1:0] PSF[3:0] Port_Group[0:0] Port[3:0] Channel[2:0]

5	0h RW	**DBC_GP2_OUT (DBC_GP2_OUT)**
4	0h RW	**DBC_GP2_IN (DBC_GP2_IN)**
3	0h RW	**DBC_GP1_OUT (DBC_GP1_OUT)**
2	0h RW	**DBC_GP1_IN (DBC_GP1_IN)**
1	0h RW	**CONTROL_EP (CONTROL_EP)**
0	0h RW	**STATUS_WRITE_ON_ERROR_EN (STATUS_WRITE_ON_ERROR_EN):** Enable status write generation on detecting error on Trace/DFx/GP2 EPs

16.482 DBC_EXI_CONTROL_STATUS_REG (DBC_EXI_CONTROL_STATUS_REG)—Offset 70h

DBC_EXI_CONTROL_STATUS_REG

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**DBC_GP2_IN_STATUS_LOG (DBC_GP2_IN_STATUS_LOG):** Set when the DMA transfer request status for GP2 IN is completed. Cleared when a new DMA transfer request is received.
30	0h RO	**DBC_GP2_OUT_STATUS_LOG (DBC_GP2_OUT_STATUS_LOG):** Set when the DMA transfer request status for GP2 OUT is completed. Cleared when a new DMA transfer request is received.
29:13	0h RO	**RSVD (RSVD)**
12	0h RW	**DBC_EXI_CLK_GATING_CTRL (DBC_EXI_CLK_GATING_CTRL):** Disable gating for prim_clk for DbC-ExI logic. By default clock gating is enabled.
11	0h RW	**DBC_SAI_CHECK_POLICY (DBC_SAI_CHECK_POLICY):** 1: Disable SAI checking on read requests only 0: Enable Default SAI check (on Reads & Writes)
10	0h RW	**TRACE_SEQUENCER_PIPELINE_DISABLE (TRACE_SEQUENCER_PIPELINE_DISABLE):** Set to disable pipelining of read requests to fabric for different trace transfer requests. By default, trace sequencer would start issuing reads requests to Fabric for a subsequent transfer request while the reads for the previous one hasnt been returned back to DbC 0: Read Pipelining enabled for Trace 1: Disable read pipelining for Trace
9:7	0h RW	**DBC_MAX_PKT_SIZE (DBC_MAX_PKT_SIZE):** Configurable MPS for Trace, DFx, GP2 EPs Default = 1KB 000 : 1KB 001 : 64B 010 : 128B 011 : 256B 100 : 512B Others : Reserved
6:1	0h RW	**DBC_NUM_PENDING_READS (DBC_NUM_PENDING_READS):** Constrain number of read requests pending on Fabric on behalf of DbC Eps. Sequencers limit the number of read requests that will be initiated on Fabric at any given time to NUM_PENDING_READ. NUM_PENDING_READ = [1..READS_PER_MPS] Where READS_PER_MPS is the number of read requests require for 1 MPS for the given EP. Applies for DbC.[Trace|DFx|GP2] IN EPs
0	0h RW	**DBC_TRACE_PIPELINE_DEPTH1 (DBC_TRACE_PIPELINE_DEPTH1):** Constrain DbC.Trace IN Pipeine to 1 deep. Limit processing of DbC Trace to one transfer at any time. In other wordsUntil Trace data for the first transfer request from NPKH is completed on USB3 interface and status returned back to NPKH, subsequent transfer request is not started, only 1 Trace sequencer is active at any given time.

20:18	1h RW	**OUT_PORT_ARB_GRANT_COUNT (OUT_PORT_ARB_GRANT_COUNT)**
17	0h RO	Reserved.
16	0h RW	**OUT_EP_BURST_SIZE (OUT_EP_BURST_SIZE):** Default: HW selects the burst size for OUT EPs based on the mode of operation Kernel Debug Mode Only: Supported OUT EP = 1 (GP1) ; Burst Size = 4 Platform Debug Mode Only: Supported OUT EPs = 2 (DFx, GP2), Burst Size = 2 Kernel and Platform debug mode: Supported OUT EPs = 3 (GP1, DFx, GP2) ; Burst Size = 1 When Set to 1 ; Burst Size = 1
15	0h RW	**IGNORE_EXI_EN (IGNORE_EXI_EN)**
14	0h RW	**IGNORE_DCE (IGNORE_DCE)**
13	0h RW	**DBC_EXI_HCRESET_DISABLE (DBC_EXI_HCRESET_DISABLE):** When set to 1, DBC/DBC-EXI will not take any action on HCReset. Default behavior is to trigger HCReset flow.
12	0h RW	**DBC_ALLOW_PG (DBC_ALLOW_PG):** When set to 1, DBC/DBC-EXI will allow PG under HW initiated low power modes (D0ix). This could be used in a flow where XHC is allowed to enter low power modes, while debug data will subsequently transported to debug host after re-entry into
11:8	Fh RW	**HC_RESET_WPR_HANDLING_TIMEOUT_VALUES (HC_RESET_WPR_HANDLING_TIMEOUT_VALUES):** 0000 : 0 us (trigger exit right away) 0001 : 250 us 0010 : 500 us 1111 : 3.75 ms
7	0h RW	**TIMEOUT_BASED_HC_RESET_WPR_HANDLING (TIMEOUT_BASED_HC_RESET_WPR_HANDLING):** When set, enable timer based mechanism to allow HCReset and Warm Port Reset to override any hung situation due to any flows not completing as expected. Use HC Reset/WPR Handling Timeout values for forcing HCReset/ WPR flows
6	0h RW	**RSVD1 (RSVD1):** Reserved
5	0h RW	**INTERNAL_DBC_EXI_ENABLE (INTERNAL_DBC_EXI_ENABLE):** Enable address decode of transactions using Source Decode transactions based on Source ID instead of the default MBAR based address based decode.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**EXI_ENABLE_OVERRIDE_ENABLE (EXI_ENABLE_OVERRIDE_ENABLE):** When this bit is set, the Internal DBC ExI Enable takes priority over the external ExI Enable signal received from EXI Bridge IP Default behavior is to use exio_scr_ectrl_eavails input from ExI Bridge
3	0h RW	**TRACE_STATUS_ADDRESS (TRACE_STATUS_ADDRESS):** When this bit is set, the address for Status Write request will include the address offset. Default address for Trace Status is the base address of the trace request
2	0h RW	**ENABLE_NON_TRANSFER_STATUS (ENABLE_NON_TRANSFER_STATUS):** Enables generation of a status write on each of the interfaces with status indicating the cause of an exception flow trigger condition Default behavior is for the sequencer to return a status completion (for transfer success, or exception scenarios) only when a pending/active DMA is in progress
1	0h RW	**ENABLE_DBC_EXI_ON_CREDIT_INIT_COMPLETION (ENABLE_DBC_EXI_ON_CREDIT_INIT_COMPLETION):** Setting this bit will enforce Credit Init completion as necessary condition to allow transfers on all 3 interfaces (Trace, GP2, DFx). Default behavior requires successful Credit Init completion as necessary condition only to allow DFX OUT EP transfer and not affect other interfaces (Trace, GP2)
0	0h RW	**CREDIT_INIT_TRIGGER (CREDIT_INIT_TRIGGER):** Writing a 1 to this bit will trigger Credit Init request. A Credit Init request will be initiated irrespective of the status of the last Credit Init request initiated.

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DBC_ECO_POLICY_REG4 (DBC_ECO_POLICY_REG4)**

16.488 DBConEXI Capability Port Status and Control Register (DBC_EXI_DCPORTSC)—Offset 88h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23	0h RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.
22	0h RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1)**
17	0h RW/C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2)**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.
9	0h RO	**Reserved (RSVD_3)**

Bit Range	Default & Access	Field Name (ID): Description
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DBC_EXI_DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4)**
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DBC_EXI_DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

16.489 DBC_GP2_OUT_DMA_STS_REG1 (DBC_GP2_OUT_DMA_STS_REG1)—Offset 8Ch

GP2 OUT DMA Status Register1

16.493 DEBUG_SW_CONTROL_STATUS_REG (DEBUG_SW_CONTROL_STATUS_REG)—Offset 100h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RSVD (RSVD)**
7	0h RW	**FAST_SW_TIMEOUT_MODE (FAST_SW_TIMEOUT_MODE):** 1 : Enable Fast Timeout Simulation Mode. When set, timeout values used for SW response Timeout mode will be in micro-seconds. 0 : Normal mode. Timeout values are as defined by SW response Timeout register.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/1C	**SW_TIMEOUT_STATUS (SW_TIMEOUT_STATUS):** 1: Set by HW when Timeout occurred and HW disabled SW Handling 0: Timeout not triggered Set by HW, Cleared by SW. Timeout will also clear Debug SW Available bit.
5:2	0h RW	**SW_RESPONSE_TIMEOUT (SW_RESPONSE_TIMEOUT):** 0000 : 1 ms 0001: 20 ms 0010: 40 ms 0011: 60 ms 0100: 80 ms 0101: 100 ms 0110: 200ms 1111: 1100ms
1	0h RW	**SW_RESPONSE_TIMEOUT_ENABLE (SW_RESPONSE_TIMEOUT_ENABLE):** 1: HW will timeout and trigger STALL response if SW did not respond within SW Timeout period 0: Timeout is not triggered.
0	0h RW	**DEBUG_SW_AVAILABLE (DEBUG_SW_AVAILABLE):** 1: Debug SW has been loaded and is available 0: Debug SW is not available When Debug SW is available, then HW presents the Control Transfer requests to SW and relies on SW to handle the requests.

16.494 DEBUG_REQUEST_INFO_AND_STATUS_REG (DEBUG_REQUEST_INFO_AND_STATUS_REG)—Offset 104h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**RESPONSE_PACKET_LAST (RESPONSE_PACKET_LAST):** Specifies that this response packet is the last packet for satisfying the current request or if there is additional packets to complete the request. 1 : Current response packet is the last data packet for the current request 0: Current response packet is not the last data packet for the current request. There is one or more additional data packets required to complete the request. For example, If the response data buffer is 512B, and the response is > 512B, then there will be multiple response data packets required, and this bit is set to 0 except for the last one.
30:27	0h RW	**RESPONSE_TYPE (RESPONSE_TYPE):** Specifies the type of response that needs to be generated 000 : DATA Response 001: ACK 010: STALL (Request not supported) Others: Reserved For DATA response, associate DATA is written into the Response Stack by SW.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW/1S	**DEBUG_RESPONSE_AVAIL (DEBUG_RESPONSE_AVAIL):** 1: Valid SW response available for HW 0: No response available SW sets this bit when it has generated a response for a debug request received. HW clears this bit after the response has been consumed (completed the transfer to host).
25:15	0h RO	**RSVD (RSVD)**
14:12	0h RW	**DEBUG_REQUEST_ERROR_TYPE (DEBUG_REQUEST_ERROR_TYPE):** Indicates that cause/Type of the error detect. Valid only when Debug Request Error Detected bit is 1 Encoding
11	0h RW	**DEBUG_REQUEST_ERROR_DETECTED (DEBUG_REQUEST_ERROR_DETECTED):** HW sets this bit to indicate to Debug SW that an error was detected on the packet received on the USB3 link
10:1	0h RO	**DEBUG_REQUEST_LENGTH (DEBUG_REQUEST_LENGTH):** Length of any data associated with the current request. This field is valid only when a debug request is pending.
0	0h RW/1C	**DEBUG_REQUEST_PENDING (DEBUG_REQUEST_PENDING):** 1: Debug request is available for SW to consume 0: No request is pending for SW HW sets this bit to indicate to Debug SW that a control transfer request is pending for SW to handle. SW clears this bit once it has consumed the request.

16.511 DEBUG_RESPONSE_INFO_AND_STATUS_REG (DEBUG_RESPONSE_INFO_AND_STATUS_REG)—Offset 148h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RESPONSE_DATA_LENGTH (RESPONSE_DATA_LENGTH):** Length of data associated with the current response. This field is valid only when a debug response is available. (bit[0] is set). The length of the data packet will be equal to the response data stack size except when the Request Packet Last = 1 where it may a short packet (< response data stack size)
15:0	0h RO	**RSVD (RSVD)**

16.512 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_0)—Offset 180h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.513 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_1)—Offset 184h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.514 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_2)—Offset 188h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.515 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_3)—Offset 18Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.516 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_4)—Offset 190h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.517 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_5)—Offset 194h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.518 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_6)—Offset 198h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.519 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_7)—Offset 19Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.520 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_8)—Offset 1A0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.521 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_9)—Offset 1A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.522 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_10)—Offset 1A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.523 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_11)—Offset 1ACh

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.524 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_12)—Offset 1B0h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.525 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_13)—Offset 1B4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.526 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_14)—Offset 1B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.527 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_15)—Offset 1BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.528 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_16)—Offset 1C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.529 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_17)—Offset 1C4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.530 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_18)—Offset 1C8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.531 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_19)—Offset 1CCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.532 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_20)—Offset 1D0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.533 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_21)—Offset 1D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.534 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_22)—Offset 1D8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.535 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_23)—Offset 1DCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.536 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_24)—Offset 1E0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.537 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_25)—Offset 1E4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.538 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_26)—Offset 1E8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.539 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_27)—Offset 1ECh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.540 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_28)—Offset 1F0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.541 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_29)—Offset 1F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.542 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_30)—Offset 1F8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.543 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_31)—Offset 1FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.544 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_32)—Offset 200h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.545 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_33)—Offset 204h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.546 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_34)—Offset 208h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.547 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_35)—Offset 20Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.548 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_36)—Offset 210h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.549 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_37)—Offset 214h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.550 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_38)—Offset 218h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.551 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_39)—Offset 21Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.552 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_40)—Offset 220h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.553 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_41)—Offset 224h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.554 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_42)—Offset 228h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.555 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_43)—Offset 22Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.556 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_44)—Offset 230h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.557 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_45)—Offset 234h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.558 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_46)—Offset 238h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.559 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_47)—Offset 23Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.560 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_48)—Offset 240h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.561 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_49)—Offset 244h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.562 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_50)—Offset 248h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.563 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_51)—Offset 24Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.564 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_52)—Offset 250h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.565 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_53)—Offset 254h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.566 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_54)—Offset 258h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.567 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_55)—Offset 25Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.568 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_56)—Offset 260h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.569 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_57)—Offset 264h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.570 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_58)—Offset 268h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.571 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_59)—Offset 26Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.572 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_60)—Offset 270h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.573 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_61)—Offset 274h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.574 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_62)—Offset 278h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.575 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_63)—Offset 27Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.576 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_64)—Offset 280h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.577 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_65)—Offset 284h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.578 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_66)—Offset 288h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.579 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_67)—Offset 28Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.580 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_68)—Offset 290h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.581 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_69)—Offset 294h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.582 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_70)—Offset 298h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.583 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_71)—Offset 29Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.584 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_72)—Offset 2A0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.585 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_73)—Offset 2A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.586 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_74)—Offset 2A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.587 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_75)—Offset 2ACh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.588 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_76)—Offset 2B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.589 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_77)—Offset 2B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.590 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_78)—Offset 2B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.591 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_79)—Offset 2BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.592 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_80)—Offset 2C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.593 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_81)—Offset 2C4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.594 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_82)—Offset 2C8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.595 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_83)—Offset 2CCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.596 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_84)—Offset 2D0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.597 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_85)—Offset 2D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.598 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_86)—Offset 2D8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.599 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_87)—Offset 2DCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.600 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_88)—Offset 2E0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.601 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_89)—Offset 2E4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.602 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_90)—Offset 2E8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.603 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_91)—Offset 2ECh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.604 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_92)—Offset 2F0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.605 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_93)—Offset 2F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.606 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_94)—Offset 2F8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.607 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_95)—Offset 2FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.608 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_96)—Offset 300h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.609 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_97)—Offset 304h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.610 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_98)—Offset 308h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.611 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_99)—Offset 30Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.612 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_100)—Offset 310h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.613 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_101)—Offset 314h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.614 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_102)—Offset 318h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.615 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_103)—Offset 31Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.616 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_104)—Offset 320h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.617 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_105)—Offset 324h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.618 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_106)—Offset 328h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.619 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_107)—Offset 32Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.620 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_108)—Offset 330h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.621 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_109)—Offset 334h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.622 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_110)—Offset 338h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.623 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_111)—Offset 33Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.624 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_112)—Offset 340h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.625 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_113)—Offset 344h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.626 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_114)—Offset 348h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.627 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_115)—Offset 34Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.628 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_116)—Offset 350h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.629 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_117)—Offset 354h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.630 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_118)—Offset 358h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.631 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_119)—Offset 35Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.632 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_120)—Offset 360h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.633 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_121)—Offset 364h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.634 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_122)—Offset 368h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.635 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_123)—Offset 36Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.636 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_124)—Offset 370h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.637 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_125)—Offset 374h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.638 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_126)—Offset 378h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.639 DEBUG_RESPONSE_DATA_STACK (DEBUG_RESPONSE_DATA_STACK_REG_127)—Offset 37Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_DATA (DEBUG_RESPONSE_DATA):** Response Data generated by SW for the current response. Data is valid only when a debug response is available (bit[0] is set) and Response Type = DATA

16.640 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_0)—Offset 380h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

16.641 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_1)—Offset 384h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

16.642 DEBUG_RESPONSE_HEADER_STACK_REG (DEBUG_RESPONSE_HEADER_STACK_REG_2)—Offset 388h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DEBUG_RESPONSE_HEADER (DEBUG_RESPONSE_HEADER):** Response header generated by SW as a response to the current request/command processed by the SW

16.643 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 21
Function: 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

16.644 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 21
Function: 0

Default: 8C31h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8C31h RO/V	**Device ID (DID):** See Global Device ID table in Chap. 6 for value

16.645 Command (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

16.646 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 21
Function: 0

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD)**

16.647 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

16.648 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 21
Function: 0

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

16.649 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 21
Function: 0

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

16.650 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 21
Function: 0

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

16.651 Master Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

16.652 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

16.653 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

Access Method

Type: CFG Register (Size: 64 bits)
Device: 21
Function: 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

16.654 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

16.655 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

16.656 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

16.657 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

16.658 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

16.659 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 1FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**ECO1 (ECO1):** Reserved
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables.
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represents the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

16.660 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 3C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**ECO1 (ECO1):** Reserved
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B

Bit Range	Default & Access	Field Name (ID): Description
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

16.661 Clock Gating (XHCLKGTEN)—Offset 50h

Access Method

Type: CFG Register (Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2 (Rsvd2):** Reserved
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown

Bit Range	Default & Access	Field Name (ID): Description
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.

Bit Range	Default & Access	Field Name (ID): Description
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

16.662 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Rsvd2 (Rsvd2)**
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

16.663 Serial Bus Release Number (SBRN)—Offset 60h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

16.664 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Read-Only. These bits are reserved for future use and should read as "00".
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

16.665 Best Effort Service Latency (BESL)—Offset 62h

Bset Effort Service Latency.

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

16.666 PCI Power Management Capability ID (PM_CID)—Offset 70h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

16.667 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

16.668 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD)**
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	2h RW/L	**Version (Version):** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

16.669 Power Management Control/Status (PM_CS)—Offset 74h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD)**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2)**
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

16.670 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 21
Function: 0

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

16.671 Next item pointer (MSI_NEXT)—Offset 81h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

16.672 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD)**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

16.673 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD)**

16.674 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

16.675 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

16.676 Device Idle Capability (DEVIDLE)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VID (VID)**
27:24	0h RO	**REV (REV)**
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long.
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CID)**

16.677 Vendor Specific Header (VSHDR)—Offset 94h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

16.678 SW LTR POINTER (SWLTRPTR)—Offset 98h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

16.679 Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 80AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	80ACh RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	1h RW/L	**Valid (VALID):** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

16.680 Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h

Access Method

Type: CFG Register (Size: 16 bits)
Device: 21
Function: 0

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

16.681 High Speed Configuration 2 (HSCFG2)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd1 (Rsvd1)**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

16.682 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.683 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2)—Offset B4h

Reserved

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.684 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.685 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset D4h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.686 XHCC3 (XHCC3)—Offset FCh

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (Rsvd1):** Reserved
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface
1	1h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

16.687 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH)**

16.688 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
15:0	100h RW/L	**Host Controller Interface Version Number (HCIVERSION)**

16.689 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10000820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	10h RW/L	**Number of Ports (MaxPorts)**
23:19	0h RW/L	**Rsvd1 (Rsvd1)**
18:8	8h RW/L	**Number of Interrupters (MaxIntrs)**
7:0	20h RW/L	**Number of Device Slots (MaxSlots)**

16.690 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 94000054h

Bit Range	Default & Access	Field Name (ID): Description
31:27	12h RW/L	**Max Scratchpad Buffers LO (MaxScratchpadBufs)**
26	1h RW/L	**Scratchpad Restore (SPR)**
25:21	0h RW/L	**Max Scratchpad Buffers HI (MaxScratchpadBufs_HI)**
20:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMax)**
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST)**

16.691 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4h RW/L	**U2 Device Exit Latency (U2DEL)**
15:8	0h RW/L	**Rsvd1 (Rsvd1)**
7:0	1h RW/L	**U1 Device Exit Latency (U1DEL)**

16.692 Capability Parameters (HCCPARAMS)—Offset 10h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 200077C1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (xECP)**
15:12	7h RW/L	**Maximum Primary Stream Array Size (MaxPSASize)**
11	0h RW/L	**Contiguous Frame ID Capability (CFC)**
10	1h RW/L	**Stopped EDLTA Capabilty (SEC)**
9	1h RW/L	**Stopped - Short Packet Capability (SPC)**
8	1h RW/L	**Parst All Event Data (PAE)**
7	1h RW/L	**No Secondary SID Support (NSS)**
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC)**
5	0h RW/L	**Light HC Reset Capability (LHRC)**
4	0h RW/L	**Port Indicators (PIND)**
3	0h RW/L	**Port Power Control (PPC)**
2	0h RW/L	**Context Size (CSZ)**
1	0h RW/L	**BW Negotiation Capability (BNC)**
0	1h RW/L	**64-bit Addressing Capability (AC64)**

16.693 Doorbell Offset (DBOFF)—Offset 14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	C00h RO	**Doorbell Array Offset (DBAO)**
1:0	0h RO	**Rsvd1 (Rsvd1)**

16.694 Runtime Register Space Offset (RTSOFF)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	100h RO	**Runtime Register Space Offset (RTRSO)**
4:0	0h RO	**Rsvd1 (Rsvd1)**

16.695 USB Command (USBCMD)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Rsvd2 (Rsvd2)**
11	0h RW	**Enable U3 MFINDEX Stop (EU3S)**
10	0h RW	**Enable Wrap Event (EWE)**
9	0h RW	**Controller Restore State (CRS)**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Controller Save State (CSS)**
7	0h RW	**Light Host Controller Reset (LHCRST)**
6:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RW	**Host System Error Enable (HSEE)**
2	0h RW	**Interrupter Enable (INTE)**
1	0h RW	**Host Controller Reset (HCRST)**
0	0h RW	**Run/Stop (RS)**

16.696 USB Status (USBSTS)—Offset 84h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Rsvd3 (Rsvd3)**
12	0h RO	**Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.
11	0h RO	**Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.
10	0h RW/C	**Save/Restore Error (SRE)**
9	0h RO	**Restore State Status (RSS)**
8	0h RO	**Save State Status (SSS)**
7:5	0h RO	**Rsvd2 (Rsvd2)**
4	0h RW/C	**Port Change Detect (PCD)**
3	0h RW/C	**Event Interrupt (EINT)**
2	0h RW/C	**Host System Error (HSE)**
1	0h RO	**Rsvd1 (Rsvd1)**

Bit Range	Default & Access	Field Name (ID): Description
0	1h RO	**HCHalted (HCH)**

16.697 Page Size (PAGESIZE)—Offset 88h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	1h RO	**Page Size (PAGESIZE)**

16.698 Device Notification Control (DNCTRL)—Offset 94h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Notification Enable (N0_N15)**

16.699 Command Ring Low (CRCR_LO)—Offset 98h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Command Ring Pointer (CRP)**

Bit Range	Default & Access	Field Name (ID): Description
5:4	0h RO	**Rsvd1 (Rsvd1)**
3	0h RO	**Command Ring Running (CRR)**
2	0h RW/1S	**Command Abort (CA)**
1	0h RW/1S	**Command Stop (CS)**
0	0h RW	**Ring Cycle State (RCS)**

16.700 Command Ring High (CRCR_HI)—Offset 9Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Ring Pointer (CRP)**

16.701 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.702 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Device Context Base Address Array Pointer (DCBAAP)**

16.703 Configure (CONFIG)—Offset B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**Max Device Slots Enabled (MaxSlotsEn)**

16.704 Port Status and Control USB2 (PORTSC1)—Offset 480h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

16.705 Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.706 Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.707 Port Status and Control USB2 (PORTSC2)—Offset 490h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

16.708 Port Power Management Status and Control USB2 (PORTPMSC2)—Offset 494h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.709 Port X Hardware LPM Control Register (PORTHLPMC2)—Offset 49Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

16.711 Port Power Management Status and Control USB2 (PORTPMSC3)—Offset 4A4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.712 Port X Hardware LPM Control Register (PORTHLPMC3)—Offset 4ACh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.713 Port Status and Control USB2 (PORTSC4)—Offset 4B0h

Access Method

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.728 Port Status and Control USB2 (PORTSC9)—Offset 500h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**
27	0h RW	**Wake on Over-current Enable (WOE):** Note: This register is sticky.
26	0h RW	**Wake on Disconnect Enable (WDE):** Note: This register is sticky.
25	0h RW	**Wake on Connect Enable (WCE):** Note: This register is sticky.
24	0h RO	**Cold Attach Status (CAS)**
23	0h RW/C	**Port Config Error Change (CEC):** Note: This register is sticky.
22	0h RW/C	**Port Link State Change (PLC):** Note: This register is sticky.
21	0h RW/C	**Port Reset Change (PRC):** Note: This register is sticky.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW/C	**Over-current Change (OCC):** Note: This register is sticky.
19	0h RW/C	**Warm Port Reset Change (WRC):** Note: This register is sticky.
18	0h RW/C	**Port Enabled Disabled Change (PEC):** Note: This register is sticky.
17	0h RW/C	**Connect Status Change (CSC):** Note: This register is sticky.
16	0h RW	**Port Link State Write Strobe (LWS)**
15:14	0h RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0h RW	**Port Speed (PortSpeed):** Note: This register is sticky.
9	1h RW	**Port Power (PP):** Note: This register is sticky.
8:5	5h RW	**Port Link State (PLS):** Note: This register is sticky.
4	0h RW/1S	**Port Reset (PR)**
3	0h RW	**Over-current Active (OCA):** Note: This register is sticky.
2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW/C	**Port Enabled Disabled (PED):** Note: This register is sticky.
0	0h RW	**Current Connect Status (CCS):** Note: This register is sticky.

16.729 Port Power Management Status and Control USB2 (PORTPMSC9)—Offset 504h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Port Test Control (PTC):** Note: This register is sticky.
27:17	0h RO	**Rsvd1 (Rsvd1)**
16	0h RW	**Hardware LPM Enable (HLE)**

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**Device Address (DA):** Note: This register is sticky.
7:4	0h RW	**Host Initiated Resume Duration (HIRD):** Note: This register is sticky.
3	0h RW	**Remote Wake Enable (RWE):** Note: This register is sticky.
2:0	0h RW	**L1 Status (L1S):** Note: This register is sticky.

16.730 Port X Hardware LPM Control Register (PORTHLPMC9)—Offset 50Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**RESERVED (RSVD)**
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.
1:0	0h RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.

16.731 Port Status and Control USB3 (PORTSC10)—Offset 510h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR)**
30	0h RW/L	**Device Removable (DR)**
29:28	0h RO	**Rsvd2 (Rsvd2)**

16.750 Port Power Management Status and Control USB3 (PORTPMSC16)—Offset 574h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved (RSVD)**
16	0h RW	**Force Link PM Accept (FLA)**
15:8	0h RW/S	**U2 Timeout (U2T)**
7:0	0h RW/S	**U1 Timeout (U1T)**

16.751 USB3 Port Link Info (PORTLI16)—Offset 578h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RO	**Link Error Count (LEC)**

16.752 Microframe Index (RTMFINDEX)—Offset 2000h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd1 (Rsvd1)**
13:0	0h RO	**Microframe Index (IMAN0)**

16.753 Interrupter 1 Management (IMAN0)—Offset 2020h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.754 Interrupter 1 Moderation (IMOD0)—Offset 2024h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.755 Event Ring Segment Table Size 1 (ERSTSZ0)—Offset 2028h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.756 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO0)—Offset 2030h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.757 Event Ring Segment Table Base Address High 1 (ERSTBA_HI0)—Offset 2034h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.758 Event Ring Dequeue Pointer Low 1 (ERDP_LO0)—Offset 2038h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.759 Event Ring Dequeue Pointer High 1 (ERDP_HI0)—Offset 203Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.760 Interrupter 2 Management (IMAN1)—Offset 2040h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.761 Interrupter 2 Moderation (IMOD1)—Offset 2044h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.762 Event Ring Segment Table Size 2 (ERSTSZ1)—Offset 2048h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.763 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO1)—Offset 2050h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.764 Event Ring Segment Table Base Address High 2 (ERSTBA_HI1)—Offset 2054h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.765 Event Ring Dequeue Pointer Low 2 (ERDP_LO1)—Offset 2058h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.766 Event Ring Dequeue Pointer High 2 (ERDP_HI1)—Offset 205Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.767 Interrupter 3 Management (IMAN2)—Offset 2060h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.768 Interrupter 3 Moderation (IMOD2)—Offset 2064h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.769 Event Ring Segment Table Size 3 (ERSTSZ2)—Offset 2068h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.770 Event Ring Segment Table Base Address Low 3 (ERSTBA_LO2)—Offset 2070h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.771 Event Ring Segment Table Base Address High 3 (ERSTBA_HI2)—Offset 2074h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.772 Event Ring Dequeue Pointer Low 3 (ERDP_LO2)—Offset 2078h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.773 Event Ring Dequeue Pointer High 3 (ERDP_HI2)—Offset 207Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.774 Interrupter 4 Management (IMAN3)—Offset 2080h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.775 Interrupter 4 Moderation (IMOD3)—Offset 2084h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.776 Event Ring Segment Table Size 4 (ERSTSZ3)—Offset 2088h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.777 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO3)—Offset 2090h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.778 Event Ring Segment Table Base Address High 4 (ERSTBA_HI3)—Offset 2094h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.779 Event Ring Dequeue Pointer Low 4 (ERDP_LO3)—Offset 2098h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.780 Event Ring Dequeue Pointer High 4 (ERDP_HI3)—Offset 209Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.781 Interrupter 5 Management (IMAN4)—Offset 20A0h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**
1	0h RW	**Interrupt Enable (IE)**
0	0h RW/C	**Interrupt Pending (IP)**

16.782 Interrupter 5 Moderation (IMOD4)—Offset 20A4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**

16.796 Interrupter 7 Moderation (IMOD6)—Offset 20E4h

There are 8 IMOD registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC)**
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI)**

16.797 Event Ring Segment Table Size 7 (ERSTSZ6)—Offset 20E8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd1 (Rsvd1)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS)**

16.798 Event Ring Segment Table Base Address Low 7 (ERSTBA_LO6)—Offset 20F0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA)**
5:0	0h RO	**Rsvd1 (Rsvd1)**

16.799 Event Ring Segment Table Base Address High 7 (ERSTBA_HI6)—Offset 20F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.800 Event Ring Dequeue Pointer Low 7 (ERDP_LO6)—Offset 20F8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.801 Event Ring Dequeue Pointer High 7 (ERDP_HI6)—Offset 20FCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.802 Interrupter 8 Management (IMAN7)—Offset 2100h

There are 8 IMAN registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Rsvd1 (Rsvd1)**

16.806 Event Ring Segment Table Base Address High 8 (ERSTBA_HI7)—Offset 2114h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA)**

16.807 Event Ring Dequeue Pointer Low 8 (ERDP_LO7)—Offset 2118h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP)**
3	0h RW/C	**Event Handler Busy (EHB)**

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RW	**Dequeue ERST Segment Index (DESI)**

16.808 Event Ring Dequeue Pointer High 8 (ERDP_HI7)—Offset 211Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP)**

16.809 Door Bell 1 (DB0)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.810 Door Bell 2 (DB1)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.811 Door Bell 3 (DB2)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.812 Door Bell 4 (DB3)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.813 Door Bell 5 (DB4)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.814 Door Bell 6 (DB5)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.815 Door Bell 7 (DB6)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.816 Door Bell 8 (DB7)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.817 Door Bell 9 (DB8)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.818 Door Bell 10 (DB9)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.819 Door Bell 11 (DB10)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.820 Door Bell 12 (DB11)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.821 Door Bell 13 (DB12)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.822 Door Bell 14 (DB13)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.823 Door Bell 15 (DB14)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.824 Door Bell 16 (DB15)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.825 Door Bell 17 (DB16)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.826 Door Bell 18 (DB17)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.827 Door Bell 19 (DB18)—Offset 3048h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.828 Door Bell 20 (DB19)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.829 Door Bell 21 (DB20)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.830 Door Bell 22 (DB21)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.831 Door Bell 23 (DB22)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.832 Door Bell 24 (DB23)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.833 Door Bell 25 (DB24)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.834 Door Bell 26 (DB25)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.835 Door Bell 27 (DB26)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.836 Door Bell 28 (DB27)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.837 Door Bell 29 (DB28)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.838 Door Bell 30 (DB29)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.839 Door Bell 31 (DB30)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.840 Door Bell 32 (DB31)—Offset 307Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.841 Door Bell 32 (DB32)—Offset 3080h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	**Rsvd1 (Rsvd1)**
7:0	0h RW	**DB Target (DT)**

16.842 XECP_SUPP_USB2_0 (XECP_SUPP_USB2_0)—Offset 8000h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 2000802h

Bit Range	Default & Access	Field Name (ID): Description
31:24	2h RO	**USB Major Revision: 2.0 (USB2_MAJ_REV)**
23:16	0h RO	**USB Minor Revision (USB_MIN_REV)**
15:8	8h RO	**Next Capability Pointer (NCP)**
7:0	2h RO	**Supported Protocol ID (SPID)**

16.843 XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1)—Offset 8004h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 20425355h

Bit Range	Default & Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1):** Namestring USB

16.844 XECP_SUPP_USB2_2 (XECP_SUPP_USB2_2)—Offset 8008h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 30190901h

Bit Range	Default & Access	Field Name (ID): Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low)
27:21	0h RO	**Rsvd0 (Rsvd0)**
20	1h RW/L	**BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMCC registers.
19	1h RW/L	**Protocol Defined - Hardware LMP Capability (HLC)**
18	0h RO	**Protocol Defined - Integrated Hub Implementation (IHI)**

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Protocol Defined - High SPeed Only (HSO)**
16	1h RO	**Reserved (RSVD)**
15:8	9h RO	**Compatible Port Count (CPC)**

16.858 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This is a register that describe the host controller the extended cap location. It includes the , XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192. This register is not subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 4DFFC0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	4Dh RW/L	**Valid Length (VALID_LENGTH):** Indicates the number of valid DWords in the capability, that need to be saved and restored. 47h -> 818Bh is the last valid byte
15:8	FFh RW/L	**Next Capability Pointer (XECP_HOST_NEXT_CAP_OFFSET)**
7:0	C0h RW/L	**Supported Protocol ID (VEND_DEF_HOST_CAP_ID)**

16.859 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP

16.860 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.

