## 1. General description

The LPC55S6x is an ARM Cortex-M33 based microcontroller for embedded applications. These devices include an ARM Cortex-M33 coprocessor, CASPER Crypto/FFT engine, PowerQuad hardware accelerator for DSP functions, up to 320 KB of on-chip SRAM, up to 640 KB on-chip flash, PRINCE module for on-the-fly flash encryption/decryption, high-speed and full-speed USB host and device interface with crystal-less operation for full-speed, SD/MMC/SDIO interface, five general-purpose timers, one SCTimer/PWM, one RTC/alarm timer, one 24-bit Multi-Rate Timer (MRT), a Windowed Watchdog Timer (WWDT), nine flexible serial communication peripherals (which can be configured as a USART, SPI, high speed SPI, ${ }^{2} \mathrm{C}$, or $\mathrm{I}^{2}$ S interface), Programmable Logic Unit (PLU), one 16-bit 1.0 Msamples/sec ADC, comparator, and temperature sensor.

The ARM Cortex-M33 provides a security foundation, offering isolation to protect valuable IP and data with TrustZone® technology. It simplifies the design and software development of digital signal control systems with the integrated digital signal processing (DSP) instructions. To support security requirements, the LPC55S6x also offers support for secure boot, HASH, AES, RSA, UUID, dynamic encrypt and decrypt, debug authentication, and TBSA compliance.

## 2. Features and benefits

- ARM Cortex-M33 core (CPU0, r0p3):
- Running at a CPU frequency of up to 150 MHz (device revision 1B only).
- TrustZone®, Floating Point Unit (FPU) and Memory Protection Unit (MPU).
- ARM Cortex M33 built-in Nested Vectored Interrupt Controller (NVIC).
- Non-maskable Interrupt (NMI) input with a selection of sources.
- Serial Wire Debug with eight breakpoints and four watch points. Includes Serial Wire Output for enhanced debug capabilities.
- System tick timer.

■ ARM Cortex-M33 co-processor (CPU1, r0p3):

- Running at a CPU frequency of up to 150 MHz (device revision 1B only).
- The configuration of this instance does not include MPU, FPU, DSP, ETM, and Trustzone.
- System tick timer.

- CASPER Crypto co-processor is provided to enable hardware acceleration for various functions required for certain asymmetric cryptographic algorithms, such as, Elliptic Curve Cryptography (ECC).
- PowerQuad hardware accelerator for (fixed and floating point unit) CMSIS DSP functions with support of SDK software API faster execution of ARM CMSIS instruction set.
- On-chip memory:
- Up to 640 KB on-chip flash program memory with flash accelerator and 512 byte page erase and write.
- Up to 320 KB total SRAM consisting of 32 KB SRAM on Code Bus, 272 KB SRAM on System Bus ( 272 KB is contiguous), and additional 16 KB USB SRAM on System Bus which can be used by the USB interface or for general purpose use.
- PRINCE module for real-time encryption of data being written to on-chip flash and decryption of encrypted flash data during read to allow asset protection, such as securing application code, and enabling secure flash update.
- On-chip ROM bootloader supports:

Booting of images from on-chip flash

- Supports CRC32 image integrity checking.
- Supports flash programming through In System Programming (ISP) commands over following interfaces: USB0/1 interfaces using HID Class device, UART interface (Flexcomm 0) with auto baud, SPI slave interfaces (Flexcomm 3 or 9 ) using mode 3 (CPOL = 1 and CPHA $=1$ ), and I2C slave interface (Flexcomm 1)
- ROM API functions: Flash programming API, Power control API, and Secure firmware update API using NXP Secure Boot file format, version 2.0 (SB2 files).
- Supports booting of images from PRINCE encrypted flash regions.
- Support NXP Debug Authentication Protocol version 1.0 (RSA-2048) and 1.1 (RSA-4096).
- Supports setting a sealed part to Fault Analysis mode through Debug authentication.
- Secure Boot support:
- Uses RSASSA-PKCS1-v1_5 signature of SHA256 digest as cryptographic signature verification.
- Supports RSA-2048 bit public keys (2048 bit modulus, 32-bit exponent).
- Supports RSA-4096 bit public keys (4096 bit modulus, 32-bit exponent).
- Uses x509 certificate format to validate image public keys.
- Supports up to four revocable Root of Trust (RoT) or Certificate Authority keys, Root of Trust establishment by storing the SHA-256 hash digest of the hashes of four RoT public keys in protected flash region (PFR).
- Supports anti-rollback feature using image key revocation and supports up to 16 Image key certificates revocations using Serial Number field in x509 certificate.
- Serial interfaces:
- Flexcomm Interface contains up to nine serial peripherals (Flexcomm Interface 0-7 and Flexcomm Interface 8). Each Flexcomm Interface (except flexcomm 8, which is dedicated for high-speed SPI) can be selected by software to be a USART, SPI, $I^{2} \mathrm{C}$, and $I^{2} S$ interface. Each Flexcomm Interface includes a FIFO that supports USART, SPI, and ${ }^{2}$ S. A variety of clocking options are available to each Flexcomm Interface, including a shared fractional baud-rate generator, and time-out feature. Flexcomm interfaces 0 to 7 each provide one channel pair of $I^{2}$ S.
- ${ }^{2}$ C-bus interfaces support Fast-mode and Fast-mode Plus with data rates of up to $1 \mathrm{Mbit} / \mathrm{s}$ and with multiple address recognition and monitor mode. Two sets of true $1^{2} \mathrm{C}$ pads also support high-speed Mode (3.4 Mbit/s) as a slave.
- USB 2.0 full speed host/device controller with on-chip PHY and dedicated DMA controller supporting crystal-less operation in device mode using software library example in technical note (TNOOO63).
- USB 2.0 high-speed host/device controller with on-chip high-speed PHY.
- Digital peripherals:
- DMAO controller with 23 channels and up to 22 programmable triggers, able to access all memories and DMA-capable peripherals.
- DMA1 controller with 10 channels and up to 15 programmable triggers, able to access all memories and DMA-capable peripherals.
- Secured digital input/output (SD/MMC and SDIO) card interface with DMA support. SDIO with support for up to two cards. Supported card types are MMC, SDIO, and CE-ATA. Supports SD2.0, and SDR25 ( 52 MHz ).
- CRC engine block can calculate a CRC on supplied data using one of three standard polynomials with DMA support.
- Up to 64 General-Purpose Input/Output (GPIO) pins.
- GPIO registers are located on the AHB for fast access. The DMA supports GPIO ports.
- Up to eight GPIOs can be selected as pin interrupts (PINT), triggered by rising, falling or both input edges.
- Two GPIO grouped interrupts (GINT) enable an interrupt based on a logical (AND/OR) combination of input states.
- I/O pin configuration with support for up to 16 function options.
- Programmable Logic Unit (PLU) to create small combinatorial and/or sequential logic networks including state machines.
- Security Features:
- ARM TrustZone® enabled.
- AES-256 encryption/decryption engine with keys fed directly from PUF or a software supplied key
- Secure Hash Algorithm (SHA2) module supports secure boot with dedicated DMA controller.
- Physical Unclonable Function (PUF) using dedicated SRAM for silicon fingerprint. PUF can generate, store, and reconstruct key sizes from 64 to 4096 bits. Includes hardware for key extraction.
- True Random Number Generator (TRNG).
- 128 bit unique device serial number for identification (UUID).
- Secure GPIO.
- Timers:
- Five 32-bit standard general purpose asynchronous timers/counters, which support up to four capture inputs and four compare outputs, PWM mode, and external count input. Specific timer events can be selected to generate DMA requests.
- One SCTimer/PWM with 8 input and 10 output functions (including 16 capture and match registers). Inputs and outputs can be routed to or from external pins and internally to or from selected peripherals. Internally, the SCTimer/PWM supports 16 captures/matches, 16 events, and 32 states.
-32-bit Real-time clock (RTC) with 1 s resolution running in the always-on power domain. Another timer in the RTC can be used for wake-up from all low power modes including deep power-down, with 1 ms resolution. The RTC is clocked by the 32 kHz FRO or 32.768 kHz external crystal.
$\bullet$ Multiple-channel multi-rate 24-bit timer (MRT) for repetitive interrupt generation at up to four programmable, fixed rates.
- Windowed Watchdog Timer (WWDT) with FRO 1 MHz as clock source.
- The Micro-Tick Timer running from the watchdog oscillator can be used to wake-up the device from sleep and deep-sleep modes. Includes 4 capture registers with pin inputs.
- 42-bit free running OS Timer as continuous time-base for the system, available in any reduced power modes. It runs on 32 kHz clock source, allowing a count period of more than 4 years.
- Analog peripherals:
- 16-bit ADC with five differential channel pair (or 10 single-ended channels), and with multiple internal and external trigger inputs and sample rates of up to 1.0 MSamples/sec. The ADC supports two independent conversion sequences.
- Integrated temperature sensor connected to the ADC.
- Comparator with five input pins and external or internal reference voltage.
- Clock generation:
- Internal Free Running Oscillator (FRO). This oscillator provides a selectable 96 MHz output, and a 12 MHz output (divided down from the selected higher frequency) that can be used as a system clock. The FRO is trimmed to $+/-2 \%$ accuracy over the entire voltage and temperature range.
- 32 kHz Internal Free Running Oscillator FRO. The FRO is trimmed to $+/-2 \%$ accuracy over the entire voltage and temperature range.
- Internal low power oscillator (FRO 1 MHz ) trimmed to +/- $15 \%$ accuracy over the entire voltage and temperature range.
- Crystal oscillator with an operating frequency of 12 MHz to 32 MHz . Option for external clock input (bypass mode) for clock frequencies of up to 24 MHz .
- Crystal oscillator with 32.768 KHz operating frequency. Option for external clock input (bypass mode) for clock frequencies of up to 100 kHz .
- PLLO and PLL1 allows CPU operation up to the maximum CPU rate without the need for a high-frequency external clock. PLL0 and PLL1 can run from the internal FRO 12 MHz output, the external oscillator, internal FRO 1 MHz output, or the 32.768 KHz RTC oscillator.
- Clock output function with divider to monitor internal clocks.
- Frequency measurement unit for measuring the frequency of any on-chip or off-chip clock signal.
- Each crystal oscillator has one embedded capacitor bank which can be used as an integrated load capacitor. Using APIs, the capacitor banks on each crystal pin can tune the frequency for crystals with a Capacitive Load (CL) which conserves board space and reduces costs.
- Power-saving modes and wake-up:
- Integrated PMU (Power Management Unit) to minimize power consumption.
- Reduced power modes: Sleep, deep-sleep with RAM retention, power-down with RAM retention and CPUO retention, and deep power-down with RAM retention.
- Configurable wake-up options from peripherals interrupts.
- The Micro-Tick Timer running from the watchdog oscillator, and the Real-Time Clock (RTC) running from the 32.768 kHz clock, can be used to wake-up the device from sleep and deep-sleep modes.
- Power-On Reset (POR).
- Brown-Out Detectors (BOD) for VBAT_DCDC for forced reset or interrupt.
- Operating from internal DC-DC converter.
- Single power supply 1.8 V to 3.6 V .
- JTAG boundary scan supported.
- Operating temperature range $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$.
- Available in HLQFP100, HTQFP64, and VFBGA98 packages.

## 3. Ordering information

Table 1. Ordering information

| Type number | Package |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Name | Description | Version |  |
| LPC55S66JBD100 | HLQFP100 | plastic low profile quad flat package; 100 leads; body $14 \times 14 \times 0.5 \mathrm{~mm}$ pitch | SOT1570-3 |  |
| LPC55S69JBD100 | HLQFP100 | plastic low profile quad flat package; 100 leads; body $14 \times 14 \times 0.5 \mathrm{~mm}$ pitch | SOT1570-3 |  |
| LPC55S66JEV98 | VFBGA98 | thin fine-pitch ball grid array package; 98 balls; body $7^{‘} 7^{‘} 0.5 \mathrm{~mm}$ | SOT1982-1 |  |
| LPC55S69JEV98 | VFBGA98 | thin fine-pitch ball grid array package; 98 balls; body $7 \times 7 \times 0.5 \mathrm{~mm}$ | SOT1982-1 |  |
| LPC55S66JBD64 | HTQFP64 | thin fine-pitch ball grid array package; 64 leads; body $10 \times 10 \times 0.5 \mathrm{~mm}$ pitch | SOT855-5 |  |
| LPC55S69JBD64 | HTQFP64 | thin fine-pitch ball grid array package; 64 leads; body $10 \times 10 \times 0.5 \mathrm{~mm}$ pitch | SOT855-5 |  |

[1] Device revision 1B operates at a maximum CPU frequency of up to 150 MHz . Device revision 0A operates at a maximum CPU frequency of up to 100 MHz .

## 4. Marking

The LPC55S6x VFBGA98 package has the following top-side marking:

- First line: LPC55S6x
- Second line: JEV98
- Third line: $x \times x \times x \times x x$
- Fourth line: zzzyywwxR
- yyww: Date code with yy = year and ww = week.
- xR: Device revision 1B

The LPC55S6x HLQFP100 package has the following top-side marking:

- First line: LPC55S6x
- Second line: xxxxxxxx
- Third line: zzzyywwxR
- yyww: Date code with yy = year and ww = week.
- xR: Device revision 0A or Device revision 1B

The LPC55S6x HTQFP64 package has the following top-side marking:

- First line: LPC55S6x
- Second line: JBD64
- Third line: xxxx
- Fourth line: xxxx
- Third line: zzzyywwxR
- yyww: Date code with yy = year and ww = week.
- xR: Device revision 1B

## 5. Block diagram

Fig 3. LPC55S6x Block diagram

## 6. Pinning information

### 6.1 Pin description

Table 4 shows the pin functions available on each pin, and for each package. These functions are selectable using the IOCON control registers.