16.861 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**RESERVED (RSVD)**
9:5	0h WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots
4:1	0h WO	**EP Number (EP_NUM):** 4bits of EP number
0	0h WO	**Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP

16.862 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8100h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RW	**Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** 31:25 Reserved (24): disable marking overlap flag on all TT periodic INs. (23): disable async. scheduling while periodic active to same port (22): disable "level" method of USB2 port periodic done check (on by default) (21): enable "strobe" method of USB2 port periodic done check (off by default)
20:13	4h RW	**TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved
12:11	0h RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16
10:9	0h RW	**Maximum EP Per Slot (MAX_EP_SLOT):** 0: 32 1: 16 2: 8 3: 4
8	1h RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN)**

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Scheduler Host Control Reg (SCHED_HOST_CTRL):** (0): disable poll delay (1): disable TRM active in EP valid check (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) (5:4) scheduler sort pattern 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 (6): disable 1 pack scheduling limit when ISO pending in present microframe (7): enable check to stop scheduling on port that are not connected

16.863 Global Port Control (HOST_CTRL_PORT_CTRL)—Offset 80A0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 380Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OVERFLOW ERROR DETECTION ENABLE (OVERFLOW_ERR_DETECT_EN)**
30:12	3h RW	**HBUF_WATER_MARK (HBUF_WATER_MARK)**
11	1h RW	**CPL Cut Thru Enable (CPL_CUT_THRU_EN)**
10:4	0h RW	**RESERVED (RSVD0)**
3:0	Fh RW	**RESERVED (RSVD1)**

16.864 Power Management Control (PMCTRL_REG)—Offset 80A4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 2DFF90h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.
30	0h RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in in reference to the source prior to the RTD3 changes.
29	0h RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate
28	0h RW	**CLR_PME_FLAG_PULSE_AUX_CCLK (CLR_PME_FLAG_PULSE_AUX_CCLK)**
27	0h RW	**RESERVED (RSVD)**
26	0h RW	**XLFPSCOUNTSRC (XLFPSCOUNTSRC):** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0h RW	**XELFPSRTC (XELFPSRTC):** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3
24	0h RW	**XMPHYSPGDD0I2 (XMPHYSPGDD0I2):** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
23	0h RW	**XMPHYSPGDD0I3 (XMPHYSPGDD0I3):** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
22	0h RW	**XMPHYSPGDRTD3 (XMPHYSPGDRTD3):** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled
21:18	Bh RW	**XD3RTCPTTM (XD3RTCPTTM):** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining SSIC Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and SSIC H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms.
17	0h RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3/SSIC ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3/SSIC PHY SUS Well Power Gating is enabled.

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD
15:8	FFh RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection.
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL (SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL):** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.
3	0h RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state.
2	0h RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.
1	0h RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0 RTD3 triggered 1 - Port Triggered when in L1, L2 or Disabled, Disconnected
0	0h RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled

16.865 PGCB Control (PGCBCTRL_REG)—Offset 80A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 315555h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:25	0h RW	**IP_INACCESSIBLE_HYSTERESIS_TIMER (IP_INACCESSIBLE_HYSTERESIS_TIMER):** 000 ? 50us 001 ? 100us 010 ? 150us 011 ? 200us 000 ? 250us 001 ? 300us 010 ? 350us 111 ? 400us
24	0h RW	**Override_Disable (OVERRIDE_DISABLE)**
23:20	3h RW	**CDH Aggregation Minimum Wait Time (CDH_MIN_WAIT_TIME):** This field controls the minimum time that we must wait for resets to propagate before allowing Power Up flow to complete. The Power Up flow requires special handling of clocks, reset and sleep signaling which requires the CDH to monitor reset propagation. This timer allow for flexibility on when we consider all resets propagated. 0h Disabled 1h 2 clocks 2h 4 clocks 3h 8 clocks 4h 16 clocks 5h 32 clocks 6h 64 clocks 7h 128 clocks
19	0h RW	**RESERVED (CDH_RST_PROPAGATION_CNTRL):** This bit will indicate the mode of operation for the CDH Reset Propagation Aggregator. It allows for a mode where the aggregation will wait for an indication from each CDH before proceeding OR ignore the CDH indication before proceeding. Regardless of the mode, the aggregator will enforce the CDH Aggregation Mini Wait Time. 0 Aggregate all the CDH indications before triggering the CDH Aggregation Mini Wait Time. Once the Min Wait Time is met a notification to the Power Sequencer/Control will be initiated 1 Trigger the CDH Aggregation Mini Wait Time w/o waiting for CDH indication. Once the Min Wait time is met a notification to the Power Sequencer/Control will be initiated.
18	0h RW	**MMP_PFET_REQ_OVRD (MMP_PFET_REQ_OVRD):** This bit will disable the MMP PFET request condition for PGCB control. 1 MMP PFET Request Ignored 0 Default
17:16	1h RW	**PGCB Clock Gate Request to PGCB Sleep (PGCB_CLK_GATE_REQ_2_PGCB_SLEEP):** Value representing the minimum number of delay clocks required between the assertion of pgcb_ip_clkgate_b to the deassertion of pgcb_sleep on PG exit. (This is only applicable for IP-Accessible PG with state-retention enabled.) Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
15:14	1h RW	**PGCB Sleep Deassertion to PGCB ISM Unlock Req (PGCB_SLEEP_DEASRTN_2_ISM_UNLOCK_REQ):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of gcb_sleepto the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
13:12	1h RW	**PGCB Prim Reset Deassertion to PGCB Next State (PGCB_PRIMRST_DEASRTN_2_NSTATE):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b.
11:10	1h RW	**PGCB Side Reset Deassertion to PGCB Prim Reset Deassertion (PGCB_SIDERST_DEASRTN_2_PRIMERST_DEASRTN):** Value representing the number of delay clocks required between the deassertion of gcb_force_rst_bto the deassertion of gcb_force_prim_rst_b (This is only applicable for IP-Accessible PG.) Please see the description of cfg_tsleepact for more details.
9:8	1h RW	**PGCB Latch Isolation High to PGCB Clock Ungate Request (PGCB_LATCH_ISO_HI_2_PGCB_CLK_UNGATE_REQ):** Value representing the number of delay clocks required between the assertion of pgcb_isol_latchen to the deassertion of pgcb_ip_clkgate_req_b. Please see the description of cfg_tsleepact for more details.
7:6	1h RW	**PGCB Isolation Deassertion to PGCB Latch Isolation High Count (PGCB_ISO_DEASRTN_2_PGCB_ISO_HI_CNT):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_en_b to the assertion of gcb_isol_latchen. Please see the description of cfg_tsleepact for more details.
5:4	1h RW	**PGCB Reset Assertion to PGCB Power Down Request Count (PGCB_RST_2_PGCB_PWRDOWN_REQCNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_pmc_pg_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_sleep. Please see the description of cfg_tsleepact for more details.

Bit Range	Default & Access	Field Name (ID): Description
3:2	1h RW	**PGCB Isolation Assertion to PGCB Reset Assertion Count (PGCB_ISO_ASRTN_2_PGCB_RST_ASRTN_CNT):** Value representing the minimum number of delay clocks required between the assertion of gcb_isol_en_bto the assertion of gcb_force_prim_rst_band gcb_force_rst_b Please see the description of [1:0] for more details.
1:0	1h RW	**PGCB Sleep Assertion to PGCB Isolation Enable Count (PGCB_SLEEP_ASRTN_2_PGCB_ISO_EN_CNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_sleep (and the deassertion of pgcb_isol_latchen) to the assertion of pgcb_isol_en_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_latchen to the assertion of pgcb_isol_en_b, as well as the minimum number of delay clocks required between the assertion of pgcb_sleep to the assertion of pgcb_pmc_pg_req_b. Common for all cfg_t* inputs: 0 1 clock 1 2 clocks 0 8 clocks 1 256 clocks For any of the cfg_t* inputs that an IP may feel are a don-care and the IP does not feel they will be useful for post-silicon debug, the recommendation is to tie the input to 201 (2 clocks). Otherwise, the inputs may be tied to another relevant value or connected to a configuration register. Note: These signals may only change while pgcb_pwrupidle is asserted, if pgcb_pwrupidle is deasserted it should be valid and stable. (It may change the same cycle that ip_pgcb_pg_rdy_req_b asserts.)

16.866 D0I3 Control (DOI3CTRL_REG)—Offset 80ACh

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3	1h RW/1C	**RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0I3 (D0I3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1:0	0h RO	**RESERVED (RSVD1)**

16.867 HOST_CTRL_MISC_REG (HOST_CTRL_MISC_REG)—Offset 80B0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 1037Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USB2_LTRUPDT_DIS (USB2_LTRUPDT_DIS)**
30	0h RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset.
29	0h RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected
28	0h RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling.
27	0h RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination.
26	0h RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk.
25	0h RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, we rely on gating of frame timer due to proper port state and idleness tracking from the pipeline.
24	0h RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RW	**RESERVED (RSVD1)**
19	0h RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins.
18:16	1h RW	**Extra uFrame (EXTRA_UFRAME):** This register controls the extra number of uFrames added onto the advancing of late FID check.
15:0	37Fh RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in miliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error.

6:0	0h RW	**SSPE_REG (SSPE_REG)**

16.870 (SSPITPE)—Offset 80BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**RSVD (RSVD)**
6:0	7Fh RW	**ITP Transmit Enable (ITP_TRANSMIT_EN):** Width is scaled with USB3 Port Count PortCount=4

16.871 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 15FC0F0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. Write 1 to this register will issue a cold reset to USB3 ports.
30	0h RW	**RESERVED (RSVD)**
29	0h RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.
28	0h RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.
27	0h RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.
26	0h RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.
25	0h RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS
24	1h RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1 prevent a reset being generated due to the USB3 port link down condition.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1 ignore the main power up reset for USB3 PIPE PHY reset.
22	1h RW	**RESERVED (RSVD_1)**
21	0h RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1' ignore HC reset to reset the USB2 Port logic
20	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1' ignore HC reset to the USB PHY power-on reset
19	1h RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core.
18	1h RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1' enable EEPROM reload on every main power-up
17	1h RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1' ignore HC reset to the PCIe PHY PIPE reset
16	1h RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1' ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset
15	1h RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1' ignore warm reset the USB PHY power on reset
14	1h RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1' allow PCIe link down to cause a reset to the rest of the core
13	0h RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1' ignore hot reset to the USB3 port logic
12	0h RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1' ignore warm reset to the USB3 port logic
11	0h RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1' ignore main power up reset to USB3 port logic
10	0h RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1' ignore main power up reset to USB2 port logic
9	0h RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1' ignore main power up reset to PCIe core
8	0h RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1' ignore main power up reset to PCIe PHY
7	1h RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1' ignore HC reset to the USB PHY
6	1h RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1' ignore warm reset to the USB PHY
5	1h RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function

Bit Range	Default & Access	Field Name (ID): Description
4	1h RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1' allow main power off condition to trigger a main power domain reset
3	0h RW	**Ignore Wait For PERST# During Power Show Down (IGN_PERST_PSD):** When set to '1' ignore waiting for PERST# deassertion during main power show down.
2	0h RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** When fundamental reset is asserted during AUX power up, if this bit is set, then we will ignore PERST# such that purely wait for timeout to deassert fundamental reset.
1:0	0h RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset

16.872 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4A4008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	4A4h RW	**Max. TT BW Allowed (MAX_TT_BWA):** see white paper
11:0	8h RW	**Per Packet Overhead SS BW (PP_OVRH_SSBW):** BW calculation: Overhead per packet for SS BW calculations. see white paper.

16.873 High Speed TT Bandwidth Overload (HOST_BW_OV_HS_REG)—Offset 80C8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1A01Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
23:12	1Ah RW	**Per Packet Overhead HS-TT BW (PP_OVRH_HSTTBW):** BW calculation: Overhead per packet for HS-TT BW calculations. see white paper.
11:0	1Fh RW	**Per Packet Overhead HS BW (PP_OVRH_HSBW):** BW calculation: Overhead per packet for HS BW calculations. see white paper.

16.874 Bandwidth Overload Full Low Speed (HOST_BW_OV_FS_LS_REG)—Offset 80CCh

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 14080h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	14h RW	**Per Packet Overhead FS BW (PP_OVRH_FSBW):** BW calculation: Overhead per packet for FS BW calculations. see white paper.
11:0	80h RW	**Per Packet Overhead LS BW (PP_OVRH_LSBW):** BW calculation: Overhead per packet for LS BW calculations. see white paper.

16.875 System Bandwidth Overload (HOST_BW_OV_SYS_REG)—Offset 80D0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 32010h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	32h RW	**Per TT Packet Overhead System BW (PTTP_OVRH_SBW):** BW calculation: Overhead per TT packet for System BW calculations. see white paper.

Bit Range	Default & Access	Field Name (ID): Description
11:0	10h RW	**Per Packet Overhead System BW (PP_OVRH_SBW):** BW calculation: Overhead per packet for System BW calculations. see white paper.

16.876 Scheduler Async Delay (HOST_CTRL_SCH_ASYNC_DELAY_REG)—Offset 80D4h

Global defaults for inserting delays between packets in the scheduler for async. types.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**RESERVED (RSVD)**
19	0h RW	**High-Speed Bulk Delay Enable (HS_BD_EN)**
18:16	0h RW	**High-Speed Bulk Delay Default (HS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
15	0h RW	**Full-Speed Bulk Delay Enable (FS_BD_EN)**
14:12	0h RW	**Full-Speed Bulk Delay Default (FS_BD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
11	0h RW	**High-Speed Control Delay Enable (HS_CD_EN)**
10:8	0h RW	**High-Speed Control Delay Default (HS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
7	0h RW	**Full-Speed Control Delay Enable (FS_CD_EN)**
6:4	0h RW	**Full-Speed Control Default (FS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)
3	0h RW	**Low-Speed Control Delay Enable (LS_CD_EN)**
2:0	0h RW	**Low-Speed Control Delay Default (LS_CD_DEF):** (0=125us,1=250us,2=500us,3=1ms,...)

16.877 DEVICE MODE CONTROL REG 0 (DUAL_ROLE_CFG_REG0)—Offset 80D8h

All bits in this register must be in the Always ON Power domain (ungated SUS or AON as appropriate)

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**XDCI_DRD_CTRL_EN (REG_IN_XDCI):** When DRD_ACCESS_MODE (bit 18) =1, 0 -- The policies below is controlled by register in the XHCI MMIO 1 -- The policies below is controlled by register in the XDCI MMIO When DRD_ACCESS_MODE =0, this bit is a don?t care.
30:28	0h RW	**DRD_WDT_TIMER (DRD_WDT_TIMER):** 0-based incremental of 500ms
27	0h RW	**EN_DRD_WDT_SWITCH_FROM_HOST_TO_DEVICE (EN_DRD_WDT_SWITCH_FROM_HOST_TO_DEVICE)**
26	0h RW	**EN_DRD_WDT_SWITCH_FROM_DEVICE_TO_HOST (EN_DRD_WDT_SWITCH_FROM_DEVICE_TO_HOST)**
25	0h RW	**EN_DRD_WDT_SWITCH_OUT_OF_COLD_RESET (EN_DRD_WDT_SWITCH_OUT_OF_COLD_RESET)**
24	0h RW	**SW_VBUS_VALID (SW_VBUS_VALID):** if SW_IDPIN_EN (bit 21) is 1, 0 ? deassert sw vbus valid 1 ? assert sw vbus valid
23	0h RW	**EN_PIPE_4_1_SYNC_PHY_STATUS (EN_PIPE_4_1_SYNC_PHY_STATUS)**
22	0h RW	**EN_PIPE_RX_ON_IDPIN (EN_PIPE_RX_ON_IDPIN):** During the connection to a device, there may be a delay in DRD switch from XDCI to XHCI mode,the rx term can be low after idpin deasserts. If this bit is 0, the rx term will be assert immediately after idpin toggle. Otherwise, the device may fall back to USB2 mode. 1 -- drive 0s on utmi rx signals to controller if not connected.
21	0h RW	**SW_IDPIN_EN (SW_IDPIN_EN):** SW_IDPIN_EN 1 -- enable SW id pin (pre DRD) 0 -- disable SW id pin.
20	0h RW	**SW_IDPIN (SW_IDPIN):** if SW_IDPIN_EN (bit 21) is 1, 0 - host mode 1 - device mode
19	0h RW	**USB2_SUSP_OR_DIS (USB2_SUSP_OR_DIS):** 1 - The DRD UTMI suspendm will be controlled by host/device based on the DRD switch. 0 - whenever device or host deassert suspendm, the DRD UTMI suspendm will be deasserted.
18	0h RW	**DRD_ACCESS_MODE (DRD_ACCESS_MODE):** 0 - The DUAL_ROLE register from host and device are ORed to control DRD 1 - The DUAL_ROLE register from host and device are selected by XDCI_DRD_CTRL_EN (bit 31) to control DRD
17	0h RW	**EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN (EN_DIRECT_DRD_SWITCH_ON_USB3PORT_BY_IDPIN):** 0 enable the direct DRD switch on USB3 port by idpin 1 disable the direct DRD switch

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**SW_SWITCH_ENABLE (SW_SWITCH_ENABLE):** SW switch enable 0 (default) ID pin HW controlled DRD. 1 -- SW controlled DRD (ignore idpin), switch based on the DRD_CONFIG.
15	0h RW	**RSVD (RSVD)**
14:3	100h RW	**DEBOUNCE_VAL (DEBOUNCE_VAL):** ID ping debounce timer (DEBOUNCE_VAL): in the unit of RTC clock (33us) default to 8.448 ms
2	0h RW	**SYNCHRONIZE_SS_HS_SWITCH (SYNCHRONIZE_SS_HS_SWITCH):** Synchronize the SS and HS switch: 0 (default) Does not synchronize. i.e. HS switch on the debounced id pin, while SS switch independently controlled by the sequencer. 1 synchronize HS and SS switch. Both speeds switch when sequencer switch.
1:0	0h RW	**DRD_CONFIG (DRD_CONFIG):** 00 Dynamic DRD switch mode 01 static host mode 10 static device mode 11 -- reserved

16.878 DEVICE MODE CONTROL REG 1 (DUAL_ROLE_CFG_REG1)—Offset 80DCh

All bits in this register must be in the Always ON Power domain (ungated SUS or AON as appropriate)

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 10000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0h RO	**DRD_STATUS_B31_30 (DRD_STATUS_30)**
29	0h RO	**DRD_MODE (DRD_MODE):** SS DRD mode 0 device mode 1 host mode
28	1h RO	**IDPIN (IDPIN):** IDPIN value hw version
27:16	0h RO	**DRD_STATUS_B27_16 (DRD_STATUS_B27_16)**
15:0	0h RW	**DRD_CONTROL_B15_0 (DRD_CONTROL_B15_0)**

16.879 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 808DBCA0h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from pin input which is set 1. But we allow software to alter it if it is needed. 1: D3 hot enabled 0: D3 hot not abled.
30	0h RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.
29	0h RW	**Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.
28	0h RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.
27	0h RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset
26	0h RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.
25	0h RW	**Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.
24	0h RW	**Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.
23	1h RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.
22	0h RW	**RESERVED (RSVD_1)**
21	0h RW	**Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.
20	0h RW	**CFG DISABLE_WARM_RST_DET_specUpPorts (cfg_dis_WrstDet_specU)**
19	1h RW	**cfg iob drivestrength[1] (CIDS1)**

Bit Range	Default & Access	Field Name (ID): Description
18	1h RW	**cfg iob drivestrength[0] (CIDS0)**
17	0h RW	**Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2
16	1h RW	**cfg clk gate dis (CCGD)**
15	1h RW	**Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3
14	0h RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst
13	1h RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCIe PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states.
12	1h RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to whether or not eable this host engine to generate PME message.
11	1h RW	**Enable Isolation (EN_ISOL):** When set to '1' enable isolation
10	1h RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function.
9	0h RW	**Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
8	0h RW	**Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle.
7	1h RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support
6	0h RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.
5	1h RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering
4:1	0h RW	**Forced PM State (FORCED_PM_STATE)**
0	0h RW	**Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1

16.880 Battery Charge (BATTERY_CHARGE_REG)—Offset 80E4h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable DM_SRC Battery Charge (EN_DS_BC):** 1 - Always enable battery charge DM_SRC if not connected. Don't wait for portable device detect. (spec. ver. 1.2) 0 - Battery charge spec ver. 1.1.
30:4	0h RO	**RESERVED (RSVD)**
3	0h RW	**Enable Port 3 Battery Charging (EN_P3_BC):** 0 - Battery charging disabled (Physical Port #3) 1 - Battery charging enabled (Physical Port #3)
2	0h RW	**Enable Port 2 Battery Charging (EN_P2_BC):** 0 - Battery charging disabled (Physical Port #2) 1 - Battery charging enabled (Physical Port #2)
1	0h RW	**Enable Port 1 Battery Charging (EN_P1_BC):** 0 - Battery charging disabled (Physical Port #1) 1 - Battery charging enabled (Physical Port #1)
0	0h RW	**Enable Port 0 Battery Charging (EN_P0_BC):** 0 - Battery charging disabled (Physical Port #0) 1 - Battery charging enabled (Physical Port #0)

16.881 Port Watermark (HOST_CTRL_WATERMARK_REG)—Offset 80E8h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 800080h

Bit Range	Default & Access	Field Name (ID): Description
31:16	80h RW	**RBUF water mark (RBUF_WM)**
15:0	80h RW	**XBUF water mark (XBUF_WM)**

16.882 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 18010000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	3h RW	**Force LTSSM State (FORCE_LTSSM_ST):** LTSSM state to be forced.
26	0h RW	**Direct Link LTSSM State (DL_LTSSM_ST):** 0: Normal operation mode 1: Direct link to a specific state specified by bit 31:27 . It shall be written 0 in normal operation mode.
25	0h RW	**Direct Link To U0 (DL_U0):** 0: Normal operation mode 1: Direct link to U0. It shall be written 0 in normal operation mode.
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT):** Compliance pattern to be forced to enter compliance mode.
20	0h RW	**Enable Link Error Slave Count (EN_LES_CNT):** 0: Disable link error slave count 1: Enable link error slave count
19:17	0h RW	**Debug Mode Select (DEBUG_MD_SEL)**
16:15	2h RW	**PHY Low Power Latency (PHY_LP_LAT):** This field defines the latency to drive the PHY to enter low power mode 0: 4 cycles 1: 8 cycles 2: 16 cycles 3: 32 cycles
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM):** This value defines the minimum time for the link to stay in Recovery.Active other than from U3. The granuity is 128us.
11:9	0h RW	**Link Polling Minimum Time (LP_MIN_TM):** This value defines the minimum time for the link to stay in Polling.Active and Recovery.Active from U3. The granuity is 128us.
8	0h RW	**Force Link Accept PM Command (FORCE_LA_PMC):** 0: Normal operation mode 1: Force link to accept power management command
7	0h RW	**Direct Link Recovery U0 (DL_REC_U0):** 0: Normal operation mode 1: Direct link to Recovery from U0
6	0h RW	**Link Fast Training Mode (LINK_FTM):** 0: Normal operation mode 1: Link fast training mode This bit should be written 0 in normal operation.
5	0h RW	**Disable Link Scrambler (DIS_LINK_SCRAM):** 0: Enable link scrambler 1: Disable link scrambler
4	0h RW	**Direct Link U3 From U0 (DL_U3_U0):** 0: Normal operation mode 1: Direct link to U3 from U0. It shall be written 0 in normal operation mode.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**Direct Link U3 From U0 (DL_U2_U0):** 0: Normal operation mode 1: Direct link to U2 from U0. It shall be written 0 in normal operation mode.
2	0h RW	**Direct Link U3 From U0 (DL_U1_U0):** 0: Normal operation mode 1: Direct link to U1 from U0. It shall be written 0 in normal operation mode.
1	0h RW	**Enable Link Loopback Master Mode (EN_LINK_LB_MAST):** 0: Disable link loopback master mode 1: Enable link loopback master mode
0	0h RW	**Disable Link Compliance Mode (DIS_LINK_CM):** 0: Enable link compliance mode 1: Disable link compliance mode

16.883 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 310803A0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.
23:21	0h RW	**Reserved (RSVD0)**
20	0h RW	**L1_EXIT_RECOVERY_MODE (L1_EXIT_RECOVERY_MODE):** Mode for extended L1 Exit recovery delay: 0: 12us 1: 50us
19	1h RW	**L1_TO_INCR_MODE (L1_TO_INCR_MODE):** Mode select for L1 Timeout increments: 0: time out increments are in 125us 1: L1 Timeout increments are in 256us. Refer to USB2 PORTHLPMC.L1 Timeout in XHCI Spec for additional details
18	0h RW	**Reserved (RSVD1)**
17	0h RW	**EN_DETECT_NOMINAL_PKT_EOP (EN_DETECT_NOMINAL_PKT_EOP):** 0: Detect minimal packet EOP. 1: Detect nominal packet EOP.
16	0h RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE):** 0: Normal 1: Force full speed on host ports (disable chirp response)

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Disable 192 Byte Limit Check (DIS_192B_LIM):** 0: Enforce 192 byte limit on complete-split INs. Treat any packet) 192 as babble case. 1: Disable 192 byte limit check.
14	0h RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS):** 0: Internal FS/LS Disconnect from linestate(1:0) 1: External provided FS/LS Disconnect from hostdisconnect input

16.884 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 80C40620h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**Total Reset Duration[0] (TOT_RST_DUR_0):** # of microseconds for total reset duration
30:18	31h RW	**Chirp-K Duration (CHIRPK_DUR):** # of microseconds of Chirp-K to register that a device is chirping
17:5	31h RW	**K/J Disconnect Connect Delay (KJ_DIS_CON_DEL):** # of microseconds of K/J in disconnected state to register connect has occurred.
4:0	0h RW	**FS/LS Mode SE0 Disconnect Delay[12:8] (FSLS_SE0_DIS_DEL_12_8):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.

16.885 USB2 Port Link Control 3 (USB2_LINK_MGR_CTRL_REG3)—Offset 80F8h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: F865EB6Bh

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW	**U2 Entry Ignore Linestate Changes Duration[3:0] (U2_IGN_LS_DUR_3_0):** # of microseconds after entering U2, linestate changes are ignored as bus settles
27:15	10CBh RW	**U3 Entry Ignore Linestate Changes Duration (U3_IGN_LS_DUR):** # of microseconds after entering U3, linestate changes are ignored as bus settles
14:0	6B6Bh RW	**Total Reset Duration[15:1] (TOT_RST_DUR_15_1):** # of microseconds for total reset duration

16.886 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8003h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED (RSVD)**
21:9	40h RW	**U2 Detect Remote Wake Delay (U2D_RWAKE_DEL):** #of microseconds after detecting U2 remote wake condition to reflect K
8:0	3h RW	**U2 Entry Ignore Linestate Changes Duration[12:4] (U2_IGN_LS_DUR_12_4):** # of microseconds after entering U2, linestate changes are ignored as bus settles

16.887 Bandwidth Calc Control (HOST_CTRL_BW_CTRL_REG)—Offset 8100h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:0	8008h RW	**Reserved (RSVD_1)**

16.888 Host Interface Control (HOST_IF_CTRL_REG)—Offset 8108h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**Rsvd1 (Rsvd1)**
0	1h RW	**Host IF (HOSTIF)**

16.889 Bandwidth Overload Burst (HOST_BW_OV_BURST_REG)—Offset 810Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED (RSVD)**
23:12	8h RW	**Per Burst Overhead System BW (PB_OVRH_SBW):** BW calculation: Overhead per burst for system BW calculations. see white paper.
11:0	20h RW	**Per Burst Overhead System BW (PB_OVRH_SSBW):** BW calculation: Overhead per burst for SS BW calculations. see white paper.

16.890 USB Max Bandwidth Control 4 (HOST_CTRL_BW_MAX_REG)—Offset 8128h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: F42528505647F42h

Bit Range	Default & Access	Field Name (ID): Description
63:60	0h RO	**Reserved (RSVD)**
59:48	F42h RW	**PCIe Max BW Units (PCIE_MAX_BW):** Max. Number of BW units for PCIe (system interface) (denominator in 90% calculation)
47:36	528h RW	**TT Max BW Units (TT_MAX_BW):** Max. Number of BW units for TTs. (denominator in 90% calculation)

Bit Range	Default & Access	Field Name (ID): Description
35:24	505h RW	**FS/LS Max BW Units (FSLS_MAX_BW):** Max. Number of BW units for FS/LS ports. (denominator in 90% calculation)
23:12	647h RW	**HS Max BW Units (HS_MAX_BW):** Max. Number of BW units for HS ports. (denominator in 80% calculation)
11:0	F42h RW	**SS Max BW Units (SS_MAX_BW):** Max. Number of BW units for SS ports. (denominator in 90% calculation)

16.891 USB2 Linestate Debug (LINESTATE_DEBUG_REG)—Offset 8130h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**RESERVED (RSVD)**
27:26	0h RO	**Port 14 UTMI Linestate (P14_UTMI_LS)**
25:24	0h RO	**Port 13 UTMI Linestate (P13_UTMI_LS)**
23:22	0h RO	**Port 12 UTMI Linestate (P12_UTMI_LS)**
21:20	0h RO	**Port 11 UTMI Linestate (P11_UTMI_LS)**
19:18	0h RO	**Port 10 UTMI Linestate (P10_UTMI_LS)**
17:16	0h RO	**Port 9 UTMI Linestate (P9_UTMI_LS)**

7:0	Ch RW	**GAP time HS TX Packet (HSTX_GAP_TIME)**

16.893 USB2 Protocol Bus Timeout Timer (USB2_PROTOCOL_BTO_TIMER_REG)—Offset 813Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8D4258B8h

Bit Range	Default & Access	Field Name (ID): Description
31:21	46Ah RW	**Bus timeout count for LS (LS_BUS_TO)**
20:10	96h RW	**Bus timeout count for FS (FS_BUS_TO)**

Bit Range	Default & Access	Field Name (ID): Description
9:0	B8h RW	**Bus timeout count for HS (HS_BUS_TO)**

16.894 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: A019132h

Bit Range	Default & Access	Field Name (ID): Description
31:24	Ah RW	**Engine Idle Hysteresis (EIH):** This register controls the min. idle span that has to be observed from the engine idle indicators before the power state flags (xhc_*_idle) will indicate a 1.
23:12	19h RW	**Backbone PLL Shutdown Advance Wake (BPSAW):** This register controls the time before the next scheduled transaction where the Backbone PLL request will assert. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)
11:0	132h RW	**Backbone PLL Shutdown Min. Idle Duration (BPSMID):** The sum of this register plus the Backbone PLL Shutdown Advance Wake form to a Total Idle time. When the next scheduled periodic transaction is after present time + Total Idle, the Backbone PLL request will de-assert, allowing the PLL to shutdwon. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)

16.895 Power Scheduler Control-2 (PWR_SCHED_CTRL2)—Offset 8144h

These bit enable by EP type those EPs classes that are considered for determining next periodic active interval for pre-wake of the periodic_active signal. EP classes that are disabled may never be observed in setting of the periodic_active signal.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 33Fh

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**HS Interrupt-OUT Alarm (HS_INT_OUT_ALRM)**
8	1h RW	**HS Interrupt-IN Alarm (HS_INT_IN_ALRM)**
7	0h RW	**SS Interrupt-OUT FC Alarm (SS_INT_OUT_FC_ALRM)**
6	0h RW	**SS Interrupt-IN Alarm (SS_INT_IN_FC_ALRM)**
5	1h RW	**SS Interrupt-OUT & not in FC Alarm (SS_INT_OUT_ALRM)**
4	1h RW	**SS Interrupt-IN & not in FC Alarm (SS_INT_IN_ALRM)**
3	1h RW	**HS ISO-OUT Alarm (HS_ISO_OUT_ALRM)**
2	1h RW	**HS ISO-IN Alarm (HS_ISO_IN_ALRM)**
1	1h RW	**SS ISO-OUT Alarm (SS_ISO_OUT_ALRM)**
0	1h RW	**SS ISO-IN Alarm (SS_ISO_IN_ALRM)**

16.896 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 81390206h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**DIS_L1P2_EXIT_ON_WAKE_EN (DIS_L1P2_EXIT_ON_WAKE_EN):** This bit disables the dependency on Wake Enables defined in PORTSC for L1P2 exit when in D0
30:28	0h RW	**RESERVED0 (RSVD0)**
27:25	0h RW	**RESERVED (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
24	1h RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature.
23	0h RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection
22	0h RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2 (TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2):** This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature.
21	1h RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if we are in D3Hot.
20	1h RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2
19	1h RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state
18	0h RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0 (EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0):** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature
17	0h RW	**U2_EXIT_LFPS_TIMER_VALUE (U2_EXIT_LFPS_TIMER_VALUE):** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain

Bit Range	Default & Access	Field Name (ID): Description
16	1h RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP (EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP):** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.
15:14	0h RW	**P3_ENTRY_TIMEOUT (P3_ENTRY_TIMEOUT):** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us)
13	0h RW	**Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL)**
10	0h RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered
9	1h RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0
8:4	0h RW	**Debug Mode Select Register (DEB_MODE_SEL)**
3	0h RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition.
2	1h RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2.
1	1h RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed.
0	0h RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.

16.897 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FCh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD)**
7	1h RW	**EN_CMDM_TXRXB (EN_CMDM_TXRXB):** Enable Command Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
6	1h RW	**EN_TTE_TXRXB (EN_TTE_TXRXB):** Enable TTE Active indication for Tx/Rx Bias circuit HS Phy PM Policy
5	1h RW	**EN_IDMA_TXRXB (EN_IDMA_TXRXB):** Enable IDMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
4	1h RW	**EN_ODMA_TXRXB (EN_ODMA_TXRXB):** Enable ODMA Active indication for Tx/Rx Bias circuit HS Phy PM Policy
3	1h RW	**EN_TRM_TXRXB (EN_TRM_TXRXB):** Enable Transfer Manager Active indication for Tx/Rx Bias circuit HS Phy PM Policy
2	1h RW	**EN_SCH_TXRXB (EN_SCH_TXRXB):** Enable Scheduler Active indication for Tx/Rx Bias circuit HS Phy PM Policy
1	0h RW	**Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)
0	0h RW	**Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)

16.898 USB Power Gating Control (USB_PGC)—Offset 8168h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 282EEh

Bit Range	Default & Access	Field Name (ID): Description
31:1	14177h RO	**Reserved (RSVD)**
0	0h RW	**USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse.

16.899 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD)**
19	0h RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.
18	0h RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.
17	0h RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.
16	0h RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.
15	0h RO	**Reserved1 (RSVD1):** Reserved
14	0h RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.
11:8	4h RW	**U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. 0x0: 1us 0x1: 128us 0x2: 256us 0x3: 512us 0x4: 640us 0x5: 768us 0x6: 896us 0x7: 1024us Others: Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.
6	0h RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.
5	0h RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
4	0h RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
3	0h RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
2	0h RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.
1	0h RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.

Function:

Default: 20C8h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Rsvd (Rsvd)**
17:16	0h RW	**U2P3 LFPS Periodic Sampling Control (XU2P3LPSC):** This field controls the OFF time for the LFPS periodic sampling for SS and SSIC ports in U2P3. If LFPSPM for a port is 1, it will override the OFF time and LFPS receiver will remain OFF permanently. For Fast Sim mode, 500us will be equivalent to 5us. 0x0 Polling Disable. (RXDET Polling will become 100ms.) 0x1 500us OFF Time 0x2 1ms OFF Time 0x3 1.5ms OFF Time
15:10	8h RW	**XLFPSONCNTSSIC (XLFPSONCNTSSIC):** This time would describe the number of clocks SSIC LFPS will remain ON. SSIC LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 8.
9:0	C8h RW	**XLFPSONCNTSS (XLFPSONCNTSS):** This time would describe the number of clocks LFPS will remain ON. LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 200.