Some functions, such as ADC or comparator inputs, are available only on specific pins when digital functions are disabled on those pins. By default, the GPIO function is selected except on pins PIO0_11 an PIO0_12, which are the serial wire debug pins. This allows debug to operate through reset.

All pins have all pull-ups, pull-downs, and inputs turned off at reset except PIOO_2, PIO0_5, PIO0_11, PIO0_12, PIO0_13 and PIO0_14 pins. This prevents power loss through pins prior to software configuration. Due to special pin functions, some pins have a different reset configuration. $\mathrm{PIO} \_5$ and $\mathrm{PIO} \_12$ pins have internal pull-up enabled by default, and PIO0_2 and PIO0_11 have internal pull-down enabled by default. PIO0_13 and PIO0_14 are true open drain pins. Refer to pin description table for default reset configuration.

The state of port pin PIOO_5 at Reset determines the boot source of the part or if the handler is invoked.

The external reset pin or 3 wake-up pins can trigger a wake-up from deep power-down mode. For the wake-up pins, do not assign any function to this pin if it will be used as a wake-up input when using deep power-down mode. If not in deep power-down mode, a function can be assigned to this pin. If the pin is used for wake-up, it should be pulled HIGH externally before entering deep power-down mode. A LOW-going pulse as short as 50 ns causes the chip to exit deep power-down mode wakes up the part.

The JTAG functions TRST, TCK, TMS, TDI, and TDO, are selected on pins PIO0_2 to PIO0_6 by hardware when the part is in boundary scan mode. The JTAG functions cannot be used for debug mode.

Table 3. Pin description

| Symbol |  |  |  |  |  | $\stackrel{\otimes}{2}$ |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { PIOO_0/ } \\ & \text { ACMPO_A } \end{aligned}$ | 36 | L12 | 54 | [4] | Z | $\begin{aligned} & \text { I/O } \\ & ; \\ & \text { AI } \end{aligned}$ | 0 | PIOO_O/ACMPO_A — General-purpose digital input/output pin. Comparator 0 , input $A$ if the DIGIMODE bit is set to 0 and ANAMODE is set to 1 in the IOCON register for this pin. |
|  |  |  |  |  |  |  | 1 | R - Reserved. |
|  |  |  |  |  |  | I/O | 2 | FC3_SCK - Flexcomm 3: USART, SPI, or I2S clock. |
|  |  |  |  |  |  | O | 3 | CTIMERO_MATO - 32-bit CTimer0 match output 0. |
|  |  |  |  |  |  | I | 4 | SCTO_GPIO - Pin input 0 to SCTimer/PWM. |
|  |  |  |  |  |  |  | 5 | R - Reserved. |
|  |  |  |  |  |  | I | 6 | SD1_CARD_INT_N - SD/MMC 1 card interrupt. |

| USB1_VBUS | 25 | N8 | 36 | [6][8] |  | I |  | VBUS pin (power on USB cable). |
| USB1_3V3 | 27 | N7 | 38 | [10] | - | - |  | USB1 analog 3.3 V supply. |
| USB1_VSS | 22;26 | N5 | 33; 37 |  | - | - |  | USB1 analog 3.3 V ground. |
| VBAT_DCDC | 32 | N13 | 49, 50 | [9] | - | - |  | Supply of DCDC output stage. DCDC core supply (references and regulation stages). |

Table 3. Pin description ...continued

| Symbol |  |  |  |  |  | $\stackrel{\otimes 口}{2}$ |  | Description |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VBAT_PMU | 33 | M13 | 51 | [9] | - | - |  | Analog supply. |
| VDD | $\begin{aligned} & 8 ; 16 ; \\ & 43 ; 54 \end{aligned}$ | M1; <br> A5; <br> A9; <br> A13 | $\begin{aligned} & 15 ; 25 ; \\ & 44 ; 63 ; \\ & 69 ; 75 ; \\ & 84 ; 95 ; \\ & 100 \end{aligned}$ |  | - | - |  | Single 1.8 V to 3.6 V power supply powers I/Os. |
| VDD_PMU | 28 | M9 | 39 |  | - | - |  | Core supply. For applications with DCDC converter, VDD_PMU and FB are tied at PCB level. |
| VDDA | 9 | G2 | 16 |  | - | - |  | Analog supply voltage. At PCB level, has to be tied to main supply (VBAT_PMU, VBAT_DCDC) |
| VREFN | - | H1 | 18 |  | - | - |  | ADC negative reference voltage. |
| VREFP | 10 | G1 | 17 |  | - | - |  | ADC positive reference voltage. |
| VSS | exposed pad | N1; B5; B9; <br> B13 | exposed pad |  | - | - |  | Ground. |
| VSS_DCDC | 30 | N12, M12 | 46, 47 |  | - | - |  | Star ground connection is managed to PCB ground plane. |
| VSS_PMU | - | M11 | - |  | - | - |  | Star ground connection is managed to PCB ground plane. |
| VSSA | 11 | H2 | 19 |  | - | - |  | Analog ground. |
| XTAL32K_N | 35 | J12 | 53 |  | - | - |  | RTC oscillator output. |
| XTAL32K_P | 34 | J13 | 52 |  | - | - |  | RTC oscillator input. |
| XTAL32M_N | 19 | M3 | 28 | [7] | - | - |  | Main oscillator output. |
| XTAL32M_P | 20 | N3 | 29 | [7] | - | - |  | Main oscillator input. |

[1] $\mathrm{PU}=$ input mode, pull-up enabled (pull-up resistor pulls pin up towards $\mathrm{V}_{\mathrm{DD}}$ ). $\mathrm{PD}=$ input mode, pull-down enabled (pull-down resistor pulls pin down towards $V_{S S}$ ). $Z=$ high impedance; pull-up, pull-down, and input disabled. $\mathrm{AI}=$ analog input. $\mathrm{I}=\mathrm{input} . \mathrm{O}=0$ output. $\mathrm{I} / \mathrm{O}=$ input/output. Reset state reflects the pin state at reset without boot code operation. For termination on unused pins, see Section 6.1 .1 "Termination of unused pins".
[2] Pad with programmable glitch filter; provides digital I/O functions with TTL levels and hysteresis; normal drive strength. Pulse width of spikes or glitches suppressed by input filter is from 3 ns to 16 ns (simulated value).
[3] True open-drain pin. I2C-bus pins compliant with the I2C-bus specification for I2C standard mode, I2C Fast-mode, and I2C Fast-mode Plus. The pin requires an external pull-up to provide output functionality. When power is switched off, this pin is floating and does not disturb the I2C lines. Open-drain configuration applies to all functions on this pin.
[4] Pin providing standard digital I/O functions with configurable modes, configurable hysteresis, and analog input. When configured as an analog input, the digital section of the pin is disabled.
[5] Reset pad with glitch filter and hysteresis. Pulse width of spikes or glitches suppressed by input filter is from 3 ns to 20 ns (simulated value)
[6] Transparent analog pad.
[7] Optional bypass mode is supported, xtal32M_P can be driven by an external clock with restrictions in terms of drive level.
[8] The corresponding VBUS must be connected to supply voltage when using the USB peripheral. VBUS is 5V tolerant.
[9] Main battery supply: Star connection at application level (PCB).
[10] If the USB1_3V3 pin is not using the same supply as the VBAT_PMU pin, the application should ensure the supply on USB1_3V3 does not drop below 2.8 V . If the USB1_3V3 pin is using separate supply and this voltage unexpectedly drops below 2.8 V , the USB PHY can go into unknown state causing USB transactions (R/W) to hang. In this case, the application can detect this event with a time-out and would have to recover by performing a USB reset.

### 6.1.1 Termination of unused pins

Table 4 shows how to terminate pins that are not used in the application. In many cases, unused pins should be connected externally or configured correctly by software to minimize the overall power consumption of the part.

Unused pins with GPIO function should be configured as outputs set to LOW with their internal pull-up disabled. To configure a GPIO pin as output and drive it LOW, select the GPIO function in the IOCON register, select output in the GPIO DIR register, and write a 0 to the GPIO PORT register for that pin. Disable the pull-up in the pin's IOCON register.

In addition, it is recommended to configure all GPIO pins that are not bonded out on smaller packages as outputs driven LOW with their internal pull-up disabled.

Table 4. Termination of unused pins

| Pin | Default <br> state[1] | Recommended termination of unused pins |
| :--- | :--- | :--- |
| RESET | I; PU | The RESET pin can be left unconnected if the application does not use it. |
| all PIOn_m (not open-drain) | I; PU | Can be left unconnected if driven LOW and configured as GPIO output with pull-up <br> or pull-down disabled by software. |
| PIOn_m (I2C open-drain) | IA | Can be left unconnected if driven LOW and configured as GPIO output by software. |
| XTAL32K_P | - | Connect to ground. When grounded, the RTC oscillator is disabled. |
| XTAL32K_N | - | Can be left unconnected. |
| XTAL32M_P | - | Connect to ground. When grounded, the RTC oscillator is disabled. |
| XTAL32M_N | - | Can be left unconnected. |
| VREFP | - | Tie to VBAT_DCDC. |
| VREFN | - | Tie to VSS. |
| VDDA | - | Tie to VBAT_DCDC. |
| VSSA | F | Can be left unconnected. |
| USBn_DP | F | Can be left unconnected. |
| USBn_DM | F | Tie to VBAT_DCDC. |
| USBn_3V3 | F | Tie to VBAT_DCDC. |
| USB1_VBUS | F | Tie to VSS. |
| USBn_VSS |  |  |

[1] I = Input, IA = Inactive (no pull-up/pull-down enabled), PU = Pull-Up enabled

### 6.1.2 Using Internal DC-DC converter

Fig 4. Using internal DC-DC converter

## 7. Functional description

### 7.1 Architectural overview

The Arm Cortex M33 includes two AHB-Lite buses, one system bus and one code and bus. The Code AHB (C-AHB) interface is used for any instruction fetch and data access to the Code region of the ARMv8-M memory map ([0x00000000-0x1FFFFFFF]). The System AHB (S-AHB) interface is used for instruction fetch and data access to all other regions of the ARMv8-M memory map ([0x20000000-0xFFFFFFFF]).

The LPC55S6x uses a multi-layer AHB matrix to connect the ARM Cortex-M33 buses and other bus masters to peripherals in a flexible manner that optimizes performance by allowing peripherals that are on different slave ports of the matrix to be accessed simultaneously by different bus masters. Figure 3 "LPC55S6x Block diagram" shows details of the available matrix connections.

### 7.2 Arm Cortex-M33 processor (CPU0)

The ARM Cortex-M33 is based on the ARMv8-M architecture that offers systems enhancements, such as ARM TrustZone ${ }^{\circledR}$ security, single-cycle digital signal processing, low power consumption, enhanced debug features, and a high level of support block integration. The ARM Cortex-M33 CPU employs a 7-stage instruction pipe and includes an internal prefetch unit that supports speculative branching. A hardware floating-point processor is integrated into the core. On the LPC55S6x, the Cortex-M33 is augmented with two hardware co-processors providing accelerated support for additional DSP algorithms and cryptography.

The Arm Cortex M33 provides a security foundation, offering isolation to protect valuable IP and data with TrustZone technology. It simplifies the design and software development of digital signal control systems with the integrated digital signal processing (DSP) instructions.

### 7.3 Arm Cortex-M33 integrated Floating Point Unit (FPU)

The FPU fully supports single-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations. It also provides conversions between fixed-point and floating-point data formats, and floating-point constant instructions.

The FPU provides floating-point computation functionality that is compliant with the ANSI/IEEE Std 754-2008, IEEE Standard for Binary Floating-Point Arithmetic, referred to as the IEEE 754 standard.

### 7.4 Arm Cortex-M33 (CPU1)

The LPC55S6x device includes a second instance of Cortex-M33. The configuration of this instance does not include MPU, FPU, DSP, ETM, Trustzone (SECEXT), Secure Attribution Unit (SAU) or co-processor interface. It supports the same debug levels and interrupt lines as the primary CPU.

### 7.5 Memory Protection Unit (MPU)

The Cortex-M33 includes a Memory Protection Unit (MPU) which can be used to improve the reliability of an embedded system by protecting critical data within the user application.

The MPU allows separating processing tasks by disallowing access to each other's data, disabling access to memory regions, allowing memory regions to be defined as read-only and detecting unexpected memory accesses that could potentially break the system.

The MPU separates the memory into distinct regions and implements protection by preventing disallowed accesses. The MPU supports up to eight regions each of which can be divided into eight subregions. Accesses to memory locations that are not defined in the MPU regions, or not permitted by the region setting, will cause the Memory Management Fault exception to take place.

### 7.6 Nested Vectored Interrupt Controller (NVIC) for Cortex-M33 (CPU0)

The NVIC is an integral part of the Cortex-M33. The tight coupling to the CPU allows for low interrupt latency and efficient processing of late arriving interrupts.

### 7.6.1 Features

- Controls system exceptions and peripheral interrupts.
- 60 vectored interrupts.
- Eight programmable interrupt priority levels, with hardware priority level masking.
- Relocatable vector table using Vector Table Offset Register (VTOR).
- Non-Maskable Interrupt (NMI).
- Software interrupt generation.

### 7.6.2 Interrupt sources

Each peripheral device has one interrupt line connected to the NVIC but may have several interrupt flags.

### 7.7 Nested Vectored Interrupt Controller (NVIC) for Cortex-M33 (CPU1)

 The NVIC is an integral part of the Cortex-M33. The tight coupling to the CPU allows for low interrupt latency and efficient processing of late arriving interrupts.
### 7.7.1 Features

- Controls system exceptions and peripheral interrupts.
- 60 vectored interrupts.
- Four programmable interrupt priority levels, with hardware priority level masking.
- Relocatable vector table using VTOR.
- Non-Maskable Interrupt (NMI).
- Software interrupt generation.