16.915 (USB2PMCTRL_REG)—Offset 81C4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**Reserved (RSVD)**
11	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated. 0 Do not

Bit Range	Default & Access	Field Name (ID): Description
10:8	0h RW	**USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC):** This controls the amount of hysteresis time the controller will enforce after detecting the USB2 PHY SUS Power Gate entry condition. 0h 0 clocks 1h 32 clocks 2h 64 clocks 3h 128 clocks 4h 256 clocks 5h 512 clocks 6h 1024 clocks 7h 2048 clocks
7:4	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT):** This field represents the worst case latency for the USB2 Common Lane to enter and exit its power gate state. This fields is required to be compared to a ports HIRD/HIRD value for the ports that have allowed L1 to L2 mapping to determine if the Common Lane can be allowed to power off. If the power gate entry/ exit latency is greater than the HIRD/HIRDD then the common lane should not be allowed to power gate as this will result in a L1 exit violation. 0h 100 us 1h 200 us 2h 300 us Eh 1500us Fh 1600 us
3:2	0h RW	**USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP):** This field controls when to enable the USB2 PHY SUS Well Power Gating when the proper conditions are met. 00 USB2 PHY SUS Power Gating is Disabled. 01 USB2 PHY SUS Power Gating is Enabled in Only D0 (Excludes D0i3 and D3) 10 USB2 PHY SUS Power Gating is Eanabled in only in D0 and D0i3 (Excludes D3) 11 USB2 PHY SUS Power Gating is Eanabled in D0/D0i3/D3
1	0h RW	**USB2 Common Lane Power Gating Enable During L1 to L2 Mapping for USB2 PHY Power Gating (U2CLPGEL1L2):** This field when set enables the controller to allow for the common lane power gating to be enabled when all ports are exposed as in L2 to the USB2 PHY while at least 1 port has been mapped to L2 from L1. This field alone does not guarantee power gating since the L1 HIRD/HIRDD Value must be compared with the PHYs power gate exit latency (U2CLPGLAT) held in this register to ensure that L1 exit is not violated. 0 USB2 Common Lane Power Gating is disabled when any port has been mapped from L1 to L2. 1 USB2 Common Lane Power Gating is allowed when any port has been mapped to L2 from L1 with the additional condition that the HIRD/HIRDD is greater than the PHYs Power Gate exit latency.
0	0h RW	**USB2 Data Lane L1 to L2 Mapping Enable for USB2 PHY Power Gating (U2DLL1L2ME):** This field when set enables the controller to map an L1 entry directly to L2 to allow the USB2 PHY to trigger its Autonomous Power Gating. The USB2 PHY will trigger PG only when in L2 since it does not fully understand the requirements for L1. 0 USB2 L1 to L2 mapping is disabled for all ports 1 USB2 L1 to L2 mapping is enabled for all ports

Bit Range	Default & Access	Field Name (ID): Description
63:18	0h RO	**RSVD (RSVD)**
17:0	0h RO	**USB2_PORT_STATE_REG (USB2_PORT_STATE_REG):** Per USB2 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

16.919 USB3_PORT_STATE_REG (USB3_PORT_STATE_REG)—Offset 8408h

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:14	0h RO	**RSVD (RSVD)**
13:0	0h RO	**USB3_PORT_STATE_REG (USB3_PORT_STATE_REG):** Per USB3 Port State Register indicating the following states 0x0 - Connected 0x1 - Suspended 0x2 - Disabled 0x3 - Reserved This register is Read Only and will reflect the state of the ports. Status can change at any time and any usage of this information must be done with care and under specific flows where port state change race conditions are properly handled.

16.920 FUS1_REG (FUS1_REG)—Offset 8410h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**RSVD (RSVD)**
20:18	0h RO	**DEV_ID (DEV_ID):** Provides a fuse over-ride for the lower 3 bits of device ID.
17	0h RO	**XHC_DPGDIS (XHC_DPGDIS):** When asserted, it indicates that the xHCI will not dynamically power gate the controller.
16	1h RO	**USBR_DIS (USBR_DIS):** When asserted, it indicates that xHCI does not support USBr
15	0h RO	**XHC_FXN_DIS (XHC_FXN_DIS):** When asserted, it indicates the xHCI is fused to function disabled.
14:10	0h RO	**USB2_PORT_COUNT (USB2_PORT_COUNT):** 0x0 = MAX USB2 Ports enabled 0x1 = Max USB2 Ports -1 enabled 0x1F = All ports disabled
9:5	0h RO	**USB3_PORT_COUNT (USB3_PORT_COUNT):** 0x0 = MAX USB3 Ports enabled 0x1 = Max USB3 Ports -1 enabled 0x1F = All ports disabled
4	0h RO	**DEBUG_MODE_ENABLE (DEBUG_MODE_ENABLE):** 0 = USB debug mode disabled 1 = USB debug mode enabled Not used for LPT.
3	0h RO	**XHC_DCGDIS (XHC_DCGDIS):** 0= USB3 (xHC) dynamic clock gating enabled 1= USB3 (xHC) dynamic clock gating disabled
2	0h RO	**REGFILE_DPGDIS (REGFILE_DPGDIS):** 0 = USB3 (xHC) dynamic RF power gating enabled 1 = USB3 (xHC) dynamic RF power gating disabled

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	**USBIO_PMDIS (USBIO_PMDIS):** 0=USB2 HW LPM and USB3 HW Ux under xHC enabled 1= USB2 HW LPM and USB3 HW Ux under xHC disabled
0	0h RO	**USB2_PLL_SHUTDOWN_DIS (USB2_PLL_SHUTDOWN_DIS):** 0= USB2 PLL Shutdown enabled 1= USB2 PLL Shutdown disabled

16.921 FUS2_REG (FUS2_REG)—Offset 8414h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	**RSVD (RSVD)**
11:0	0h RO	**PORT_MAP_FUS1 (PORT_MAP_FUS1):** 1:0 Port 1 3:2 Port 2 5:4 Port 3 31:30 Port 16 Bit Description: 00: Port assgned to USB3 01: Port assigned to non-XHCI controller 10: Port assigned to Flex IO mapping. Mapping is based on Soft Straps. 11: Reserved.

16.922 FUS3_REG (FUS3_REG)—Offset 8418h

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**RSVD (RSVD)**

16.923 STRAP1_REG (STRAP1_REG)—Offset 841Ch

This register is NOT subject to HW save and restore.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RSVD (RSVD)**
5:0	0h RO	**FlexIO mapping (FLEX_IO_MAPPING):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is owned by XHCI 1: Port is not owned by XHCI

16.924 STRAP2_REG (STRAP2_REG)—Offset 8420h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**RSVD (RSVD)**
5:0	0h RO	**USB3_SSIC_MODE (USB3_SSIC_MODE):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is operated in USB3 mode 1: Port is operated in SSIC mode.

16.925 STRAP3_REG (STRAP3_REG)—Offset 8424h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**RSVD (RSVD)**
1:0	0h RO	**XHCI_PRI_CLK_FREQ_SEL (XHCI_PRI_CLK_FREQ_SEL):** Specifies the frequency of the Primary clock (iosf_prim_mux_clk) used by XHCI 00 : 200 MHz (default) 01 : 125 MHz 10 : 250 MHz

16.926 DFT_REG1 (DFT_REG1)—Offset 8430h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**SS/SSIC DFT CRC (SSDFTCRC):** These register bits contain the value of SS DFT CRC
15:12	0h RO	**RSVD0 (RSVD0):** RSVD0
11	0h RW	**DFTLFPSSEL (DFTLFPSSEL):** DFTLFPSSEL 0: Rxelecidle is driven from GPIO Pin 1: Rxelecidle is Driven as specified by Super Speed DFT LFPS Mode Select
10	0h RW	**Super Speed DFT LFPS Mode Select (SSDFTLMSEL):** This bit selects the Super Speed DFT LFPS mode, and will only take effect when Super Speed HBP mode is enabled. 0b: HBP logic will internally loopback TX LFPS as RX LFPS and AFE RX LFPS path to the controller is disconnected. 1b: RX LFPS path works normally
9:6	0h RW	**SS/SSIC DFT CRC Select (SSDFTCRCSEL):** These bits select which Super Speed DFT CRC value is reflected in SSDFTCRC bits. In addition, these bits also select which SuperSpeed DFT CRC MSB value is sent to GPIO monitor pin, i.e. sata3gp_gp37 to aid silicon debug. Live version of selected CRC's MSB will be- sent to GPIO monitor pin, i.e. sata3gp_gp37. 0h (default): No SuperSpeed DFT CRC is selected. 1h: Data Payload CRC 2h: Link Management Packet CRC 3h: Transaction Packet CRC 4h: Isochronous Timestamp Packet CRC 5h: Data Packet Header CRC 6h: Link Command Packet CRC 7h: RRAP Packet CRC 8h: Tx/Rx Cfg CRC Others: Reserved Note : CRC types 7 and 8 are onlyapplicable if Port is SSIC Port
5	0h RO	**RSVD1 (RSVD1):** RSVD1
4:0	0h RW	**SS/SSIC DFT CRC Port Select (SSICDFTCPS):** One CRC per packet type is shared for all the Super Speed ports. These bits select the Super Speed port for which CRC data will be updated. 000b: (default) No SuperSpeed Port is selected 001b: SS/SSIC Port 0 010b: SS/SSIC Port 1 011b: SS/SSIC Port 2 100b: SS/SSIC Port 3 101b: SS/SSIC PORT4 110b :SS/SSIC Port 5 others : Rsvd

16.927 DFT_REG2 (DFT_REG2)—Offset 8434h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**HS/HSIC TX CRC (TXCRC):** These register bits contain the value of TX CRC. This TX CRC is placed right after the 480MHz XCLKQ.
15:11	0h RW	**HSIC/UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved
10:7	0h RW	**Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) +E27
6:5	0h RW	**Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved
4	0h RW	**Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled
3:2	0h RW	**Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved
1:0	0h RW	**UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.

16.928 DFT_REG3 (DFT_REG3)—Offset 8438h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern
15:2	0h RW	**Loopback Lane Select (UTMILPBKSEL_13_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0
1	0h RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet
0	0h RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported

16.929 dft_reg4 (DFT_REG4)—Offset 843Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RW	**RSVD (RSVD)**
10:0	0h RW	**Loopback Pattern (UTMILPBKPATSEL):** Loopback Lane Select (UTMILPBKSEL): Port is selected if the corresponding bit (zero based) is selected Bit 0 = Port 1 Bit 1 = Port 2 Etc.

16.930 dft_reg5 (DFT_REG5)—Offset 8440h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/L	**High Speed Bypass Enable (HIGH_SPEED_BYPASS_ENABLE):** 0000 - Disable all HBP 0001 - Enable SS HBP 0010 - Enable HS HBP 0011 - Enable HSIC HBP 0100 - Enable SSIC HBP Others - Reserved

Bit Range	Default & Access	Field Name (ID): Description
27	0h RW	**DFTIDPINSEL (DFTIDPINSEL):** Select Between Device and Host Controller in HBP mode 0h : Device Controller is selected 1h : Host Controller is selected
26	0h RW/O	**Lock Bit (LOCK):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to HBP Enable is disabled (locked state). When set to '0', the write access to bit locked are enable (unlocked state). Writable once after platform reset.
25	0h RW/L	**Loopback Enable (UTMILPBKEN):** Enable loopback test mode. If asserted, loopback test mode is enabled
24:0	0h RO	**Rsvd (Rsvd)**

16.931 XECP_CMDM_STS0 (XECP_CMDM_STS0)—Offset 8448h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**IDMA_OWNS_CNTX (IDMA_OWNS_CNTX):** Indicates that IDMA module owns the context access currently
30	0h RO	**ODMA_OWNS_CNTX (ODMA_OWNS_CNTX):** Indicates that ODMA module owns the context access currently
29	0h RO	**TRM_OWNS_CNTX (TRM_OWNS_CNTX):** Indicates that TRM modules owns the context access currently
28	0h RO	**CMD_RING_REQUESTED_CNTX_LOCK (CMD_RING_REQUESTED_CNTX_LOCK):** Indicates that Command Manager has requested a context lock
27	0h RO	**CMD_RING_STOP_IN_PROGRESS (CMD_RING_STOP_IN_PROGRESS):** Indicates that Command Ring stop command is in progress
26	0h RO	**SCH_UPDATE_CLR_EP_IN_PROGRESS (SCH_UPDATE_CLR_EP_IN_PROGRESS):** Indicates that clearing an EP out of schedule is in progress
25	0h RO	**ADDR_DEV_DONE (ADDR_DEV_DONE):** Indicates that current address device command is done by ODMA
24	0h RO	**ADDR_DEV_IN_PROGRESS (ADDR_DEV_IN_PROGRESS):** Indicates that ODMA has an address device command in progress
23	0h RO	**EP_STATE_UPDATE_IN_PROGRESS (EP_STATE_UPDATE_IN_PROGRESS):** Indicates that updating of EP state is in progress

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO	**EP_STATE_IN_PROGRESS_FROM_STOP_DUE_TO_DB (EP_STATE_IN_PROGRESS_FROM_STOP_DUE_TO_DB):** Indicates that doorbell manager is issuing and EP update due to a doorbell ring on an EP that is in stop state
21	0h RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_EP_ERROR (EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_EP_ERROR):** Indicates that transfer ring manager is isuing and EP update due to an EP error condition detected
20	0h RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_STALL (EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_STALL):** Indicates that transfere ring manager is issuing an EP state update due to stall received
19	0h RO	**Reserved (RSVD)**

16.935 XECP_CMDM_STS4 (XECP_CMDM_STS4)—Offset 8458h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer Low (EREPL)**

16.936 XECP_CMDM_STS5 (XECP_CMDM_STS5)—Offset 845Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Event Ring Enqueue Pointer High (EREPH)**

16.937 AUX Power PHY Reset (UPORTS_PON_RST_REG)—Offset 8460h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**RESERVED (RSVD)**
3:0	0h WO	**Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY

16.938 Latency Tolerance Control 0 (HOST_IF_LAT_TOL_CTRL_REG0)—Offset 8464h

The Latency Tolerance Control Register is used by SW to control which BELT is returned when this register is read. SW shall write to this register to program a Slot-ID, Port-ID and BELT Select to determine which BELT is selected. When this register is read the selected BELT is returned.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: D0000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h WO	**BELT Select (BELT_SEL):** This field determines what value will be selected to read back from SW when reading this register 0: Returns the SW programmed Latency Tolerance Value 1: Returns the Lowest BELT in the Host 2: Returns the BELT for the requested Slot-ID (Slot Select) 3: Returns the BELT for the requested Port-ID (Port Select)
29:20	0h RO	**Rsvd1 (Rsvd1)**
19:16	Dh WO	**Port Select (PORT_SEL):** Used to select the BELT for a given Port # when the BELT Select is programmed to select the Port-ID (this field is 0 based)
15:12	0h RO	**Rsvd (Rsvd)**
11:5	0h RO	**BELT Value (BELTV):** Value of selected BELT is return in this field
4:0	0h RW	**Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)

16.939 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 2201h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Rsvd2 (Rsvd2)**

16.941 Port Disable Override capability register (PDO_CAPABILITY)—Offset 84F4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3C6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	3h RO	**Next Capability Pointer (NCP)**
7:0	C6h RO	**Capability ID (CID)**

16.942 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd1 (Rsvd1)**
8:0	0h RW/O	**USB2PDO (USB2PDO)**

16.943 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd1 (Rsvd1)**
6:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** A '1' in a bit position prevents the corresponding USB3 port from reporting a Device Connection to the XHC.

16.944 HW state capability register (HW_STATE_CAPABILITY)—Offset 8500h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1F40C7h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Rsvd (Rsvd)**
23:16	1Fh RO	**Save Length (SAVE_LENGTH):** Indicates the number of DWords in this capability starting at offset 04h, that need to be saved and restored
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C7h RO	**Capability ID (CID)**

16.945 HW state register 1 (HW_STATE_REG1)—Offset 8504h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG1 (HW_STATE_REG1)**

16.946 HW state register 2 (HW_STATE_REG2)—Offset 8508h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG2 (HW_STATE_REG2)**

16.947 HW state register 3 (HW_STATE_REG3)—Offset 850Ch

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG3 (HW_STATE_REG3)**

16.948 HW state register 4 (HW_STATE_REG4)—Offset 8510h

Implementation defined HW state: SW must not access this register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HW_STATE_REG4 (HW_STATE_REG4)**

16.949 CONFIG mirror capability register (CONFIG_MIRROR_CAPABILITY)—Offset 8600h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40C2h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C2h RO	**Capability ID (CID)**

16.950 Command (CMD_MMIO)—Offset 8604h

Dummy register, mirror of physical register as CMD

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD)**
10	0h RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.
1	0h RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.
0	0h RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only.

16.951 Device Status (STS_MMIO)—Offset 8606h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE):** This bit is set by the Intel PCH whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the Intel PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
12	0h RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.
11	0h RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.
8	0h RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the Intel PCH whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.
7	1h RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.
6	0h RO	**User Definable Features (UDF):** Reserved as 0. Read-Only.
5	0h RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only.
4	1h RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.
3	0h RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.
2:0	0h RO	**Reserved (RSVD)**

16.952 Revision ID (RID_MMIO)—Offset 8608h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** See Chap 6 for value.

16.953 Programming Interface (PI_MMIO)—Offset 8609h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.

16.954 Sub Class Code (SCC_MMIO)—Offset 860Ah

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.

16.955 Base Class Code (BCC_MMIO)—Offset 860Bh

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.

16.956 Master Latency Timer (MLT_MMIO)—Offset 860Dh

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.

16.957 Header Type (HT_MMIO)—Offset 860Eh

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB):** Read only indicating single function device.
6:0	0h RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.

16.958 Memory Base Address (MBAR_MMIO)—Offset 8610h

Dummy register, mirror of physical register as MBAR. Value in this register will be different after the enumeration process.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.
15:4	0h RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.
3	0h RO	**Prefetchable (Prefetchable):** This bit is hardwired to 0 indicating that this range should not be prefetched.
2:1	2h RO	**Type (Type):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space

16.959 USB Subsystem Vendor ID (SSVID_MMIO)—Offset 862Ch

Dummy register, mirror of physical register as SSVID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

16.960 USB Subsystem ID (SSID_MMIO)—Offset 862Eh

Dummy register, mirror of physical register as SSID. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

16.961 Capabilities Pointer (CAP_PTR_MMIO)—Offset 8634h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.

16.962 Interrupt Line (ILINE_MMIO)—Offset 863Ch

Dummy register, mirror of physical register as ILINE.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the Intel PCH. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

16.963 Interrupt Pin (IPIN_MMIO)—Offset 863Dh

Dummy register, mirror of physical register as IPIN.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).

16.964 XHC System Bus Configuration 1 (XHCC1_MMIO)—Offset 8640h

Dummy register, mirror of physical register as XHCC1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RW	**ECO1 (ECO1):** Reserved
24	0h RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
23	0h RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.
22	0h RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.
21:19	0h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	0h RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled.
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables.

Bit Range	Default & Access	Field Name (ID): Description
16:12	0h RW	**Periodic Complete Pre Wake Time (PCPWT):** The value programmed in this field determines how far in advance of the start of the next micro-frame the host controller must de-assert the "Periodic Complete" signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter

16.965 XHC System Bus Configuration 2 (XHCC2_MMIO)—Offset 8644h

Dummy register, mirror of physical register as XHCC2

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 3C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.
30:26	0h RW	**ECO1 (ECO1):** Reserved
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Read Request Size Control (IDMA_RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	0h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.
20	0h RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access.
19:14	Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes.
9:8	0h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 11: Always inhibit Cx
7:6	0h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. 00: Never inhibit DMI L1. 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0.
5:3	0h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. 000: 128B 001: 256B 010: 512B 011 - 110: Reserved 111: 64B

16.966 Clock Gating (XHCLKGTEN_MMIO)—Offset 8650h

Dummy register, mirror of physical register as XHCLKGTEN

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Rsvd2 (Rsvd2):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	0h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	0h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	0h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
24	0h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	0h RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	0h RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	0h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	0h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper
9:8	0h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	0h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off
4	0h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.
3	0h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.
1	0h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.
0	0h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.

16.967 Audio Time Synchronization (AUDSYNC_MMIO)—Offset 8658h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Rsvd2 (Rsvd2)**
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.

16.968 Serial Bus Release Number (SBRN_MMIO)—Offset 8660h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.

16.969 Frame Length Adjustment (FLADJ_MMIO)—Offset 8661h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Reserved (RSVD):** Read-Only. These bits are reserved for future use and should read as "00".
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

16.970 Best Effort Service Latency (BESL_MMIO)—Offset 8662h

Dummy register, mirror of physical register as BESL. Bset Effort Service Latency.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

16.971 PCI Power Management Capability ID (PM_CID_MMIO)—Offset 8670h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.

16.972 Next Item Pointer #1 (PM_NEXT_MMIO)—Offset 8671h

Dummy register, mirror of physical register as PM_NEXT. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

16.973 Power Management Capabilities (PM_CAP_MMIO)—Offset 8672h

Dummy register, mirror of physical register as PM_CAP. Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the Intel PCH is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_Support):** This 5-bit field indicates the power states in which the function may assert PME#. The Intel PCH XHC does not support the D1 or D2 states. For all other states, the Intel PCH XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_Support):** The D2 state is not supported.
9	0h RW/L	**D1_Support (D1_Support):** The D1 state is not supported.
8:6	7h RW/L	**Aux_Current (Aux_Current):** The Intel PCH XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.
5	0h RW/L	**DSI (DSI):** The Intel PCH reports 0, indicating that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/L	**PME Clock (PMEClock):** The Intel PCH reports 0, indicating that no PCI clock is required to generate PME#.
2:0	2h RW/L	**Version (Version):** The Intel PCH reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.

16.974 Power Management Control/Status (PM_CS_MMIO)—Offset 8674h

Dummy register, mirror of physical register as PM_CS

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_Status):** This bit is set when the Intel PCH XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data_Scale (Data_Scale):** The Intel PCH hardwires these bits to 00 because it does not support the associated Data register.
12:9	0h RO	**Data_Select (Data_Select):** The Intel PCH hardwires these bits to 0000 because it does not support the associated Data register.
8	0h RW	**PME_En (PME_En):** A 1 enables the Intel PCH XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.
7:4	0h RO	**Reserved (RSVD)**
3	1h RO	**No Soft Reset (NSR):** No_Soft_Reset - When set ("1"), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD2)**

Bit Range	Default & Access	Field Name (ID): Description
1:0	0h RW	**PowerState (PowerState):** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the Intel PCH must not accept accesses to the XHC memory range, but the configuration space must still be accessible.

16.975 Message Signaled Interrupt CID (MSI_CID_MMIO)—Offset 8680h

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID):** Indicates that this is an MSI capability

16.976 Next item pointer (MSI_NEXT_MMIO)—Offset 8681h

Dummy register, mirror of physical register as MSI_NEXT

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list

16.977 Message Signaled Interrupt Message Control (MSI_MCTL_MMIO)—Offset 8682h

Dummy register, mirror of physical register as MSI_MCTL

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD)**
8	0h RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.
6:4	0h RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.

16.978 Message Signaled Interrupt Message Address (MSI_MAD_MMIO)—Offset 8684h

Dummy register, mirror of physical register as MSI_MAD

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Addr (Addr):** Lower DW of system specified message address, always DWORD aligned
1:0	0h RO	**Reserved (RSVD)**

16.979 Message Signaled Interrupt Upper Address (MSI_MUAD_MMIO)—Offset 8688h

Dummy register, mirror of physical register as MSI_MUAD

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address.

16.980 Message Signaled Interrupt Message Data (MSI_MD_MMIO)—Offset 868Ch

Dummy register, mirror of physical register as MSI_MD

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (Data):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.

16.981 Device Idle Capability (DEVIDLE_MMIO)—Offset 8690h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VID (VID)**

Bit Range	Default & Access	Field Name (ID): Description
27:24	0h RO	**REV (REV)**
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long.
15:8	0h RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CID)**

16.982 Vendor Specific Header (VSHDR_MMIO)—Offset 8694h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

16.983 SW LTR POINTER (SWLTRPTR_MMIO)—Offset 8698h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to '1' to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to '0' to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

16.984 Device Idle Pointer Register (DEVIDLEPTR_MMIO)—Offset 869Ch

Dummy register, mirror of physical register as DEVIDLEPTR

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 80AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	80ACh RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW/L	**Valid (VALID):** Set to '1' to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to '0' to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

16.985 Device Idle Power ON Latency (DEVIDLEPOL_MMIO)—Offset 86A0h

Dummy register, mirror of physical register as DEVIDLEPOL

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	**Rsvd1 (Rsvd1)**
12:10	2h RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.
9:0	0h RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is '0'.

16.986 High Speed Configuration 2 (HSCFG2_MMIO)—Offset 86A4h

Dummy register, mirror of physical register as HSCFG2

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd1 (Rsvd1)**
18	0h RW	**PORT1_HOST_MODE_OVERRIDE (PORT1_HOST_MODE_OVERRIDE):** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.
17:16	0h RW	**eUSB2SEL (eUSB2SEL):** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2
15	0h RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.
14	0h RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.
13	1h RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.
12:11	0h RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton
10:4	0h RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.
3:0	0h RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.

16.987 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1_MMIO)—Offset 86B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.988 XHCI USB2 Overcurrent Pin Mapping 2 (U2OCM2_MMIO)—Offset 86B4h

Reserved

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd (Rsvd):** Reserved
8:0	0h RW/L	**OC Mapping (OCM)**

16.989 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1_MMIO)—Offset 86D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.990 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2_MMIO)—Offset 86D4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd (Rsvd)**
6:0	0h RW/L	**OC Mapping (OCM)**

16.991 XHCC3 (XHCC3_MMIO)—Offset 86FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (Rsvd1):** Reserved
4	0h RW	**Error Handing: Disable masking of extra read to completion collect buffer (SUPP_XTRA_RD_CPL_COLL_BUF):** When set to 1, the fix to supress extra read to completion collect buffer is disabled. The fix is relevent only when ECC checking is enabled
3	0h RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface
2	0h RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface

Bit Range	Default & Access	Field Name (ID): Description
1	1h RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected
0	0h RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.

16.992 Debug Capability ID Register (DCID)—Offset 8700h

This register is modified and maintained by BIOS

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 5100Ah

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD)**
20:16	5h RW	**Debug Capability Event Ring Segment Table Max (DCERSTM):** Note: This register is sticky.
15:8	10h RW	**Next Capability Pointer (NCP):** Note: This register is sticky.
7:0	Ah RW	**Capability ID (CID):** Note: This register is sticky.

16.993 Debug Capability Doorbell Register (DCDB)—Offset 8704h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:8	0h RW	**Doorbell Target (DBTGT):** This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. Value Definition 0 Data EP 1 OUT Enqueue Pointer Update 1 Data EP 1 IN Enqueue Pointer Update 2:255 Reserved This field returns '0' when read and the value should be treated as undefined by software.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Reserved (RSVD_1)**

16.994 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8708h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Reserved (RSVD)**
15:0	0h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Debug Capability Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the DCERST Max field in the DCID register Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.

16.995 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8710h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3:0	0h RW	**Reserved (RSVD)**

16.996 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8718h

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.
3	0h RW	**Reserved (RSVD)**
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.

16.997 Debug Capability Control Register (DCCTRL)—Offset 8720h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Debug Capability Enable (DCE)**
30:24	0h RO	**Device Address (DADDR)**
23:16	0h RO	**Debug Max Burst Size (DMBS):** LPT-LP USB Debug Device does not support bursting.
15:5	0h RO	**Reserved (RSVD)**
4	0h RW/C	**DbC Run Change (DRC)**
3	0h RW/1S	**Halt IN TR (HIT)**
2	0h RW/1S	**Halt OUT TR (HOT)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Link Status Event Enable (LSE)**
0	0h RO	**DbC Run (DCR)**

16.998 Debug Capability Status Register (DCST)—Offset 8724h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.
23:1	0h RO	**Reserved (RSVD)**
0	0h RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register.

16.999 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 8728h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23	0h RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'
21	0h RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
20:18	0h RO	**Reserved (RSVD_1)**
17	0h RW/C	**Connect Status Change (CSC):** '1' = Change in Current Connect Status. '0' = No change. Indicates a change has occurred in the port's Current Connect Status. The xHC sets this bit to '1' for all changes to the Debug Device connect status, even if system software has not cleared an existing DbC Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, hardware will be "setting" an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.
16:14	0h RO	**Reserved (RSVD_2)**
13:10	0h RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.
9	0h RO	**Reserved (RSVD_3)**
8:5	4h RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.
4	0h RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.
3:2	0h RO	**Reserved (RSVD_4)**

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.
0	0h RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.

16.1000 Debug Capability Context Pointer Register (DCCP)—Offset 8730h

Access Method

Type: MEM Register (Size: 64 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0h RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.
3:0	0h RO	**Reserved (RSVD)**

16.1001 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 8738h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 80870000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	8087h RW	**Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor idVendor field.
15:8	0h RO	**Reserved (RSVD)**
7:0	0h RW	**DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor bInterfaceProtocol field. Value Function 0 Debug Target vendor defined. 1 GNU Remote Debug Command Set supported. 2-255 Reserved.

16.1002 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 873Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field.
15:0	0h RW	**Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field.

16.1003 Debug Capability Descriptor Parameters (DCDP)—Offset 8740h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 30C3h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD)**
23:16	0h RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.
15:8	30h RW/S	**NEXT CAPABILITY POINTER (NCP)**
7:0	C3h RW/S	**Capability ID (CID)**

16.1004 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8748h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**Reserved (RSVD)**
18	0h RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
17:14	0h RW	**Reserved (RSVD_1)**
13	0h RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP
12:9	0h RW	**Reserved (RSVD_2)**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines
7	0h RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports
6	0h RW	**Reserved (RSVD_3)**
5	0h RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state
4	0h RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state
3	0h RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state
2:0	0h RW	**Reserved (RSVD_4)**

16.1005 DBC Control Register 1 (DBCCTL_REG)—Offset 8760h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** RSVD
7	0h RW	**SW_DCE_SEL (SW_DCE_SEL)**
6:3	0h RW	**DISC_RXD_CNT (DISC_RXD_CNT)**
2	0h RO	Reserved.
1	0h RW	**Force DCE Mode (FORCE_DCE_MODE):** 0: When DCE is set, the DbC switches to Mode 2 1: When DCE is set, the DbC switches to Mode 3

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Force Disconnect upon DCE (FORCE_DISCONNECT_ON_DCE):** If this bit is set by BIOS, the DbC will temporarily disconnect from the remote host if the DCE is set, and shortly thereafter re-connect. This allows the DbC to switch from Mode1 to Mode2 or Mode 3 operation upon DCE being set.

16.1006 SSIC Policy and Implementation Specific Registers Capability ID register (SSIC_IMPLEMENTATION_CAPABILITY_ID_REG)—Offset 8800h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 40C4h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD)**
15:8	40h RO	**Next Capability Pointer (NCP)**
7:0	C4h RO	**Supported Protocol ID (PID)**

16.1007 SSIC global configuration control register (SSIC_GLOBAL_CONFIG_CONTROL_REG)—Offset 8804h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD)**
17:16	0h RW	**T_ACT_H8_MARGIN (T_ACT_H8_MARGIN):** Specifies the margin time added to the tActivate spec time of 100us in T_ACT_H8_TIME. 11: Reserved 10: 50us 01: 20us (default for ModPHY) 00: 10us (default for MIPI MPHY)
15:4	0h RO	**Reserved1 (RSVD1)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**BB_PLL_OVRD_DURING_PWM (BB_PLL_OVRD_DURING_PWM)**
2	0h RW	**CMN_LANE_PWRGATE_DIS (CMN_LANE_PWRGATE_DIS):** This will disable the MPHY common lane power gate.
1	0h RW	**HS_CLK_GATE_DIS (HS_CLK_GATE_DIS):** This will disable the HS Clock gate request from XHCI to MIPI PLL.
0	0h RW	**PWM_CLK_GATE_DIS (PWM_CLK_GATE_DIS):** This will disable the PWM Clock gate request from XHCI to MIPI PLL.

16.1008 (PORT1_SSIC_CONFIG_REG1)—Offset 8808h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 82286010h

Bit Range	Default & Access	Field Name (ID): Description
31:30	2h RW	**NUM_RRAP_ATTEMPT (NUM_RRAP_ATTEMPT):** Specify the number of RRAP access attempt if there was tRRAPInitiatorResponse timeout.
29:22	8h RW	**TX_MIN_STALL (TX_MIN_STALL):** (TX_Min_STALL_NoConfig_Time_Capability in MIPI PHY Spec). PA will ensure TX_MIN_STALL time in STALL before entering HS-BURST or HIBERN8. Specifies minimum time in SI in STALL state.
21:17	14h RW	**PWM_EXIT_TIME (PWM_EXIT_TIME):** This will be max of RX_Min_ActivateTime_Capability and TX_Min_SAVE_Config_Time_Capability in MIPI PHY Specs) Specifies minimum activate time needed in 5us steps. PA will wait PWM_EXIT_TIME time after exiting PWM to start HS-BURST. SSIC spec requires it to be at 100us. For speedup mode this time would be in 1us steps.
16	0h RW	**DSP_DISC_BURST_CLOSE_RRAP (DSP_DISC_BURST_CLOSE_RRAP):** 0 - Send BURST Closure RRAP for DSP Disconnect 1 - Dont send Burst Closure RRAP for DSP Disconnect. For device PWM exit would be indication for DSP Disconnect.
15:13	3h RW	**TX_MIN_ACTIVATE (TX_MIN_ACTIVATE):** (TX_Min_ActivateTime in MIPI PHY Spec) Specifies minimum activate time needed in 100us steps. PA will wait TX_MIN_ACTIVATE time after H8 exit to start of PWM Burst. SSIC spec requires it to be at 1.5ms. For speedup mode this time would be 10us to 150us in steps of 10us.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**RRAP_BYPASS (RRAP_BYPASS):** Enables DFx Loopback test mode where RRAP command /response is bypassed for HS_CONFIG and PWM_BURST_CLOSURE. Host will still perform initial enter and exit PWM mode with no RRAP transfers.
11	0h RW	**Reserved (RSVD)**
10:8	0h RW	**T_ACT_H8_EXIT (T_ACT_H8_EXIT):** Specifies minimum time in 100us steps for T_ACTIVATE_TIME to exit H8. Val: Si Time / Fast Sim Time 000: 110us / 10us 001: 210us / 20us 110: 710us / 70us 111: 5ms / 500us Spec required timing is 100us.
7:5	0h RW	**MIN_HIBERN8_TIME (MIN_HIBERN8_TIME):** Minimum time in HIBERN8 state 0 110us 1 210us .. 7 810us PA will ensure MIN_HIBERN8_TIME in its TX HIBERN8. For speedup mode this time will be from 10us to 80us in steps of 10us.
4	1h RW	**SSICRATE (SSICRATE):** 0 B Series 1 A Series
3:2	0h RW	**HSGEAR (HSGEAR):** 0=HS-G1 1=HS-G2 2=HS-G3
1:0	0h RW	**SSICLANE (SSICLANE):** 0=Single lane 1=Bi-lane 2=Quad-lane

16.1009 (PORT1_SSIC_CONFIG_REG2)—Offset 880Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4881F46h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**SSIC_PORT_UNUSED (SSIC_PORT_UNUSED):** This indicates that no SSIC device is connected to the port and PORTSC register would always reflect DISCONNECTED.
30	0h RW	**PROG_DONE (PROG_DONE):** BIOS will program this bit once SSIC profile programming is done. SSIC will enable the MPHY and local PLL once this bit is set.
29:26	1h RW	**NUM_OF_MK0 (NUM_OF_MK0):** Number of MK0 which transmitter will send before sending any data.
25	0h RW	**DISABLE_SCRAMBLING (DISABLE_SCRAMBLING):** This bit will disable scrambling in HS-BURST
24:21	4h RW	**RETRAIN_TIME (RETRAIN_TIME):** Corresponds to time in 10us to detect improper training of the local and remote M-RX as part of HS-BURST entry. SSIC Spec specific 40 to 50us
20:16	8h RW	**PHY_RESET_TIME (PHY_RESET_TIME):** Corresponds to time in 100ns, PA will drive PHY RESET for MIPI PHY.