### 7.7.2 Interrupt sources

Each peripheral device has one interrupt line connected to the NVIC but may have several interrupt flags.

### 7.8 System Tick timer (SysTick)

The ARM Cortex-M33 core include a system tick timer (SysTick) that is intended to generate a dedicated SYSTICK exception. The clock source for the SysTick can be the system clock or the SYSTICK clock.

### 7.9 On-chip static RAM

The LPC55S6x support up to 320 KB SRAM with separate bus master access for higher throughput and individual power control for low-power operation.

### 7.10 On-chip flash

The LPC55S6x supports up to 640 kB of on-chip flash memory. The last 17 pages ( 10 KB ) are reserved on the 640 KB flash devices resulting in 630 KB internal flash memory.

### 7.11 On-chip ROM

The on-chip ROM contains the bootloader and the following features:

- Booting of images from on-chip flash.
- Supports CRC32 image integrity checking.
- Supports flash programming through In System Programming (ISP) commands over following interfaces: USB0/1 interfaces using HID Class device, UART interface (Flexcomm 0) with auto baud, SPI slave interfaces (Flexcomm 3 or 9 ) using mode 3 (CPOL = 1 and CPHA = 1), and I2C slave interface (Flexcomm 1)
- ROM API functions: Flash programming API, Power control API, and Secure firmware update API using NXP Secure Boot file format, version 2.0 (SB2 files).
- Supports booting of images from PRINCE encrypted flash region.
- Supports NXP Debug Authentication Protocol version 1.0 (RSA-2048) and 1.1 (RSA-4096)
- Supports setting a sealed part to Fault Analysis mode through Debug authentication.

The on-chip ROM supports the following secure boot features:

- Uses RSASSA-PKCS1-v1_5 signature of SHA256 digest as cryptographic signature verification
- Supports RSA-2048 bit public keys (2048 bit modulus, 32-bit exponent)
- Supports RSA-4096 bit public keys (4096 bit modulus, 32-bit exponent)
- Uses x509 certificate format to validate image public keys
- Supports up to four revocable Root of Trust (or Certificate Authority) keys, Root of Trust (RoT) establishment by storing the SHA-256 hash digest of the hashes of four RoT public keys in protected flash region (PFR)
- Supports anti-rollback feature using image key revocation and supports up to 16 Image key certificates revocations using Serial Number field in x509 certificate.

### 7.12 Protected Flash Region (PFR)

The protected flash region is available to configure secure boot, debug authentication, read UUID, store PUF in key store area, and user defined fields available for specific data storage.

### 7.13 Memory mapping

### 7.14 AHB multilayer matrix

The LPC55S6x uses a multi-layer AHB matrix to connect the CPU buses and other bus masters to peripherals in a flexible manner that optimizes performance by allowing peripherals that are on different slave ports of the matrix to be accessed simultaneously by different bus masters. The device block diagram in Figure 3 shows details of the available matrix connections.

### 7.15 Memory Protection Unit (MPU)

CPU0 has a memory protection unit (MPU) that provides fine grain memory control, enabling applications to implement security privilege levels, separating code, data and stack on a task-by-task basis. Such requirements are critical in many embedded applications.

The MPU register interface is located on the CPU private peripheral bus and is described in detail in Ref 1 "Cortex-M33 DEBUG"

### 7.16 TrustZone and system mapping on this device

The implementation of ARM TrustZone for CPU0 involves using address bit 28 to divide the address space into potential secure and non-secure regions. Address bit 28 is not decoded in memory access hardware, so each physical location appears in two places on whatever bus they are located on. Other hardware determines which kinds of accesses (including non-secure callable) are actually allowed for any particular address.

Table 5 shows the overall mapping of the code and data buses for secure and non-secure accesses to various device resources.

Remark: Address regions considered secure by TrustZone may also be accessible to CPU1 if it is assigned as a secure master and marked as secure by checker hardware.

Remark: In the peripheral description chapters of this manual, only the native (non-secure) base address is noted, secure base addresses can be found in this chapter or created by setting bit 28 in the address as needed.

Table 5. TrustZone and system general mapping

| Start address | End address | TrustZone, CPU0 only | CPU bus | CM-33 usage (both CPUs) |
| :--- | :--- | :--- | :--- | :--- |
| $0 \times 00000000$ | $0 \times 0 F F F$ FFFF | Non-secure | Code | Flash memory, Boot ROM, SRAM X. |
| $0 \times 10000000$ | $0 \times 1 F F F$ FFFF | Secure | Code | Same as above. |
| $0 \times 20000000$ | $0 \times 2 F F F$ FFFF | Non-secure | Data | SRAM 0, SRAM 1, SRAM 2, SRAM 3, SRAM 4. |
| $0 \times 30000000$ | $0 \times 3 F F F ~ F F F F$ | Secure | Data | Same as above. |
| $0 \times 40000000$ | $0 \times 4 F F F ~ F F F F$ | Non-secure | Data | AHB and APB peripherals. |
| $0 \times 50000000$ | $0 \times 5 F F F ~ F F F F$ | Secure | Data | Same as above. |

[1] The size shown for peripherals spaces indicates the space allocated in the memory map, not the actual space used by the peripheral or memory.
[2] Selected areas of secure regions may be marked as non-secure callable.

### 7.17 Links to specific memory map descriptions and tables:

- Section 7.18 "Memory map overview"
- Section 7.19 "APB peripherals"
- Section 7.20 "AHB peripherals"

### 7.18 Memory map overview

Table 6 gives a more detailed memory map as seen by the 2 Cortex-M33 (both CPU0 and $\overline{\text { CPU1). The purpose of the four address spaces for the shared RAMs is outlined at the }}$ beginning of this chapter. The details of which shared RAM regions are on which AHB matrix slave ports can be seen here.

Table 6. Memory map overview

| AHB port | Non-secure start address | Non-secure end address | Secure start address | Secure end address | Function [1] |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0x0000 0000 | 0x0009 FFFF | 0x1000 0000 | 0x1009 FFFF | Flash memory, on CM33 code bus. The last 17 pages ( 10 KB ) are reserved on the 640 KB flash devices resulting in 630 KB internal flash memory. |
|  | 0x0300 0000 | 0x0301 FFFF | 0x1300 0000 | 0x1301 FFFF | Boot ROM, on CM33 code bus. |
| 1 | 0x0400 0000 | 0x0400 7FFF | 0x1400 0000 | 0x1400 7FFF | SRAM X on CM33 code bus, 32 KB. SRAMX_0 ( $0 \times 14000000$ to $0 \times 1400$ 0FFF) and SRAMX_1 ( $0 \times 14004000$ to $0 \times 1400$ 4FFF) are used for Casper (total 8 KB ). If CPU retention used in power-down mode, SRAMX_2 ( $0 \times 14006000$ to $0 \times 1400$ 65FF) is used (total 1.5 KB ) by default in power API and this is user configurable within SRAMX_2 and SRAMX_3. |
| 2 | 0x2000 0000 | 0x2000 FFFF | $0 \times 30000000$ | 0x3000 FFFF | SRAM 0 on CM33 data bus, 64 KB . |
| 3 | 0x2001 0000 | 0x2001 FFFF | 0x3001 0000 | 0x3001 FFFF | SRAM 1 on CM33 data bus, 64 KB . |
| 4 | 0x2002 0000 | 0x2002 FFFF | 0x3002 0000 | 0x3002 FFFF | SRAM 2 on CM33 data bus, 64 KB . |
| 5 | 0x2003 0000 | 0x2003 FFFF | 0x3003 0000 | 0x3003 FFFF | SRAM 3 on CM33 data bus, 64 KB . |
| 6 | 0x2004 0000 | 0x2004 3FFF | 0x3004 0000 | 0x3004 3FFF | SRAM 4 on CM33 data bus, 16 KB . Entire SRAM 4 is used by PowerQuad when PowerQuad is enabled. |
| 7 | 0x4000 0000 | 0x4001 FFFF | 0x5000 0000 | 0x5001 FFFF | AHB to APB bridge 0. See Section 7.19. |
|  | 0x4002 0000 | 0x4003 FFFF | 0x5002 0000 | 0x5003 FFFF | AHB to APB bridge 1. See Section 7.19. |
| 8 | 0x4008 0000 | 0x4008 FFFF | $0 \times 50080000$ | 0x5008 FFFF | AHB peripherals. See Section 7.20. |
| 9 | 0x4009 0000 | 0x4009 FFFF | 0x5009 0000 | 0x5009 FFFF | AHB peripherals. See Section 7.20. |
| 10 | 0x400A 0000 | 0x400A FFFF | 0x500A 0000 | 0x500A FFFF | AHB peripherals. See Section 7.20. |
| 11 | 0x4010 0000 | 0x4010 FFFF | 0x5010 0000 | 0x5010 FFFF | AHB peripherals. See Section 7.20. |

[1] Gaps between AHB matrix slave ports are not shown.

### 7.19 APB peripherals

Table 7 provides details of the addresses for APB peripherals. APB peripherals have both secure and non-secure access possibilities.

Table 7. APB peripherals memory map

| APB bridge | Non-secure base address | Secure base address | Peripheral |
| :---: | :---: | :---: | :---: |
| 0 | 0x4000 0000 | 0x5000 0000 | Syscon. |
|  | 0x4000 1000 | 0x5000 1000 | IOCON. Pin function selection and pin control setup. |
|  | 0x4000 2000 | 0x5000 2000 | Group GPIO input interrupt 0 (GINTO) |
|  | 0x4000 3000 | 0x5000 3000 | Group GPIO input interrupt 1 (GINT1) |
|  | 0x4000 4000 | 0x5000 4000 | Pin interrupt and pattern match (PINT) |
|  | 0x4000 5000 | 0x5000 5000 | Secure pin interrupt and pattern match. |
|  | 0x4000 6000 | 0x5000 6000 | Input multiplexing 0 and frequency measure. |
|  | 0x4000 7000 | 0x5000 7000 | Reserved. |
|  | 0x4000 8000 | 0x5000 8000 | CT32B0 (standard counter/timer 0). |
|  | 0x4000 9000 | 0x5000 9000 | CT32B1 (standard counter/timer 1). |
|  | 0x4000 C000 | 0x5000 C000 | WWDT0 (windowed watchdog timer 0). |
|  | 0x4000 D000 | 0x5000 D000 | MRT (Multi-Rate Timer). |
|  | 0x4000 E000 | 0x5000 E000 | Utick (micro-tick timer). |
|  | 0x4001 0000 | 0x5001 0000 | ACMP0 (analog comparator). |
|  | 0x4001 3000 | 0x5001 3000 | Analog controls. |
|  | 0x4001 5000 | 0x5001 5000 | Reserved. |
| 1 | 0x4002 3000 | 0x5002 3000 | Sysctl (I2S signal sharing) |
|  | 0x4002 8000 | 0x5002 8000 | CT32B2 (standard counter/timer 2). |
|  | 0x4002 9000 | 0x5002 9000 | CT32B3 (standard counter/timer 3). |
|  | 0x4002 A000 | 0x5002 A000 | CT32B4 (standard counter/timer 4). |
|  | 0x4002 C000 | 0x5002 C000 | RTC \& Wake-up timer. |
|  | 0x4002 D000 | 0x5002 D000 | OS_Event Timer. |
|  | 0x4003 4000 | 0x5003 4000 | Flash controller. |
|  | 0x4003 5000 | $0 \times 50035000$ | PRINCE dynamic encrypt/decrypt |
|  | 0x4003 8000 | 0x5003 8000 | USB HS Phy. |
|  | 0x4003 A000 | 0x5003 A000 | True Random Number Generator. |
|  | 0x4003 B000 | 0x5003 B000 | PUF (Physical Unclonable Function). |
|  | 0x4003 D000 | 0x5003 D000 | PLU (Programmable Logic Unit). |

### 7.20 AHB peripherals

Table 8 provides details of the addresses for AHB peripherals. AHB peripherals have both secure and non-secure access possibilities.

Table 8. AHB peripheral memory map

| AHB port | Non-secure base address | Secure base address | Peripheral |
| :---: | :---: | :---: | :---: |
| 8 | 0x4008 2000 | 0x5008 2000 | DMA0 registers. |

### 7.21 RAM configuration

Table 9 describes the RAM configuration for the LPC55S6x.
Table 9. RAM Configuration

| RAM Total | RAM-X (KB) | RAM0 (KB) | RAM1 (KB) | RAM2 (KB) | RAM3 (KB) | RAM4 (KB) | USB-RAM (KB) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 320 KB <br> devices | 32 | 64 | 64 | 64 | 64 | 16 | 16 |
| 256 KB <br> devices | 32 | 64 | 64 | 64 | - | 16 | 16 |
| 144 KB <br> devices | 32 | 64 | 32 | - | - | - | 16 |

### 7.22 System control

### 7.22.1 Clock sources

The LPC55S6x supports 2 external and 3 internal clock sources:

- Internal Free Running Oscillator (FRO). This oscillator provides a selectable 96 MHz output, and a 12 MHz output (divided down from the selected higher frequency) that can be used as a system clock. The FRO is trimmed to +/- $2 \%$ accuracy over the entire voltage and temperature range. The FRO 12 MHz oscillator provides the default clock at reset and provides a clean system clock shortly after the supply pins reach operating voltage.
- 32 kHz Internal Free Running Oscillator FRO. The FRO is trimmed to +/- $2 \%$ accuracy over the entire voltage and temperature range.
Internal low power oscillator (FRO 1 MHz ). The FRO is trimmed to +/- $15 \%$ accuracy over the entire voltage and temperature range.
- Crystal oscillator with an operating frequency of 1 MHz to 32 MHz . Option for external clock input (bypass mode) for clock frequencies of up to 24 MHz
- Crystal oscillator with 32.768 KHz operating frequency. Option for external clock input (bypass mode) for clock frequencies of up to 100 kHz
- Each crystal oscillator has one embedded capacitor bank which can be used as an integrated load capacitor. Using APIs, the capacitor banks on each crystal pin can tune the frequency for crystals with a Capacitive Load (CL) which conserves board space and reduces costs.