Bit Range	Default & Access	Field Name (ID): Description
15:8	1Fh RW	**LRST_TIME (LRST_TIME):** Corresponds to time in 100us PA will drive DIF-P for line reset. MIPI PHY specifies 3.1 ms Minimum. For speedup mode this time will be in steps of 5us.
7:0	46h RW	**ACTIVATE_LRST_TIME (ACTIVATE_LRST_TIME):** (Corresponds to tResetDIFN) Specifies in step of 1ms period of time a DSP is required to drive a DIF-N prior to a LINE-RESET. SSIC spec defined range is 60-80ms. For speedup mode this time will be from 5us to 400us in steps of 5us.

16.1010 (PORT1_SSIC_CONFIG_REG3)—Offset 8810h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 40400000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	4h RW	**U0_STALL_TO (U0_STALL_TO):** Time in 2^[U-STALL_TO] clock for U0 STALL entry. If there is no packet in arbiter for U0_STALL_TO time, PA will enable U0 STALL if DISABLE_U0_STALL is not set. 0000 0011 (Not recommended) 0100 16 SSIC HS CLK . 1111 32768 SSIC HS CLK
27	0h RW	**MPHY_TEST_MODE_EN (MPHY_TEST_MODE_EN):** When this bit is set, controller would not initiate any PWM once it enters PWM Mode. It will wait for tester to send Loopback RRAP Command.
26	0h RW	**DL_PWR_GATE_DIS (DL_PWR_GATE_DIS)**
25:21	2h RW	**HIBERN8_ENTER_TX (HIBERN8_ENTER_TX):** The time PA will drive DIF-N after last bit of Line-CFG before entering H8. In steps of 50ns. Legal range is 50 to 1000ns.
20:19	0h RW	**LUP_LDN_TIMER_MAX (LUP_LDN_TIMER_MAX):** 00: 10 us 01: 100 us 10: 1000us /1ms 11: (Timer is disable and dont transmit LDN)
18:3	0h RW	**RESERVED (RSVD):** rsvd
2	0h RW	**DISABLE_U0_STALL (DISABLE_U0_STALL):** This bit will disable the STALL entry in U0
1	0h RW	**SSIC_PG_U3_DIS (SSIC_PG_U3_DIS):** This disables MPHY DL PG during U3.
0	0h RW	**SSIC_PG_U2_DIS (SSIC_PG_U2_DIS):** This disables MPHY DL PG during U2.

16.1011 (PORT1_SSIC_CONFIG_REG4)—Offset 8814h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: C00000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD)**
25	0h RW	**RRAP Register Bank Valid (RRAP_REG_BANK_VALID):** 0 = No valid Commands in the Lane N register bank. Host Controller can close the PWM burst once commands from this register are completed. 1 = Valid commands present in the Lane N register bank. Host controller must complete commands from the register bank before closing the burst.
24	0h RW	**Target Phy (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy Setting this bit to 1 allows the use of this command mechanism to write to local Phy profile and AFE tuning registers Primarily as a back up option.
23	1h RW	**HS_Config (HS_CONFIG):** When this bit is set to 1 the host controller will issue an RRAP write with HS_Config=1 once it sees Command Phase Done = 1
22	1h RW	**Command Phase Done (CPD):** When set to 1, this indicates that SW has completed performing RRAP cycles through the command register.
21	0h RW	**Command Valid (CMD_VALID):** When written to 1 indicates that the Attribute ID and Attribute Data for writes fields are valid.
20	0h RW	**Read_Write (READ_WRITE):** 0 = Write 1= Read
19:8	0h RW	**Attribute ID (ATT_ID):** Attribute ID that is being written or read
7:0	0h RW	**Attribute Write Data (ATT_WRITE_DATA):** Data byte that is required to be written to either the local phy or the remote phy

16.1017 SSIC Port N Register Access Status (PORT1_REGISTER_ACCESS_STATUS)—Offset 8908h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	**Reserved (RSVD)**
9:8	0h RW	**Command Completion Status (CCS):** 00 = Command not complete 01 = Command complete with Success 10 = Command complete with Error These bits must be cleared before a new command is initiated.
7:0	0h RO	**Read data (READ_DATA):** Data read as a result of the RRAP operation

16.1018 (PORT1_PROFILE_ATTRIBUTES_REG0)—Offset 890Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1019 (PORT1_PROFILE_ATTRIBUTES_REG1)—Offset 8910h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1020 (PORT1_PROFILE_ATTRIBUTES_REG2)—Offset 8914h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1021 (PORT1_PROFILE_ATTRIBUTES_REG3)—Offset 8918h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1022 (PORT1_PROFILE_ATTRIBUTES_REG4)—Offset 891Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1023 (PORT1_PROFILE_ATTRIBUTES_REG5)—Offset 8920h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16

7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1051 (PORT1_PROFILE_ATTRIBUTES_REG33)—Offset 8990h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1052 (PORT1_PROFILE_ATTRIBUTES_REG34)—Offset 8994h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1053 (PORT1_PROFILE_ATTRIBUTES_REG35)—Offset 8998h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1054 (PORT1_PROFILE_ATTRIBUTES_REG36)—Offset 899Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16
14	0h RW	**TARGET_PHY (TARGET_PHY):** 0 = Remote Phy 1 = Local Phy
13:8	0h RO	**Reserved (RSVD1)**
7:0	0h RW	**ATTRIBUTE VALUE (ATT_VALUE)**

16.1055 (PORT1_PROFILE_ATTRIBUTES_REG37)—Offset 89A0h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD)**
27:16	0h RW	**Attribute ID (ATT_ID)**
15	0h RW	**Valid (VALID):** When set, indicates that the attribute value in bits 7:0 must be written to the address specified in bits 27:16

16.1082 GLOBAL_TIME_SYNC_CAP_REG (GLOBAL_TIME_SYNC_CAP_REG)—Offset 8E10h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 12C9h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED (RSVD)**
15:8	12h RO	**Next Capability pointer (NCP)**
7:0	C9h RO	**Capability ID (CID)**

16.1083 GLOBAL_TIME_SYNC_CTRL_REG (GLOBAL_TIME_SYNC_CTRL_REG)—Offset 8E14h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**RESERVED (RSVD)**
0	0h RW/1S	**Time Stamp Counter Capture Initiate (TIME_STAMP_CNTR_CAPTURE_INITIATE):** SW sets this bit to initiate a time capture. Once the time capture is complete and the time values are valid in the Local and Global time capture registers, HW clears the bit.

16.1084 MICROFRAME_TIME_REG (MICROFRAME_TIME_REG)—Offset 8E18h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED (RSVD)**
29:16	0h RO	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits [29:16] reflect state of bits [13:0] of FRINDEX
15:13	0h RO	**RESERVED1 (RSVD1)**
12:0	0h RO	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done via Bus Interval Adjust (BIA).

16.1085 GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW_REG)—Offset 8E20h

Global Time Value (Low):

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW):** Global Time Value (Low):

16.1086 GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI_REG)—Offset 8E24h

Global Time Value (High):

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI):** Global Time Value (High):

16.1087 Debug Status Capability Register (DEBUG_STATUS_CAPABILITY_REG)—Offset 8E58h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: CBh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Rsvd (Rsvd)**

Default: 24400000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**reserved_32_30 (reserved_32_30)**
29	1h RW	**USBRxPktCntSel (USBRxPktCntSel)**
28	0h RO	**reserved_29_28 (reserved_29_28)**
27:24	4h RW	**USBRxPktCnt (USBRxPktCnt)**
23:19	8h RW	**USBMaxRxBurstSize (USBMaxRxBurstSize)**
18:16	0h RO	**reserved_19_16 (reserved_19_16)**
15	0h RW	**reserved_16_15 (reserved_16_15)**
14:11	0h RO	**reserved_15_11 (reserved_15_11)**
10:0	0h RO	**reserved_11_0 (reserved_11_0)**

16.1115 GCTL (GCTL)—Offset C110h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 102000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	2h RW	**PWRDNSCALE (PWRDNSCALE)**
18	0h RW	**MASTERFILTBYPASS (MASTERFILTBYPASS)**
17	0h RW	**BYPSSETADDR (BYPSSETADDR)**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**U2RSTECN (U2RSTECN)**
15:14	0h RW	**FRMSCLDWN (FRMSCLDWN)**
13:12	2h RW	**PRTCAPDIR (PRTCAPDIR)**
11	0h RW	**CORESOFTRESET (CORESOFTRESET)**
10	0h RW	**SOFITPSYNC (SOFITPSYNC)**
9	0h RW	**U1U2TimerScale (U1U2TimerScale)**
8	0h RW	**DEBUGATTACH (DEBUGATTACH)**
7:6	0h RW	**RAMCLKSEL (RAMCLKSEL)**
5:4	0h RW	**SCALEDOWN (SCALEDOWN)**
3	0h RW	**DISSCRAMBLE (DISSCRAMBLE)**
2	0h RW	**U2EXIT_LFPS (U2EXIT_LFPS)**
1	0h RW	**GblHibernationEn (GblHibernationEn)**
0	0h RW	**DSBLCLKGTNG (DSBLCLKGTNG)**

16.1116 GPMSTS (GPMSTS)—Offset C114h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h WO	**PortSel (PortSel)**
27:16	0h RW	**Reserved_16_27 (Reserved_16_27)**
15:12	0h RO	**U3Wakeup (U3Wakeup)**
11:9	0h RW	**Reserved_9_11 (Reserved_9_11)**

Bit Range	Default & Access	Field Name (ID): Description
8:0	0h RO	**U2Wakeup (U2Wakeup)**

16.1117 GSTS (GSTS)—Offset C118h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3E800000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	3E8h RO	**CBELT (CBELT)**
19:12	0h RO	**reserved_20_12 (reserved_20_12)**
11	0h RO	**SSIC_IP (SSIC_IP)**
10	0h RO	**OTG_IP (OTG_IP)**
9	0h RO	**BC_IP (BC_IP)**
8	0h RO	**ADP_IP (ADP_IP)**
7	0h RO	**Host_IP (Host_IP)**
6	0h RO	**Device_IP (Device_IP)**
5	0h RO	**CSRTimeout (CSRTimeout)**
4	0h RO	**BUSERRADDRVLD (BUSERRADDRVLD)**
3:2	0h RO	**reserved_4_2 (reserved_4_2)**
1:0	0h RO	**CURMOD (CURMOD)**

16.1118 GUCTL1 (GUCTL1)—Offset C11Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**reserved_32_15 (reserved_32_15)**
14:9	0h RW	**Reserved_15_9 (Reserved_15_9)**
8	0h RW	**L1_SUSP_THRLD_EN_FOR_HOST (L1_SUSP_THRLD_EN_FOR_HOST)**
7:4	0h RW	**L1_SUSP_THRLD_FOR_HOST (L1_SUSP_THRLD_FOR_HOST)**
3	0h RW	**HC_ERRATA_ENABLE (HC_ERRATA_ENABLE)**
2	0h RW	**HC_PARCHK_DISABLE (HC_PARCHK_DISABLE)**
1	1h RW	**OVRLD_L1_SUSP_COM (OVRLD_L1_SUSP_COM)**
0	0h RW	**LOA_FILTER_EN (LOA_FILTER_EN)**

16.1119 GSNPSID (GSNPSID)—Offset C120h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 5533260Ah

Bit Range	Default & Access	Field Name (ID): Description
31:0	5533260Ah RO	**SYNOPSYSID (SYNOPSYSID)**

16.1120 GGPIO (GGPIO)—Offset C124h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**GPO (GPO)**
15:0	0h RO	**GPI (GPI)**

16.1121 GUID (GUID)—Offset C128h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8086A0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	8086A0h RW	**USERID (USERID)**

16.1122 GUCTL (GUCTL)—Offset C12Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RW	**REFCLKPER (REFCLKPER)**
21	0h RW	**NoExtrDl (NoExtrDl)**
20:18	0h RW	**PSQExtrResSp (PSQExtrResSp)**
17	0h RW	**SprsCtrlTransEn (SprsCtrlTransEn)**
16	0h RO	**reserved_17_16 (reserved_17_16)**
15	0h RO	**reserved_16_15 (reserved_16_15)**
14	0h RW	**USBHstInAutoRetryEn (USBHstInAutoRetryEn)**

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**EnOverlapChk (EnOverlapChk)**
12	0h RW	**ExtCapSupptEN (ExtCapSupptEN)**
11	0h RW	**InsrtExtrFSBODI (InsrtExtrFSBODI)**
10:9	0h RW	**DTCT (DTCT)**
8:0	10h RW	**DTFT (DTFT)**

16.1123 GBUSERRADDRLO (GBUSERRADDRLO)—Offset C130h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**BUSERRADDR (BUSERRADDR)**

16.1124 GBUSERRADDRHI (GBUSERRADDRHI)—Offset C134h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**BUSERRADDR (BUSERRADDR)**

16.1125 GPRTBIMAPLO (GPRTBIMAPLO)—Offset C138h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**BINUM8 (BINUM8)**
27:24	0h RO	**BINUM7 (BINUM7)**
23:20	0h RO	**BINUM6 (BINUM6)**
19:16	0h RO	**BINUM5 (BINUM5)**
15:12	0h RO	**BINUM4 (BINUM4)**
11:8	0h RO	**BINUM3 (BINUM3)**
7:4	0h RO	**BINUM2 (BINUM2)**
3:0	0h RW	**BINUM1 (BINUM1)**

16.1126 GPRTBIMAPHI (GPRTBIMAPHI)—Offset C13Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**reserved_32_28 (reserved_32_28)**
27:24	0h RO	**BINUM15 (BINUM15)**
23:20	0h RO	**BINUM14 (BINUM14)**
19:16	0h RO	**BINUM13 (BINUM13)**
15:12	0h RO	**BINUM12 (BINUM12)**
11:8	0h RO	**BINUM11 (BINUM11)**
7:4	0h RO	**BINUM10 (BINUM10)**

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RO	**BINUM9 (BINUM9)**

16.1127 GHWPARAMS0 (GHWPARAMS0)—Offset C140h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40204008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	40h RO	**DWC_USB3_ADWIDTH_31_24 (DWC_USB3_ADWIDTH_31_24)**
23:16	20h RO	**DWC_USB3_SDWIDTH_23_16 (DWC_USB3_SDWIDTH_23_16)**
15:8	40h RO	**DWC_USB3_MDWIDTH_15_8 (DWC_USB3_MDWIDTH_15_8)**
7:6	0h RO	**DWC_USB3_SBUS_TYPE_7_6 (DWC_USB3_SBUS_TYPE_7_6)**
5:3	1h RO	**DWC_USB3_MBUS_TYPE_5_3 (DWC_USB3_MBUS_TYPE_5_3)**
2:0	0h RO	**DWC_USB3_MODE_2_0 (DWC_USB3_MODE_2_0)**

16.1128 GHWPARAMS1 (GHWPARAMS1)—Offset C144h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 260C93Bh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved_31 (Reserved_31)**
30	0h RO	**DWC_USB3_RM_OPT_FEATURES_30 (DWC_USB3_RM_OPT_FEATURES_30)**
29	0h RO	**Reserved1_29 (Reserved1_29)**

Bit Range	Default & Access	Field Name (ID): Description
28	0h RO	**DWC_USB3_RAM_BUS_CLKS_SYNC_28 (DWC_USB3_RAM_BUS_CLKS_SYNC_28)**
27	0h RO	**DWC_USB3_MAC_RAM_CLKS_SYNC_27 (DWC_USB3_MAC_RAM_CLKS_SYNC_27)**
26	0h RO	**DWC_USB3_MAC_PHY_CLKS_SYNC_26 (DWC_USB3_MAC_PHY_CLKS_SYNC_26)**
25:24	2h RO	**DWC_USB3_EN_PWROPT_25_24 (DWC_USB3_EN_PWROPT_25_24)**
23	0h RO	**DWC_USB3_SPRAM_TYP_23 (DWC_USB3_SPRAM_TYP_23)**
22:21	3h RO	**DWC_USB3_NUM_RAMS_22_21 (DWC_USB3_NUM_RAMS_22_21)**
20:15	1h RO	**DWC_USB3_DEVICE_NUM_INT_20_15 (DWC_USB3_DEVICE_NUM_INT_20_15)**
14:12	4h RO	**DWC_USB3_ASPACEWIDTH_14_12 (DWC_USB3_ASPACEWIDTH_14_12)**
11:9	4h RO	**DWC_USB3_REQINFOWIDTH_11_9 (DWC_USB3_REQINFOWIDTH_11_9)**
8:6	4h RO	**DWC_USB3_DATAINFOWIDTH_8_6 (DWC_USB3_DATAINFOWIDTH_8_6)**
5:3	7h RO	**DWC_USB3_BURSTWIDTH_5_3 (DWC_USB3_BURSTWIDTH_5_3)**
2:0	3h RO	**DWC_USB3_IDWIDTH_2_0 (DWC_USB3_IDWIDTH_2_0)**

16.1129 GHWPARAMS2 (GHWPARAMS2)—Offset C148h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 8086A0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	8086A0h RO	**DWC_USB3_USERID_31_0 (DWC_USB3_USERID_31_0)**

16.1130 GHWPARAMS3 (GHWPARAMS3)—Offset C14Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10420085h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved_31 (Reserved_31)**

7:4	0h RW	**DEVSELECT (DEVSELECT)**
3:0	0h RW	**EPSELECT (EPSELECT)**

16.1140 GDBGLSP (GDBGLSP)—Offset C174h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**LSPDEBUG (LSPDEBUG)**

16.1141 GDBGEPINFO0 (GDBGEPINFO0)—Offset C178h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EPDEBUG (EPDEBUG)**

16.1142 GDBGEPINFO1 (GDBGEPINFO1)—Offset C17Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 800000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	800000h RO	**EPDEBUG (EPDEBUG)**

16.1143 GPRTBIMAP_HSLO (GPRTBIMAP_HSLO)—Offset C180h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**BINUM8 (BINUM8)**
27:24	0h RO	**BINUM7 (BINUM7)**
23:20	0h RO	**BINUM6 (BINUM6)**
19:16	0h RO	**BINUM5 (BINUM5)**

3:0	0h RO	**BINUM9 (BINUM9)**

16.1145 GPRTBIMAP_FSLO (GPRTBIMAP_FSLO)—Offset C188h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**BINUM8 (BINUM8)**
27:24	0h RO	**BINUM7 (BINUM7)**
23:20	0h RO	**BINUM6 (BINUM6)**
19:16	0h RO	**BINUM5 (BINUM5)**
15:12	0h RO	**BINUM4 (BINUM4)**
11:8	0h RO	**BINUM3 (BINUM3)**
7:4	0h RO	**BINUM2 (BINUM2)**
3:0	0h RW	**BINUM1 (BINUM1)**

16.1146 GPRTBIMAP_FSHI (GPRTBIMAP_FSHI)—Offset C18Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**reserved_32_28 (reserved_32_28)**
27:24	0h RO	**BINUM15 (BINUM15)**
23:20	0h RO	**BINUM14 (BINUM14)**
19:16	0h RO	**BINUM13 (BINUM13)**

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	**BINUM12 (BINUM12)**
11:8	0h RO	**BINUM11 (BINUM11)**
7:4	0h RO	**BINUM10 (BINUM10)**
3:0	0h RO	**BINUM9 (BINUM9)**

16.1147 Reserved_94 (Reserved_94)—Offset C194h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**reserved_32_0 (reserved_32_0)**

16.1148 Reserved_98 (Reserved_98)—Offset C198h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**reserved_32_0 (reserved_32_0)**

16.1149 GUSB2PHYCFG_0 (GUSB2PHYCFG_0)—Offset C200h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2400h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PHYSOFTRST (PHYSOFTRST)**
30	0h RW	**U2_FREECLK_EXISTS (U2_FREECLK_EXISTS)**
29	0h RW	**ULPI_LPM_WITH_OPMODE_CHK (ULPI_LPM_WITH_OPMODE_CHK)**
28:27	0h RW	**HSIC_CON_WIDTH_ADJ (HSIC_CON_WIDTH_ADJ)**
26	0h RW	**INV_SEL_HSIC (INV_SEL_HSIC)**
25:19	0h RO	**reserved_25_19 (reserved_25_19)**
18	0h RW	**ULPIEXTVBUSINDIACTOR (ULPIEXTVBUSINDIACTOR)**
17	0h RW	**ULPIEXTVBUSDRV (ULPIEXTVBUSDRV)**

2:0	0h RW	**B1L (B1L)**

16.1150 GUSB2I2CCTL_0 (GUSB2I2CCTL_0)—Offset C240h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**reserved_32_0 (reserved_32_0)**

16.1151 GUSB2PHYACC_ULPI_0 (GUSB2PHYACC_ULPI_0)—Offset C280h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**reserved_32_27 (reserved_32_27)**
26	0h RO	**DISUIPIDRVR (DISUIPIDRVR)**
25	0h RO	**NEWREGREQ (NEWREGREQ)**
24	0h RO	**VSTSDONE (VSTSDONE)**
23	0h RO	**VSTSBSY (VSTSBSY)**
22	0h RO	**REGWR (REGWR)**
21:16	0h RO	**REGADDR (REGADDR)**
15:13	0h RW	**Reserved_13_15 (Reserved_13_15)**
12:8	0h RO	**EXTREGADDR (EXTREGADDR)**
7:0	0h RO	**REGDATA (REGDATA)**

16.1152 GUSB3PIPECTL_0 (GUSB3PIPECTL_0)—Offset C2C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2020002h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**PHYSoftRst (PHYSoftRst)**
30	0h RW	**HstPrtCmpl (HstPrtCmpl)**
29	0h RW	**U2SSInactP3ok (U2SSInactP3ok)**
28	0h RW	**DisRxDetP3 (DisRxDetP3)**
27	0h RW	**Ux_exit_in_Px (Ux_exit_in_Px)**
26	0h RW	**ping_enhancement_en (ping_enhancement_en)**
25	1h RW	**u1u2exitfail_to_recov (u1u2exitfail_to_recov)**
24	0h RW	**request_p1p2p3 (request_p1p2p3)**
23	0h RW	**StartRxDetU3RxDet (StartRxDetU3RxDet)**
22	0h RW	**DisRxDetU3RxDet (DisRxDetU3RxDet)**
21:19	0h RW	**DelayP1P2P3 (DelayP1P2P3)**
18	0h RW	**DELAYP1TRANS (DELAYP1TRANS)**
17	1h RW	**SUSPENDENABLE (SUSPENDENABLE)**
16:15	0h RO	**DATWIDTH (DATWIDTH)**
14	0h RW	**AbortRxDetInU2 (AbortRxDetInU2)**
13	0h RW	**SkipRxDet (SkipRxDet)**
12	0h RW	**LFPSP0Algn (LFPSP0Algn)**
11	0h RW	**P3P2TranOK (P3P2TranOK)**
10	0h RW	**P3ExSigP2 (P3ExSigP2)**
9	0h RW	**LFPSFILTER (LFPSFILTER)**
8	0h RW	**RX_DETECT_to_Polling_LFPS_Control (RX_DETECT_to_Polling_LFPS_Control)**

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**SSICEn (SSICEn)**
6	0h RW	**TX_SWING (TX_SWING)**
5:3	0h RW	**TX_MARGIN (TX_MARGIN)**
2:1	1h RW	**TX_DE_EPPHASIS (TX_DE_EPPHASIS)**
0	0h RW	**ELASTIC_BUFFER_MODE (ELASTIC_BUFFER_MODE)**

16.1153 GTXFIFOSIZ0_0 (GTXFIFOSIZ0_0)—Offset C300h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 42h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	42h RW	**TXFDEP_N (TXFDEP_N)**

16.1154 GTXFIFOSIZ1_0 (GTXFIFOSIZ1_0)—Offset C304h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 420184h

Bit Range	Default & Access	Field Name (ID): Description
31:16	42h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	184h RW	**TXFDEP_N (TXFDEP_N)**

16.1155 GTXFIFOSIZ2_0 (GTXFIFOSIZ2_0)—Offset C308h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1C60184h

Bit Range	Default & Access	Field Name (ID): Description
31:16	1C6h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	184h RW	**TXFDEP_N (TXFDEP_N)**

16.1156 GTXFIFOSIZ3_0 (GTXFIFOSIZ3_0)—Offset C30Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 34A0184h

Bit Range	Default & Access	Field Name (ID): Description
31:16	34Ah RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	184h RW	**TXFDEP_N (TXFDEP_N)**

16.1157 GTXFIFOSIZ4_0 (GTXFIFOSIZ4_0)—Offset C310h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4CE0082h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4CEh RW	**TXFSTADDR_N (TXFSTADDR_N)**

Bit Range	Default & Access	Field Name (ID): Description
15:0	82h RW	**TXFDEP_N (TXFDEP_N)**

16.1158 GTXFIFOSIZ5_0 (GTXFIFOSIZ5_0)—Offset C314h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 5500082h

Bit Range	Default & Access	Field Name (ID): Description
31:16	550h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	82h RW	**TXFDEP_N (TXFDEP_N)**

16.1159 GTXFIFOSIZ6_0 (GTXFIFOSIZ6_0)—Offset C318h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 5D20082h

Bit Range	Default & Access	Field Name (ID): Description
31:16	5D2h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	82h RW	**TXFDEP_N (TXFDEP_N)**

16.1160 GTXFIFOSIZ7_0 (GTXFIFOSIZ7_0)—Offset C31Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 6540082h

Bit Range	Default & Access	Field Name (ID): Description
31:16	654h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	82h RW	**TXFDEP_N (TXFDEP_N)**

16.1161 GTXFIFOSIZ8_0 (GTXFIFOSIZ8_0)—Offset C320h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 6D60022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	6D6h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1162 GTXFIFOSIZ9_0 (GTXFIFOSIZ9_0)—Offset C324h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 6F80022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	6F8h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1163 GTXFIFOSIZ10_0 (GTXFIFOSIZ10_0)—Offset C328h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 71A0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	71Ah RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1164 GTXFIFOSIZ11_0 (GTXFIFOSIZ11_0)—Offset C32Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 73C0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	73Ch RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1165 GTXFIFOSIZ12_0 (GTXFIFOSIZ12_0)—Offset C330h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 75E0022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	75Eh RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1166 GTXFIFOSIZ13_0 (GTXFIFOSIZ13_0)—Offset C334h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7800022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	780h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1167 GTXFIFOSIZ14_0 (GTXFIFOSIZ14_0)—Offset C338h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7A20022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	7A2h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1168 GTXFIFOSIZ15_0 (GTXFIFOSIZ15_0)—Offset C33Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 7C40022h

Bit Range	Default & Access	Field Name (ID): Description
31:16	7C4h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	22h RW	**TXFDEP_N (TXFDEP_N)**

16.1169 GRXFIFOSIZ0_0 (GRXFIFOSIZ0_0)—Offset C380h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 385h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RXFSTADDR_N (RXFSTADDR_N)**
15:0	385h RW	**RXFDEP_N (RXFDEP_N)**

16.1170 GEVNTADRLO_0 (GEVNTADRLO_0)—Offset C400h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRLO (EVNTADRLO)**

16.1171 GEVNTADRHI_0 (GEVNTADRHI_0)—Offset C404h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRHI (EVNTADRHI)**

16.1172 GEVNTSIZ_0 (GEVNTSIZ_0)—Offset C408h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**EVNTINTRPTMASK (EVNTINTRPTMASK)**
30:16	0h RO	**reserved_31_16 (reserved_31_16)**
15:0	0h RW	**EVENTSIZ (EVENTSIZ)**

16.1173 GEVNTCOUNT_0 (GEVNTCOUNT_0)—Offset C40Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**reserved_32_16 (reserved_32_16)**
15:0	0h NA	**EVNTCOUNT (EVNTCOUNT)**

16.1174 GHWPARAMS8 (GHWPARAMS8)—Offset C600h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2F6h

Bit Range	Default & Access	Field Name (ID): Description
31:0	2F6h RO	**DWC_USB3_DCACHE_DEPTH_INFO_32_0 (DWC_USB3_DCACHE_DEPTH_INFO_32_0)**

16.1175 GTXFIFOPRIDEV (GTXFIFOPRIDEV)—Offset C610h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**reserved_32_16 (reserved_32_16)**
15:0	0h RW	**gtxfifopridev (gtxfifopridev)**

16.1176 GFLADJ (GFLADJ)—Offset C630h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**GFLADJ_REFCLK_240MHZDECR_PLS1 (GFLADJ_REFCLK_240MHZDECR_PLS1)**
30:24	0h RW	**GFLADJ_REFCLK_240MHZ_DECR (GFLADJ_REFCLK_240MHZ_DECR)**
23	0h RW	**GFLADJ_REFCLK_LPM_SEL (GFLADJ_REFCLK_LPM_SEL)**
22	0h RW	**reserved_22 (reserved_22)**
21:8	0h RW	**GFLADJ_REFCLK_FLADJ (GFLADJ_REFCLK_FLADJ)**
7	0h RW	**GFLADJ_30MHZ_SDBND_SEL (GFLADJ_30MHZ_SDBND_SEL)**
6	0h RW	**reserved_6 (reserved_6)**
5:0	0h RW	**GFLADJ_30MHZ (GFLADJ_30MHZ)**

16.1177 RID - Bridge revision ID Register (RID)—Offset 30h

register contains the Bridge Revision ID

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0:** Reserved
7:0	0h RO	**RID:** Revision ID of the Bridge.

16.1178 GEN_REGRW1 - General Purpose register (GEN_REGRW1)—Offset 600h

General Purpose PRV RW Register 1.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:** This register value is brought out as oob_gen_prv_rw_reg1 out of band signal

16.1179 GEN_REGRW2 - General Purpose register (GEN_REGRW2)—Offset 604h

General Purpose PRV RW Register 2.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:** This register value is brought out as oob_gen_prv_rw_reg2 out of band signal

16.1180 GEN_REGRW3 - General Purpose register (GEN_REGRW3)—Offset 608h

General Purpose PRV RW Register 3.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:** This register value is brought out as oob_gen_prv_rw_reg3 out of band signal

16.1181 GEN_REGRW4 - General Purpose register (GEN_REGRW4)—Offset 60Ch

General Purpose PRV RW Register 4.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:** This register value is brought out as oob_gen_prv_rw_reg4 out of band signal

16.1182 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

16.1183 (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

16.1184 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: C03FE00h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C03FEh RO	**CLASS_CODES**
7:0	0h RO	**RID**

16.1185 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

16.1186 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**BASEADDR**
20:12	0h RO	**RSVD**
11:4	0h RO	**SIZEINDICATOR**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

16.1187 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**BASEADDR1_HIGH**
31:12	0h RW	**BASEADDR1**
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

16.1188 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/O	**SUBSYSTEMVENDORID**

16.1189 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

16.1190 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

16.1191 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	1h RO	**INTPIN**
7:0	0h RW	**INTLINE**

16.1192 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT**
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

16.1193 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

16.1194 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

16.1195 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

16.1196 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**
0	0h RO	**SW_LAT_VALID**

16.1197 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

16.1198 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	0h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**
16	0h RW	**D3_ENABLE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

16.1199 (MANID)—Offset F8h

Manufacturers ID

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MANID**

16.1200 (DEVVENDID)—Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID**
15:0	8086h RO	**VENDORID**

16.1201 (STATUSCOMMAND)—Offset 4h

STATUSCOMMAND- Status and Command

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved0**
29	0h RW/1C	**RMA**
28	0h RW/1C	**RTA**
27:21	0h RO	**Reserved1**
20	1h RO	**CAPLIST**
19	0h RO	**INTR_STATUS**
18:16	0h RO	**Reserved2**
15:11	0h RO	**Reserved3**
10	0h RW	**INTR_DISABLE**
9	0h RO	**Reserved4**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR_ENABLE**
7:3	0h RO	**Reserved5**
2	0h RW	**BME**
1	0h RW	**MSE**
0	0h RO	**Reserved6**

16.1202 (REVCLASSCODE)—Offset 8h

REVCLASSCODE - Revision ID and Class Code

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: C03FE00h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C03FEh RO	**CLASS_CODES**
7:0	0h RO	**RID**

16.1203 (CLLATHEADERBIST)—Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved0**
23	0h RO	**MULFNDEV**
22:16	0h RO	**HEADERTYPE**

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**LATTIMER**
7:0	0h RW	**CACHELINE_SIZE**

16.1204 (BAR)—Offset 10h

BAR -Base Address Register

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 21
Function: 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**BASEADDR**
20:12	0h RO	**RSVD**
11:4	0h RO	**SIZEINDICATOR**
3	0h RO	**PREFETCHABLE**
2:1	2h RO	**TYPE**
0	0h RO	**MESSAGE_SPACE**

16.1205 (BAR1)—Offset 18h

BAR1 -Base Address Register1

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 21
Function: 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**BASEADDR1_HIGH**
31:12	0h RW	**BASEADDR1**

Bit Range	Default & Access	Field Name (ID): Description
11:4	0h RO	**SIZEINDICATOR1**
3	0h RO	**PREFETCHABLE1**
2:1	2h RO	**TYPE1**
0	0h RO	**MESSAGE_SPACE1**

16.1206 (SUBSYSTEMID)—Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID**
15:0	0h RW/O	**SUBSYSTEMVENDORID**

16.1207 (EXPANSION_ROM_BASEADDR)—Offset 30h

EXPANSION ROM base address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE**

16.1208 (CAPABILITYPTR)—Offset 34h

CAPABILITYPTR - Capabilities Pointer

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved0**
7:0	80h RO	**CAPPTR_POWER**

16.1209 (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT**
23:16	0h RO	**MIN_GNT**
15:12	0h RO	**Reserved0**
11:8	1h RO	**INTPIN**
7:0	0h RW	**INTLINE**

16.1210 (POWERCAPID)—Offset 80h

POWERCAPID - PowerManagement Capability ID

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT**

Bit Range	Default & Access	Field Name (ID): Description
26:19	0h RO	**Reserved0**
18:16	3h RO	**VERSION**
15:8	90h RO	**NXTCAP**
7:0	1h RO	**POWER_CAP**

16.1211 (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved0**
15	0h RW/1C	**PMESTATUS**
14:9	0h RO	**Reserved1**
8	0h RW	**PMEENABLE**
7:4	0h RO	**Reserved2**
3	1h RO	**NO_SOFT_RESET**
2	0h RO	**Reserved3**
1:0	0h RW	**POWERSTATE**

16.1212 (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP**
27:24	0h RO	**REVID**
23:16	14h RO	**CAP_LENGTH**
15:8	0h RO	**NEXT_CAP**
7:0	9h RO	**CAPID**

16.1213 (DEVID_VEND_SPECIFIC_REG)—Offset 94h

DEVID VENDOR SPECIFIC REG

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH**
19:16	0h RO	**VSEC_REV**
15:0	10h RO	**VSECID**

16.1214 (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET**
3:1	0h RO	**SW_LAT_BAR_NUM**

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**SW_LAT_VALID**

16.1215 (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: 10F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET**
3:1	0h RO	**BAR_NUM**
0	1h RO	**VALID**

16.1216 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 1

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved0**
21	0h RW	**HAE**
20	0h RO	**Reserved1**
19	1h RW	**SLEEP_EN**
18	0h RW	**PGE**
17	0h RW	**I3_ENABLE**

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**D3_ENABLE**
15:13	0h RO	**Reserved2**
12:10	2h RW/O	**POW_LAT_SCALE**
9:0	0h RW/O	**POW_LAT_VALUE**

16.1217 (MANID)—Offset F8h

Manufacturers ID

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MANID**

§ §

17 USB-Device (xDCI) Registers

This chapter documents the registers in Bus: 0, Device 21, Function 1.

17.1 DEVVENDID — Offset 0h

DEVICEVENDORID - Device ID and Vendor ID Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**DEVICEID:**
15:0	8086h RO	**VENDORID:**

17.2 STATUSCOMMAND — Offset 4h

STATUSCOMMAND- Status and Command

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED0:** Reserved
29	0h RW/1C	**RMA:**
28	0h RW/1C	**RTA:**
27:21	0h RO	**RESERVED1:** Reserved
20	1h RO	**CAPLIST:**
19	0h RO	**INTR_STATUS:**
18:16	0h RO	**RESERVED2:** Reserved
15:11	0h RO	**RESERVED3:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**INTR_DISABLE:**
9	0h RO	**RESERVED4:** Reserved
8	0h RW	**SERR_ENABLE:**
7:3	0h RO	**RESERVED5:** Reserved
2	0h RW	**BME:**
1	0h RW	**MSE:**
0	0h RO	**RESERVED6:** Reserved

17.3 REVCLASSCODE — Offset 8h

REVCLASSCODE - Revision ID and Class Code

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 8h	C03FE00 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	C03FEh RO	**CLASS_CODES:**
7:0	0h RO	**RID:**

17.4 CLLATHEADERBIST — Offset Ch

CLLATHEADERBIST - Cache Line Latency Header and BIST

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED0:** Reserved
23	0h RO	**MULFNDEV:**

Bit Range	Default & Access	Field Name (ID): Description
22:16	0h RO	**HEADERTYPE:**
15:8	0h RO	**LATTIMER:**
7:0	0h RW	**CACHELINE_SIZE:**

17.5 BAR — Offset 10h

BAR -Base Address Register

Type	Size	Offset	Default
CFG	64 bit	[B:0, D:21, F:1] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**BASEADDR:**
20:12	0h RO	**RSVD:** Reserved
11:4	0h RO	**SIZEINDICATOR:**
3	0h RO	**PREFETCHABLE:**
2:1	2h RO	**TYPE:**
0	0h RO	**MESSAGE_SPACE:**

17.6 BAR1 — Offset 18h

BAR1 -Base Address Register1

Type	Size	Offset	Default
CFG	64 bit	[B:0, D:21, F:1] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**BASEADDR1_HIGH:**
31:12	0h RW	**BASEADDR1:**

Bit Range	Default & Access	Field Name (ID): Description
11:4	0h RO	**SIZEINDICATOR1:**
3	0h RO	**PREFETCHABLE1:**
2:1	2h RO	**TYPE1:**
0	0h RO	**MESSAGE_SPACE1:**

17.7 SUBSYSTEMID — Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:**
15:0	0h RW/O	**SUBSYSTEMVENDORID:**

17.8 EXPANSION_ROM_BASEADDR — Offset 30h

EXPANSION ROM base address

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:**

17.9 CAPABILITYPTR — Offset 34h

CAPABILITYPTR - Capabilities Pointer

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	80h RO	**CAPPTR_POWER:**

17.10 INTERRUPTREG — Offset 3Ch

INTERRUPTREG - Interrupt Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:**
23:16	0h RO	**MIN_GNT:**
15:12	0h RO	**RESERVED0:** Reserved
11:8	1h RO	**INTPIN:**
7:0	0h RW	**INTLINE:**

17.11 POWERCAPID — Offset 80h

POWERCAPID - PowerManagement Capability ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 80h	48039001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:**
26:19	0h RO	**RESERVED0:** Reserved
18:16	3h RO	**VERSION:**
15:8	90h RO	**NXTCAP:**

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**POWER_CAP:**

17.12 PMECTRLSTATUS — Offset 84h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED0:** Reserved
15	0h RW/1C	**PMESTATUS:**
14:9	0h RO	**RESERVED1:** Reserved
8	0h RW	**PMEENABLE:**
7:4	0h RO	**RESERVED2:** Reserved
3	1h RO	**NO_SOFT_RESET:**
2	0h RO	**RESERVED3:** Reserved
1:0	0h RW	**POWERSTATE:**

17.13 PCIDEVIDLE_CAP_RECORD — Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:**
27:24	0h RO	**REVID:**
23:16	14h RO	**CAP_LENGTH:**

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NEXT_CAP:**
7:0	9h RO	**CAPID:**

17.14 DEVID_VEND_SPECIFIC_REG — Offset 94h

DEVID VENDOR SPECIFIC REG

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:**
19:16	0h RO	**VSEC_REV:**
15:0	10h RO	**VSECID:**

17.15 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:**
3:1	0h RO	**SW_LAT_BAR_NUM:**
0	0h RO	**SW_LAT_VALID:**

17.16 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + 9Ch	10F8301 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET:**
3:1	0h RO	**BAR_NUM:**
0	1h RO	**VALID:**

17.17 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

DEVICE PG CONFIG

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + A0h	80800 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED0:** Reserved
21	0h RW	**HAE:**
20	0h RO	**RESERVED1:** Reserved
19	1h RW	**SLEEP_EN:**
18	0h RW	**PGE:**
17	0h RW	**I3_ENABLE:**
16	0h RW	**D3_ENABLE:**
15:13	0h RO	**RESERVED2:** Reserved
12:10	2h RW/O	**POW_LAT_SCALE:**
9:0	0h RW/O	**POW_LAT_VALUE:**

17.18 GEN_REGRW1 — Offset B0h

General Purpose Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:**

17.19 GEN_REGRW2 — Offset B4h

General Purpose Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:**

17.20 GEN_REGRW3 — Offset B8h

General Purpose Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:**

17.21 GEN_REGRW4 — Offset BCh

General Purpose Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**GEN_REG_RW4:** Reserved
2	0h RW	**XDCI_PIPE_CLK_GATE_DIS:** xdci pipe clock gating disable
1	0h RW	**XDCI_SB_CLK_GATE_DIS:** xdci sideband clock gating disable
0	0h RW	**XDCI_PRIM_CLK_GATE_DIS:** xdci primary clock gating disable

17.22 GEN_INPUT_REGRW — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:21, F:1] + C0h	1008000B h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**BVALID_HW (HW_BVALID):** hardware bvalid
30	0h RO	**GSTS_BUSERRADDVLD:** Bus error
29	0h RO	**DRD_MODE:** SS DRD mode 0 device mode 1 host mode
28	1h RO	**IDPIN:** IDPIN value (debounce)
27:26	0h RO	**U2_DSSR_STATE:** USB2 DSSR State
25:21	0h RO	**U2_PRT_STATE:** USB2 Port State
20:17	4h RO	**LTDB_LINK_STATE:** USB3 Link state
16:13	0h RO	**LTDB_SUB_STATE:** USB3 Link sub state
12	0h RO	**RESERVED1:** Reserved
11:10	0h RO	**CURRENT_POWER_STATE_U3PMU:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	0h RO	**CURRENT_POWER_STATE_U2PMU:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0h RO	**CONNECT_STATE_U3PMU:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RO	**CONNECT_STATE_U2PMU:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0h RO	**UTMI_L1_SUSPEND_COM_N:** Common L1 suspend
4	0h RO	**UTMI_SUSPEND_COM_N:** Common suspend
3	1h RO	**UTMI_SUSPEND_N:** USB 2.0 Port Suspend
2:1	1h RO	**USB2_ENUMSPEED:** Device Enumerated Speed
0	1h RO	**B2RL_CUR_MODE:** Current Mode. Current Mode 1'b0 Host ,1'b1 Device

17.23 MANID — Offset F8h

Manufacturers ID register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MANID:** Manufacturer ID: Default value comes from straps.

§ §

18 PCI Express* Controller Registers

This chapter documents the registers of the PCIe controller devices. The processor contains multiple PCIe controller devices:

- Bus: 0, Device: 20, Function: 0 PCIe0 (Func0)
- Bus: 0, Device: 20, Function: 1 PCIe0 (Func1)
- Bus: 0, Device: 19, Function: 0 PCIe1 (Func0)
- Bus: 0, Device: 19, Function: 1 PCIe1 (Func1)
- Bus: 0, Device: 19, Function: 2 PCIe1 (Func2)
- Bus: 0, Device: 19, Function: 3 PCIe1 (Func3)

NOTE: Register default values are taken from device PCIe0 only. Refer Vol1 for Device IDs

18.1 ID — Offset 0h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**Device Identification (DID):** The value of this ID is product specific.
15:0	0h RO	**Vendor Identification (VID):** Indicates Intel

18.2 Device Command; Primary Status (CMD_PSTS) — Offset 4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**DPE:** Set when the root port receives a command or data from the backbone with a parity error. This is set even if CMD.PERE is not set.
30	0h RW/1C/V	**Signaled System Error (SSE):** Set when the root port signals a system error to the internal SERR# logic.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the root port receives a completion with unsupported request status from the backbone.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the root port receives a completion with completer abort from the backbone.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set whenever the root port forwards a target abort received from the downstream device onto the backbone.
26:25	0h RO	**Primary DEVSEL# Timing Status (PDTS):** Reserved per PCI-Express spec
24	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the root port receives a completion with a data parity error on the backbone and CMD.PERE is set.
23	0h RO	**Primary Fast Back to Back Capable (PFBC):** Reserved per PCI-Express spec.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Primary 66 MHz Capable (PC66):** Reserved per PCI-Express spec.
20	0h RO	**Capabilities List (CLIST):** Indicates the presence of a capabilities list.
19	0h RO/V	**Interrupt Status (IS):** Indicates status of hot plug and power management interrupts on the root port that result in INTx# message generation. This bit is not set if MSI is enabled. If MSI is not enabled, this bit is set regardless of the state of CMD.ID.
18:16	0h RO	**Reserved (RSVD_1):** Reserved
15:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW/V2	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above.
9	0h RO	**Fast Back to Back Enable (FBE):** Reserved per PCI-Express spec.
8	0h RW	**SERR# Enable (SEE):** When set, enables the root port to generate an SERR# message when PSTS.SSE is set.
7	0h RO	**Wait Cycle Control (WCC):** Reserved per PCI-Express spec.
6	0h RW	**Parity Error Response Enable (PERE):** Indicates that the device is capable of reporting parity errors as a master on the backbone.
5	0h RO	**VGA Palette Snoop (VGA_PSE):** Reserved per PCI-Express spec.
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved per PCI-Express spec.
3	0h RO	**Special Cycle Enable (SCE):** Reserved per PCI-Express and PCI bridge spec.
2	0h RW	**Bus Master Enable (BME):** When set, allows the root port to forward Memory and I/O Read/Write cycles onto the backbone from a PCI-Express device. When this bit is 0b, Memory and I/O requests received at a Root Port must be handled as Unsupported Requests (UR). This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O requests is not controlled by this bit.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**Memory Space Enable (MSE):** When set, memory cycles within the range specified by the memory base and limit registers can be forwarded to the PCI-Express device. When cleared, these memory cycles are master aborted on the backbone.
0	0h RW	**I/O Space Enable (IOSE):** When set, I/O cycles within the range specified by the I/O base and limit registers can be forwarded to the PCI-Express device. When cleared, these cycles are master aborted on the backbone..

18.3 Revision ID;Class Code (RID_CC) — Offset 8h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Base Class Code (BCC):** Indicates the device is a bridge device.
23:16	0h RO/V	**Sub-Class Code (SCC):** The default indicates the device is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:8	0h RO/V	**Programming Interface (PI):** The value reported in this register is a function of the Decode Control.Subtractive Decode Enable (SDE) register. SDE Value reported in this register 0: 00h 1: 01h
7:0	0h RO/V	**Revision ID (RID):** Indicates the revision of the bridge.

18.4 Cache Line Size; Primary Latency Timer; Header Type (CLS_PLT_HTYPE) — Offset Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**Multi-function Device (MFD):** This bit is '1' to indicate a multi-function device.
22:16	0h RO/V	**Header Type (HTYPE):** The default mode identifies the header layout of the configuration space, which is a PCI-to-PCI bridge. If the MPC.BT register is set to a '1' for a Host Bridge, this register reads 00h.
15:11	0h RO	**Latency Count (CT):** Reserved per PCI-Express spec
10:8	0h RO	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Line Size (LS):** This is read/write but contains no functionality, per PCI-Express spec

18.5 Bus Numbers; Secondary Latency Timer (BNUM_SLT) — Offset 18h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 18h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/V2	**Secondary Latency Timer (SLT):** For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is a RW register; else this register is RO and returns 0. This register does not affect the behavior of any HW logic.
23:16	0h RW	**Subordinate Bus Number (SBBN):** Indicates the highest PCI bus number below the bridge.
15:8	0h RW	**Secondary Bus Number (SCBN):** Indicates the bus number the port.
7:0	0h RW	**Primary Bus Number (PBN):** Indicates the bus number of the backbone.

18.6 I/O Base and Limit; Secondary Status (IOBL_SSTS) — Offset 1Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the port receives a poisoned TLP.
30	0h RW/1C/V	**Received System Error (RSE):** Set when the port receives an ERR_FATAL or ERR_NONFATAL message from the device.
29	0h RW/1C/V	**Received Master Abort (RMA):** Set when the port receives a completion with 'Unsupported Request' status from the device.
28	0h RW/1C/V	**Received Target Abort (RTA):** Set when the port receives a completion with 'Completion Abort' status from the device.
27	0h RW/1C/V	**Signaled Target Abort (STA):** Set when the port generates a completion with 'Completion Abort' status to the device.
26:25	0h RO/V	**Secondary DEVSEL# Timing Status (SDTS):** Reserved per PCI-Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 01b when read, else this register returns a value of 00b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW/1C/V	**Data Parity Error Detected (DPD):** Set when the BCTRL.PERE, and either of the following two conditions occurs: Port receives completion marked poisoned. Port poisons a write request to the secondary side.
23	0h RO/V	**Secondary Fast Back to Back Capable (SFBC):** Reserved per PCI Express spec For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register returns a value of 1b when read, else this register returns a value of 0b.
22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Secondary 66 MHz Capable (SC66):** Reserved per PCI Express spec
20:16	0h RO	**Reserved (RSVD_1):** Reserved
15:12	0h RW	**I/O Address Limit (IOLA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to FFFh.
11:8	0h RO	**I/O Limit Address Capability (IOLC):** Indicates that the bridge does not support 32-bit I/O addressing.
7:4	0h RW	**I/O Base Address (IOBA):** I/O Base bits corresponding to address lines 15:12 for 4KB alignment. Bits 11:0 are assumed to be padded to 000h.
3:0	0h RO	**I/O Base Address Capability (IOBC):** Indicates that the bridge does not support 32-bit I/O addressing.

18.7 Memory Base and Limit (MBL) — Offset 20h

Accesses that are within the ranges specified in this register will be sent to the attached device if CMD.MSE is set. Accesses from the attached device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is MB [gt]= AD[lb]31:20[rb] [lt]= ML.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 20h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Memory Limit (ML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RW	**Memory Base (MB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**Reserved (RSVD_1):** Reserved

18.8 Prefetchable Memory Base and Limit (PMBL) — Offset 24h

Accesses that are within the ranges specified in this register will be sent to the device if CMD.MSE is set. Accesses from the device that are outside the ranges specified will be forwarded to the backbone if CMD.BME is set. The comparison performed is PMBU32:PMB [gt]= AD[lb]63:32[rb]:AD[lb]31:20[rb] [lt]= PMLU32:PML.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits 31:20 of the incoming address to determine the upper 1MB aligned value of the range.
19:16	0h RO	**64-bit Indicator (I64L):** Indicates support for 64-bit addressing.
15:4	0h RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits 31:20 of the incoming address to determine the lower 1MB aligned value of the range.
3:0	0h RO	**64-bit Indicator (I64B):** Indicates support for 64-bit addressing.

18.9 Prefetchable Memory Base Upper 32 Bits (PMBU32) — Offset 28h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 28h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Base Upper Portion (PMBU):** Upper 32-bits of the prefetchable address base.

18.10 Prefetchable Memory Limit Upper 32 Bits (PMLU32) — Offset 2Ch

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Upper 32-bits of the prefetchable address limit.

18.11 Capabilities List Pointer (CAPP) — Offset 34h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 34h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RW/O	**Capabilities Pointer (PTR):** Indicates that the pointer for the first entry in the capabilities list. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value. Capability Linked List (Default Settings) OffsetCapability Next Pointer 40h PCI Express 80h 80h Message Signaled Interrupt (MSI) 90h 90h Subsystem Vendor A0h A0h PCI Power Management 00h Extended PCIe Capability Linked List OffsetCapability Next Pointer 100h Advanced Error Reporting 000h

18.12 Interrupt Information; Bridge Control (INTR_BCTRL) — Offset 3Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27	0h RW/V2	**Discard Timer SERR# Enable (DTSE):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
26	0h RO	**Discard Timer Status (DTS):** Reserved per PCI-Express spec. For PCI Bus Emulation Mode compatibility, this register can remain RO as no secondary discard timer exists that will ever cause it to be set.
25	0h RW/V2	**Secondary Discard Timer (SDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
24	0h RW/V2	**Primary Discard Timer (PDT):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Fast Back to Back Enable (FBE):** Reserved per Express spec.
22	0h RW	**Secondary Bus Reset (SBR):** Triggers a Hot Reset on the PCI-Express port.
21	0h RW/V2	**Master Abort Mode (MAM):** Reserved per Express spec. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register is RW else it is RO. This register is only maintained for SW compatibility and has no functionality within the port.
20	0h RW	**VGA 16-Bit Decode (V16):** When set, indicates that the I/O aliases of the VGA range (see BCTRL:VE definition below), are not enabled. 0: Execute 10-bit address decode on VGA I/O accesses. 1: Execute 16-bit address decode on VGA I/O accesses.
19	0h RW	**VGA Enable (VE):** When set, the following ranges will be claimed off the backbone by the root port: Memory ranges A0000h-BFFFFh I/O ranges 3B0h 3BBh and 3C0h 3DFh, and all aliases of bits 15:10 in any combination of 1's
18	0h RW	**ISA Enable (IE):** This bit only applies to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64KB of PCI I/O space. If this bit is set, the root port will block any forwarding from the backbone to the device of I/O transactions addressing the last 768 bytes in each 1KB block (offsets 100h to 3FFh).
17	0h RW	**SE:** When set, ERR_COR, ERR_NONFATAL, and ERR_FATAL messages received are forwarded to the backbone. When cleared, they are not.
16	0h RW	**Parity Error Response Enable (PERE):** When set, poisoned write TLPs and completions indicating poisoned TLPs will set the SSTS.DPD.
15:8	0h RO/V	**Interrupt Pin (IPIN):** Indicates the interrupt pin driven by the root port. At reset, this register takes on the following values, which reflect the reset state of the STRPFUSECFG register in chipset config space: Port Bits[lb]15:12[rb] Bits[lb]11:08[rb] 1 0h STRPFUSECFG.P1IP 2 0h STRPFUSECFG.P2IP 3 0h STRPFUSECFG.P3IP 4 0h STRPFUSECFG.P4IP 5 0h STRPFUSECFG.P5IP 6 0h STRPFUSECFG.P6IP 7 0h STRPFUSECFG.P7IP 8 0h STRPFUSECFG.P8IP The value that is programmed into STRPFUSECFG.PxIP is always reflected in this register. For PCI Bus Emulation Mode compatibility, if the DC.PCIBEM register is set, this register returns a value of 00h when read.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register.

18.13 Capabilities List; PCI Express Capabilities (CLIST_XCAP) — Offset 40h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 40h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30	0h RO	**Reserved (RSVD_1):** Reserved
29:25	0h RO	**Interrupt Message Number (IMN):** The root port does not have multiple MSI interrupt numbers.
24	0h RW/O	**Slot Implemented (SI):** Indicates whether the root port is connected to a slot. Slot support is platform specific. BIOS programs this field, and it is maintained until a platform reset.

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RO	**Device / Port Type (DT):** Indicates this is a PCI-Express root port
19:16	0h RO	**Capability Version (CV):** Version 2.0 indicates devices compliant to the PCI Express 2.0 specification which incorporates the Register Expansion ECN.
15:8	0h RW/O	**NEXT:** Indicates the location of the next capability. The default value of this register is 80h which points to the MSI Capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	0h RO	**Capability ID (CID):** Indicates this is a PCI Express capability

18.14 Device Capabilities (DCAP) — Offset 44h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 44h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved (RSVD):** Reserved
28	0h RO	**Function Level Reset Capable (FLRC):** Not supported in Root Ports
27:26	0h RO	**Captured Slot Power Limit Scale (CSPS):** Not supported
25:18	0h RO	**Captured Slot Power Limit Value (CSPV):** Not supported
17:16	0h RO	**Reserved (RSVD_1):** Reserved
15	0h RO	**Role Based Error Reporting (RBER):** When Set, this bit indicates that the Function implements the functionality originally defined in the Error Reporting ECN for PCI Express Base Specification, Revision 1.0a, and later incorporated into PCI Express Base Specification, Revision 1.1. This bit must be Set by all Functions conforming to the ECN, PCI Express Base Specification, Revision 1.1, or subsequent PCI Express Base Specification revisions.
14	0h RO	**Reserved (RSVD_2):** Reserved
13	0h RO	**Reserved (RSVD_3):** Reserved
12	0h RO	**Reserved (RSVD_4):** Reserved
11:9	0h RO	**Endpoint L1 Acceptable Latency (E1AL):** Reserved for root ports.
8:6	0h RO	**Endpoint L0 Acceptable Latency (E0AL):** Reserved for Root port.
5	0h RO	**Extended Tag Field Supported (ETFS):** The root port never needs to initiate a transaction as a Requester with the Extended Tag bits being set. This bit does not affect the root port's ability to forward requests as a bridge as the root port always supports forwarding requests with extended tags.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RO	**Phantom Functions Supported (PFS):** No phantom functions supported
2:0	0h RW/O	**Max Payload Size Supported (MPS):** BIOS should write to this field during system initialization. Only Max Payload Size of up to 256B is supported. Programming this field to any values other than 128B max payload size will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface.

18.15 Device Control; Device Status (DCTL_DSTS) — Offset 48h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 48h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RO	**Transactions Pending (TDP):** This bit has no meaning for the root port since it never initiates a non-posted request with its own Requester ID.
20	0h RO	**AUX Power Detected (APD):** The root port contains AUX power for wakeup
19	0h RW/1C/V	**Unsupported Request Detected (URD):** Indicates an unsupported request was detected.
18	0h RW/1C/V	**Fatal Error Detected (FED):** Indicates a fatal error was detected. Set when a fatal error occurred on from a data link protocol error, buffer overflow, or malformed tlp
17	0h RW/1C/V	**Non-Fatal Error Detected (NFED):** Indicates a non-fatal error was detected. Set when an received a non-fatal error occurred from a poisoned tlp, unexpected completions, unsupported requests, completor abort, or completer timeout
16	0h RW/1C/V	**Correctable Error Detected (CED):** Indicates a correctable error was detected. Set when received an internal correctable error from receiver errors / framing errors, tlp crc error, dllp crc error, replay num rollover, replay timeout.
15	0h RO	**Reserved (RSVD_1):** Reserved
14:12	0h RO	**Max Read Request Size (MRRS):** Hardwired to 0. This field applies only to the PCIe link interface.
11	0h RO	**Enable No Snoop (ENS):** Not supported. The root port will never issue non-snoop requests.
10	0h RW/P	**Aux Power PM Enable (APME):** The OS will set this bit to '1' if the device connected has detected aux power.
9	0h RO	**Phantom Functions Enable (PFE):** Not supported
8	0h RO	**Extended Tag Field Enable (ETFE):** Not supported

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RW	**Max Payload Size (MPS):** The root port only supports up to 256B max payload. Programming this field to any values other than 128B or 256B max payload size will result in aliasing to 128B max payload size. If the DCAP.MPS indicates 128B max payload size support, programming this field to any values other than 128B will result in aliasing to 128B max payload size. Programming this field to any values greater than DCAP.MPS will result in aliasing to 128B max payload size. 000b: 128 bytes max payload size. 001b: 256 bytes max payload size. 010b: 512 bytes max payload size. 011b: 1024 bytes max payload size. 100b: 2048 bytes max payload size. 101b: 4096 bytes max payload size. 110b: Reserved. 111b: Reserved. This field applies only to the PCIe link interface. Note: Software should ensure that the system is quiescent and no TLP is in progress prior to changing this field. BIOS should program this field prior to enabling BME.
4	0h RO	**Enable Relaxed Ordering (ERO):** Not supported
3	0h RW	**Unsupported Request Reporting Enable (URE):** When set, allows signaling ERR_NONFATAL, ERR_FATAL, or ERR_COR to the Root Control register when detecting an unmasked Unsupported Request (UR). An ERR_COR is signaled when a unmasked Advisory Non-Fatal UR is received. An ERR_FATAL, ERR_or NONFATAL, is sent to the Root Control Register when an uncorrectable non-Advisory UR is received with the severity set by the Uncorrectable Error Severity register.
2	0h RW	**Fatal Error Reporting Enable (FEE):** enables signaling of ERR_FATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
1	0h RW	**Non-Fatal Error Reporting Enable (NFE):** When set, enables signaling of ERR_NONFATAL to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.
0	0h RW	**Correctable Error Reporting Enable (CEE):** When set, enables signaling of ERR_CORR to the Root Control register due to internally detected errors or error messages received across the link. Other bits also control the full scope of related error reporting.

18.16 Link Capabilities (LCAP) — Offset 4Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 4Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**Port Number (PN):** Indicates the port number for the root port. This value is different for each implemented port: Port # Value of PN field 1 01h 2 02h 3 03h 4 04h
23	0h RO	**Reserved (RSVD):** Reserved
22	0h RW/O	**ASPM Optionality Compliance (ASPMOC):** ASPM Optionality Compliance(ASPMOC): This bit must be set to 1b for PCIe 3.0 compliant port. Components implemented against certain earlier versions of this specification will have this bit set to 0b. Software is permitted to use the value of this bit to help determine whether to enable ASPM or whether to run ASPM compliance tests.
21	0h RO	**Link Bandwidth Notification Capability (LBNC):** This port supports Link Bandwidth Notification status and interrupt mechanisms.
20	0h RO	**Link Active Reporting Capable (LARC):** This port supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**Surprise Down Error Reporting Capable (SDERC):** Set to '0' to indicate the root port does not support Surprise Down Error Reporting
18	0h RO	**Clock Power Management (CPM):** '0' Indicates that root ports do not support the CLKREQ# mechanism.
17:15	0h RW/O	**L1 Exit Latency (EL1):** Indicates an exit latency of 2us to 4us. 000b Less than 1 us 001b 1 us to less than 2 us 010b 2 us to less than 4 us 011b 4 us to less than 8 us 100b 8 us to less than 16 us 101b 16 us to less than 32 us 110b 32 us to 64 us 111b More than 64 us Note: If PXP PLL shutdown is enabled, BIOS should program this latency to comprehend PLL lock latency.
14:12	0h RO/V	**L0s Exit Latency (EL0):** Indicates an exit latency based upon common-clock configuration: LCTL.CCC Value 0 MPC.UCEL 1 MPC.CCEL
11:10	0h RW/O	**Active State Link PM Support (APMS):** Indicates the level of active state power management on this link Bits Definition 00 No ASPM Supported 01 L0s Supported 10 L1 Supported 11 L0s and L1 supported Note: If STRPFUSECFG.ASPMDIS is 1, the default of this field is '01'. Otherwise, the default of this field is '11'. If STRPFUSECFG.ASPMDIS is 1, BIOS writing '11' to this field will have the same effect as writing '01'. '01' will be reflected on this register when read and the register will turn to Read-Only once written once.
9:4	0h RO/V	**Maximum Link Width (MLW):** For the root ports, several values can be taken, based upon the value of the chipset configuration register field RPC.PC1 for ports 1-4: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h
3:0	0h RO/V	**Max Link Speeds (MLS):** Indicates the supported link speeds of the Root Port. 0001b 2.5 GT/s Link speed supported 0010b 5.0 GT/s and 2.5GT/s Link speeds supported This register reports a value of 0001b if the Root Port Gen2 Disable Fuse is set or the MPC.PCIEGEN2DIS bit is set, else this register reports a value of 0010b. Max Link Speeds (MLS): This field indicates the maximum Link speed of the associated Port. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the maximum Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0010b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

18.17 Link Control; Link Status (LCTL_LSTS) — Offset 50h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 50h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is Set by hardware to indicate that hardware has autonomously changed Link speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation. This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was indicated as an autonomous change. The default value of this bit is 0b.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is Set by hardware to indicate that either of the following has occurred without the Port transitioning through DL_Down status: - A Link retraining has completed following a write of 1b to the Retrain Link bit Note: This bit is Set following any write of 1b to the Retrain Link bit, including when the Link is in the process of retraining for some other reason. - Hardware has changed Link speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process This bit must be set if the Physical Layer reports a speed or width change was initiated by the Downstream component that was not indicated as an autonomous change. The default value of this bit is 0b.
29	0h RO/V	**Link Active (LA):** Set to 1b when the Data Link Control and Management State Machine is in the DL_Active state, 0b otherwise.
28	0h RO/V	**Slot Clock Configuration (SCC):** In normal mode, root port uses the same reference clock as on the platform and does not generate its own clock. Note: The default of this register bit is dependent on the 'PCIe Non-Common Clock With SSC Mode Enable Strap'. If the strap enables non-common clock with SSC support, this bit shall default to '0'. Otherwise, this bit shall default to '1'.
27	0h RO/V	**Link Training (LT):** The root port sets this bit whenever link training is occurring, or that 1b was written to the Retrain Link bit but Link training has not yet begun. It clears the bit upon completion of link training.
26	0h RO	**Reserved (RSVD):** Reserved
25:20	0h RO/V	**Negotiated Link Width (NLW):** For the root ports, this register could take on several values: Port # Value of PN field RPC.PC1 00 01 10 11 1 01h 02h 02h 04h 2 01h 01h 01h 01h 3 01h 01h 02h 01h 4 01h 01h 01h 01h The value of this register is undefined if the link has not successfully trained.
19:16	0h RO/V	**Current Link Speed (CLS):** 0001b Link is 2.5Gb/s Link 0010b 5.0 GT/s Link This field indicates the negotiated Link speed of the given link. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. The value of this field is undefined if the link is not up.
15:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** Link Autonomous Bandwidth Interrupt Enable - When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been Set.
10	0h RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been Set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b. Default value of this bit is 0b.
9	0h RW	**Hardware Autonomous Width Disable (HAWD):** When Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. Default value of this bit is 0b. Note: When operating as PCI Express, this bit defines the value of the Link Upconfigure Capability in TS2 Ordered Sets.
8	0h RO	**Enable Clock Power Management (ECPM):** Reserved. Not supported on Root Ports.
7	0h RW	**Extended Synch (ES):** When set, forces extended transmission of FTS ordered sets in FTS and extra TS2 at exit from L1 prior to entering L0. Note: This functionality is not applicable for Mobile Express.
6	0h RW	**Common Clock Configuration (CCC):** When set, indicates that the root port and device are operating with a distributed common reference clock.

Bit Range	Default & Access	Field Name (ID): Description
5	0h WO	**Retrain Link (RL):** When set, the root port will train its downstream link. This bit always returns '0' when read. Software uses LSTS.LT to check the status of training. It is permitted to write 1b to this bit while simultaneously writing modified values to other fields in this register. If the LTSSM is not already in Recovery or Configuration, the resulting Link training must use the modified values. If the LTSSM is already in Recovery or Configuration, the modified values are not required to affect the Link training that's already in progress.
4	0h RW	**Link Disable (LD):** When set, the root port will disable the link by directing the LTSSM to the Disabled state.
3	0h RW/O	**Read Completion Boundary Control (RCBC):** Indicates the read completion boundary is 64 bytes.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Active State Link PM Control (ASPM):** Indicates whether the root port should enter L0s or L1 or both. Bits Definition 00 Disabled 01 L0s Entry Enabled 10 L1 Entry Enabled 11 L0s and L1 Entry Enabled The value of this register is used unless the Root Port ASPM Control Override Enable register is set, in which case the Root Port ASPM Control Override value is used. Note: If STRPFUSECFG.ASPMDIS is '1', hardware will always see '00' as an output from this register. BIOS reading this register should always return the correct value.

18.18 Slot Capabilities (SLCAP) — Offset 54h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 54h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW/O	**Physical Slot Number (PSN__31_24):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
23:19	0h RW/O	**Physical Slot Number (PSN__23_19):** This is a value that is unique to the slot number. BIOS sets this field and it remains set until a platform reset.
18	0h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	0h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	0h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

18.19 Slot Control; Slot Status (SLCTL_SLSTS) — Offset 58h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 58h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved (RSVD):** Reserved
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the SLSTS.PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:13	0h RO	**Reserved (RSVD_1):** Reserved
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

18.20 Root Control (RCTL) — Offset 5Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 5Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

18.21 Root Status (RSTS) — Offset 60h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 60h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

18.22 Device Capabilities 2 (DCAP2) — Offset 64h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 64h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved (RSVD):** Reserved
19:18	0h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. BIOS should program this field to 00b or 10b during system initialization to advertise the level of hardware OBFF support to software. BIOS should never program this field to 01b or 11b since OBFF messaging is not supported.
17:12	0h RO	**Reserved (RSVD_1):** Reserved
11	0h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/disable the root port from declaring support for the LTR capability.
10:6	0h RO	**Reserved (RSVD_2):** Reserved
5	0h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	0h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C 0111b Ranges A, B [amp] C [lt]-- This is what PCH supports 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved.

18.23 Device Control 2; Device Status 2 (DCTL2_DSTS2) — Offset 68h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 68h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**Reserved (RSVD_1):** Reserved
14:13	0h RW	**Optimized Buffer Flush/Fill Enable (OBFFEN):** 00b Disable OBFF mechanism. 01b Enable OBFF mechanism using Message signaling (Variation A). 10b Enable OBFF mechanism using Message signaling (Variation B). 11b Enable OBFF using WAKE# signaling. Note: Only encoding 00b and 11b are supported. The encoding of 01b or 10b would be aliased to 00b. If DCAP2.OBFFS is clear, programming this field to any non-zero values will have no effect.
12:11	0h RO	**Reserved (RSVD_2):** Reserved
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	**Reserved (RSVD_3):** Reserved
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued.

18.24 Link Capabilities 2 (LCAP2) — Offset 6Ch

Type	Size	Offset	Default

31:23	0h RO	**Reserved (RSVD):** Reserved
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Not supported.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved. This register reports a value of 0001b if GEN1 data rate is supported but both GEN2 and GEN3 data rate support are disabled through Fuse or MPC.PCIESD register. This register reports a value of 0011b if both GEN1 and GEN2 data rate are supported but GEN3 data rate support is disabled through Fuse or MPC.PCIESD register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Reserved (RSVD_1):** Reserved

18.25 Link Control 2; Link Status 2 (LCTL2_LSTS2) — Offset 70h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 70h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EQC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value.
3:0	0h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported Link Speeds Vector field bit 0. 0010b: Supported Link Speeds Vector field bit 1. 0011b: Supported Link Speeds Vector field bit 2. 0100b: Supported Link Speeds Vector field bit 3. 0101b: Supported Link Speeds Vector field bit 4. 0110b: Supported Link Speeds Vector field bit 5. 0111b: Supported Link Speeds Vector field bit 6. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, as indicated by the Supported Link Speeds Vector, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s or 5 GT/s data rate.

18.26 Slot Capabilities 2 (SLCAP2) — Offset 74h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 74h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved (RSVD):** Reserved

18.27 Slot Control 2; Slot Status 2 (SLCTL2_SLSTS2) — Offset 78h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 78h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RO	**Reserved (RSVD_1):** Reserved

18.28 Message Signaled Interrupt Identifiers; Message Signaled Interrupt Message Control (MID_MC) — Offset 80h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 80h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	0h RW/O	**NEXT:** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	0h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

18.29 Message Signaled Interrupt Message Address (MA) — Offset 84h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	**Reserved (RSVD):** Reserved

18.30 Message Signaled Interrupt Message Data (MD) — Offset 88h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

18.31 Subsystem Vendor Capability (SVCAP) — Offset 90h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:8	0h RW/O	**NEXT:** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	0h RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

18.32 Subsystem Vendor IDs (SVID) — Offset 94h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

18.33 Power Management Capability; PCI Power Management Capabilities (PMCAP_PMC) — Offset A0h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy Microsoft* operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 0mA (self-powered), as use of this controller does not add to suspect well power consumption.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	**Reserved (RSVD):** Reserved
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	0h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**NEXT:** Indicates this is the last item in the list.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

18.34 PCI Power Management Control And Status (PMCS) — Offset A4h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	**Reserved (RSVD):** Reserved
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy Microsoft* operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD_2):** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

18.35 Advanced Error Extended Reporting Capability Header (AECH) — Offset 100h

Size:32 bits The AER capability can optionally be included or excluded from the capabilities list. The full AER is supported.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 100h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

18.36 Uncorrectable Error Status (UES) — Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 104h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Reserved. Access Control Services are not supported
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Status (TE):** Not supported.