### 7.22.2 PLL (PLL0 and PLL1)

PLLO and PLL1 allows CPU operation up to the maximum CPU rate without the need for a high-frequency external clock. PLLO and PLL1 can run from the internal FRO 12 MHz output, the external oscillator, internal FRO 1 MHz output, or the 32.768 KHz RTC oscillator.

The system PLL accepts an input clock frequency in the range of $2 \mathrm{kHz}-150 \mathrm{MHz}$. The input frequency is multiplied up to a high frequency with a Current Controlled Oscillator (CCO). The PLL can be enabled or disabled by software.

### 7.22.3 Clock generation

The system control block facilitates the clock generation. Many clocking variations are possible. Figure 5 gives an overview of potential clock options. Table 10 describes signals on the clocking diagram. The maximum clock frequency is 150 MHz .

Remark: The indicated clock multiplexers shown in Figure 5 are synchronized. In order to operate, the currently selected clock must be running, and the clock to be switched to must also be running. This is so that the multiplexer can gracefully switch between the two clocks without glitches. Other clock multiplexers are not synchronized. The output divider can be stopped and restarted gracefully during switching if a glitch-free output is needed.

The low-power oscillator provides a frequency in the range of 1 MHz . The accuracy of this clock is limited to +/- 15\% over temperature, voltage, and silicon processing variations after trimming made during assembly. To determine the actual watchdog oscillator output, use the frequency measure block.

The part contains one system PLL that can be configured to use a number of clock inputs and produce an output clock in the range of 1.2 MHz up to the maximum chip frequency, and can be used to run most on-chip functions. The output of the PLL can be monitored through the CLKOUT pin.

Table 10. Clocking diagram signal name descriptions

| Name | Description |
| :--- | :--- |
| 32k_osc | The 32 kHz output of the RTC oscillator. The 32 kHz clock must be enabled in the RTCOSCCTRL register. |
| clk_in | This is the internal clock that comes from the external oscillator. |
| frg_clk | The output of each Fractional Rate Generator to Flexcomm clock. Each FRG and its source selection is shown in <br> Figure 5. |
| fro_12m | 12 MHz divided down from the currently selected on-chip FRO oscillator. |
| fro_hf | The currently selected FRO high speed output at 96 MHz. |
| main_clk | The main clock used by the CPU and AHB bus, and potentially many others. The main clock and its source <br> selection are shown in Figure 5. |
| mclk_in | The MCLK input function, when it is connected to a pin by selecting it in the IOCON block. |
| pll0_clk | The output of the PLL0. The PLLO and its source selection is shown in Figure 5. |
| pll__clk | The output of the PLL1. The PLL1 and its source selection is shown in Figure 5. |
| fro_1m | The output of the low power oscillator. |
| "none" | A tied-off source that should be selected to save power when the output of the related multiplexer is not used. |

Fig 6. Clock generation (Part 2 of 2)

### 7.22.4 Brownout detection

The LPC55S6x includes one Brown-out detector to monitor the voltage of VBAT. If the voltage falls below one of the selected voltages, the BOD asserts an interrupt to the NVIC or issues a reset.

### 7.23 Power control

The LPC55S6x support a variety of power control features. In Active mode, when the chip is running, power and clocks to selected peripherals can be adjusted for power consumption. In addition, there are four special modes of processor power reduction with different peripherals running: sleep mode, deep-sleep mode, power-down mode, and deep power-down mode which can be activated by the power mode configure API.

### 7.23.1 Sleep mode

In sleep mode, the system clock to both CPUs (CPU0 and CPU1) are stopped and execution of instructions is suspended until either a reset or interrupt occurs. Peripheral functions, if selected to be clocked can continue operation during sleep mode and may generate interrupts to cause the processor to resume execution. Sleep mode eliminates dynamic power used by the processor itself, memory systems and related controllers, internal buses, and unused peripherals.

### 7.23.2 Deep-sleep mode

In deep-sleep mode, the flash is powered down. The system clock to both CPUs (CPU0 and CPU1) are stopped and if not configured, the peripherals receives no clocks. Through the power profiles API, selected peripherals such as USB0, USB1, Flexcomm interfaces 0 to 7 (SPI, I2C, USART, I2S), Flexcomm interface 10 (High Speed SPI), Micro-tick, WWDT, RTC, OSTimer, Standard Timers, comparator, and BOD can be left running in deep-sleep mode. Clock sources such as FRO12 MHz, FRO 32 KHz , FRO 1 MHz , the 32.768 kHz RTC clock, and the external oscillator can be enabled or disabled via software.

The LPC55S6x can wake up from deep-sleep mode via a reset, digital pins selected as inputs to the pin interrupt block and group interrupt block, OS Timer, Standard Timers, Micro-tick, RTC alarm, a watchdog timer interrupt/reset, BOD interrupt/reset, an interrupt from the USB0, USB1, SPI, I2C, I2S, USART, comparator, and PLU. Some peripherals can have DMA service during deep-sleep mode without waking up entire device.

In deep-sleep mode, all SRAM, logic state, and registers maintain their internal states. All SRAM instances that are not configured to enter in 'retention state' will stay in active state. Deep-sleep mode allows for very low quiescent power and fast wake-up options.

### 7.23.3 Power-down mode

In power-down mode, nearly all on-chip power consumption is turned off by shutting down the internal DC-DC converter. The flash is powered down. The system clock to both CPUs (CPU0 and CPU1) are stopped and if not configured, the peripherals receives no clocks. Through the power profiles API, selected peripherals such as Flexcomm interfaces 3 (SPI, I2C, USART, I2S), RTC, OS Timer, and comparator can be left running in power-down mode. Clock sources such as FRO 32 KHz , and the 32.768 kHz RTC clock can be enabled or disabled via software.

The LPC55S6x can wake up from power-down mode via a reset, digital pins selected as inputs to the group interrupt block, OS Timer, RTC alarm, an interrupt from the Flexcomm Interface 3 (SPI, I2C, I2S, USART), and comparator.

In power-down mode, the CPUO processor state is retained to allow resumption of code execution when a wake-up event occurs.

All SRAM, logic state, and registers maintain their internal states. All SRAM instances that are not configured to enter in 'retention state' will stay in active state.

### 7.23.4 Deep power-down mode

In deep power-down mode, power is shut off to the entire chip except for the RTC power domain, the RESET pin, 4 Wake-up pins, and the OT Timer if enabled. Clock sources such as FRO 32 KHz , and the 32.768 kHz RTC clock can be enabled or disabled via software. The LPC55S6x can wake up from deep power-down mode via the RESET pin, the RTC alarm, four special wake-up pins, or without an external signal, by using the time-out of the OS Timer. The ALARM1HZ flag in RTC control register generates an RTC wake-up interrupt request, which can wake up the part. SRAM can maintain their internal states. All SRAM instances that are not configured to enter in 'retention state' will stay in active state. In deep power-down mode all functional pins are in tri-state.

### 7.24 General Purpose I/O (GPIO)

The LPC55S6x provide GPIO ports 0 and 1 with a total of 64 GPIO pins.
Device pins that are not connected to a specific peripheral function are controlled by the GPIO registers. Pins may be dynamically configured as inputs or outputs. Separate registers allow setting or clearing any number of outputs simultaneously. The current level of a port pin can be read back no matter what peripheral is selected for that pin.

See Table 3 "Pin description" for the default state on reset.

### 7.24.1 Features

- Accelerated GPIO functions:
- GPIO registers are located on the AHB so that the fastest possible I/O timing can be achieved.
- Mask registers allow treating sets of port bits as a group, leaving other bits unchanged.
- All GPIO registers are byte and half-word addressable.
- Entire port value can be written in one instruction.
- Bit-level set, clear, and toggle registers allow a single instruction set, clear or toggle of any number of bits in one port.
- Direction control of individual bits.
- All I/O default to inputs after reset.
- All GPIO pins can be selected to create an edge or level-sensitive GPIO interrupt request.
- Two GPIO group interrupts can be triggered by a combination of any pin or pins to reflect two distinct interrupt patterns.
- The grouped interrupts can wake up the part from sleep, deep-sleep, and power-down modes.

### 7.25 Pin interrupt/pattern engine

The pin interrupt block configures up to eight pins from all digital pins for providing eight external interrupts connected to the NVIC. The pattern match engine can be used in conjunction with software to create complex state machines based on pin inputs. Any digital pin, independent of the function selected through the switch matrix can be configured through the SYSCON block as an input to the pin interrupt or pattern match engine. The registers that control the pin interrupt or pattern match engine are located on the I/O+ bus for fast single-cycle access.

### 7.25.1 Features

- Pin interrupts:
- Up to eight pins can be selected from all GPIO pins on ports 0 and 1 as edge-sensitive or level-sensitive interrupt requests. Each request creates a separate interrupt in the NVIC.
- Edge-sensitive interrupt pins can interrupt on rising or falling edges or both.
- Level-sensitive interrupt pins can be HIGH-active or LOW-active.
- Level-sensitive interrupt pins can be HIGH-active or LOW-active.
- Pin interrupts can wake up the device from sleep mode, and deep-sleep mode.
- Pattern match engine:
- Up to eight pins can be selected from all digital pins on ports 0 and 1 to contribute to a boolean expression. The boolean expression consists of specified levels and/or transitions on various combinations of these pins.
- Each bit slice minterm (product term) comprising of the specified boolean expression can generate its own, dedicated interrupt request.
- Any occurrence of a pattern match can also be programmed to generate an RXEV notification to the CPU. The RXEV signal can be connected to a pin.
- Pattern match can be used in conjunction with software to create complex state machines based on pin inputs.
- Pattern match engine facilities wake-up only from active and sleep modes.

### 7.26 Communication peripherals

### 7.26.1 Full-speed USB Host/Device Interface (USB0)

The USB is a 4-wire bus that supports communication between a host and one or more (up to 127) peripherals. The host controller allocates the USB bandwidth to attached devices through a token-based protocol. The bus supports hot plugging and dynamic configuration of the devices. All transactions are initiated by the host controller.

### 7.26.1.1 USBO device controller

The device controller enables $12 \mathrm{Mbit} / \mathrm{s}$ data exchange with a USB host controller. It consists of a register interface, serial interface engine, endpoint buffer memory. The serial interface engine decodes the USB data stream and writes data to the appropriate endpoint buffer. The status of a completed USB transfer or error condition is indicated via status registers. An interrupt is also generated if enabled.

## Features

- USB2.0 full-speed device controller supporting crystal-less operation in device mode using software library example in technical note (TN00063).
- Supports ten physical (five logical) endpoints including one control endpoint.
- Single and double-buffering supported.
- Each non-control endpoint supports bulk, interrupt, or isochronous endpoint types.
- Supports wake-up from Deep-sleep mode on USB activity and remote wake-up.
- Supports SoftConnect.
- Link Power Management (LPM) supported.

### 7.26.1.2 USBO host controller

The host controller enables full- and low-speed data exchange with USB devices attached to the bus. It consists of register interface, serial interface engine and DMA controller. The register interface complies with the Open Host Controller Interface $(\mathrm{OHCl})$ specification.

Features

- OHCl compliant.
- Two downstream ports.

### 7.26.2 High-Speed USB Host/Device Interface (USB1)

The Universal Serial Bus (USB) is a 4-wire bus that supports communication between a host and one or more (up to 127) peripherals. The host controller allocates the USB bandwidth to attached devices through a token-based protocol. The bus supports hot plugging and dynamic configuration of the devices. All transactions are initiated by the host controller.

### 7.26.2.1 USB1 device controller

The device controller enables $480 \mathrm{Mbit} / \mathrm{s}$ data exchange with a USB host controller. It consists of a register interface, serial interface engine, endpoint buffer memory. The serial interface engine decodes the USB data stream and writes data to the appropriate endpoint buffer. The status of a completed USB transfer or error condition is indicated via status registers. An interrupt is also generated if enabled.

## Features

- Fully compliant with USB 2.0 Specification (high speed).
- Supports 8 physical (16 logical) endpoints with up to 8 kB endpoint buffer RAM.
- Supports Control, Bulk, Interrupt and Isochronous endpoints.
- Scalable realization of endpoints at run time.
- Endpoint Maximum packet size selection (up to USB maximum specification) by software at run time.
- While USB is in the Suspend mode, the LPC55S6x can enter deep-sleep mode and wake up on USB activity.
- Double buffer implementation for Bulk and Isochronous endpoints

### 7.26.2.2 USB1 host controller

The host controller enables high speed data exchange with USB devices attached to the bus. It consists of register interface and serial interface engine. The register interface complies with the Enhanced Host Controller Interface (EHCl) specification

Features

- EHCI compliant.
- Two downstream ports.
- Supports per-port power switching.

### 7.26.3 Flexcomm Interface serial communication

Each Flexcomm Interface provides a choice of peripheral functions, one of which must be chosen by the user before the function can be configured and used.

### 7.26.3.1 Features

- USART with asynchronous operation or synchronous master or slave operation.
- SPI master or slave with up to 4 slave selects.
- $I^{2} \mathrm{C}$, including separate master, slave, and monitor functions.
- Flexcomm interfaces 0 to 7 each provide one channel pair of $\mathrm{I}^{2} \mathrm{~S}$.
- Data for USART, SPI, and I2S traffic uses the Flexcomm FIFO. The $\mathrm{I}^{2} \mathrm{C}$ function does not use the FIFO.