18.37 Uncorrectable Error Mask (UEM) — Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 108h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Mask (AVM):** Reserved. Access Control Services are not supported
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Mask (TE):** Not supported.

18.38 Uncorrectable Error Severity (UEV) — Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 10Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved (RSVD):** Reserved
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	0h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	**Reserved (RSVD_1):** Reserved
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

18.39 Correctable Error Status (CES) — Offset 110h

This register is only reset by a loss of core power

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 110h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/1C/V/P	**RE:** Indicates a receiver error occurred.

18.40 Correctable Error Mask (CEM) — Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 114h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved (RSVD):** Reserved
13	0h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	**Reserved (RSVD_1):** Reserved
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	**Reserved (RSVD_2):** Reserved
0	0h RW/P	**RE:** Mask for receiver errors.

18.41 Advanced Error Capabilities and Control (AECC) — Offset 118h

This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 118h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

18.42 Header Log DW1 (HL_DW1) — Offset 11Ch

Size:32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 11Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**1st dWord of TLP (DW1):** Byte0 [amp][amp] Byte1 [amp][amp] Byte2 [amp][amp] Byte3

18.43 Header Log DW2 (HL_DW2) — Offset 120h

Size:32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 120h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**2nd dWord of TLP (DW2):** Byte4 [amp][amp] Byte5 [amp][amp] Byte6 [amp][amp] Byte7

18.44 Header Log DW3 (HL_DW3) — Offset 124h

Size:32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 124h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**3rd dWord of TLP (DW3):** Byte8 [amp][amp] Byte9 [amp][amp] Byte10 [amp][amp] Byte11

18.45 Header Log DW4 (HL_DW4) — Offset 128h

Size:32 bits These registers report the header for the TLP corresponding to a detected error. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 128h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V/P	**4th dWord of TLP (DW4):** Byte12 [amp][amp] Byte13 [amp][amp] Byte14 [amp][amp] Byte15

18.46 Root Error Command (REC) — Offset 12Ch

This register allows errors to generate interrupts.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 12Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	**Reserved (RSVD):** Reserved
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

18.47 Root Error Status (RES) — Offset 130h

This register can track more than one error and set the 'multiple' bits if a second or subsequent error occurs and the first has not been serviced. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 130h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Advanced Error Interrupt Message Number (AEMN):** Reserved. There is only one error interrupt allocated.
26:7	0h RO	**Reserved (RSVD):** Reserved
6	0h RW/1C/V/P	**Fatal Error Message Received (FEMR):** Set when one or more Fatal Uncorrectable Error Messages have been received.
5	0h RW/1C/V/P	**Non-Fatal Error Messages Received (NFEMR):** Set when one or more Non-Fatal Uncorrectable error messages have been received
4	0h RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Set when the first Uncorrectable Error message received is for a fatal error.
3	0h RW/1C/V/P	**Multiple ERR_FATAL/NONFATAL Received (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set.
2	0h RW/1C/V/P	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received.
1	0h RW/1C/V/P	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set.
0	0h RW/1C/V/P	**ERR_COR Received (CR):** Set when a correctable error message is received.

18.48 Error Source Identification (ESID) — Offset 134h

Size:32 bits Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 134h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

18.49 ACS Extended Capability Header (ACSECH) — Offset 140h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 140h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

18.50 ACS Capability Register; ACS Control Register (ACSCAPR_ACSCTLR) — Offset 144h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 144h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Reserved (RSVD):** Reserved
22	0h RO	**ACS Direct Translated P2P Enable (TE):** ACS Direct Translated P2P Enable (TE): ACS Direct Translated P2P is not supported.
21	0h RO	**ACS P2P Egress Control Enable (EE):** ACS P2P Egress Control Enable (EE): ACS P2P Egress Control is not supported.
20	0h RO	**ACS Upstream Forwarding Enable (UE):** ACS Upstream Forwarding Enable (UE): ACS Upstream Forwarding is not supported.
19	0h RW	**ACS P2P Completion Redirect Enable (CE):** ACS P2P Completion Redirect Enable (CE): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
18	0h RW	**ACS P2P Request Redirect Enable (RE):** ACS P2P Request Redirect Enable (RE): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect.
17	0h RW	**ACS Translation Blocking Enable (BE):** ACS Translation Blocking Enable (BE): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking.
16	0h RW	**ACS Source Validation Enable (VE):** ACS Source Validation Enable (VE): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation.

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD_1):** Reserved
7	0h RO	**Reserved (RSVD_2):** Reserved
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	0h RO	**ACS Upstream Forwarding (U):** ACS Upstream Forwarding (U): ACS Upstream Forwarding is not supported.
3	0h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect.
2	0h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect.
1	0h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking.
0	0h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation.

18.51 PTM Extended Capability Header (PTMECH) — Offset 150h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 150h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support PTM Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support PTM Extended Capability, BIOS should write a 001Fh to this register else it should write 0.

18.52 PTM Capability Register (PTMCAPR) — Offset 154h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 154h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:8	0h RW/O	**Local Clock Granularity (LCG):** Local Clock Granularity(LCG): 0000 0000b - Time Source does not implement a local clock. It simply propagates timing information obtained from further Upstream in the PTM Hierarchy when responding to PTM Request messages. 0000 0001b - 1111 1110b: Indicates the period of this Time Sources local clock in ns. 1111 1111b: Indicates the period of this Time Sources local clock is greater than 254 ns. If the PTM Root Select bit is Set, this local clock is used to provide PTM Master Time. Otherwise, the Time Source uses this local clock to locally track PTM Master Time received from further Upstream within a PTM Hierarchy.
7:3	0h RO	**Reserved (RSVD_1):** Reserved
2	0h RW/O	**PTM Root Capable (PTMRC):** PTM Root Capable(PTMRC): Root Ports must set this bit to 1b.
1	0h RW/O	**PTM Responder Capable (PTMRSPC):** PTM Responder Capable(PTMRSPC): Root Ports are permitted to set this bit to 1b to indicate that they implement the PTM Responder role.
0	0h RO	**PTM Requester Capable (PTMREQC):** PTM Requester Capable(PTMREQC): PTM Requester Role is not supported by Root Port.

18.53 PTM Control Register (PTMCTLR) — Offset 158h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 158h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:8	0h RO	**Effective Granularity (EG):** Effective Granularity(EG): Root Port does not support PTM Requester role.
7:2	0h RO	**Reserved (RSVD_1):** Reserved
1	0h RW	**Root Select (RS):** Root Select(RS): When Set, if the PTM Enable bit is also Set, this Time Source is the PTM Root. Within each PTM Hierarchy, it is recommended that system software select only the furthest Upstream Time Source to be the PTM Root.
0	0h RW	**PTM Enable (PTME):** PTM Enable(PTME): When Set, this Function is permitted to participate in the PTM mechanism according to its selected role. Software must not have the PTM Enable bit Set in the PTM Control register on a Function associated with an Upstream Port unless the associated Downstream Port on the Link already has the PTM Enable bit Set in its associated PTM Control register. Register Attribute: Static.

18.54 L1 Sub-States Extended Capability Header (L1SECH) — Offset 200h

Size:32 bits Note: When operating in Mobile Express mode, this capability should not be enabled.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 200h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh. .

18.55 L1 Sub-States Capabilities (L1SCAP) — Offset 204h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 204h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:19	0h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	**Reserved (RSVD_1):** Reserved
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. '00b': 2 us '01b': 10 us '10b': 100 us '11b': Reserved Required for all Ports that support L1.OFF.
15:8	0h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7:5	0h RO	**Reserved (RSVD_2):** Reserved
4	0h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM.
3	0h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	0h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
0	0h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

18.56 L1 Sub-States Control 1 (L1SCTL1) — Offset 208h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 208h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe root port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	**Reserved (RSVD):** Reserved
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe root port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time the PCIe root port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
7:4	0h RO	**Reserved (RSVD_1):** Reserved
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic Note: If STRPFUSECFG.mPHYIOPMDIS is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.

18.57 L1 Sub-States Control 2 (L1SCTL2) — Offset 20Ch

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 20Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved (RSVD):** Reserved
7:3	0h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	**Reserved (RSVD_1):** Reserved
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. '00b': 2 us '01b': 10 us '10b': 100us '11b': Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

18.58 Secondary PCI Express Extended Capability Header (SPEECH) — Offset 220h

Size:32 bits Note: When operating in Mobile Express mode, this capability should not be enabled.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 220h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.

Bit Range	Default & Access	Field Name (ID): Description
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEECID):** PCI Express Extended Capability ID (PCIEECID): This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h. For systems that support Secondary PCI Express Extended Capability, BIOS should write a 0019h to this register else it should write 0.

18.59 Link Control 3 (LCTL3) — Offset 224h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 224h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:9	0h RO	**Enable Lower SKP OS Generation Vector (ELSOSGV):** Enable Lower SKP OS Generation Vector(ELSOSGV): When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not set.
8:2	0h RO	**Reserved (RSVD_1):** Reserved
1	0h RW	**Link Equalization Request Interrupt Enable (LERIE):** Link Equalization Request Interrupt Enable (LERIE): When set, this bit enables the generation of an interrupt to indicate that the Link Equalization Request bit has been set.
0	0h RW	**PE:** Perform Equalization (PE): When this bit is 1b and Link Retrain bit is set with the Target Link Speed field set to 8 GT/s, the Downstream Port must perform Link Equalization. This bit is cleared by Root Port upon entry to Link Equalization

18.60 Lane Error Status (LES) — Offset 228h

The Lane number is the default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 228h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW/1C/V/P	**Lane 3 Error Status (L3ES):** Lane 3 Error Status (L3ES): Lane 3 detected a Lane-based error.
2	0h RW/1C/V/P	**Lane 2 Error Status (L2ES):** Lane 2 Error Status (L2ES): Lane 2 detected a Lane-based error.
1	0h RW/1C/V/P	**Lane 1 Error Status (L1ES):** Lane 1 Error Status (L1ES): Lane 1 detected a Lane-based error.
0	0h RW/1C/V/P	**Lane 0 Error Status (L0ES):** Lane 0 Error Status (L0ES): Lane 0 detected a Lane-based error.

18.61 Lane 0 and Lane 1 Equalization Control (L01EC) — Offset 22Ch

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 22Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description

7	0h RO	**Reserved (RSVD_3):** Reserved
6:4	0h RW	**Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH):** Downstream Port Lane 0 Receiver Preset Hint (DPL0RPH): Receiver Preset Hint may be used as a hint for receiver equalization by this Port when the Port is operating as a Downstream Port.
3:0	0h RW	**Downstream Port Lane 0 Transmitter Preset (DPL0TP):** Downstream Port Lane 0 Transmitter Preset (DPL0TP): Transmitter Preset used for equalization by this Port when the Port is operating as a Downstream Port. This field is ignored when the Port is operating as an Upstream Port.

18.62 Lane 2 and Lane 3 Equalization Control (L23EC) — Offset 230h

Each entry contains the values for the Lane with the corresponding default Lane number which is invariant to Link width and Lane reversal negotiation that occurs during Link training. Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane status bits should be ignored

18.63 PCI Express Replay Timer Policy 1 (PCIERTP1) — Offset 300h

The Replay Timer controlled by the Replay Timeout field is started when the Retry Buffer is empty and a TLP is placed into it or an Ack/Nak DLLP is received and there are still non-acknowledged packets within the Retry Buffer. The counter continues to count until the next valid Ack DLLP or a NAK DLLP that acknowledges unacknowledged TLPs is received, or it reaches the timeout value specified by this register. When a valid Ack/Nak DLLP is received, the timer is reset to zero and restarted if there are still non-acknowledged packets within the Retry Buffer. Otherwise if the Retry Buffer is empty, the counter is just reset to zero. If the timer reaches the timeout value, the non-acknowledged packets within the Retry Buffer will be replayed. The default for this register is dependant on the MAX_PAYLOAD_SIZE , the NEGOTIATED_WIDTH, and the NEGOTIATED_SPEED.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 3B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved (RSVD):** Reserved
20:18	0h RW	**Periodic Local TSC Link Fetch Frequency (PLTLFF):** Periodic Local TSC Link Fetch Frequency (PLTLFF): When this register is programmed to a non-zero values, the Local TSC Link Clock would perform a periodic fetch to obtain the latest TSC from the Local TSC XTAL Clock domain. This mechanism would ensure the Root Port Local TSC Link is always synchronized with the actual TSC as Link Clock domain is able to drift due to SSC. 000: Disable this feature. 001: Always pull without waiting for expiration. 010: Every 8 clocks 011: Every 16 clocks 100: Every 32 clocks 101: Every 64 clocks 110: Every 128 clocks 111: Every 256 clocks This register is only available in Port 1. Note: Software is expected to program this register prior to setting PTM Enable.

Bit Range	Default & Access	Field Name (ID): Description
17:15	0h RW/1C/V	**Global Time Fetch Retry Counter (GTFRC):** Global Time Fetch Retry Counter. This register is incremented when the Root Port detected a retry on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU re-sends a LocalSync message. If more than 7 Retries are detected during the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 111 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
14:13	0h RW/1C/V	**Global Time Fetch Fail Counter (GTFFC):** Global Time Fetch Fail Counter. This register is incremented when the Root Port detected a fail on each Global Time Fetch on IOSF Sideband. The Root Port would increment the value of this register whenever ARU sends a SyncComp with the Fail status. If more than 3 failures are detected in the Global Time Fetch, Root Port would keep the value of this register to 111 (max) value. Software is expected to write 11 to this register to clear the entire field to 0. Note: For each x4 instance, only the value from Port 1 is used.
12	0h RO/V	**Global Time Fetch Status Pending Completion (GTFSPC):** Global Time Fetch Status Pending Completion. This register is set to 1 by the Root Port when it is in progress of fetching the Global Time from ARU. Note: For each x4 instance, only the value from Port 1 is used.
11:9	0h RW	**Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF):** Periodic Global Time Stamp Counter Fetch Frequency (PGTSCFF) : This field determine the frequency the Root Port would autonomously fetch the Global Time Stamp Counter. 00: 10us 01: 100us 10: 500us 10: 1ms Software is expected to program this bit first before programming the PGTSCFE register. Attribute: Dynamic Note: For each x4 instance, only the value from Port 1 is used.
8	0h RW	**Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE):** Periodic Global Time Stamp Counter Fetch Enable (PGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
7	0h RW	**Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE):** Trigger Global Time Stamp Counter Fetch Enable (TGTSCFE) : When this bit set, the Controller will re-fetch the Global Time from the Always Running Unit (ARU). Once Fetch is completed, the Controller would update all the Local TSC with the newly fetch Global Time. If any PTM dialog is initiated while the re-fetch occurred, the Controller would use the existing Local TSC timers. Hardware would clear this bit upon completed fetching the Global Time. Software can only set this register if PGTSCFE is not set. Attribute : Dynamic Note: For each x4 instance, only the value from Port 1 is used.
6	0h RW	**PTM Request Periodic ACK Enable (PTMRPAE):** PTM Request Periodic ACK Enable (PTMRPAE) : When this register is set to 1, whenever a valid PTM request TLP is received, the Link Layer would transmit multiple ACK DLLPs corresponding to the PTM Request message. The number of ACK DLLP that the Link Layer would transmit is based on the PTMRNOPAD register. Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.
5:4	0h RW	**PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD):** PTM Request Number Of Periodic ACK DLLP (PTMRNOPAD) : When PTMRPAE is enable, whenever a valid PTM Request message is received, the Link Layer would transmit multiple ACK DLLP corresponding to the receiving of the PTM Request message. This register define the number of DLLP ACK will be transmitted as high priority. 00 - TX 1 DLLP ACK 01 - TX 2 DLLP ACK 10 - TX 3 DLLP ACK 11 - TX 4 DLLP ACK Attribute : Static Note: For each x4 instance, only the value from Port 1 is used.

31	0h RO/V	**mod-PHY Power Gating Disable Fuse (MPHYPGD):** 0: mod-PHY power gating is enabled. 1: mod-PHY power gating is disabled. Note: Prior to fuse pull, the default of this bit is specified in the 'Reset' column of this field. The default value will reflect the fuse value once fuse pull is done.
30:0	0h RO	**Reserved (RSVD):** Reserved

18.81 Thermal and Power Throttling (TNPT) — Offset 418h

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 418h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Throttle Period (TP):** Throttle Period (TP): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the duration in milliseconds that defines the Throttling Window. When TNPT.TTG is set to 0, the effective Throttling Period is: 00h: 1 ms 01h: 2 ms : : FFh: 256 ms Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttling Period is: 00h: 100 us 01h: 200 us : : FFh: 25.6 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.
23:16	0h RW	**Throttle Time (TT):** Throttle Time (TT): If any of the TNPT.DRXLTE or TNPT.DTXLTE bit is '1, this field defines the period of the Throttling Zone within the Throttling Window specified by TNPT.TP. The value specified in this field will be multiplied by the respective multiplier in TNPT.TSLxM fields depending on the throttling severity indication received together with the Throttling State change indication. When TNPT.TTG is set to 0, the effective Throttle Time is: 00h: 1 ms 01h: 2 ms : 3Fh: 64 ms Others: Alias to 3Fh. Note: The Throttle Period will have an uncertainty of +/-1 ms. When TNPT.TTG is set to 1, the effective Throttle Time is: 00h: 100 us 01h: 200 us : 3Fh: 6.4 ms Note: The Throttle Period will have an uncertainty of +/-100 us. Note: If the reserved encoding is programmed to this field, hardware will behave the same as if the field is programmed to 3Fh. Note: Since the design is using a 1 ms tick for this timer, the Throttle Time will have an uncertainty of +/-1 ms. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling. Note: If TNPT.TT is programmed to a value bigger than TNPT.TP, the hardware behavior is undefined.
15:12	0h RO	**Reserved (RSVD):** Reserved
11:10	0h RW	**Throttling Severity Level 3 Multiplier (TSL3M):** Throttling Severity Level 3 Multiplier (TSL3M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
9:8	0h RW	**Throttling Severity Level 2 Multiplier (TSL2M):** Throttling Severity Level 2 Multiplier (TSL2M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: Always throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.
7:6	0h RW	**Throttling Severity Level 1 Multiplier (TSL1M):** Throttling Severity Level 1 Multiplier (TSL1M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the link throttling
5:4	0h RW	**Throttling Severity Level 0 Multiplier (TSL0M):** Throttling Severity Level 0 Multiplier (TSL0M): This register determines the multiplier to be used together with the TNPT.TT field to specify the period of the Throttling Zone within the Throttling Window. 00b: x1 01b: x2 10b: x4 11b: No throttling. Note: To change the Link Throttling control bits, the DRXLTE and DTXLTE bits must be disabled first, change the value, and then re-enable the Link throttling.

18.86 Equalization Configuration 1 (EQCFG1) — Offset 450h

This register must be configured prior to enabling 8.0 GT/s data rate. This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 450h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO/V	**REC:** Recovery Entry Count (REC): This field indicates the value of the Recovery Entry Counter. This is a 1-based counter. Software must read this register multiple times. The value is valid only if the same value is read out on both of the reads.
23	0h RW	**Recovery Entry and Idle Framing Error Count Enable (REIFECE):** Recovery Entry and Idle Framing Error Count Enable (REIFECE): This bit, when set by software turns on the Recovery Entry Counter and the per-lane Idle Framing Error Counter. The counters are reset when this bit is cleared. This bit is expected to be used by the Software Preset/Coefficient Search tool but is not precluded to be used for other debug purpose. The value of the Recovery Entry Count can be read through EQCFG1.REC field. The value of the Idle Framing Error Count can be read through the Monitor Mux register.
22	0h RW	**Quiesce Guarantee (QG):** Quiesce Guarantee (QG): When set, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be set in Recovery.RcvrCfg. When clear, the Quiesce Guarantee bit in the transmitted TS2 Ordered Set will be clear. In all other states, the Quiesce Guarantee bit is Reserved.
21	0h RW	**Link Equalization Request SMI Enable (LERSMIE):** Link Equalization Request SMI Enable (LERSMIE): When set, this bit enables the generation of an SMI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that BIOS can be invoked to address the Re-Equalization request.
20	0h RW	**Reset EIEOS Interval Count (REIC):** Reset EIEOS Interval Count(REIC): When set, allows the root port to restrict the device from sending EIEOS until after 65536 TS1 Ordered Sets have been transmitted in Phase 3 of the Link Equalization, in the window when the receiver is evaluating the remote transmitter settings..
19	0h RW	**Link Equalization Bypass (LEB):** Link Equalization Bypass (LEB): When set, the root port will never initiate entry to Recovery.Equalization state. This includes never send EQ TS2 in Recovery.RcvrCfg that could cause the device to set start_equalization_w_preset variable. Note: This bit only affects the initial autonomous transition to Link Equalization state when equalization_done_8GT_data_rate = 0. This bit does not affect the software-direction to re-perform Link Equalization.
18	0h RW	**Link Equalization Phase 2 and 3 Bypass (LEP23B):** Link Equalization Phase 2 and 3 Bypass(LEP23B): When set, bypasses the Phase 2 and Phase 3 of Link Equalization. Once Phase 1 is completed, Root Port transitions from Phase 1 directly to Recovery.RcvrLock.
17	0h RW	**Link Equalization 3 Bypass (LEP3B):** Link Equalization 3 Bypass(LEP3B): When set, bypasses the Phase 3 of Link Equalization. Once Phase 2 is completed, Root Port transitions from Phase 2 directly to Recovery.RcvrLock.
16	0h RW	**Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB):** Remote Transmit Link Equalization Preset/Coefficient Evaluation Bypass (RTLEPCEB): When set, this bit disables the Hardware Autonomous Preset/Coefficient Search mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset/Coefficient values used by the remote Transmitter will be accepted and the Link Equalization phase will be completed after one round of receiver link training, excluding margining. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Remote Transmitter Preset Coefficient Override Enable (RTPCOE):** Remote Transmitter Preset Coefficient Override Enable (RTPCOE): When set, this bit disables the hardware mechanism to search for the best Preset or Coefficient by traversing the Preset or Coefficient List and checking the receiver eye width margin for each of the settings. Instead, the Preset or Coefficient values specified by the override fields are used. If RTPCL1.PCM = 1, the Preset Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0. Lane 1: RTPCL1.RTPOSTCL0PL1. Lane 2: RTPCL1.RTPRECL1PL2. Lane 3: RTPCL1.RTPOSTCL1PL3. If RTPCL1.PCM = 0, the Coefficient Override values for each lanes is derived from the following register fields: Lane 0: RTPCL1.RTPRECL0PL0 and RTPCL1.RTPOSTCL0PL1. Lane 1: RTPCL1.RTPRECL1PL2 and RTPCL1.RTPOSTCL1PL3. Lane 2: RTPCL1.RTPRECL2PL4 and RTPCL2.RTPOSTCL2PL5. Lane 3: RTPCL2.RTPRECL3PL6 and RTPCL2.RTPOSTCL3PL7. BIOS must ensure that the corresponding RTPCL* registers above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
14	0h RW	**Link Equalization Request SCI Enable (LERSCIE):** Link Equalization Request SCI Enable (LERSCIE): When set, this bit enables the generation of an SCI to indicate that the Link Equalization Request bit has been set. This mode is meant for survivability purpose such that SCI handler can be invoked to address the Re-Equalization request.
13	0h RW/1S/V	**Hardware Preset to Coefficient Mapping Query Enable (HPCMQE):** Hardware Preset to Coefficient Mapping Query Enable(HPCMQE): When set, the controller will query the Preset to Coefficient mapping through the PIPE GetLocalPresetCoefficients and LocalTxCoefficientsValid interface whenever this bit transitions from 0 to 1. The default of this register bit is 1, indicating that the Preset to Coefficient mapping query will be done on the PIPE interface once coming out of reset. Controller will then update the Preset-Coefficient Mapping registers with the corresponding Coefficient, for each Preset. Controller will also update the LFFS Local LF and Local FS field with the local PHY LF and FS values. Hardware will clear this bit when the Preset to Coefficient mapping query over the PIPE interface is completed. If the Hardware Preset to Coefficient Mapping mechanism is never enabled, the value of the Preset to Coefficient mapping configured by BIOS through the Preset-Coefficient Mapping registers will be used instead of querying through the PIPE interface. Note: BIOS should check to ensure that this field is cleared before enabling Controller Power Gating or mod-PHY Power Gating.
12	0h RO/V	**Hardware Autonomous Equalization Done (HAED):** Hardware Autonomous Equalization Done(HAED): This bit will be cleared when Hardware Autonomous Preset/ Coefficient Search starts and will be set when Hardware Autonomous Preset/Coefficient Search is done. This bit is polled by software to ensure that the Hardware Autonomous Preset/Coefficient Search is done before proceeding with the next software sequencing. Some of the Hardware Autonomous Preset/ Coefficient search algorithm may involve the hardware initiating multiple speed change to allow multiple iterations of Link Equalization to be done with different Preset/Coefficient lists. This bit will remain cleared until the iterations are done.
11:8	0h RW	**Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE):** Receiver Wait Time For New Equalization Value Evaluation (RWTNEVE): For Downstream Port: This field specifies the amount of time the receiver will wait after entering Phase 3 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For Upstream Port: This field specifies the amount of time the receiver will wait after entering Phase 2 and sending the new Preset or Coefficient values through the TS1 Ordered Sets before validating the Block Alignment and eventually evaluate the incoming ordered sets (RXEqEval on the PIPE interface asserts). For both Upstream and Downstream Port, this field also specifies the amount of time the receiver will wait after entering Phase 1 before instructing the receiver to adapt to the incoming ordered sets. For Loopback Master: This field specifies the amount of time the receiver will wait after instructing the Loopback Slave to apply a specific Preset through EQ TS1. 0h: 500 ns. 1h: 1 us. 2h: 2 us. 3h: 3 us. 4h: 4 us. : : Fh:15 us.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**EQ TS2 in Recovery.ReceiverConfig Enable (EQTS2IRRC):** EQ TS2 in Recovery.ReceiverConfig Enable(EQTS2IRRC): When set, enables the transmitter to send EQ TS2 in Recovery.RcvrCfg state even when equalization_done_8GT_data_rate variable is 1b, provided that the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When clear, the transmitter can only send EQ TS2 if equalization_done_8GT_data_rate variable is 0b and the Downstream Port advertised 8.0 GT/s data rate support in Recovery.RcvrLock, and 8.0 GT/s data rate support has been advertised in the Configuration.Complete or Recovery.RcvrCfg substates by the Upstream Port since exiting the Detect state, and eight consecutive TS1 or TS2 Ordered Sets were received on any configured Lane prior to entry to this substate with speed_change bit set to 1b. When this bit is used, hardware must ensure that the start_equalization_w_preset variable are in the correct state to ensure that the components on both sides of the link are never out of sync.
6:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RW	**Link EQ Phase 1 Transmit Coefficient Settling Policy (LEQP1TCSP):** Link EQ Phase 1 Transmit Coefficient Settling Policy(LEQP1TCSP): When operating in GEN3 data rate and there is a software/hardware request to re-perform Link Equalization through the Recovery.RcvrLock to Recovery.Equalization arc, PCIe spec requires that the downstream port transmitter switch to the setting specified by the Downstream Port Lane X Transmitter Preset registers in Phase 1. This switching is happening while the downstream port is still actively transmitting TS1 and the upstream port is only required to sample 2 TS1 to determine the next sub-state to transition to. Since the new coefficient setting can take up to 256 ns to settle, the 2 TS1 sampled by the upstream port may be incorrect causing the two LTSSM to be out of sync. When this bit is set, the RP will continue to send EIEOS until the local transmitter setting has settled (specified by PHYCTL2.TXCFGCHGWAIT) before sending TS1 as required in Recovery.Equalization Phase 1. When this bit is clear, the RP will send TS1 with EC = 01 in Recovery.Equalization Phase 1 even though the transmitter setting is still settling.
2	0h RW	**Multi-Fragment Linear and Nine-Tile List Enable (MFLNTL):** Multi-Fragment Linear and Nine-Tile List Enable(MFLNTL): When set in Hardware Autonomous Linear Preset/Coefficient Search mode, the full Preset/Coefficient List will be traversed in multiple fragments, where each fragments is done in separate entry to Recovery. This is used in the case where a longer dwelling time is required for a particular Preset/ Coefficient (configured through EQCFG2.PCET). Subsequent Preset/Coefficient entries within the list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery. When set in Hardware Autonomous Nine-Tiles Search mode, the 9-tiles list that could not be covered within that Recovery session will be covered in subsequent re-entries into Recovery.
1	0h RW	**Transmitter Use Preset Policy (TUPP):** Transmitter Use Preset Policy(TUPP): This field applies to the Link Equalization Phase where the local transmitter setting is being adjusted. When set, the transmitted TS1 Use Preset bit will be set if the remote device requests the local transmitter to apply specific Preset(instead of Coefficient). When clear, the Use Preset bit will not be set in this case. Note: This bit must be set before changing speed to GEN3 data rate.
0	0h RW	**Receiver Use Preset Policy (RUPP):** Receiver Use Preset Policy(RUPP): This field applies to the Link Equalization Phase where the remote transmitter setting is being adjusted. When set, the received TS1 Use Preset bit will be checked. When clear, the Use Preset bit in the received TS1 will be ignored. Note: This bit must be set before changing speed to GEN3 data rate.

18.87 Remote Transmitter Preset Coefficient List 1 (RTPCL1) — Offset 454h

This register must be configured prior to enabling 8.0 GT/s data rate This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 454h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Preset/Coefficient Mode (PCM):** Preset/Coefficient Mode (PCM): This bit defines whether the Preset List or Coefficient List should be sent to the remote TX to adjust the remote TX setting. For Downstream Port, this is used in Phase 3 of the Link Equalization. For Upstream Port, this is used in Phase 2 of the Link Equalization. The list of coefficient or preset is configurable through the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers. When this bit is set, Coefficient Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:4[rb] registers contain the Coefficient List. When this bit is clear, Preset Mode is enabled and the Remote Transmitter Preset Coefficient List [lb]1:3[rb] registers contain the Preset List.
30	0h RO	**Reserved (RSVD):** Reserved
29:24	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4):** Remote Transmitter Pre-Cursor Coefficient List 2/Preset List 4 (RTPRECL2PL4): For Downstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 2 or Preset List 4 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
23:18	0h RW	**Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3):** Remote Transmitter Post-Cursor Coefficient List 1/Preset List 3 (RTPOSTCL1PL3): For Downstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the post-cursor coefficient List 1 or Preset List 3 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
17:12	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2):** Remote Transmitter Pre-Cursor Coefficient List 1/Preset List 2 (RTPRECL1PL2): For Downstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 1 or Preset List 2 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient or preset, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient or preset is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient or preset in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit when EQCFG1.RTPCOE = 0. If EQCFG1.RTPCOE = 1, the definition of this field is described in the EQCFG1.RTPCOE description. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

For Upstream Port: This field defines the pre-cursor coefficient List 8 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
11:6	0h RW	**Remote Transmitter Pre-Cursor Coefficient List 8 (RTPRECL8):** Remote Transmitter Pre-Cursor Coefficient List 8 (RTPRECL8): For Downstream Port: This field defines the pre-cursor coefficient List 8 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 8 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.
5:0	0h RW	**Remote Transmitter Post-Cursor Coefficient List 7 (RTPOSTCL7):** Remote Transmitter Post-Cursor Coefficient List 7 (RTPOSTCL7): For Downstream Port: This field defines the pre-cursor coefficient List 7 to be used for the remote TX in Phase 3. For Upstream Port: This field defines the pre-cursor coefficient List 7 to be used for the remote TX in Phase 2. When the remote TX has successfully applied the coefficient, the local RX will then perform Receiver Eye Width Margining to check the margin. The list of coefficient is traversed sequentially starting from List 0 to List N, where N is the most significant coefficient in the list. This field is treated as Preset or Coefficient based on RTPCL1.PCM bit. The value of coefficient programmed into this field assumes FS=64. Hardware will scale the coefficient accordingly based on the remote device FS value.

18.91 Figure Of Merit Status (FOMS) — Offset 464h

This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 464h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Reserved (RSVD):** Reserved
30:29	0h RW	**I:** Index (I): The FOMV field will reflect the Figure of Merit Scoreboard value for the index specified by this field. List N below refers to the Figure of Merit values captured in the scoreboard corresponding to the Preset or Coefficient List N. 00b: Index 0 =[gt] {List 2, List 1, List 0}. 01b: Index 1 =[gt] {List 5, List 4, List 3}. 10b: Index 2 =[gt] {List 8, List 7, List 6}. 11b: Index 3 =[gt] {Rsvd, List 10, List 9}.
28:24	0h RW	**Lane Number (LN):** Lane Number (LN): The FOMV field will reflect the Figure of Merit Scoreboard value for the lane specified by this field. 00000b: Lane 0. 00001b: Lane 1. 00010b: Lane 2. 00011b: Lane 3. Others: Reserved.
23:0	0h RO/V	**Figure of Merit Scoreboard Value (FOMSV):** Figure of Merit Scoreboard Value (FOMSV): This field will reflect the Figure of Merit Scoreboard entries referenced by the Lane Number and Index field in this register. For example, when Index == 00b, this field will reflect the Figure of Merit values for Lane specified in Lane Number field and the encoding of this field is as shown below: 23:16: Figure of Merit for Preset/ Coefficient List 2. 15:8 : Figure of Merit for Preset/Coefficient List 1. 7:0 : Figure of Merit for Preset/Coefficient List 0. If the Receiver Eye Width margining completes with error, the value of Figure of Merit should reflect 0x00.

18.92 Hardware Autonomous Equalization Control (HAEQ) — Offset 468h

Size:32 bits

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 468h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Hardware Autonomous Preset/Coefficient Count Per-Iteration (HAPCCPI):** Hardware Autonomous Preset/Coefficient Count Per-Iteration(HAPCCPI): This field defines the number of Preset/Coefficient to be traversed for every iteration of Recovery Equalization. For the Linear Mode, EQCFG2.HAPCSB specifies the total number of Presets/Coefficients to be checked in total while this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. Hardware will enter Recovery Equalization and check the number of Presets/Coefficients specified by this field. Once that is done, hardware will exit Recovery Equalization and trigger another entry to Recovery Equalization to check another set of Presets/Coefficients. This goes on until the total number of Presets/Coefficients are checked. For Nine-Tiles Mode, EQCFG2.NTIC specifies the number of 9-tiles iterations, which indirectly specifies the total number of Presets/Coefficients to be checked in total. Similar to Linear Mode, this field specifies the number of Presets/Coefficients to be checked per-iteration of Recovery Equalization. 0h: 1 Preset/Coefficient per-iteration. 1h: 2 Preset/ Coefficient per-iteration. 2h: 3 Preset/Coefficient per-iteration. ... 9h: 10 Preset/ Coefficient per-iteration. Ah: 11 Preset/Coefficient per-iteration. Others: Reserved.