### 7.26.3.2 SPI serial I/O (SPIO) controller

## Features

- Maximum supported bit rate for SPI master mode (transmit/receive) is $50 \mathrm{Mbit} / \mathrm{s}$. The maximum supported bit rate for SPI slave receive mode is $25 \mathrm{Mbit} / \mathrm{s}$ and for SPI slave transmit mode is $50 \mathrm{Mbits} / \mathrm{s}$.
- Master and slave operation.
- Data frames of 4 to 16 bits supported directly. Larger frames supported by software.
- The SPI function supports separate transmit and receive FIFOs with eight entries each.
- Supports DMA transfers: SPIn transmit and receive functions can operated with the system DMA controller.
- Data can be transmitted to a slave without the need to read incoming data. This can be useful while setting up an SPI memory.
- Up to Four Slave Select input/outputs with selectable polarity and flexible usage.

### 7.26.3.3 $\quad \mathrm{I}^{2} \mathrm{C}$-bus interface

The $\mathrm{I}^{2} \mathrm{C}$-bus is bidirectional for inter-IC control using only two wires: a serial clock line (SCL) and a serial data line (SDA). Each device is recognized by a unique address and can operate as either a receiver-only device (for exanple, an LCD driver) or a transmitter with the capability to both receive and send information (such as memory). Transmitters
and/or receivers can operate in either master or slave mode, depending on whether the chip has to initiate a data transfer or is only addressed. The $I^{2} \mathrm{C}$ is a multi-master bus and can be controlled by more than one bus master connected to it.

## Features

- Support standard, Fast-mode, and Fast-mode Plus (specific I2C pins) with data rates of up to $1 \mathrm{Mbit} / \mathrm{s}$.
- Support high-speed slave mode with data rates of up to 3.4 Mbit/s (specific I2C pins).
- Independent Master, Slave, and Monitor functions.
- Supports both Multi-master and Multi-master with Slave functions.
- Multiple $\mathrm{I}^{2} \mathrm{C}$ slave addresses supported in hardware.
- One slave address can be selectively qualified with a bit mask or an address range in order to respond to multiple $\mathrm{I}^{2} \mathrm{C}$-bus addresses.
- 10-bit addressing supported with software assist.
- Supports SMBus.
- Separate DMA requests for master, slave, and monitor functions.
- No chip clocks are required in order to receive and compare an address as a slave, so this event can wake-up the device from deep-sleep mode.
- Automatic modes optionally allow less software overhead for some use cases.

### 7.26.3.4 USART

## Features

- Maximum bit rates of $6.25 \mathrm{Mbit} / \mathrm{s}$ in asynchronous mode and $10 \mathrm{Mbit} / \mathrm{s}$ in synchronous mode for USART functions.
- 7 , 8 , or 9 data bits and 1 or 2 stop bits.
- Synchronous mode with master or slave operation. Includes data phase selection and continuous clock option.
- Multiprocessor/multidrop (9-bit) mode with software address compare.
- RS-485 transceiver output enable.
- Autobaud mode for automatic baud rate detection
- Parity generation and checking: odd, even, or none.
- Software selectable oversampling from 5 to 16 clocks in asynchronous mode.
- One transmit and one receive data buffer.
- RTS/CTS for hardware signaling for automatic flow control. Software flow control can be performed using Delta CTS detect, Transmit Disable control, and any GPIO as an RTS output.
- Received data and status can optionally be read from a single register
- Break generation and detection.
- Receive data is 2 of 3 sample "voting". Status flag set when one sample differs.
- Built-in Baud Rate Generator with auto-baud function.
- A fractional rate divider is shared among all USARTs.
- Interrupts available for Receiver Ready, Transmitter Ready, Receiver Idle, change in receiver break detect, Framing error, Parity error, Overrun, Underrun, Delta CTS detect, and receiver sample noise detected.
- Loopback mode for testing of data and flow control.
- In synchronous slave mode, wakes up the part from deep-sleep and deep-sleep2 modes.
- Special operating mode allows operation at up to 9600 baud using the 32.768 kHz RTC oscillator as the UART clock. This mode can be used while the device is in deep-sleep and can wake-up the device when a character is received.
- USART transmit and receive functions work with the system DMA controller.
- The USART function supports separate transmit and receive FIFO with 16 entries each.

### 7.26.3.5 $\quad{ }^{2} \mathrm{~S}$-bus interface

The $I^{2} S$ bus provides a standard communication interface for streaming data transfer applications such as digital audio or data collection. The ${ }^{2} S$ bus specification defines a 3 -wire serial bus with one data, one clock, and one word select/frame trigger signal, providing single or dual (mono or stereo) audio data transfer in addition to other configurations. Each Flexcomm Interface implements one $I^{2} S$ channel pair.

The $I^{2} S$ interface within one Flexcomm Interface provides one channel pair that can be configured as a master or a slave. The channel pair within one Flexcomm Interface shares one set of $I^{2}$ S signals, and are configured together for either transmit or receive operation, using the same mode, same data configuration, and frame configuration. All such channel pairs can participate in a Time Division Multiplexing (TDM) arrangement. For cases requiring an MCLK input and/or output, this is handled outside of the $I^{2} S$ block in the system level clocking scheme.

## Features

- A Flexcomm Interface can implement one or more $I^{2} S$ channel pairs, the first of which could be a master or a slave, and the rest would be slaves. All channel pairs are configured together for either transmit or receive and other shared attributes.
- Flexcomm interfaces 0 to 7 each provide one channel pair of $I^{2} S$ function.
- Configurable data size for all channels within one Flexcomm Interface, from 4 bits to 32 bits. Each channel pair can also be configured independently to act as a single channel (mono as opposed to stereo operation).
- All channel pairs within one Flexcomm Interface share a single bit clock (SCK) and word select/frame trigger (WS), and data line (SDA).
- Data for all $I^{2}$ S traffic within one Flexcomm Interface uses the Flexcomm FIFO. The FIFO depth is 8 entries.
- Left justified and right justified data modes.
- DMA support using FIFO level triggering.
- TDM with a several stereo slots and/or mono slots is supported. Each channel pair can act as any data slot. Multiple channel pairs can participate as different slots on one TDM data line.
- The bit clock and WS can be selectively inverted.
- Sampling frequencies supported depends on the specific device configuration and applications constraints (For example, system clock frequency and PLL availability) but generally supports standard audio data rates.

### 7.26.4 High-speed SPI serial I/O controller

### 7.26.4.1 Features

- Master and slave operation.
- The maximum supported bit rate for SPI master mode (transmit/receive) and slave mode (transmit/receive) is $50 \mathrm{Mbit} / \mathrm{s}$.
- Data frames of 4 to 16 bits supported directly. Larger frames supported by software.
- The SPI function supports separate transmit and receive FIFOs with eight entries each.
- Supports DMA transfers: SPIn transmit and receive functions can operated with the system DMA controller.
- Data can be transmitted to a slave without the need to read incoming data. This can be useful while setting up an SPI memory.
- Up to Four Slave Select input/outputs with selectable polarity and flexible usage.

### 7.27 SDIO/MMC interface

Secured digital input/output (SD/MMC and SDIO) card interface with DMA support. SDIO with support for up to two cards. Supported card types are MMC, SDIO, and CE-ATA. Supports SD2.0, and SDR25 (52MHz).

### 7.27.1 Features

- Secure Digital memory protocol commands.
- Secure Digital I/O protocol commands.
- Multimedia Card protocol commands.
- CE-ATA digital protocol commands.
- Two SD or MMC (4.4), CE-ATA (1.1), or eMMC (4.4) device.
- CRC 2.0 generation and error detection.
- SDIO interrupts in 1-bit and 4-bit modes.
- Block size of 1 to 65,535 bytes.
- Internal (bus mastering) DMA.
- Two FIFOs, TX and RX FIFO (FIFO depth $=32$ and FIFO data width $=32$ bits).

### 7.28 Standard counter/timers (CT32B0 to 4)

The LPC55S6x includes five general-purpose 32-bit timer/counters.
The timer/counter is designed to count cycles of the system derived clock or an externally-supplied clock. It can optionally generate interrupts, generate timed DMA requests, or perform other actions at specified timer values, based on four match registers. Each timer/counter also includes two capture inputs to trap the timer value when an input signal transitions, optionally generating an interrupt.

### 7.28.1 Features

- A 32-bit timer/counter with a programmable 32-bit prescaler.
- Counter or timer operation.
- Up to four 32-bit capture channels per timer, that can take a snapshot of the timer value when an input signal transitions. A capture event may also generate an interrupt.
- The timer and prescaler may be configured to be cleared on a designated capture event. This feature permits easy pulse width measurement by clearing the timer on the leading edge of an input pulse and capturing the timer value on the trailing edge.
- Four 32-bit match registers that allow:
- Continuous operation with optional interrupt generation on match.
- Stop timer on match with optional interrupt generation.
- Reset timer on match with optional interrupt generation.
- Up to four external outputs per timer corresponding to match registers with the following capabilities:
- Set LOW on match.
- Set HIGH on match.
- Toggle on match.
- Do nothing on match.
- Up to two match registers can be used to generate timed DMA requests.
- Up to 4 match registers can be configured for PWM operation, allowing up to 3 single edged controlled PWM outputs.WM mode using up to three match channels for PWM output.

### 7.28.2 SCTimer/PWM subsystem

The SCTimer/PWM is a flexible timer module capable of creating complex PWM waveforms and performing other advanced timing and control operations with minimal or no CPU intervention.

The SCTimer/PWM can operate as a single 32-bit counter or as two independent, 16-bit counters in uni-directional or bi-directional mode. It supports a selection of match registers against which the count value can be compared, and capture registers where the current count value can be recorded when some pre-defined condition is detected.

The SCTimer/PWM module supports multiple separate events that can be defined by the user based on some combination of parameters including a match on one of the match registers, and/or a transition on one of the SCTimer/PWM inputs or outputs, the direction of count, and other factors.

Every action that the SCTimer/PWM block can perform occurs in direct response to one of these user-defined events without any software overhead. Any event can be enabled to:

- Start, stop, or halt the counter.
- Limit the counter which means to clear the counter in unidirectional mode or change its direction in bi-directional mode.
- Set, clear, or toggle any SCTimer/PWM output.
- Force a capture of the count value into any capture registers.
- Generate an interrupt of DMA request.

### 7.28.2.1 Features

- The SCTimer/PWM Supports:
- Eight inputs.
- Ten outputs.
- Sixteen match/capture registers.
- Sixteen events.
- Thirty two states.
- Counter/timer features:
- Each SCTimer/PWM is configurable as two 16-bit counters or one 32-bit counter.
- Counters clocked by system clock or selected input.
- Configurable number of match and capture registers. Up to sixteen match and capture registers total.
- Sixteen events.
- Thirty two states.
- Upon match and/or an input or output transition create the following events: interrupt; stop, limit, halt the timer or change counting direction; toggle outputs; change the state.
- Counter value can be loaded into capture register triggered by a match or input/output toggle.
- PWM features:
- Counters can be used in conjunction with match registers to toggle outputs and create time-proportioned PWM signals.
- Up to eight single-edge or four dual-edge PWM outputs with independent duty cycle and common PWM cycle length.
- Event creation features:
- The following conditions define an event: a counter match condition, an input (or output) condition such as an rising or falling edge or level, a combination of match and/or input/output condition.
- Selected events can limit, halt, start, or stop a counter or change its direction.
- Events trigger state changes, output toggles, interrupts, and DMA transactions.
- Match register 0 can be used as an automatic limit.
- In bi-directional mode, events can be enabled based on the count direction.
- Match events can be held until another qualifying event occurs.
- State control features:
- A state is defined by events that can happen in the state while the counter is running.
- A state changes into another state as a result of an event.
- Each event can be assigned to one or more states.
- State variable allows sequencing across multiple counter cycles.

### 7.28.3 Windowed WatchDog Timer (WWDT)

The purpose of the Watchdog Timer is to reset or interrupt the microcontroller within a programmable time if it enters an erroneous state. When enabled, a watchdog reset is generated if the user program fails to feed (reload) the Watchdog within a predetermined amount of time.

### 7.28.3.1 Features

- Internally resets chip if not reloaded during the programmable time-out period.
- Optional windowed operation requires reload to occur between a minimum and maximum time period, both programmable.
- Optional warning interrupt can be generated at a programmable time prior to watchdog time-out.
- Programmable 24-bit timer with internal fixed pre-scaler.
- Selectable time period from 1,024 watchdog clocks (TWDCLK $\times 256 \times 4$ ) to over 67 million watchdog clocks (TWDCLK $\times 224 \times 4$ ) in increments of four watchdog clocks.
- "Safe" watchdog operation. Once enabled, requires a hardware reset or a Watchdog reset to be disabled.
- Incorrect feed sequence causes immediate watchdog event if enabled.
- The watchdog reload value can optionally be protected such that it can only be changed after the "warning interrupt" time is reached.
- Flag to indicate Watchdog reset.
- The watchdog clock (WDCLK) is generated from always on FRO_1 MHz clock which can be divided by WDT clock divider register. The accuracy of this clock is limited to +/- 15\% over temperature, voltage, and silicon processing variations.
- The Watchdog timer can be configured to run in Deep-sleep mode.
- Debug mode.

### 7.28.4 RTC timer

The RTC block to count seconds and generate an alarm interrupt to the processor whenever the counter value equals the value programmed into the associated 32-bit match register.