Bit Range	Default & Access	Field Name (ID): Description
27:20	0h RW	**FOM Error Mask (FOMEM):** FOM Error Mask(FOMEM): The FOM error counter will be masked(thus ignoring the FOM error) for all the FOM values prior to the FOM value specified in this field. If this field is programmed to 00h, this mechanism is disabled. This bit must be configured before training to GEN3 data rate.
19	0h RW	**MAC FOM Control (MACFOMC):** MAC FOM Control(MACFOMC): When set, MAC controls the advancement of the FOM values completely while in the Link Equalization mode. For downstream port, this is done in Phase 3 and for upstream port, this is done in Phase 2 of the Link Equalization. The dwelling time for each of the FOM values are programmed through the remaining fields of this register. When enabled, the hardware will start in Speeding Mode, where it will instruct the PHY to increment the FOM value after the Speeding Latency specified by HAEQ.SL field. Once the FOM value matches HAEQ.SFOMFM, the hardware switches from Speeding Mode to Dwelling Mode. In Dwelling mode, the MAC will instruct PHY to increment the FOM value after the Dwelling Latency specified by HAEQ.DL field. This is done until the link equalization phase is completed. When cleared, PHY controls the advancement of the FOM values completely, during the Link Equalization mode. This bit must be configured before training to GEN3 data rate.
18:16	0h RW	**Speeding Latency (SL):** Speeding Latency(SL): Specifies the residency time for a particular FOM value in Speeding Mode. 000b: 192 ns. 001b: 256 ns. 010b: 512 ns. 011b: 1 us. 100b: 2 us. 101b: 4 us. 110b: 8 us. 111b: 16 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
15:8	0h RW	**Dwelling Latency (DL):** Dwelling Latency(DL): Specifies the residency time for a particular FOM value in Dwelling Mode. 00h: 2 us. 01h: 4 us. 02h: 6 us. ... FFh: 512 us. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.
7:0	0h RW	**Starting FOM For Margining (SFOMFM):** Starting FOM For Margining(SFOMFM): Define the FOM where MAC switches from Speeding Mode to Dwelling Mode after hitting the programmed FOM value in Hardware Autonomous Preset/Coefficient mode. This register is only applicable when HAEC.MACFOMC is set and must be configured before setting the HAEC.MACFOMC bit.

18.93 Local Transmitter Coefficient Override 1 (LTCO1) — Offset 470h

Based on the Port Configuration setting, if the maximum link width of the port is less than x4, the upper lane bits are not used. This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 470h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved (RSVD):** Reserved
25	0h RW	**Lane 1 Transmitter Coefficient Override Enable (L1TCOE):** Lane 1 Transmitter Coefficient Override Enable (L1TCOE): When set, the transmitter coefficient override values LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L1TPRECO and LTPCO1.L1TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.

Bit Range	Default & Access	Field Name (ID): Description
24	0h RW	**Lane 0 Transmitter Coefficient Override Enable (L0TCOE):** Lane 0 Transmitter Coefficient Override Enable (L0TCOE): When set, the transmitter coefficient override values LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO are used as the local transmitter coefficient value, and the coefficient requested by the remote device is ignored. BIOS must ensure that the corresponding LTPCO1.L0TPRECO and LTPCO1.L0TPOSTCO fields above are programmed correctly prior to setting this bit. BIOS must ensure that the link runs in either GEN1 or GEN2 when the registers are configured. Once the register programming are done, BIOS should set the Perform Equalization bit to '1, Target Link Speed register to 0011b and initiate Link Retrain by setting the Retrain Link bit to 1b.
23:18	0h RW	**Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO):** Lane 1 Transmitter Post-Cursor Coefficient Override (L1TPOSTCO): For Downstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 2. For Upstream Port: This field defines the post-cursor coefficient override values to be used for the local TX in Phase 3. This override value is used only when LTPCO1.L1TCOE = 1.
17:12	0h RW	**Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO):** Lane 1 Transmitter Pre-Cursor Coefficient Override (L1TPRECO): For Downstream Port: This field defines the pre-cursor coefficient override values to be used for the local TX in Phase 2. 18.95 GEN3 L0s Control (G3L0SCTL) — Offset 478h

This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 478h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Gen3 Active State L0s Preparation Latency (G3ASL0SPL):** Gen3 Active State L0s Preparation Latency (G3ASL0SPL) Determines how long the Link layer has to indicate IDLE before the link initialization and control logic enters L0s 00: 0 clocks (enter immediately) 01: 1 clock ... FF: 255 clocks The value of this register is only used if the Gen3 L0s Entry Idle Control register is set to [quote]11[/quote] and operating in Gen3 mode.
23:22	0h RW	**Gen3 L0s Entry Idle Control (G3L0SIC):** Gen3 L0s Entry Idle Control (G3L0SIC): 00 : Allow entry into L0s after the link has been idle for a period of time equal to of the received N_FTS total entry time (1/4 * N_FTS * 16) 01 : Allow entry into L0s after the link has been idle for for a period of time equal to of the received N_FTS total entry time (1/2 * N_FTS * 16) 10 : Allow entry after the link has been idle for for a period of time equal to the received N_FTS total entry time (N_FTS * 16) 11: Allow entry into L0s after the link has been idle for a period specified in the Gen3 Active State L0s Preparation Latency register. This register is only applied when operating in Gen3 mode.
21:16	0h RO	**Reserved (RSVD):** Reserved
15:8	0h RW	**Gen3 Unique Clock N_FTS (G3UCNFTS):** Gen3 Unique Clock N_FTS (G3UCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a unique (non-common) clock configuration (LCTL.CCC=0) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.
7:0	0h RW	**Gen3 Common Clock N_FTS (G3CCNFTS):** Gen3 Common Clock N_FTS (G3CCNFTS): Number of Fast Training Sequence ordered sets required to be transmitted for a root port Receiver to exit L0s in a common clock configuration (LCTL.CCC=1) when operating in Gen3 mode. The N_FTS value is sent in TS1 and TS2 training sets during link training. 00: 0 FTS sets 01: 1 FTS set ... FF: 255 FTS sets Note: When operating in Mobile Express mode, the output of this field is not used to determine the number of FTS to be sent on TXL0s exit. Mobile Express does not support Fast Training Sequence. Instead, SYNC is used to achieve bit lock. However, the output of this field is still used in L0s Entry Idle Control registers to determine the L0s Entry Idle latency.

18.96 Equalization Configuration 2 (EQCFG2) — Offset 47Ch

Size:32 bits This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 47Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**Nine-Tiles Iteration Count (NTIC):** Nine-Tiles Iteration Count(NTIC): This field specifies the number of iterations to perform the 9-tiles search. Each iteration involves evaluating the neighboring 9-tiles for the best Preset/Coefficient margin and then use the Preset/Coefficient as the centerpoint to identify and evaluate the next 9-tiles. 00h: 1 iteration. 01h: 2 iterations. 02h: 3 iterations. ... FFh: 256 iterations.
23	0h RW	**Equalization Margining Disable (EMD):** Equalization Margining Disable(EMD):When set, the Root Port will not request the PHY to perform Receiver Margining by asserting RxEqEval on each Preset/Coefficient list traversed. This allows the receiver to still measure the Bit Error Count without margining. When cleared, the Root Port will request the PHY to perform Receiver Margining by asserting RxEqEval. This field is only valid when operating in Hardware Autonomous Preset/Coefficient Search mode. The Preset/Coefficient list will still be traversed to the end.

Bit Range	Default & Access	Field Name (ID): Description
22:20	0h RW	**Nine-Tiles Step Size (NTSS):** Nine-Tiles Step Size(NTSS): This field specifies the step size used to identify the surrounding 9-tiles to be used for margining. 000b: 1 step. 001b: 2 steps. 010b: 3 steps. 011b: 4 steps. 100b: 5 steps. 101b: 6 steps. 110b: 7 steps. 111b: 8 steps. Each of the steps is measured in terms of incrementing of decrementing the coefficient values.
19:16	0h RW	**Preset/Coefficient Evaluation Timeout (PCET):** Preset/Coefficient Evaluation Timeout(PCET): This field specifies the evaluation timeout for a single Preset/ Coefficient in the List when operating in Hardware Autonomous Preset/Coefficient Search mode. By spec, the evaluation phase must be completed before the 24 ms timeout. To support 12 Presets (11 Presets + 1 final good Preset), each Preset will have up to 2 ms for evaluation. This field allows the 2 ms timer to be programmable. This is useful if the EQCFG2.HAPCSB limits the Preset/Coefficient List to smaller than 12 such that each Preset/Coefficient could be evaluated for a time longer than 2 ms. 0h: 2 ms. 1h: 2.5 ms. 2h: 3 ms. 3h: 3.5 ms. 4h: 4 ms. 5h: 4.5 ms. 6h: 5 ms. 7h: 6 ms. 8h: 7 ms. 9h: 8 ms. Ah: 9 ms. Bh:10 ms. Ch:11 ms. Dh:21 ms. Eh:22 ms. Fh:23 ms.
15:12	0h RW	**Hardware Autonomous Preset/Coefficient Search Bound (HAPCSB):** Hardware Autonomous Preset/Coefficient Search Bound(HAPCSB): This field defines the number of Preset/Coefficient List to be traversed, out of 11 for Presets or out of 10 for Coefficients. The Preset/Coefficient list will be traversed from List 0 to the value specified by this field in incremental order. This field allows equalization to be done with smaller set of Preset/Coefficient list and each of the Preset/Coefficient list could be run for a longer time. 0h: Preset/Coefficient List 0 only. 1h: Preset/Coefficient List 0 - 1. 2h: Preset/Coefficient List 0 - 2. : : 9h: Preset/Coefficient List 0 - 9. Ah: Preset List 0 - 10/Coefficient List 0-9. Others: Reserved.
11	0h RW	**Nine-Tiles Equalization Mechanism Enable (NTEME):** Nine-Tiles Equalization Mechanism Enable(NTEME): When set, the Nine-Tiles Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
10	0h RW	**Mid-Point Equalization Mechanism Enable (MPEME):** Mid-Point Equalization Mechanism Enable(MPEME): When set, the Mid-Point Equalization Mechanism is enabled when running in Hardware Autonomous Preset/Coefficient Search Mode.
9:8	0h RW	**Receiver Eye Width Margin Error Threshold Multiplier (REWMETM):** Receiver Eye Width Margin Error Threshold Multiplier (REWMETM): This field specifies the multiplier to be used with REWMET field. 00b: Multiply REWMET by 1 (effectively no multiplier). 01b: Multiply REWMET by 10. 10b: Multiply REWMET by 100. 11b: Multiply REWMET by 1000.
7:0	0h RW	**Receiver Eye Width Margin Error Threshold (REWMET):** Receiver Eye Width Margin Error Threshold (REWMET): This field specifies the count threshold which upon exceeded, will cause controller to terminate the current iteration of Receiver Eye Width Margining and move on to the next preset or coefficient in the list. The value specified in this field will need to be multiplied with the multiplier specified in REWMETM field to get the final threshold values. 00h: Terminate on 1 x REWMETM errors. 01h: Terminate on 2 x REWMETM errors. 02h: Terminate on 4 x REWMETM errors. 03h: Terminate on 6 x REWMETM errors. : : FEh: Terminate on 508 x REWMETM errors. FFh: Never terminate. Rely on PHY to terminate the margining.

18.97 Monitor Mux (MM) — Offset 480h

This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:19, F:X] + 480h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO/V	**Monitor Signal State (MSST):** Monitor Signal State(MSST): The internal signal groupings selected by MM.MSS field is reflected in this field. The intention of this monitor signal is provide software a capability to monitor some of the GEN3 related parameters accumulated by the controller through the Link Equalization that are too costly to be mapped to dedicated registers. Implementation MUST NEVER expose any security related information through this Monitor Mux.
7:0	0h RW	**Monitor Signal Select (MSS):** Monitor Signal Select(MSS): This field is essentially the mux select for the Monitor Signal mux. Setting this field allows different monitor signals to be muxed out and readable by software through the MM.MSST field.

18.98 Lane0 P0 and P1 Preset-Coefficient Mapping (L0P0P1PCM) — Offset 500h

This register must be configured prior to enabling 8.0 GT/s data rate. This register is not applicable when operating in Mobile Express mode.

Type	Size	Offset	Default

18	0h RW	**Reserved (RSVD_1):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Partition/Trunk Oscillator Clock Gating Enable (PTOCGE):** Partition/Trunk Oscillator Clock Gating Enable (PTOCGE): When set, the oscillator clock will be clock gated at the partition/trunk level when the conditions to clock gate are met. When clear, the oscillator clock will never be clock gated at the partition/trunk level. Note: If STRPFUSECFG.CDCGDIS is '1, hardware will always see '0 as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static.
16	0h RW	**Oscillator/Side Clock Dynamic Clock Gating Enable (OSCDCGE):** Oscillator/Side Clock Dynamic Clock Gating Enable (OSCDCGE): When set, the oscillator and side clock will be dynamically clock gated when the conditions to clock gate are met. When clear, the oscillator and side clock will never be dynamically clock gated. Note: If STRPFUSECFG.CDCGDIS is '1, hardware will always see '0 as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static.
15	0h RW	**Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE):** Side Clock Partition/Trunk Clock Gating Enable (SCPTCGE): When set, the Side Clock will be clock gated at the partition/trunk level when the conditions to clock gate are met. When clear, the Side Clock will never be clock gated at the partition/trunk level. Note: If STRPFUSECFG1.CDCGDIS is '1, hardware will always see '0 as an output from this register. BIOS reading this register should always return the correct value. Register Attribute: Static.
14:2	0h RO	**Reserved (RSVD_2):** Reserved (RSVD).
1:0	0h RW	**IOSF Sideband ISM Idle Counter (SBIC):** IOSF Sideband ISM Idle Counter (SBIC): This register provides configuration flexibility to govern when the IOSF sideband ISM transitions to IDLE_REQ state with respect to sideband interface idle. 00b: IOSF sideband ISM will transition to IDLE_REQ after 16 clocks of idle on sideband interface. 01b: IOSF sideband ISM will transition to IDLE_REQ after 31 clocks of idle on sideband interface. 10b: IOSF sideband ISM will transition to IDLE_REQ after 64 clocks of idle on sideband interface. 11b: IOSF sideband ISM will never transition to IDLE_REQ on sideband interface. Register Attribute: Dynamic.

18.131 Device Reference Clock Request Mapping 1 (DRCRM1)—Offset 100h

Size:32 bits
FIA Private Configuration Register: Offset 100h: DRCRM1 - Device Reference Clock Request Mapping 1

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 76543210h

Bit Range	Default & Access	Field Name (ID): Description
31:28	7h RW/L	**Express Port 7 CLKREQ Mapping (P7CKRQM):** Express Port 7 CLKREQ Mapping (P7CKRQM): The mapping of Express Port 7 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 7 maps to CLKREQ0# pin. 0001b: Express Port 7 maps to CLKREQ1# pin. 0010b: Express Port 7 maps to CLKREQ2# pin. 0011b: Express Port 7 maps to CLKREQ3# pin. 0100b: Express Port 7 maps to CLKREQ4# pin. 0101b: Express Port 7 maps to CLKREQ5# pin. : : 1111b: Express Port 7 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
27:24	6h RW/L	**Express Port 6 CLKREQ Mapping (P6CKRQM):** Express Port 6 CLKREQ Mapping (P6CKRQM): The mapping of Express Port 6 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 6 maps to CLKREQ0# pin. 0001b: Express Port 6 maps to CLKREQ1# pin. 0010b: Express Port 6 maps to CLKREQ2# pin. 0011b: Express Port 6 maps to CLKREQ3# pin. 0100b: Express Port 6 maps to CLKREQ4# pin. 0101b: Express Port 6 maps to CLKREQ5# pin. : : 1111b: Express Port 6 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
23:20	5h RW/L	**Express Port 5 CLKREQ Mapping (P5CKRQM):** Express Port 5 CLKREQ Mapping (P5CKRQM): The mapping of Express Port 5 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 5 maps to CLKREQ0# pin. 0001b: Express Port 5 maps to CLKREQ1# pin. 0010b: Express Port 5 maps to CLKREQ2# pin. 0011b: Express Port 5 maps to CLKREQ3# pin. 0100b: Express Port 5 maps to CLKREQ4# pin. 0101b: Express Port 5 maps to CLKREQ5# pin. : : 1111b: Express Port 5 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
19:16	4h RW/L	**Express Port 4 CLKREQ Mapping (P4CKRQM):** Express Port 4 CLKREQ Mapping (P4CKRQM): The mapping of Express Port 4 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 4 maps to CLKREQ0# pin. 0001b: Express Port 4 maps to CLKREQ1# pin. 0010b: Express Port 4 maps to CLKREQ2# pin. 0011b: Express Port 4 maps to CLKREQ3# pin. 0100b: Express Port 4 maps to CLKREQ4# pin. 0101b: Express Port 4 maps to CLKREQ5# pin. : : 1111b: Express Port 4 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
15:12	3h RW/L	**Express Port 3 CLKREQ Mapping (P3CKRQM):** Express Port 3 CLKREQ Mapping (P3CKRQM): The mapping of Express Port 3 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 3 maps to CLKREQ0# pin. 0001b: Express Port 3 maps to CLKREQ1# pin. 0010b: Express Port 3 maps to CLKREQ2# pin. 0011b: Express Port 3 maps to CLKREQ3# pin. 0100b: Express Port 3 maps to CLKREQ4# pin. 0101b: Express Port 3 maps to CLKREQ5# pin. : : 1111b: Express Port 3 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
11:8	2h RW/L	**Express Port 2 CLKREQ Mapping (P2CKRQM):** Express Port 2 CLKREQ Mapping (P2CKRQM): The mapping of Port 2 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 2 maps to CLKREQ0# pin. 0001b: Express Port 2 maps to CLKREQ1# pin. 0010b: Express Port 2 maps to CLKREQ2# pin. 0011b: Express Port 2 maps to CLKREQ3# pin. 0100b: Express Port 2 maps to CLKREQ4# pin. 0101b: Express Port 2 maps to CLKREQ5# pin. : : 1111b: Express Port 2 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
7:4	1h RW/L	**Express Port 1 CLKREQ Mapping (P1CKRQM):** Express Port 1 CLKREQ Mapping (P1CKRQM): The mapping of Express Port 1 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 1 maps to CLKREQ0# pin. 0001b: Express Port 1 maps to CLKREQ1# pin. 0010b: Express Port 1 maps to CLKREQ2# pin. 0011b: Express Port 1 maps to CLKREQ3# pin. 0100b: Express Port 1 maps to CLKREQ4# pin. 0101b: Express Port 1 maps to CLKREQ5# pin. : : 1111b: Express Port 1 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW/L	**Express Port 0 CLKREQ Mapping (P0CKRQM):** Express Port 0 CLKREQ Mapping (P0CKRQM): The mapping of Express Port 0 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 0 maps to CLKREQ0# pin. 0001b: Express Port 0 maps to CLKREQ1# pin. 0010b: Express Port 0 maps to CLKREQ2# pin. 0011b: Express Port 0 maps to CLKREQ3# pin. 0100b: Express Port 0 maps to CLKREQ4# pin. 0101b: Express Port 0 maps to CLKREQ5# pin. : : 1111b: Express Port 0 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

18.132 Device Reference Clock Request Mapping 2 (DRCRM2)—Offset 104h

Device:

Function:

Default: F000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RW/L	**GbE Port CLKREQ Mapping (GBEPCKRQM):** GbE Port CLKREQ Mapping (GBEPCKRQM): The mapping of GBE Port to the corresponding CLKREQ# pin is configured by this field. 0000b: GbE Port maps to CLKREQ0# pin. 0001b: GbE Port maps to CLKREQ1# pin. 0010b: GbE Port maps to CLKREQ2# pin. 0011b: GbE Port maps to CLKREQ3# pin. 0100b: GbE Port maps to CLKREQ4# pin. 0101b: GbE Port maps to CLKREQ5# pin. : : 1111b: GbE Port maps to CLKREQ15# pin. Software must never map multiple Express Ports and GbE Port to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.
27:16	0h RO	**Reserved (RSVD):** Reserved
15:12	Fh RW/L	**Express Port 19 CLKREQ Mapping (P19CKRQM):** Express Port 19 CLKREQ Mapping (P19CKRQM): The mapping of Express Port 19 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 19 maps to CLKREQ0# pin. 0001b: Express Port 19 maps to CLKREQ1# pin. 0010b: Express Port 19 maps to CLKREQ2# pin. 0011b: Express Port 19 maps to CLKREQ3# pin. 0100b: Express Port 19 maps to CLKREQ4# pin. 0101b: Express Port 19 maps to CLKREQ5# pin. : : 1111b: Express Port 19 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
11:8	Fh RW/L	**Express Port 18 CLKREQ Mapping (P18CKRQM):** Express Port 18 CLKREQ Mapping (P18CKRQM): The mapping of Express Port 18 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 18 maps to CLKREQ0# pin. 0001b: Express Port 18 maps to CLKREQ1# pin. 0010b: Express Port 18 maps to CLKREQ2# pin. 0011b: Express Port 18 maps to CLKREQ3# pin. 0100b: Express Port 18 maps to CLKREQ4# pin. 0101b: Express Port 18 maps to CLKREQ5# pin. : : 1111b: Express Port 18 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
7:4	Fh RW/L	**Express Port 17 CLKREQ Mapping (P17CKRQM):** Express Port 17 CLKREQ Mapping (P17CKRQM): The mapping of Express Port 17 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 17 maps to CLKREQ0# pin. 0001b: Express Port 17 maps to CLKREQ1# pin. 0010b: Express Port 17 maps to CLKREQ2# pin. 0011b: Express Port 17 maps to CLKREQ3# pin. 0100b: Express Port 17 maps to CLKREQ4# pin. 0101b: Express Port 17 maps to CLKREQ5# pin. : : 1111b: Express Port 17 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
3:0	Fh RW/L	**Express Port 16 CLKREQ Mapping (P16CKRQM):** Express Port 16 CLKREQ Mapping (P16CKRQM): The mapping of Express Port 16 to the corresponding CLKREQ# pin is configured by this field. 0000b: Express Port 16 maps to CLKREQ0# pin. 0001b: Express Port 16 maps to CLKREQ1# pin. 0010b: Express Port 16 maps to CLKREQ2# pin. 0011b: Express Port 16 maps to CLKREQ3# pin. 0100b: Express Port 16 maps to CLKREQ4# pin. 0101b: Express Port 16 maps to CLKREQ5# pin. : : 1111b: Express Port 16 maps to CLKREQ15# pin. Software must never map multiple Express Ports to the same CLKREQ# pin. The hardware behavior is undefined if this ever happens. Note: This field is must be configured prior to enabling any power management features. Note: For SPT-LP, there only CLKREQ[lb]0:5[rb]# are supported for PCIe. Configuring this field to map to any unsupported CLKREQ# pins may result in undefined hardware behavior. This register bit is Read-Only when the CC.SRL bit is set. Register Attribute: Static.

§ §

19 SATA Registers

This chapter documents the registers in Bus: 0, Device 18, Function 0.

19.1 ID — Offset 0h

Identifiers

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 0h	8086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

19.2 Command (CMD) — Offset 4h

Command

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	**Reserved (RSVD):** Reserved
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Reserved
8	0h RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0h RO	**Wait Cycle Enable (WCC):** Reserved
6	0h RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0h RO	**VGA:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0h RO	**Memory Write and Invalidate Enable (MWIE):** Reserved
3	0h RO	**Special Cycle Enable (SCE):** Reserved
2	0h RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

19.3 Device Status (STS) — Offset 6h

Device Status

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 6h	2B0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0h RW/1C/V	**Signalled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0h RW/1C/V	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0h RW/1C/V	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0h RW/1C/V	**Signalled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0h RW/1C/V	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	1h RO	**Fast Back-to-Back Capable (FBC):** Reserved
6	0h RO	**Reserved (RSVD):** Reserved
5	1h RO	**66 MHz Capable (RSV):** Reserved
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared
2:0	0h RO	**Reserved (RSVD):** Reserved

19.4 Revision ID (RID) — Offset 8h

Revision ID

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + 8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

19.5 Programming Interface (PI) — Offset 9h

Programming Interface

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + 9h	1 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

19.6 Class Code (CC) — Offset Ah

Class Code

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + Ah	106 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	6h RO	**Sub Class Code (SCC):** The value reported in this field is dependent on SATAGC.SMS and various fuses and configuration bits.

19.7 Cache Line Size (CLS) — Offset Ch

Cache Line Size

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

19.8 Master Latency Timer (MLT) — Offset Dh

Master Latency Timer

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + Dh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Master Latency Timer (MLT):** This register has no meaning for the SATA controller.

19.9 Header Type (HTYPE) — Offset Eh

Header Type

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + Eh	0 h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** Indicates this controller is not part of a multi-function device.

Bit Range	Default & Access	Field Name (ID): Description
6:0	0h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

19.10 MSI-X Table Base Address (MXTBA) — Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 10h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**BA:** Base address of memory space.
14	0h RW/V	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW/V	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

19.11 MXP Base Address (MXPBA) — Offset 14h

This BAR is used to allocate 256-byte Memory space for the MSI-X PBA.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**BA:** Base address of memory space (aligned to 256B).
7:4	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

19.12 SCMDBA — Offset 18h

BAR2 register define a 8-byte I/O space but this space is not implemented. Accesses to this space will get master abort. This space is created to workaround an issue in RST.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 18h	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:3	0h RW	**Base Address (BAR):** Base address of the I/O space.
2:1	0h RO	**Reserved (RSVD):** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

19.13 SCTLBA — Offset 1Ch

BAR3 register define a 4-byte I/O space but this space is not implemented. Accesses to this space will get master abort. This space is created to workaround an issue in RST.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 1Ch	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:2	0h RW	**Base Address (BAR):** Base address of the I/O space.
1	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

19.14 AHCI Index Data Pair Base Address (AIDPBA) — Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 20h	1 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:5	0h RW	**BA:** Base address of the I/O space.
4:1	0h RO	**Reserved (RSVD):** Reserved
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

19.15 AHCI Base Address (ABAR) — Offset 24h

This register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted.. The Memory space size is determined by BIOS by making bit 15:11 Read-Only '1' or Read-Write '0' based on SATAGC.ASSEL[1:0].

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 24h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**BA:** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

19.16 Sub System Identifiers (SS) — Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion. This register is not reset by FLR.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

19.17 CAP — Offset 34h

Capabilities Pointer

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signalled Interrupt capability). The following capability structures are linked by default: CAP.CP -> 80h (MSI) -> D0h (MSI-X)-> 70h (PCI Power) -> A8h (SATA) -> 00h end. BIOS may alter the capability structure list above (by programming a leading capability structure's Next Pointer field) if BIOS wants to bypass any specific capability. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.

19.18 Interrupt Information (INTR) — Offset 3Ch

Interrupt Information

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 3Ch	100 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

19.19 PCI Power Management Capability ID (PID) — Offset 70h

PCI Power Management Capability ID

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 70h	A801 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A8h RW/L	**NEXT:** A8h is location of the Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

19.20 PC — Offset 72h

PCI Power Management Capabilities

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 72h	4003 h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PME_SUPPORT):** The default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	**D2 Support (D2_SUPPORT):** The D2 state is not supported.
9	0h RO	**D1 Support (D1_SUPPORT):** The D1 state is not supported.
8:6	0h RO	**Aux Current (AUX_CURRENT):** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	**Reserved (RSVD):** Reserved
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

19.21 PCI Power Management Control and Status (PMCS) — Offset 74h

PCI Power Management Control and Status

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 74h	8 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0h RO	**Reserved (RSVD):** Reserved
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from D3HOT on a wake event. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru SATAGC.SMS. This register field is not reset by FLR.
7:4	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3	1h RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved. Upon transition from the D3hot to the D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from D3hot to the D0 by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	**Reserved (RSVD):** Reserved
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: 00 = D0 state; 11 = D3HOT state. When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. If software attempts to write a 10 or 01 to these bits, the write will be ignored. On software requirements in ensuring I/O space, memory space and Bus Master are disabled prior to entering D3 state.

19.22 Message Signaled Interrupt Identifier (MID) — Offset 80h

Message Signaled Interrupt Identifier

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 80h	7005 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RW/L	**NEXT:** Indicates the next item in the list is the PCI power management pointer. This is the recommended value. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

19.23 Message Signalled Interrupt Message Control (MC) — Offset 82h

Message Signalled Interrupt Message Control

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 82h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

19.24 Message Signalled Interrupt Message Address (MA) — Offset 84h

Message Signalled Interrupt Message Address

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 84h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**ADDR:** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0h RO	**Reserved (RSVD):** Reserved

19.25 Message Signalled Interrupt Message Data (MD) — Offset 88h

Message Signalled Interrupt Message Data

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + 88h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**DATA:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

19.26 Port Mapping Register (MAP) — Offset 90h

Port Mapping Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 90h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RW/O	**SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 7 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 7 physically.
22	0h RW/O	**SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 6 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 6 physically.
21	0h RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 5 physically.
20	0h RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 4 physically.
19	0h RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 & 3). 2.Fuse FFSATA8 (disable port 1 & 3). 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
18	0h RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA7 (disable port 2 & 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is RO-one if ANY of the fuse/strap/gpio condition below is true else this bit is RW-zero. 1.Fuse FFSATA8 (disable port 1 & 3). 2.PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 1 physically.
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1.In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This field is not reset by FLR. This bit is only applicable to project(s): that has port 0 physically.
15:8	0h RO	**Reserved (RSVD):** Reserved
7:0	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 7: Port 7, this bit is applicable to projects: that has port 7 physically; Bit 6: Port 6, this bit is only applicable to project(s): that has port 6 physically; Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically; Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically; Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically; Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically; Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically; Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically. If a particular port is not available, software shall set the corresponding bit to 1. Software can also set the corresponding bit(s) to 1 after disabling particular port(s). Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1.

19.27 Port Control and Status (PCS) — Offset 94h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This register is not reset by FLR. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to '1' prior to booting the OS, regardless as to whether or not a device is currently on the port.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 94h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23	0h RO/V	**Port 7 Present (P7P):** Same as P0P, except for port 7. This bit is only applicable to project(s): That has port 7 physically.
22	0h RO/V	**Port 6 Present (P6P):** Same as P0P, except for port 6. This bit is only applicable to project(s): That has port 6 physically.
21	0h RO/V	**Port 5 Present (P5P):** Same as P0P, except for port 5. This bit is only applicable to project(s): That has port 5 physically.
20	0h RO/V	**Port 4 Present (P4P):** Same as P0P, except for port 4. This bit is only applicable to project(s): That has port 4 physically.
19	0h RO/V	**Port 3 Present (P3P):** Same as P0P, except for port 3. This bit is only applicable to project(s): That has port 3 physically.
18	0h RO/V	**Port 2 Present (P2P):** Same as P0P, except for port 2. This bit is only applicable to project(s): That has port 2 physically.
17	0h RO/V	**Port 1 Present (P1P):** Same as P0P, except for port 1. This bit is only applicable to project(s): That has port 1 physically.
16	0h RO/V	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s): That has port 0 physically.
15:8	0h RO	**Reserved (RSVD):** Reserved
7	0h RW/V	**Port 7 Enabled (P7E):** When MAP.SPD[7] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 7. This bit takes precedence over P7CMD.SUD. This bit is only applicable to project(s): That has port 7 physically.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW/V	**Port 6 Enabled (P6E):** When MAP.SPD[6] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 6. This bit takes precedence over P6CMD.SUD. This bit is only applicable to project(s): That has port 6 physically.
5	0h RW/V	**Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 5. This bit takes precedence over P5CMD.SUD. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW/V	**Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW/V	**Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD. This bit is only applicable to project(s): That has port 3 physically.
2	0h RW/V	**Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW/V	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/V	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 6 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us.

19.28 SATA General Configuration (SATAGC) — Offset 9Ch

SATA General Configuration

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + 9Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is required to program this field to 1 prior to handle off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process. This field is not reset by FLR.
30:18	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**Do SERR Disable (DOSERRD):** When 1,SERR reporting is disabled (DO_SERR Sideband message sending is disabled or SERR# Wire is supressed. STS.SSE setting is not governed by this policy bit). When 0, SERR reporting is enabled (DO_SERR Sideband message sending is enabled or SERR# Wire is not supressed)
16	0h RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: 0b = AHCI mode; 1b = RAID mode; Notes : SW shall not manipulate SATAGC.SMS during runtime operation; i.e. the OS will not do this. The BIOS may choose to switch from one mode to another during POST; AHCI mode may be selected when RAID feature is enabled by fuse; RAID mode may only be selected when FFSATA5 & FFSATA3 (concatenated value not indicating No RAID); This register field is not reset by FLR.
15	0h RW	**Data Phase Parity Error Enable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled.
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0h RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handling is enabled. When 0, the command parity error handling is disabled.
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS isnot able to revert it back to Function Enable until next round of platform reset.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signalled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0h RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime. This field is not reset by FLR.
6	0h RW/O/V	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. Note: WBG BIOS is required to program this field to 1 together with the write to the AIE bit in a single configuration write cycle. BIOS is required to program this bit to 0 together with the write to the AIE bit in a single configuration write cycle. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h. This field is not reset by FLR.
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. This field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is 32k when MSS[1:0]=00, 16k when MSS[1:0]=01, 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is 2k when ASSEL[2:0]=000, 16k when ASSEL[2:0]=001, 32k when ASSEL[2:0]=010, 64k when ASSEL[2:0]=011, 128k when ASSEL[2:0]=100, 256k when ASSEL[2:0]=101, 512k when ASSEL[2:0]=110. This field is not reset by FLR.

19.29 SATA Initialization Register Index (SIRI) — Offset A0h

SATA Initialization Register Index

Type	Size	Offset	Default
CFG	8 bit	[B:0, D:18, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written.
1:0	0h RO	**Reserved (RSVD):** Reserved

19.30 SATA Initialization Register Data (SIRD) — Offset A4h

SATA Initialization Register Data

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + A4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

19.31 Serial ATA Capability Register 0 (SATACR0) — Offset A8h

Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + A8h	100012 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved (RSVD):** Reserved
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0h RW/L	**NEXT:** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	12h RO	**CAP:** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

19.32 Serial ATA Capability Register 1 (SATACR1) — Offset ACh

Serial ATA Capability Register 1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + ACh	48 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved (RSVD):** Reserved
15:4	4h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. 000h = 0h offset; 001h = 4h offset; 002h = 8h offset; 003h = Ch offset; 004h = 10h offset; ...; FFFh = 3FFFh offset (max 16 KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). 0000 - 0011b = reserved; 0100b = 10h => BAR0; 0101b = 14h => BAR1; 0110b = 18h => BAR2; 0111b = 1Ch => BAR3; 1000b = 20h => AIDPBA; 1001b = 24h => BAR5; 1010 - 1110b = reserved; 1111b = Index/Data pair in PCI Configuration space which is not supported.

19.33 FLR Capability ID (FLRCID) — Offset B0h

FLR Capability ID

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + B0h	13 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	**NEXT:** 00h indicating the final item in the Capability List.
7:0	13h RO/V	**Capability ID (CID):** The value of this field depends on the FLRCSSEL bit. • SATAGC.FLRCSSEL = 0, Capability ID = 13h. • SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

19.34 FLR Capability Length and Version (FLRCAP) — Offset B2h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1. This register is not reset by FLR.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + B2h	306 h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	**Reserved (RSVD):** Reserved
9	1h RW/O	**FLR Capability (FLRCAP):** A 1 in this bit indicates support for Function Level Reset (FLR).
8	1h RW/O	**TXP Capability (TXPCAP):** A 1 in this bit indicates support for the Transactions Pending (TXP) bit. TXP must be supported if FLR is supported.
7:0	6h RO	**Capability Length (CAPL):** This field indicates the # of bytes as required by the PCI spec. It has the value of 06h for the FLR Capability.

19.35 FLR Control (FLRCTL) — Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	**Reserved (RSVD):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**Transactions Pending (TXP):** A 1 indicates that the controller has issued Non-Posted request which has not been completed. A 0 indicates that Completions for all non-posted requests have been received by the controller.
7:1	0h RO	**Reserved (RSVD):** Reserved
0	0h RW	**Initiate FLR (INITIATE_FLR):** Used to initiated FLR transition. A write of 1 indicates FLR transition. Since hardware must not respond to any cycles till FLR completion, the value read by software from this bit is 0. Refer to Function Level Reset (FLR) on specifics to SATA.