### 7.28.4.1 Features

- The RTC oscillator has the following clock outputs: 32.768 kHz clock (named as 32 kHz clock in rest of this chapter) 32 kHz clock, selectable for system clock and CLKOUT pin, 1 Hz clock for RTC timing, and 1024 Hz clock (named as 1 kHz clock in rest of this chapter) for high-resolution RTC timing.
- 32-bit, 1 Hz RTC counter and associated match register for alarm generation.
- 15-bit, 32 KHz sub-second counter.
- Separate 16-bit high-resolution/wake-up timer clocked at 1 kHz for 1 ms resolution with a more that one minute maximum time-out period.
- RTC alarm and high-resolution/wake-up timer time-out each generate independent interrupt requests that go to one NVIC channel. Either time-out can wake up the part from any of the low power modes, including deep power-down.
- Eight 32-bit general purpose registers can retain data in deep power-down. These registers are reset only on software reset of the RTC.

### 7.28.5 Multi-Rate Timer (MRT)

The Multi-Rate Timer (MRT) provides a repetitive interrupt timer with four channels. Each channel can be programmed with an independent time interval, and each channel operates independently from the other channels.

### 7.28.5.1 Features

- 24-bit interrupt timer.
- Four channels independently counting down from individually set values.
- Repeat interrupt, one-shot interrupt, and one-shot bus stall modes.

### 7.28.6 OS Timer

42-bit free running timer with individual match/capture and interrupt generation logic used as continuous time-base for the system, available in any reduced power modes. It runs on 32 kHz clock source, allowing a count period of more than 4 years.

### 7.28.6.1 Features

- Central 42-bit, free-running gray-code event/timestamp timer.
- Match registers compared to the main counter to generate an interrupt and/or wake-up event.
- Capture registers triggered by CPU command, readable via the AHB/IPS bus.
- APB interface for register access.
- IRQ and wake-up.
- Reads of gray-encoded timers are accomplished with no synchronization latency.

### 7.28.7 Micro-tick timer (UTICK)

The ultra-low power Micro-tick Timer, running from the Watchdog oscillator, can be used to wake up the device from sleep and deep-sleep modes.

### 7.28.7.1 Features

- Ultra simple timer.
- Write once to start.
- Interrupt or software polling.
- Four capture registers that can be triggered by external pin transitions.

### 7.29 Digital peripherals

### 7.29.1 DMA controller

The DMA controller allows peripheral-to memory, memory-to-peripheral, and memory-to-memory transactions. Each DMA stream provides unidirectional DMA transfers for a single source and destination.

Two identical DMA controllers are provided on the LPC55S6x. The user may elect to dedicate one of these to CPU0 and the other for use by the CPU1 and/or one may be used as a secure DMA the other non-secure.

### 7.29.1.1 Features

- DMAO: 22 channels, 21 of which are connected to peripheral DMA requests. These come from the Flexcomm (USART, SPI, I2C, and I2S), high-speed SPI interface, ADC, AES, and SHA interfaces. 22 trigger sources are available.
- DMA1: 10 channels, 9 of which are connected to peripheral DMA requests. These come from the Flexcomm Interfaces ( 0,1 , and 3), high-speed SPI interface, AES, and SHA interfaces. 15 trigger sources are available.
- DMA operations can be triggered by on-chip or off-chip events.
- Priority is user selectable for each channel (up to eight priority levels).
- Continuous priority arbitration.
- Address cache with four entries.
- Efficient use of data bus.
- Supports single transfers up to 1,024 words.
- Address increment options allow packing and/or unpacking data.

### 7.29.2 Programmable Logic Unit (PLU)

The PLU is comprised of 265 -input LUT elements. Each LUT element contains a 32-bit truth table (look-up table) register and a 32:1 multiplexer. During operation, the five LUT inputs control the select lines of the multiplexer. This structure allows any desired logical combination of the five LUT inputs.

### 7.29.2.1 Features

- The Programmable Logic Unit is used to create small combinatorial and/or sequential logic networks including simple state machines.
- The PLU is comprised of an array of 26 inter-connectable, 5-input Look-up Table (LUT) elements, and four flip-flops.
- Eight primary outputs can be selected using a multiplexer from among all of the LUT outputs and the four flip-flops.
- An external clock to drive the four flip-flops must be applied to the PLU_CLKIN pin if a sequential network is implemented.
- Programmable logic can be used to drive on-chip inputs/triggers through external pin-to-pin connections.
- A tool suite is provided to facilitate programming of the PLU to implement the logic network described in a Verilog RTL design.
- Any of the eight selected PLU outputs can be enabled to contribute to an asynchronous wake-up or an interrupt request from sleep and deep-sleep modes.

### 7.29.3 CRC engine

The Cyclic Redundancy Check (CRC) generator with programmable polynomial settings supports several CRC standards commonly used. To save system power and bus bandwidth, the CRC engine supports DMA transfers.

### 7.29.3.1 Features

- Supports three common polynomials CRC-CCITT, CRC-16, and CRC-32.
- CRC-CCITT: $x^{16}+x^{12}+x^{5}+1$
- CRC-16: $x^{16}+x^{15}+x^{2}+1$
- CRC-32: $x^{32}+x^{26}+x^{23}+x^{22}+x^{16}+x^{12}+x^{11}+x^{10}+x^{8}+x^{7}+x^{5}+x^{4}+x^{2}+x+1$
- Bit order reverse and 1's complement programmable setting for input data and CRC sum.
- Programmable seed number setting.
- Supports CPU PIO or DMA back-to-back transfer.
- Accept any size of data width per write: 8,16 or 32 -bit.
- 8-bit write: 1-cycle operation.
- 16-bit write: 2 -cycle operation (8-bit x 2 -cycle).
- 32-bit write: 4 -cycle operation (8-bit x 4 -cycle).

### 7.30 Analog peripherals

### 7.30.1 16-bit Analog-to-Digital Converter (ADC)

The ADC supports a resolution of 16 -bit and fast conversion rates of up to 1.0 Msamples/s. Sequences of analog-to-digital conversions can be triggered by multiple sources.

### 7.30.1.1 Features

- 16-bit Linear successive approximation algorithm.
- Differential operation with 16 -bit or 13 -bit resolution.
- Single-ended operation with 16 -bit or 12 -bit resolution.
- Support for two simultaneous single ended conversions.
- Channel support for up to 64 analog input channels for conversion of external pin and from internal sources.
- Select external pin inputs paired for conversion as differential channel input.
- Measurement of on-chip analog sources such as DAC, temperature sensor or bandgap.
- Configurable analog input sample time.
- Configurable speed options to accommodate operation in low power modes of SoC.
- Trigger detect with up to 16 trigger sources with priority level configuration. Software or hardware trigger option for each.
- Fifteen command buffers allow independent options selection and channel sequence scanning.
- Automatic compare for less-than, greater-than, within range, or out-of-range with "store on true" and "repeat until true" options.
- Two independent result FIFOs each contains 16 entries. Each FIFO has configurable watermark and overflow detection.
- Interrupt, DMA, or polled operation.
- Linearity and gain offset calibration logic.

### 7.30.2 Comparator

The analog comparator can compare voltage levels on external pins and internal voltages. The comparator has five inputs multiplexed separately to its positive and negative inputs.

### 7.30.2.1 Features

- Selectable external inputs can be used as either the positive or negative input of the comparator.
- Voltage ladder source selectable between the supply, multiplexing between internal VBAT_PMU and ACMPVREF.
- 32-stage voltage ladder can be used as either the positive or negative input of the comparator.
- Supports standard and low power modes
- Interrupt capability.

Fig 7. Comparator block diagram

### 7.30.3 Temperature sensor

The temperature sensor transducer uses an intrinsic pn-junction diode reference and outputs a Complement To Absolute Temperature ( $\mathrm{VC}_{\text {TAT }}$ ) voltage. The output voltage varies inversely with device temperature with an absolute accuracy of better than $\pm 4^{\circ} \mathrm{C}$ over the full temperature range ( $-40 \mathrm{C}{ }^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$ ). The temperature sensor is only approximately linear with a slight curvature. The output voltage is measured over different ranges of temperatures and fit with linear-least-square lines.

After power-up, the temperature sensor output must be allowed to settle to its stable value before it can be used as an accurate ADC input.

### 7.31 Security Features

The security system on LPC55S6xLPC55S6x has a set of hardware blocks and ROM code to implement the security features of the device. The hardware consists of an AES engine, a Secure Hash Algorithm (SHA) engine, a Random Number Generator (RNG), a PRINCE engine for real-time flash encryption/decryption, and a key storage block that keys from an SRAM based PUF (Physically Unclonable Function). All components of the system can be accessed by the processor or the DMA engine to encrypt or decrypt data and for hashing. The ROM is responsible for secure boot in addition to providing support for various security functions.

### 7.31.1 AES engine

The LPC55S6xx devices provide an on-chip hardware AES encryption and decryption engine to protect the image content and to accelerate processing for data encryption or decryption, data integrity, and proof of origin. Data can be encrypted or decrypted by the AES engine using a key from the PUF or a software supplied key. The AES engine supports 128 bit, 192 bit, or 256 bit keys for encryption and decryption operations.

### 7.31.1.1 Features

- Encryption and decryption of data.
- Secure storage of AES key that cannot be read.
- Supports 128 bit, 192 bit or 256 bit key in Electronic Code Book (ECB) mode, Cipher Block Chaining (CBC) mode, and Counter (CTR) mode.
- Supports 128-bit key in ICB (Indexed Code Book) mode, that offers protection against side-channel attacks.
- Compliant with the FIPS (Federal Information Processing Standard) Publication 197, Advanced Encryption Standard (AES).
- It may use the processor, DMA, or AHB Master for data movement. AHB Master may only be used to load data, DMA may be used to read-out results. DMA based result reading is a "trigger", so the application must set the size correctly.

### 7.31.2 HASH engine

The LPC55S6x devices provide on-chip Hash support to perform SHA-1 and SHA-2 with 256 -bit digest (SHA-256). Hashing is a way to reduce arbitrarily large messages or code images to a relatively small fixed size "unique" number called a digest. The SHA-1 Hash produces a 160 bit digest (five words), and the SHA-256 hash produces a 256 bit digest (eight words).

### 7.31.2.1 Features

- Performs SHA-1 and SHA-2(256) based hashing.
- Used with HMAC to support a challenge/response or to validate a message.

### 7.31.3 PUF

The PUF controller on the LPC55S6x provides generation and secure storage for keys without storing the key. The PUF controller provides a unique key per device and exists in that device based on the unique characteristics of PUF SRAM. Instead of storing the key, a Key Code is generated, which in combination with the digital fingerprint is used to reconstruct keys that are routed to the AES engine, for use by software, and by PRINCE engine. PUF keys have a dedicated path to the AES engine and PRINCE engine. There is no other mechanism by which keys can be observed.

### 7.31.3.1 Features

- Key strength of 256-bits.
- The PUF constructs 256 -bit strength device unique PUF root key using the digital fingerprint of a device derived from SRAM and error correction data called Activation Code (AC). The Activation Code (AC) is generated during enrollment process. The Activation Code (AC) should be stored on external non-volatile memory device in the system.
- Generation, storage, and reconstruction of keys.
- Key sizes from 64 bits to 4096 bits.
- PUF controller allows storage of keys, generated externally or on chip, of sizes 64 bits to 4096 bits.
- PUF controller combines keys with digital fingerprint of device to generate key codes. These key codes should be provided to the controller to reconstruct original key. They can be stored on external non-volatile memory device in the system.
- Key output via dedicated hardware interface or through register interface.
- PUF controller allows to assign a 4-bit index value for each key while generating key codes. Keys that are assigned index value zero are output through HW bus, accessible to AES and PRINCE engines only. Keys with non-zero index are available through APB register interface.
- 32-bit APB interface.

### 7.31.4 Random Number Generator

The True Random Number Generators (TRNG) module is a hardware accelerator module that generate 256 -bit entropy. The purpose of the module is to generate high quality, cryptographically secure, random data.

Random number generators are used for data masking, cryptographic, modeling and simulation application which employ keys that must be generated in a random fashion LPC55S6x embeds a hardware IP that - combined with appropriate software and the availability of a stochastic model - can be used to generate

### 7.31.5 PRINCE On-the-fly encryption/decryption

LPC55S6x devices offer support for on-the-fly encryption of date being written to flash and decryption of encrypted on-chip flash data during read using the PRINCE encryption algorithm. Compared to AES, PRINCE is fast as it can decrypt and encrypt in one clock cycle. Also, it does not need extra SRAM to copy data. It operates on a block-size of 64 bits with an 128-bit key. This functionality is useful for asset protection, such as securing application code, securing stored keys and enabling secure flash update.

### 7.31.6 Universally Unique Identifier (UUID)

Each LPC55S6x device consists of a unique 128-bit IETF RFC4122 compliant non-sequential UUID. It can be read from the protected flash region (register location 0x0009_FC70 onwards).

### 7.32 Debug Mailbox and Authentication

The Debugger Mailbox (DM) AP offers a register based mailbox accessible by both CPUs and the device debug port DP of the MCU. This port is always enabled and external world can send and receive data to/from ROM. This port is used to implement NXP Debug Authentication Protocol.

BootROM implements debug mailbox protocol to interact with tools over SWD interface. LPC55S6x offers a debug authentication protocol as a tool to authenticate the debugger and grant it access to the device. The debug authentication scheme on LPC55S6x is a challenge-response scheme and assures that debugger in possession of required debug credentials only can successfully authenticate over debug interface and access restricted parts of the device. This protocol provides a mechanism for a device and its debug interface to authenticate the identity and credentials of the debugger (or user). Access right settings can be pre-configured and gets loaded into register above upon successful debug authentication. Until debug authentication process is successfully completed, secure part of the device is non-accessible to the debugger.

### 7.33 Emulation and debugging

Debug and trace functions are integrated into the Arm Cortex-M33 (CPU0 and CPU1) Serial wire debug and trace function (Serial Wire Output) are supported. Eight breakpoints and four watch points are supported. In addition, JTAG boundary scan mode is provided.

The Arm SYSREQ reset is supported and causes the processor to reset the peripherals, execute the boot code, restart from address $0 \times 00000000$, and break at the user entry point.

The SWD pins are multiplexed with other digital I/O pins. On reset, the pins assume the SWD functions by default.

## 8. Limiting values

Table 11. Limiting values
In accordance with the Absolute Maximum Rating System (IEC 60134).[1]

| Symbol | Parameter | Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{\text {DD }}$ | Main IO supply |  | [2] | -0.3 | 3.96 | V |
| VBAT_DCDC | Supply of DCDC output stage. DCDC core supply (references and regulation stages) |  | [2] | -0.3 | 3.96 | V |
| VBAT_PMU | Analog supply |  | [2] | -0.3 | 3.96 | V |
| VDD_PMU | Analog supply for Core. DCDC output |  | [2] | -0.3 | 1.26 | V |
| USB0_3V3 | USB0 analog 3.3 V supply. |  | [2] | -0.3 | 3.96 | V |
| USB1_3V3 | USB1 analog 3.3 V supply. |  | [2] | -0.3 | 3.96 | V |
| $V_{\text {DDA }}$ | Analog supply voltage for ADC |  | [2] | -0.3 | 3.96 | V |
| $\mathrm{V}_{\text {refp }}$ | ADC positive reference voltage |  | [2] | -0.3 | 3.96 | V |
| $V_{1}$ | input voltage | only valid when the $\mathrm{V}_{\mathrm{DD}} \geq 1.8 \mathrm{~V}$ | [5] | -0.5 | $\mathrm{V}_{\mathrm{DD}}+0.5$ | V |
| $V_{1}$ | input voltage | on I2C open-drain pins |  | -0.5 | $V_{D D}+0.5$ | V |
|  |  | USB_DM, USB_DP pins |  | -0.3 | USB_3V3 + 0.5 | V |
| $\mathrm{V}_{\text {IA }}$ | analog input voltage | on digital pins configured for an analog function | [6][7] | -0.3 | 3.96 | V |
| IDD | total supply current | per supply pin (HLQFP100, VFBGA98) |  | - | 256 | mA |
| Iss | total ground current | per ground pin (HLQFP100, VFBGA98) |  | - | 256 | mA |
| $l_{\text {latch }}$ | I/O latch-up current | $\begin{aligned} & -\left(0.5 \mathrm{~V}_{\mathrm{DD}}\right)<\mathrm{V}_{\mathrm{l}}<\left(1.5 \mathrm{~V}_{\mathrm{DD}}\right) ; \\ & \mathrm{T}_{\mathrm{j}}<125^{\circ} \mathrm{C} \end{aligned}$ |  | - | 100 | mA |
| $\mathrm{T}_{\text {stg }}$ | storage temperature |  |  | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{V}_{\text {ESD }}$ | electrostatic discharge voltage | human body model; all pins | [3] |  | 2000 | V |
| $\mathrm{V}_{\text {ESD }}$ | electrostatic discharge voltage | charge device model; all pins | [3] |  | 500 | V |

[1] The following applies to the limiting values:
a) This product includes circuitry specifically designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying greater than the rated maximum.
b) Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to $\mathrm{V}_{\text {SS }}$ unless otherwise noted.
c) The limiting values are stress ratings only and operating the part at these values is not recommended and proper operation is not guaranteed. The conditions for functional operation are specified in Table 22.
[2] Maximum/minimum voltage above the maximum operating voltage (see Table 22) and below ground that can be applied for a short time ( $<10 \mathrm{~ms}$ ) to a device without leading to irrecoverable failure. Failure includes the loss of reliability and shorter lifetime of the device.
[3] Human body model: equivalent to discharging a 100 pF capacitor through a $1.5 \mathrm{k} \Omega$ series resistor.
[4] $V_{D D}$ present or not present. Compliant with the $I^{2} \mathrm{C}$-bus standard. 5.5 V can be applied to this pin when $\mathrm{V}_{\mathrm{DD}}$ is powered down.
[5] Including the voltage on outputs in 3-state mode.
[6] An ADC input voltage above 3.6 V can be applied for a short time without leading to immediate, unrecoverable failure. Accumulated exposure to elevated voltages at 4.6 V must be less than $10^{6} \mathrm{~s}$ total over the lifetime of the device. Applying an elevated voltage to the ADC inputs for a long time affects the reliability of the device and reduces its lifetime.
[7] It is recommended to connect an overvoltage protection diode between the analog input pin and the voltage supply pin.

## 9. Thermal characteristics

The average chip junction temperature, $\mathrm{T}_{\mathrm{j}}\left({ }^{\circ} \mathrm{C}\right)$, can be calculated using the following equation:
$T_{j}=T_{a m b}+\left(P_{D} \times R_{t h(j-a)}\right)$

- $\mathrm{T}_{\mathrm{amb}}=$ ambient temperature $\left({ }^{\circ} \mathrm{C}\right)$,
- $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{a})}=$ the package junction-to-ambient thermal resistance $\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$
- $P_{D}=$ sum of internal and I/O power dissipation

The internal power dissipation is the product of $I_{D D}$ and $V_{D D}$. The $/ / O$ power dissipation of the I/O pins is often small and many times can be negligible. However it can be significant in some applications.

Table 12. Thermal resistance

| Symbol | Parameter | Conditions | Max/Min | Unit |
| :---: | :---: | :---: | :---: | :---: |
| HLQFP100 Package |  |  |  |  |
| $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{a})}$ | thermal resistance from junction to ambient [1] | JESD51-9, 2s2p[2] | 27 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{c})}$ | thermal resistance from junction to case [3] | JESD51-9[2] | 2.0 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| VFBGA98 Package |  |  |  |  |
| $\mathrm{R}_{\text {th }(\mathrm{j}-\mathrm{a}}$ | thermal resistance from junction to ambient [1] | JESD51-9, 2s2p[2] | 56 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{c})}$ | Junction-to-Top of Package Thermal Characterization Parameter [3] | JESD51-9[2] | 0.7 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| HTQFP 64 Package |  |  |  |  |
| $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{a})}$ | thermal resistance from junction to ambient [1] | JESD51-9, 2s2p[2] | 28 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\mathrm{th}(\mathrm{j}-\mathrm{c})}$ | thermal resistance from junction to case [3] | JESD51-9[2] | 0.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

Table 13. Maximum Junction Temperature

| Symbol | Parameter | Conditions | Max | Unit |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{T}_{\text {jmax }}$ | maximum junction temperature |  | +107 | ${ }^{\circ} \mathrm{C}$ |

[1] Determined in accordance to JEDEC JESD51-2A natural convection environment. Thermal resistance data in this report is solely for a thermal performance comparison of one package to another in a standardized specified environment. It is not meant to predict the performance of a package in an application-specific environment
[2] Thermal test board meets JEDEC specification for this package (JESD51-9).
[3] Junction-to-Case thermal resistance determined using an isothermal cold plate. Case is defined as the bottom of the packages (exposed pad)

## 10. Static characteristics

### 10.1 General operating conditions

Table 14. General operating conditions
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$, unless otherwise specified.

| Symbol | Parameter | Conditions | Min | Typ[1] | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {clk }}$ | clock frequency | internal CPU/system clock | - | - | 150 [2] [3] | MHz |
| $\mathrm{f}_{\mathrm{clk}}$ | clock frequency | For USB high-speed device and host operations | 90 | - | 150 [2] [3] | MHz |
| $\mathrm{f}_{\mathrm{clk}}$ | clock frequency | For USB full-speed device and host operations | 12 | - | 150 [2] [3] | MHz |
| $V_{\text {DD }}$ | Main IO supply |  | 1.8 | - | 3.6 | V |
| VBAT_DCDC | Supply of DCDC output stage. DCDC core supply (references and regulation stages) |  | 1.8 | - | 3.6 | V |
| VBAT_PMU | Analog supply |  | 1.8 | - | 3.6 | V |
| VDD_PMU [4] | Analog supply for Core. DCDC output |  | 1.0 | - | 1.2 | V |
| USB0_3V3 | USB0 analog 3.3 V supply. |  | 3.0 | - | 3.6 | V |
| USB1_3V3 | USB1 analog 3.3 V supply. |  | 3.0 | - | 3.6 | V |
| $V_{\text {DDA }}$ | Analog supply voltage for ADC |  | 1.8 | - | 3.6 | V |
| $V_{\text {refp }}$ | ADC positive reference voltage |  | 0.985 | - | $\mathrm{V}_{\text {DDA }}$ | V |
| Oscillator pins |  |  |  |  |  |  |
| $\mathrm{V}_{\mathrm{i} \text { (rtcx) }}$ | RTC oscillator input voltage | on pin XTAL32K_P | 1.8 | - | 3.6 | V |
| $\mathrm{V}_{\text {o(ttcx) }}$ | RTC oscillator output voltage | on pin XTAL32K_N | 1.8 | - | 3.6 | V |
| $\mathrm{V}_{\mathrm{i}(\mathrm{xtal})}$ | System oscillator input voltage | on pin XTAL32M_P | - | 1.1 | 1.2 | V |
| $\mathrm{V}_{\text {o(rtcx }}$ | System oscillator output voltage | on pin XTAL32M_N | - | 1.1 | 1.2 | V |

[1] Typical ratings are not guaranteed. The values listed are for room temperature ( $25^{\circ} \mathrm{C}$ ), nominal supply voltages.
[2] Device revision 1B operates at a maximum CPU frequency of up to 150 MHz . Device revision 0 A operates at a maximum CPU frequency of up to 100 MHz .
[3] Flash operations (erase, blank check, program) and reading single word can only be performed for CPU frequencies of up to 100 MHz . Cannot be performed for frequencies above 100 MHz .
[4] For device revision 1B, power library in SDK sets the DCDC output based on the frequency selected. For frequencies 100 MHz or below, DCDC output is set between 1.0 V to 1.075 V , for frequencies between 101 MHz to 130 MHz , DCDC output is set between 1.025 V to 1.150 V and for frequencies above 130 MHz , DCDC output is set between 1.050 V to 1.2 V . For device revision 0 A , the default typical DCDC output is 1.1 V and for device revision 1 B , the typical default DCDC output is 1.0 V .

### 10.2 CoreMark data

Table 15. CoreMark score [6]
$T_{\text {amb }}=25^{\circ} \mathrm{C}, V B A T \_P M U=$ VBAT_DCDC $=V D D=3.0 \mathrm{~V}$

| Parameter | Conditions |  | Typ [2] | Unit |
| :---: | :---: | :---: | :---: | :---: |
| ARM Cortex-M33 (CPU0) in active mode; ARM Cortex-M33 (CPU1) in sleep mode |  |  |  |  |
| CoreMark score | CoreMark code executed from SRAMX; $\text { CCLK = } 12 \mathrm{MHz}$ | [1][3] | 4.0 | (Iterations/s) / MHz |
|  | CCLK $=48 \mathrm{MHz}$ | [1][3] | 4.0 | (Iterations/s) / MHz |
|  | CCLK $=60 \mathrm{MHz}$ | [1][3] | 4.0 | (Iterations/s) / MHz |
|  | CCLK $=96 \mathrm{MHz}$ | [1][3] | 4.0 | (Iterations/s) / MHz |
|  | CCLK $=100 \mathrm{MHz}$ | [3][5] | 4.0 | (Iterations/s) / MHz |
|  | CCLK $=150 \mathrm{MHz}$ | [3][5] | 4.0 | (Iterations/s) / MHz |
| CoreMark score | CoreMark code executed from flash; CCLK = $12 \mathrm{MHz} ; 2$ system clock flash access time. | [1][3][4] | 3.6 | (Iterations/s) / MHz |
|  | CCLK $=48 \mathrm{MHz}$, 5 system clock flash access time. | [1][3][4] | 3.0 | (Iterations/s) / MHz |
|  | CCLK $=60 \mathrm{MHz}$, 6 system clock flash access time. | [1][3][4] | 2.5 | (Iterations/s) / MHz |
|  | CCLK = $96 \mathrm{MHz}, 8$ system clock flash access time. | [1][3][4] | 2.3 | (Iterations/s) / MHz |
|  | CCLK = $100 \mathrm{MHz}, 8$ system clock flash access time. | [3][4][5] | 2.3 | (Iterations/s) / MHz |
|  | CCLK = $150 \mathrm{MHz}, 12$ system clock flash access time. | [3][4][5] | 2.0 | (Iterations/s) / MHz |

[1] Clock source FRO. PLL disabled
[2] Characterized through bench measurements using typical samples.
[3] Compiler settings: Keil v.5.28, optimization level 3, optimized for time on.
[4] See the FLASHCFG register in the LPC55S6x User Manual for system clock flash access time settings. Power Library in SDK sets the flash wait states based on the frequency selected.
[5] PLL enabled
[6] For device revision 1B, power library in SDK sets the DCDC output based on the frequency selected. For frequencies 100 MHz or below, DCDC output is set between 1.0 V to 1.075 V , for frequencies between 101 MHz to 130 MHz , DCDC output is set between 1.025 V to 1.150 V and for frequencies above 130 MHz , DCDC output is set between 1.050 V to 1.2 V . For device revision 0 A , the default typical DCDC output is 1.1 V and for device revision 1 B , the typical default DCDC output is 1.0 V .