19.36 Scratch Pad (SP) — Offset C0h

Scratch Pad

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

19.37 MSI-X Identifiers (MXID) — Offset D0h

MSI-X Identifiers

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + D0h	11 h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW/L	**NEXT:** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list.The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

19.38 MSI-X Message Control (MXC) — Offset D2h

MSI-X Message Control

Type	Size	Offset	Default
CFG	16 bit	[B:0, D:18, F:0] + D2h	0 h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	**Reserved (RSVD):** Reserved
10:0	0h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4..

19.39 MSI-X Table Offset / Table BIR (MXT) — Offset D4h

MSI-X Table Offset / Table BIR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + D4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

19.40 MSI-X PBA Offset / PBA BIR (MXP) — Offset D8h

MSI-X PBA Offset / PBA BIR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + D8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

19.41 BIST FIS Control/Status (BFCS) — Offset E0h

BIST FIS Control/Status

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + E0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Reserved (RSVD):** Reserved
17	0h RW	**Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P7E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 7 physically.
16	0h RW	**Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P6E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 6 physically.
15	0h RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P5E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 5 physically.
14	0h RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P4E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 4 physically.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable the PCS.P3E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 3 physically.
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P2E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 2 physically.
11	0h RW/1C/V	**BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0h RW/1C/V	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P1E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 1 physically.
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. The BIST FIS will only be initiated if a device is present and not in the partial or slumber states. After a BIST FIS is successfully completed, software must disable and re-enable PCS.P0E prior to attempting additional BIST FISes or to return the SATA controller to a normal operational mode. If the BIST FIS fails, as indicated by BFF in this register, software can clear and then set this bit to initiate another BIST FIS. This bit is only applicable to project(s): That has port 0 physically.
7:2	0h RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: Bit 7 (T) Far End Transmit mode; bit 6 (A) Align Bypass mode; bit 5 (S) Bypass Scrambling; bit 4 (L) Far End Retimed Loopback; bit 3 (F) Far End Analog Loopback; bit 2 (P) Primitive bit for use with Transmit mode.
1:0	0h RO	**Reserved (RSVD):** Reserved

19.42 BIST FIS Transmit Data 1 (BFTD1) — Offset E4h

BIST FIS Transmit Data 1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + E4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DATA:** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

19.43 BIST FIS Transmit Data 2 (BFTD2) — Offset E8h

BIST FIS Transmit Data 2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + E8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**DATA:** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

19.44 Manufacturing ID (MFID) — Offset F8h

Manufacturing ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:18, F:0] + F8h	8000FB1 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RSVD):** Reserved
27:24	8h RO/V	**Dot portion of Process ID (DPID):** Indicates the dot. Process is reflected in bits [7:0]. This 8-bit value is received via the IOSF Sideband SetID message.
23:16	0h RO/V	**Stepping Identifier (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
15:8	Fh RO/V	**Manufacturer Identifier (MID):** This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
7:0	B1h RO/V	**Process/Dot Identifier (PID):** Indicates the Process. Dot is reflected in bits [27:24]. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.

19.45 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:2	0h RW	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0h RO	Reserved.

19.46 AHCI Data Register (DATA)—Offset 14h

This registers are index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Access Method

Type: IO Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

19.47 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FF36FF07h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queueing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activiate optimization through the FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization..
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initiallization.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.

Bit Range	Default & Access	Field Name (ID): Description
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved. Note: if (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, , FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011.
19	0h RO	**Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	1h RO	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers. BIOS must clear this bit if Port Multipliers are not supported.
16	0h RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	1h RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	1h RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0h RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing. When command completion coalescing is supported, the HBA has implemented the CCC_CTL and the CCC_PORTS global HBA registers. When cleared to 0, indicates that the HBA does not support command completion coalescing and the CCC_CTL and CCC_PORTS global HBA registers are not implemented.
6	0h RW/O/V	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management. When enclosure management is supported, the HBA has implemented the EM_LOC and EM_CTL global HBA registers. When cleared to 0, indicates that the HBA does not support enclosure management and the EM_LOC and EM_CTL global HBA registers are not implemented.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.
4:0	7h RO/V	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC, fuses (FFSATA7, FFSATA8) and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 8 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports.

19.48 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.
30:3	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC > 0 (multiple messages requested); MC.MME > 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is leass than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0h RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect.

19.49 Interrupt Status Register (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW/1C/V	**Interrupt Pending Status Port 7 (IPS7):** If set, indicates that port 7 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 7 physically.
6	0h RW/1C/V	**Interrupt Pending Status Port 6 (IPS6):** If set, indicates that port 6 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 6 physically.
5	0h RW/1C/V	**Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 5 physically.
4	0h RW/1C/V	**Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 4 physically.
3	0h RW/1C/V	**Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 3 physically.
2	0h RW/1C/V	**Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 2 physically.
1	0h RW/1C/V	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0h RW/1C/V	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

19.50 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR. There is BIOS programming requirement on the PI register.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	0h RW/O/V	**Port 7 Implemented (PI7):** If set, then port 7 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 7 is not available.
6	0h RW/O/V	**Port 6 Implemented (PI6):** If set, then port 6 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 6 is not available.
5	0h RW/O/V	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available.
4	0h RW/O/V	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available.
3	0h RW/O/V	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available.
2	0h RW/O/V	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available.
1	0h RW/O/V	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0h RW/O/V	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

19.51 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 10300h

Bit Range	Default & Access	Field Name (ID): Description
31:16	1h RO	**Major Version Number (MJR):** Indicates the major version is 1.
15:0	300h RO	**Minor Version Number (MNR):** Indicates the minor version is 30.

19.52 Enclosure Management Location (EM_LOC)—Offset 1Ch

The enclosure management location register identifies the location and size of the enclosure management message buffer. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1600002h

Bit Range	Default & Access	Field Name (ID): Description
31:16	160h RO	**Offset (OFST):** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	2h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. Note that SATA controller only supports transmit buffer.

19.53 Enclosure Management Control (EM_CTL)—Offset 20h

This register is used to control and obtain status for the enclosure management interface. The register incluldes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Access Metho.

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 7010000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	Reserved.
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	Reserved.
9	0h RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	Reserved.
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

19.54 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h. When this bit is cleared to 0, the HBA may enter DEVSLP from any link state (active, Partial, or Slumber). BIOS is required to program this field to 1.
4	1h RW/O/V	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires. When cleared to 0, this function is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.
3	1h RW/O/V	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported. Note: If PHY IO PM Disable Fuse is 1, this register will read 0. Else this register will read 1 with RWO attribute.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW/O/V	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions. When cleared to 0, Automatic Partial to Slumber Transition is not supported. Note: If SATA PHY PM Disable Fuse is 1, this register will read only 0. Else this register will read 1 with RWO attribute.
1	0h RO	Reserved.
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

19.55 Vendor Specific (VSP)—Offset A0h

Vendor Specific

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 48h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO/V	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO/V	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	Reserved.

19.56 Vendor-Specific Capabilities Register (VS_CAP)—Offset A4h

Vendor-Specific Capabilities Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1002DEh

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:16	10h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.
15:13	0h RO	Reserved.
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K in steps of 128B. Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh, which specifies the size of the remapped memory space as 34k. This field is not reset by FLR.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

19.57 Remapping Under NVMe (RUN)—Offset A8h

Remapping Under NVMe

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW/O	**Remapping Under NVMe Enable (RUNE):** When set to 1, AHCI Host Controller become a Remapped Device under the NVMe Host Controller hence the Bus Device Function of AHCI Host Controller is hidden from the OS. When this bit is 0, AHCI Host Controller is not remapped under NVMe Host Controller
15:8	0h RO	Reserved.
7:0	0h RW/O	**NVMe Device Function (NVMEDF):** Device and function number of NVMe Host Controller that AHCI Host Controller is remapped to. Bit 7:3 is the device number, bit 2:0 is the function number

19.58 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 311C02h

Bit Range	Default & Access	Field Name (ID): Description
31:16	31h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO/V	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

19.59 Premium Feature Block (PFB)—Offset C4h

Note: Bits 4-0 are not bit-mapped to individual fuses and/or soft SKU settings; rather a single fuse FFSATA5& FFSATA 3 /soft sku is used to indicate support for all of these features (refer to VSP.PFS). These registers indicate to the Intel Rapid Storage Technology AHCI driver that those premium RAID features that can be supported on the platform.

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0h RO	Reserved.
4	0h RO/V	**Reserved (RSVD_1):** Read value is the same as VSP.PFS.
3	0h RO/V	**Reserved (RSVD_2):** Read value is the same as VSP.PFS.
2	0h RO/V	**Reserved (RSVD_3):** Read value is the same as VSP.PFS.
1	0h RO/V	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO/V	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

19.60 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 3Fh

Bit Range	Default & Access	Field Name (ID): Description
15:12	0h RO	Reserved.
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK (HDDUNLOCK):** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5 (R5):** If set to 1, then RAID5 is enabled.
2	1h RW/O	**R10 (R10):** If set to 1, then RAID10 is enabled.
1	1h RW/O	**R1 (R1):** If set to 1, then RAID1 is enabled.
0	1h RW/O	**R0 (R0):** If set to 1, then RAID0 is enabled.

19.61 Port [0-7] Command List Base Address (PxCLB0)—Offset 100h

Port [0-7] Command List Base Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.

19.62 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

Port [0-7] Command List Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

19.63 Port [0-7] FIS Base Address (PxFB0)—Offset 108h

Port [0-7] FIS Base Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

19.64 Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

Port [0-7] FIS Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

19.65 Port [0-7] Interrupt Status (PxIS0)—Offset 110h

Port [0-7] Interrupt Status

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0h RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO/V	**Port Connect Change Status (PCS):** • 1: Change in Current Connect Status. • 0: No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

19.66 Port [0-7] Interrupt Enable (PxIE0)—Offset 114h

Port [0-7] Interrupt Enable

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW/V	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

19.67 Port [0-7] Command (PxCMD0)—Offset 118h

Port [0-7] Command

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four-bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommeded to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.

Bit Range	Default & Access	Field Name (ID): Description
12:8	0h RO/V	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0h RO	Reserved.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initializatoin sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

19.68 Port [0-7] Task File Data (PxTFD0)—Offset 120h

Port [0-7] Task File Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	7h RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

19.69 Port [0-7] Signature (PxSIG0)—Offset 124h

Port [0-7] Signature

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

19.70 Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h

Port [0-7] Serial ATA Status

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0h RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0h RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

19.71 Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch

Port [0-7] Serial ATA Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

19.72 Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h

Port [0-7] Serial ATA Error

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

19.73 Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h

Port [0-7] Serial ATA Active

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

19.74 Port [0-7] Commands Issued (PxCI0)—Offset 138h

Port [0-7] Commands Issued

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

19.75 Port [0-7] SNotification (PxSNTF0)—Offset 13Ch

Port [0-7] SNotification

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

19.76 Port [0-7] Device Sleep (PxDEVSLP0)—Offset 144h

Port [0-7] Device Sleep

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1E022852h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).

Bit Range	Default & Access	Field Name (ID): Description
24:15	4h RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.
14:10	Ah RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.
0	0h RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). When this bit is set to 1, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

19.77 Port [0-7] Command List Base Address (PxCLB1)—Offset 180h

Port [0-7] Command List Base Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.

19.78 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h

Port [0-7] Command List Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

19.79 Port [0-7] FIS Base Address (PxFB1)—Offset 188h

Port [0-7] FIS Base Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

19.80 Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch

Port [0-7] FIS Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

19.81 Port [0-7] Interrupt Status (PxIS1)—Offset 190h

Port [0-7] Interrupt Status

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0h RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO/V	**Port Connect Change Status (PCS):** • 1: Change in Current Connect Status. • 0: No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0h RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0h RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

19.82 Port [0-7] Interrupt Enable (PxIE1)—Offset 194h

Port [0-7] Interrupt Enable

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW/V	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

19.83 Port [0-7] Command (PxCMD1)—Offset 198h

Port [0-7] Command

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four-bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommeded to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0h RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0h RO/V	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initializatoin sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

19.84 Port [0-7] Task File Data (PxTFD1)—Offset 1A0h

Port [0-7] Task File Data

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 7Fh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.

Bit Range	Default & Access	Field Name (ID): Description
6:4	7h RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	1h RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	3h RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	1h RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

19.85 Port [0-7] Signature (PxSIG1)—Offset 1A4h

Port [0-7] Signature

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

19.86 Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h

Port [0-7] Serial ATA Status

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0h RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0h RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

19.87 Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh

Port [0-7] Serial ATA Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

19.88 Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h

Port [0-7] Serial ATA Error

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0h RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

19.89 Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h

Port [0-7] Serial ATA Active

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

19.90 Port [0-7] Commands Issued (PxCI1)—Offset 1B8h

Port [0-7] Commands Issued

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

19.91 Port [0-7] SNotification (PxSNTF1)—Offset 1BCh

Port [0-7] SNotification

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

19.92 Port [0-7] Device Sleep (PxDEVSLP1)—Offset 1C4h

Port [0-7] Device Sleep

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 1E022852h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM).
24:15	4h RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0.

Bit Range	Default & Access	Field Name (ID): Description
14:10	Ah RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
9:2	14h RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'.DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. Note that these bits are not reset on a HBA reset.
0	0h RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). When this bit is set to 1, the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to 1 if the platform support the DEVSLP feature. If CAP2.SDS is cleared to 0 or CAP2.SADM is cleared to 0, or if PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved.

19.93 Enclosure Management Message Format (EM_MF)—Offset 580h

Enclosure Management Message Format

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**Message Type (MTYPE):** Specifies the type of the message. The message types are: • 0h: LED. • 1h: SAF-TE. • 2h: SES-2. • 3h: SGPIO (register based interface). • All other values reserved.
23:16	0h RW	**Data Size (DSIZE):** Specifies the data size in bytes. If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field. If there is no separate data buffer, this field shall have a value of '0'. The data directly follows the message in the message buffer. This value should always be '0'.
15:8	0h RW	**Message Size (MSIZE):** Specifies the size of the message in bytes. The message size does not include the one Dword header. A value of '0'. is invalid. The message size is always 4 bytes.
7:0	0h RO	Reserved.

19.94 Enclosure Management LED (EM_LED)—Offset 584h

Enclosure Management LED

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control. LED values are: 000b - LED shall be off; 001b - LED shall be solid on as perceived by human eye; All other values reserved. The LED bit locations are: Bits 2:0 - Activity LED (may be driven by hardware); Bits 5:3 - Vendor Specific LED (e.g. locate); Bits 8:6 - Vendor Specific LED (e.g. fault); Bits 15:9 - Reserved. Vendor specific message is: Bit 3:0 - Vendor Specific Pattern; Bit 15:4 - Reserved. Note: If Activity LED Hardware Driven (ATTR.ALHD) bit is set, host will output the hardware LED value sampled internally and will ignore software written activity value on bit [2:0]. Since Enclosure Management does not support port multiplier based LED message, the LED message will be generated independently based on respective port's operation activity. Vendor specific LED values Locate (Bits 5:3) and Fault (Bits 8:6) always are driven by software..
15:8	0h RW	**Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update. If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'. Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port MUltiplier. This byte should be 0.
7:0	0h RW	**HBA Information (HBA):** Specifies slot specific information related to the HBA. Bits 4:0 - HBA port number for the slot that requires the status update. Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0. Bits 7:6 - Reserved.

19.95 MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h

MSI-X Pending Bit Array QW 0

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO/V	**MSI-X Vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

19.96 MSI-X Pending Bit Array QW 1 (MXPQW0_DW1)—Offset 4h

MSI-X Pending Bit Array QW 1

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MSI-X Vector Pending QW1 (Rsvd):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

19.97 MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h

MSI-X Table Entries 0 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**MSI-X Message Lower Address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

19.98 MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h

MSI-X Table Entries 0 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI-X Message Upper 32-Bit Address (MXMUA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.

19.99 MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h

MSI-X Table Entries 0 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSI-X Message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

19.100 MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch

MSI-X Table Entries 0 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	1h RW	**MSI-X Vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

§ §

20 I/O Sensor Hub (ISH) Registers

This chapter documents the registers in Bus: 0, Device 17, Function 0.

20.1 DEVICEVENDORID - Device ID and Vendor ID Register (DEVVENDID) — Offset 0h

Device ID and Vendor ID provided by this register uniquely identifies the particular Device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 0h	22D88086 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	22D8h RO	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG, which identifies the manufacturer of the device

20.2 STATUSCOMMAND — Offset 4h

Command register to programme interrupt disable , bus master enable, and Memory space enable. Status register to read the errors and aborts

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 4h	100000 h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**RESERVED0:** Reserved
29	0h RW/1C	**RMA:** Received Master Abort
28	0h RW/1C	**RTA:** Received Target Abort
27:21	0h RO	**RESERVED1:** Reserved
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device

Bit Range	Default & Access	Field Name (ID): Description
18:16	0h RO	**RESERVED2:** Reserved
15:11	0h RO	**RESERVED3:** Reserved
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**RESERVED4:** Reserved
8	0h RW	**SERR_ENABLE:** SERR Enable , Not implemented
7:3	0h RO	**RESERVED5:** Reserved
2	0h RW	**BME:** Bus Master Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RO	**RESERVED6:** Reserved

20.3 REVCLASSCODE — Offset 8h

Revision ID register identifies revision of particular device and Class Code register is used to identify generic function of the device

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 8h	6 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device, and in some cases, a specific register-level programming interface
7:0	6h RO	**RID:** Revision ID identifies the revision of particular PCI device.

20.4 CLLATHEADERBIST — Offset Ch

Cache Line size as RW with def 0, Latency timer RW with def 0, Header type with Type 0 configuration header and Reserved BIST register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**RESERVED0:** Reserved
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	0h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	0h RO	**LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0
7:0	0h RW	**CACHELINE_SIZE:** Cacheline Size

20.5 BAR — Offset 10h

Base Address Register low [31:2] , type[2:1] in 32bit or 64bit addr range and memory space indicator [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 10h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RW	**BASEADDR:** Base Address Register Low, Base address of the OCP fabric memory space. Taken from Strap values as ones
12:4	0h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

20.6 BAR -Base Address Register High (BAR_HIGH) — Offset 14h

Base Address Register High enabled if [2:1] of BAR_type_LOW is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 14h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR_HIGH:** Base Address high - MSB

20.7 BAR1 — Offset 18h

Base Address Register1 accesses to PCI configuration space and is always 4K, type in [2:1] and memory space indicator in [0]

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 18h	4 h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

20.8 BAR1 -Base Address Register1 High (BAR1_HIGH) — Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 1Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BASEADDR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

20.9 SUBSYSTEMID — Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 2Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

20.10 EXPANSION ROM base address (EXPANSION_ROM_BASEADDR) — Offset 30h

EXPANSION ROM base address register is a RO indicates support for expansion ROMs

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 30h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM

20.11 CAPABILITYPTR — Offset 34h

Capabilities Pointer register indicates what the next capability is

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 34h	80 h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**RESERVED0:** Reserved
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

20.12 INTERRUPTREG — Offset 3Ch

Interrupt line Register isn't used in Bridge directly, Interrupt Pin register reflects the IPIN value in private config space. Min_gnt register indicating the req of latency timers and max_lat register max latency

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 3Ch	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	**RESERVED0:** Reserved
11:8	0h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	0h RW	**INTLINE:** Interrupt Line: It is used to communicate to software, the interrupt line to which the interrupt pin is connected

20.13 POWERCAPID — Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability , with Power management capabilities register for PME support and version

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 80h	39001 h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**RESERVED0:** Reserved
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	1h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

20.14 PMECTRLSTATUS — Offset 84h

power management control and status register to set and read PME status, PME enable, No Soft reset and power state

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 84h	8 h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED0:** Reserved
15	0h RW/1C	**PMESTATUS:** PME Status
14:9	0h RO	**RESERVED1:** Reserved
8	0h RW	**PMEENABLE:** PME Enable
7:4	0h RO	**RESERVED2:** Reserved
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**RESERVED3:** Reserved
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

20.15 PCI DEVICE IDLE CAPABILITY RECORD (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Vendor Specific Capability register defines Vendor specific Capability ID, revision , length , next capability and CAPID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 90h	F0140009 h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

20.16 DEVID VENDOR SPECIFIC REG (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Extended Vendor capability register for VSEC Length, revision and ID

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 94h	1400010 h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

20.17 D0I3_CONTROL_SW_LTR_MMIO_REG — Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 98h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

20.18 DEVICE_IDLE_POINTER_REG — Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location , BAR NUM and D0i3 Valid Strap

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + 9Ch	6D01 h

Bit Range	Default & Access	Field Name (ID): Description
31:4	6D0h RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR_NUM:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

20.19 D0I3_MAX_POW_LAT_PG_CONFIG — Offset A0h

D0idle_Max_Power_On_Latency register set at boot and Power control enable register to enable communication with the PGCB block below the Bridge

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + A0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**RESERVED0:** Reserved
21	0h RO	**HAE:** Hardware Autonomous Enable
20	0h RO	**RESERVED1:** Reserved
19	0h RO	**SLEEP_EN:** Sleep Enable
18	0h RO	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1?, then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RO	**I3_ENABLE:** D3-Hot Enable (D3HEN): If ?1?, then function will power gate when idle and the PMCSR[1:0] register in the function =?11? (D3).
16	0h RO	**PMCRE:** PMCRE: PMC Request Enable
15:13	0h RO	**RESERVED2:** Reserved
12:10	0h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

20.20 GEN_REGRW1 - General Purpose Read Write Register1 (GEN_REGRW1) — Offset B0h

General Purpose PCI Read Write Register1

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + B0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

20.21 GEN_REGRW2 — Offset B4h

General Purpose PCI Read Write Register2

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + B4h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

20.22 GEN_REGRW3 — Offset B8h

General Purpose PCI Read Write Register3

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + B8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

20.23 GEN_REGRW4 — Offset BCh

General Purpose PCI Read Write Register4

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + BCh	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

20.24 GEN_INPUT_REG — Offset C0h

General Purpose Input Register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + C0h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GEN_REG_INPUT_RW:** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

20.25 MANID — Offset F8h

Manufacturers ID register

Type	Size	Offset	Default
CFG	32 bit	[B:0, D:17, F:0] + F8h	0 h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**MANID:** Manufacturer ID: Default value comes from straps.

20.26 Peripheral Interrupt Status (PISR)—Offset 1000h

This register contains all the inbound and outbound interrupt status bits of the IPC registers. Interrupts ISH2HOST_Intr, ISH2SEC_Intr, ISH2PMC_Intr, HOST2ISH_intr, SEC2ISH_Intr and PMC2ISH_Intr are generated when PISR[x] & PIMR[x].

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved (RESERVED1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26	0h RO	**Interrupt Status Bit For Audio CSR Register (PISR_AUDIO_CSR):** Audio to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
25	0h RO	**Interrupt Status Bit for ISP CSR Register (PISR_ISP_CSR):** ISP to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
24	0h RO	**Interrupt Status Bit For PMC CSR Register (PISR_PMC_CSR):** PMC to ISH CSR Ored interrupt: • : Interrupt is active. • 0: Interrupt is inactive.
23	0h RO	**Interrupt Status Bit For CSME CSR Register (PISR_CSME_CSR):** CSME to ISH CSR Ored interrupt: • 1: Interrupt is active. • 0: Interrupt is inactive.
22:12	0h RO	**Reserved (RESERVED0):** Reserved.
11	0h RO	**ISH to Audio Status (PISR_ISH2AUDIO):** Outbound IPC request from ISH to audio status: • 1: Interrupt is active. • 0: Interrupt is inactive.
10	0h RO	**ISH to ISP Status (PISR_ISH2ISP):** Outbound IPC request from ISH to ISP status: • 1: Interrupt is active. • 0: Interrupt is inactive.
9	0h RO	**ISH to GFX Status (PISR_ISH2GFX):** Outbound IPC request from ISH to GFX status: • 1: Interrupt is active. • 0: Interrupt is inactive.
8	0h RO	**Audio to ISH Status (PISR_AUDIO2ISH):** Inbound IPC request from audio to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
7	0h RO	**ISP to ISH Status (PISR_ISP2ISH):** Inbound IPC request from ISP to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
6	0h RO	**GFX to ISH Status (PISR_GFX2ISH):** Inbound IPC request from GFX to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
5	0h RO	**ISH to SEC Status (PISR_ISH2SEC):** Outbound IPC request from ISH to SEC status: • 1: Interrupt is active. • 0: Interrupt is inactive.
4	0h RO	**ISH to PMC Status (PISR_ISH2PMC):** Outbound IPC request from ISH to PMC status: • 1: Interrupt is active. • 0: Interrupt is inactive.
3	0h RO	**Reserved (RESERVED):** Reserved.
2	0h RO	**SEC to ISH Status (PISR_SEC2ISH):** Inbound IPC request from SEC to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RO	**PMC to ISH Status (PISR_PMC2ISH):** Inbound IPC request from PMC to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.
0	0h RO	**Host to ISH Status (PISR_HOST2ISH):** Inbound IPC request from host to ISH status: • 1: Interrupt is active. • 0: Interrupt is inactive.

20.27 Peripheral Interrupt Mask (PIMR)—Offset 1004h

This register enables or disables Inbound and outbound interrupts between ISH&HOST, ISH&PMC and ISH&PMC. The outbound interrupts cannot be masked by HOST, PMC & SEC since this register is not accessible by external agents like HOST, PMC & SEC.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Reserved (RESERVED1):** Reserved.
27	0h RW	**H2IBCISC Interrupt Mask (H2IBCISC_IE):** Mask bit for H2IBCISC interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
26	0h RW	**Audio CSR Interrupt Mask (PIMR_AUDIO_CSR_MASK):** Mask bit for audio CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
25	0h RW	**ISP CSR Interrupt Mask (PIMR_ISP_CSR_MASK):** Mask bit for ISP CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
24	0h RW	**PMC CSR Interrupt Mask (PIMR_PMC_CSR_MASK):** Mask bit for PMC CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
23	0h RW	**CSME CSR Interrupt Mask (PIMR_CSME_CSR_MASK):** Mask bit for CSME CSR interrupt mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
22	0h RW	**ISH to Audio Busy Clear Mask (PIMR_ISH2AUDIO_BUSY_CLEAR):** Mask bit for ISH to audio busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
21	0h RW	**ISH to ISP Busy Clear Mask (PIMR_ISH2ISP_BUSY_CLEAR):** Mask bit for ISH to ISP busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**ISH2 to GFX Busy Clear Mask (PIMR_ISH2GFX_BUSY_CLEAR):** Mask bit for ISH to GFX busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
19	0h RW	**ISH to Audio Mask (PIMR_ISH2AUDIO):** Outbound IPC request from ISH to audio mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
18	0h RW	**ISH to ISP Mask (PIMR_ISH2ISP):** Outbound IPC request from ISH to ISP mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
17	0h RW	**ISH to GFX Mask (PIMR_ISH2GFX):** Outbound IPC request from ISH to GFX mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
16	0h RW	**Audio to ISH Mask (PIMR_AUDIO2ISH):** Inbound IPC request from audio to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
15	0h RW	**ISP to ISH Mask (PIMR_ISP2ISH):** Inbound IPC request from ISP to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
14	0h RW	**GFX to ISH Mask (PIMR_GFX2ISH):** Inbound IPC request from GFX to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
13	0h RW	**ISH to SEC Busy Clear Mask (PIMR_ISH2SEC_BUSY_CLEAR):** Mask bit for ISH to SEC busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
12	0h RW	**ISH to PMC Busy Clear Mask (PIMR_ISH2PMC_BUSY_CLEAR):** Mask bit for ISH to PMC busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
11	0h RW	**ISH to Host Busy Clear Mask (PIMR_ISH2HOST_BUSY_CLEAR):** Mask bit for ISH to host busy clear interrupt: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
10:6	0h RO	**Reserved (RESERVED0):** Reserved.
5	0h RW	**ISH to SEC Mask (PIMR_ISH2SEC):** Outbound IPC request from ISH to SEC mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
4	0h RW	**ISH to PMC Mask (PIMR_ISH2PMC):** Outbound IPC request from ISH to PMC mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
3	0h RO	**Reserved (RESERVED):** Reserved.
2	0h RW	**SEC to ISH Mask (PIMR_SEC2ISH):** Inbound IPC request from SEC to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**PMC to ISH Mask (PIMR_PMC2ISH):** Inbound IPC request from PMC to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.
0	0h RW	**Host to ISH Mask (PIMR_HOST2ISH):** Inbound IPC request from host to ISH mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

20.28 Host Peripheral Interrupt Mask (HOST_PIMR)—Offset 1008h

This register is for masking the interrupt, caused by setting the DB bit, for IPC from mIA to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RESERVED1):** Reserved.
8	0h RW	**Host to ISH Busy Clear Interrupt Mask Bit (PIMR_HOST2ISH_BUSY_CLEAR):** • 1: Interrupt is unmasked. • 0: Interrupt is masked.
7:1	0h RO	**Reserved (RESERVED0):** Reserved.
0	0h RW	**Mask Interrupt Caused By ISH to Host Doorbell (PIMR_ISH2HOST_IPC_REG):** Outbound IPC request from ISH to host mask: • 1: Interrupt is unmasked. • 0: Interrupt is masked.

20.29 HOST Peripheral Interrupt Status (HOST_PISR)—Offset 100Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved (RESERVED1):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW/1C	**Host to ISH Busy Clear Interrupt Status Bit (PISR_HOST2ISH_BUSY_CLEAR):** 1: Interrupt is active.
7:1	0h RO	**Reserved (RESERVED0):** Reserved.
0	0h RO	**ISH to Host DB Interrupt Status Bit (PISR_ISH2HOST_IPC_REG)**

20.30 Reserved (RESERVED2)—Offset 1010h

Reserved.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED2):** Reserved.

20.31 Reserved (RESERVED3)—Offset 1014h

Reserved.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED3):** Reserved.

20.32 Reserved (RESERVED4)—Offset 1018h

Reserved.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED4):** Reserved.

20.33 Reserved (RESERVED5)—Offset 101Ch

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED5):** Reserved.

20.34 Reserved (RESERVED6)—Offset 1020h

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED6):** Reserved.

20.35 Reserved (RESERVED7)—Offset 1024h

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED7):** Reserved.

20.36 Reserved (RESERVED8)—Offset 1028h

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED8):** Reserved.

20.37 Reserved (RESERVED9)—Offset 102Ch

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED9):** Reserved.

20.38 Reserved (RESERVED10)—Offset 1030h

Reserved.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h NA	**Reserved (RESERVED10):** Reserved.

20.39 ISH Host Firmware Status (ISH_HOST_FWSTS)—Offset 1034h

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1`b1 to indicate its status.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ISH Host Firmware Status (ISH_HOST_FWSTS)**

20.40 Host Communication (HOST_COMM)—Offset 1038h

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Host Communication Register (HOST_COMM)**

20.41 ISH SEC Firmware Status (ISH_SEC_FWSTS)—Offset 103Ch

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to 1`b1 to indicate its status.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ISH SEC Firmware Status (ISH_SEC_FWSTS)**

20.42 SEC Communication (SEC_COMM)—Offset 1040h

This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The SEC sets bits of this register to 1`b1 to communicate with the ISH.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SEC Communication (SEC_COMM):** This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. The SEC sets bits of this register to 1`b1 to communicate with the ISH.

20.43 ISH Reset (ISH_RST)—Offset 1044h

This register is reserved for SEC; SEC should not write to this register. The reset register is a 32 bit register that can be written by ISH Minute IA. The host cannot read or write this bit. Setting bit 1 will cause MinuteIA to reset.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved (RESERVED):** Reserved.
0	0h RW	**Reset Bit (RESET_BIT):** ISH reset register: • 1: Reset active. • 0: Reset inactive.

20.44 Inbound Doorbell Host to ISH (HOST2ISH_DOORBELL)—Offset 1048h

Inbound doorbell register, host core to interrupt ISH. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.45 Inbound Doorbell PMC To ISH (PMC2ISH_DOORBELL)—Offset 104Ch

Inbound doorbell register. PMC to interrupt ISH Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.46 Inbound Doorbell SEC to ISH (SEC2ISH_DOORBELL)—Offset 1050h

Inbound doorbell register, SEC to interrupt ISH Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the ISH CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.47 Outbound Doorbell ISH To Host (ISH2HOST_DOORBELL)—Offset 1054h

Outbound doorbell register for the ISH to interrupt the host. Setting bit 31 of this register causes the host to receive a IRQn interrupt. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the host CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.48 Outbound Doorbell ISH to PMC (ISH2PMC_DOORBELL)—Offset 1058h

Outbound doorbell register for the ISH to interrupt the PMC. Setting bit 31 of this register causes the PMC to receive interrupt on OOB. Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the PMC CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.49 Outbound Doorbell ISH to SEC (ISH2SEC_DOORBELL)—Offset 105Ch

Outbound doorbell register for the ISH to interrupt the SEC. Setting bit 31 of this register causes the SEC to receive interrupt on OOB Data 30:0 is 31 bit message payload used for backward compatibility.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Doorbell Busy Bit (BUSY):** When this bit is cleared, the SEC CPU is ready to accept a new message.
30:0	0h RW	**31 Bit Payload (PAYLOAD_31BIT):** 31 bit message payload for backward compatibility.

20.50 Outbound Inter Processor Messages 1 ISH to Host (ISH2HOST_MSG1)—Offset 1060h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 1 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.51 Outbound Inter Processor Messages 2 ISH to Host (ISH2HOST_MSG2)—Offset 1064h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 2 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.52 Outbound Inter Processor Messages 3 ISH to Host (ISH2HOST_MSG3)—Offset 1068h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 3 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.53 Outbound Inter Processor Messages 4 ISH to Host (ISH2HOST_MSG4)—Offset 106Ch

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 4 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.54 Outbound Inter Processor Messages 5 ISH to Host (ISH2HOST_MSG5)—Offset 1070h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 5 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.55 Outbound Inter Processor Messages 6 ISH to Host (ISH2HOST_MSG6)—Offset 1074h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 6 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.56 Outbound Inter Processor Messages 7 ISH to Host (ISH2HOST_MSG7)—Offset 1078h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 7 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.57 Outbound Inter Processor Messages 8 ISH to Host (ISH2HOST_MSG8)—Offset 107Ch

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 8 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.58 Outbound Inter Processor Messages 9 ISH to Host (ISH2HOST_MSG9)—Offset 1080h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 9 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.59 Outbound Inter Processor Messages 10 ISH to Host (ISH2HOST_MSG10)—Offset 1084h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 10 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.60 Outbound Inter Processor Messages 11 ISH to Host (ISH2HOST_MSG11)—Offset 1088h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 11 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.61 Outbound Inter Processor Messages 12 ISH to Host (ISH2HOST_MSG12)—Offset 108Ch

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 12 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.62 Outbound Inter Processor Messages 13 ISH to Host (ISH2HOST_MSG13)—Offset 1090h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 13 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.63 Outbound Inter Processor Messages 14 ISH to Host (ISH2HOST_MSG14)—Offset 1094h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 14 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.64 Outbound Inter Processor Messages 15 ISH to Host (ISH2HOST_MSG15)—Offset 1098h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 15 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.65 Outbound Inter Processor Messages 16 ISH to Host (ISH2HOST_MSG16)—Offset 109Ch

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 16 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.66 Outbound Inter Processor Messages 17 ISH to Host (ISH2HOST_MSG17)—Offset 10A0h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 17 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.67 Outbound Inter Processor Messages 18 ISH to Host (ISH2HOST_MSG18)—Offset 10A4h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 18 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.68 Outbound Inter Processor Messages 19 ISH to Host (ISH2HOST_MSG19)—Offset 10A8h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 19 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.69 Outbound Inter Processor Messages 20 ISH to Host (ISH2HOST_MSG20)—Offset 10ACh

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 20 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

20.70 Outbound Inter Processor Messages 21 ISH to Host (ISH2HOST_MSG21)—Offset 10B0h

Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Message 21 from ISH to Host (MSG):** Inter-processor message registers for ISH core to communicate to the host. These are thirty-two 32 bit registers that hold the message payload from the ISH to host.