### 10.3 Power consumption

Table 16. Static characteristics: Power consumption in active mode [6]
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$, unless otherwise specified. VBAT_PMU $=$ VBAT_DCDC $=V D D=3.0 \mathrm{~V}$

| Symbol | Parameter | Conditions |  | Min | Typ[1] | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ARM Cortex-M33 (CPU0) in active mode; ARM Cortex-M33 (CPU1) in sleep mode |  |  |  |  |  |  |  |
| $\mathrm{I}_{\mathrm{DD}}$ | supply current | CoreMark code executed from SRAMX; flash powered down CCLK $=12 \mathrm{MHz}$ | [2][3] | - | 0.9 | - | mA |
|  |  | CCLK $=48 \mathrm{MHz}$ | [2][3] | - | 2.1 | - | mA |
|  |  | CCLK $=60 \mathrm{MHz}$ | [2][3] | - | 2.3 | - | mA |
|  |  | CCLK $=96 \mathrm{MHz}$ | [2][3] | - | 3.4 | - | mA |
|  |  | CCLK $=100 \mathrm{MHz}$ | [3][4] | - | 3.5 | - | mA |
|  |  | CCLK $=150 \mathrm{MHz}$ | [3][4] | - | 6.2 | - | mA |
| IDD | supply current | CoreMark code executed from flash; CCLK = $12 \mathrm{MHz} ; 2$ system clock flash access time. | [2][3][7] | - | 0.95 | - | mA |
|  |  | CCLK $=48 \mathrm{MHz}, 5$ system clock flash access time. | [2][3][7] | - | 2.4 | - | mA |
|  |  | CCLK $=60 \mathrm{MHz}, 6$ system clock flash access time. | [2][3][7] | - | 2.6 | - | mA |
|  |  | CCLK = $96 \mathrm{MHz}, 8$ system clock flash access time. | [2][3][7] | - | 3.4 | - | mA |
|  |  | CCLK $=100 \mathrm{MHz}, 8$ system clock flash access time. | [3][4][7] | - | 3.5 | - | mA |
|  |  | CCLK = $150 \mathrm{MHz}, 12$ system clock flash access time. | [3][4][7] | - | 5.9 | - | mA |

[1] Typical ratings are not guaranteed. Typical values listed are at room temperature $\left(25^{\circ} \mathrm{C}\right)$. Characterized through bench measurements using typical samples.
[2] Clock source FRO. PLL disabled
[3] Compiler settings: IAR v.8.20.2., optimization level 0, optimized for time off.
[4] Flash is powered down
[5] PLL enabled
[6] For device revision 1B, power library in SDK sets the DCDC output based on the frequency selected. For frequencies 100 MHz or below, DCDC output is set between 1.0 V to 1.075 V , for frequencies between 101 MHz to 130 MHz , DCDC output is set between 1.025 V to 1.150 V and for frequencies above 130 MHz , DCDC output is set between 1.050 V to 1.2 V . For device revision 0 A , the default typical DCDC output is 1.1 V and for device revision 1 B , the typical default DCDC output is 1.0 V .
[7] See the FLASHCFG register in the LPC55S6x User Manual for system clock flash access time settings. Power Library in SDK sets the flash wait states based on the frequency selected.

Table 17. Static characteristics: Power consumption in sleep mode

RTC input grounded. 4KB SRAM powered.
Fig 10. Deep power-down mode: Typical supply current $I_{D D}$ versus temperature for different supply voltages VBAT_DCDC

### 10.3.1 Peripheral Power Consumption

Table 21 shows the typical peripheral power consumption measured on a typical sample at $\mathrm{T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$ and VBAT_PMU $=$ VBAT_DCDC $=\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$. The supply current per peripheral is measured as the difference in supply current between the peripheral block enabled and the peripheral block disabled using AHB clock control and PDRUNCFG registers. All other blocks are disabled and no code accessing the peripheral is executed.

The supply currents are shown for system clock frequencies of 12 MHz , and 96 MHz .

Table 21. Typical peripheral power consumption $V B A T \_P M U=V B A T \_D C D C=V_{D D}=3.3 \mathrm{~V} ; T=25^{\circ} \mathrm{C}$

| Peripheral |  | IDD (uA) |  |

| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; SLEW = 1 | [2][3] | 3.0 | - | 7.0 | ns |
| $\mathrm{t}_{\mathrm{r}}$ | rise time | pin configured as output; SLEW = 0 | [2][3] | 21.5 | - | 39.0 | ns |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | pin configured as output; SLEW = 0 | [2][3] | 29.8 | - | 36.0 | ns |

[1] Based on characterized, not tested in production
[2] Rise and fall times measured between $90 \%$ and $10 \%$ of the full input signal level.
[3] The slew rate is configured in the IOCON block the SLEW bit. See the LPC55S6x user manual.

### 11.3 Wake-up process

Table 25. Dynamic characteristic: Typical wake-up times from low power modes $V B A T_{-} P M U=V B A T \_D C D C=V_{D D}=3.3 \mathrm{~V} ; T_{\text {amb }}=25^{\circ} \mathrm{C}$; using FRO as the system clock.

| Symbol | Parameter | Conditions |  | Min | Typ[1][5] | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\text {wake }}$ | wake-up time | from Sleep mode, 12 MHz , No PRIMASK backup and restore | [2][3] |  | 4.0 |  | $\mu \mathrm{S}$ |
|  |  | from Sleep mode, 96 MHz , No PRIMASK backup and restore | [2][3] |  | 500 |  | ns |
|  |  | from Deep-sleep mode with full SRAM retention: | [2] |  | 64 |  | $\mu \mathrm{S}$ |
|  |  | from Power-down mode with CPU retention and 4 KB retained | [2] |  | 346 |  | $\mu \mathrm{S}$ |
|  |  | from deep power-down mode; 4KB retained, RTC disabled; using RESET pin. | [4][6] |  | 4.6 |  | ms |
|  |  | from deep power-down mode; 4KB retained, RTC disabled; using RESET pin. | [4][7] |  | 17 |  | ms |

[1] Typical ratings are not guaranteed. The values listed are at room temperature $\left(25^{\circ} \mathrm{C}\right)$, nominal supply voltages.
[2] The wake-up time measured is the time between when a GPIO input pin is triggered to wake the device up from the low power modes and from when a GPIO output pin is set in the interrupt service routine (ISR) wake-up handler.
[3] FRO enabled, all peripherals off.
[4] RTC disabled. Wake-up from deep power-down causes the part to go through entire reset process. The wake-up time measured is the time between when the RESET pin is triggered to wake the device up and when a GPIO output pin is set in the reset handler. Wake-up time for non-secure mode.
[5] Compiler settings: IAR v8.40, High optimization
[6] Applies to device revision 1B.
[7] Applies to device revision 0A.

### 11.4 FRO (12 MHz/96 MHz)

Table 26. Dynamic characteristic: FRO
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 1.8 \mathrm{~V} \leq \mathrm{VBAT}_{-} D C D C \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions | Min | Typ ${ }^{[1]}$ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\text {osc }(\mathrm{RC})}$ | FRO clock frequency | - | 11.76 | 12 | 12.24 | MHz |
| $\mathrm{f}_{\text {osc }(\mathrm{RC})}$ | FRO clock frequency | - | 94.08 | 96 | 97.92 | MHz |

[1] Typical ratings are not guaranteed. The values listed are at room temperature ( $25^{\circ} \mathrm{C}$ ), nominal supply voltages.

### 11.5 FRO (1 MHz)

Table 27. Dynamic characteristic: FRO
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105{ }^{\circ} \mathrm{C} ; 1.8 \mathrm{~V} \leq \mathrm{VBAT}_{-} D C D C \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions | Min | Typ [1] | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\text {osc }(\mathrm{RC})}$ | FRO clock frequency | - | 0.85 | 1 | 1.15 | MHz |

[^0]
### 11.6 FRO ( 32 KHz )

Table 28. Dynamic characteristic: FRO
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$; $1.8 \mathrm{~V} \leq$ VBAT_ $^{2} \mathrm{CDC} \leq 3.6 \mathrm{~V}$.

| Symbol | Parameter | Conditions | Min | Typ ${ }^{[1]}$ | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\text {osc }(\mathrm{RC})}$ | FRO clock frequency | - | 32.11 | 32 | 33.42 | KHz |

[1] Typical ratings are not guaranteed. The values listed are at room temperature $\left(25^{\circ} \mathrm{C}\right)$, nominal supply voltages.

### 11.7 RTC oscillator

See Section 13.3 for connecting the RTC oscillator to an external clock source.
Table 29. Dynamic characteristic: RTC oscillator
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C} ; 1.8 \leq$ VBAT_DCDC $\leq 3.6^{[1]}$

| Symbol | Parameter | Conditions |  | Min | Typ[1] | Max | Unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{f}_{\mathrm{i}}$ | input frequency | - |  | - | 32.768 |  | kHz |

[1] Parameters are valid over operating temperature range unless otherwise specified.

## $11.8 \quad \mathrm{I}^{2} \mathrm{C}$-bus

Table 30. Dynamic characteristic: $\mathrm{I}^{2} \mathrm{C}$-bus pins[1]
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $+105{ }^{\circ} \mathrm{C} ; 1.8 \mathrm{~V} \leq$ VBAT_DCDC $\leq 3.6 \mathrm{~V}$.[2]

|  |  |  | Fast-mode | 0 | 400 | kHz |
|  |  |  | Fast-mode Plus | 0 | 1 | MHz |
| $\mathrm{t}_{\mathrm{f}}$ | fall time | [4][5][6][7] | of both SDA and SCL signals Standard-mode | - | 300 | ns |
|  |  |  | Fast-mode | $20+0.1 \times \mathrm{Cb}_{\text {b }}$ | 300 | ns |
|  |  |  | Fast-mode Plus | - | 120 | ns |
| tow | LOW period of the SCL clock |  | Standard-mode | 4.7 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode | 1.3 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode Plus | 0.5 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HIGH }}$ | HIGH period of the SCL clock |  | Standard-mode | 4.0 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode | 0.6 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode Plus | 0.26 | - | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HD; }{ }^{\text {DAT }} \text { }}$ | data hold time | [3][4][8] | Standard-mode | 0 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode | 0 | - | $\mu \mathrm{s}$ |
|  |  |  | Fast-mode Plus | 0 | - | $\mu \mathrm{S}$ |
| $\mathrm{t}_{\text {SU; }}$ DAT | data set-up time | [9][10] | Standard-mode | 250 | - | ns |
|  |  |  | Fast-mode | 100 | - | ns |
|  |  |  | Fast-mode Plus | 50 | - | ns |

[1] Guaranteed by design. Not tested in production.
[2] Parameters are valid over operating temperature range unless otherwise specified. See the $I^{2} \mathrm{C}$-bus specification UM10204 for details.
[3] tHD;DAT is the data hold time that is measured from the falling edge of SCL; applies to data in transmission and the acknowledge.
[4] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the $\mathrm{V}_{\mathrm{IH}}(\mathrm{min})$ of the SCL signal) to bridge the undefined region of the falling edge of SCL.
[5] $\mathrm{C}_{\mathrm{b}}=$ total capacitance of one bus line in pF . If mixed with Hs-mode devices, faster fall times are allowed.
[6] The maximum $t_{f}$ for the SDA and SCL bus lines is specified at 300 ns . The maximum fall time for the SDA output stage $t_{f}$ is specified at 250 ns . This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified $t_{f}$.
[7] In Fast-mode Plus, fall time is specified the same for both output stage and bus timing. If series resistors are used, designers should allow for this when considering bus timing.
[8] The maximum $\mathrm{t}_{\mathrm{HD} ; \mathrm{DAT}}$ could be $3.45 \mu \mathrm{~s}$ and $0.9 \mu \mathrm{~s}$ for Standard-mode and Fast-mode but must be less than the maximum of $\mathrm{t}_{\mathrm{VD} ; \mathrm{DAT}}$ or $t_{V D ; A C K}$ by a transition time. This maximum must only be met if the device does not stretch the LOW period ( $t_{\text {Low }}$ ) of the SCL signal. If the clock stretches the SCL, the data must be valid by the set-up time before it releases the clock.
[9] tSU;DAT is the data set-up time that is measured with respect to the rising edge of SCL; applies to data in transmission and the acknowledge.
[10] A Fast-mode $\mathrm{I}^{2} \mathrm{C}$-bus device can be used in a Standard-mode $\mathrm{I}^{2} \mathrm{C}$-bus system but the requirement $\mathrm{t}_{\mathrm{Su}}$;DAT $=250 \mathrm{~ns}$ must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r(\max )}+t_{\text {Su;DAT }}=1000+250=1250 \mathrm{~ns}$ (according to the Standard-mode ${ }^{2} \mathrm{C}$-bus specification) before the SCL line is released. Also the acknowledge timing must meet this set-up time.

Fig 12. $I^{2} \mathrm{C}$-bus pins clock timing

### 11.9 I²S-bus interface $^{2}$

Table 31. Dynamic characteristics: $I^{2} S$-bus interface pins [1][4]
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$; VBAT_DCDC $=1.8 \mathrm{~V}$ to $3.6 \mathrm{~V} ; C_{L}=10 \mathrm{pF}$ balanced loading on all pins; Input slew $=1.0 \mathrm{~ns}$, SLEW setting = standard mode for all pins; Parameters sampled at the $50 \%$ level of the rising or falling edge.

[1] Based on simulation; not tested in production.
[2] Clock Divider register (DIV) $=0 \times 0$.
[3] Typical ratings are not guaranteed.
[4] The Flexcomm Interface function clock frequency should not be above 48 MHz . See the data rates section in the $I^{2} S$ chapter (UM11126) to calculate clock and sample rates.
[5] Based on simulation. Not tested in production.

Fig 13. $I^{2}$ S-bus timing (master)

Fig 14. $\mathrm{I}^{2} \mathrm{~S}$-bus timing (slave)

### 11.10 SPI interface (Flexcomm Interfaces 0-7)

The actual SPI bit rate depends on the delays introduced by the external trace, the external device, system clock (CCLK), and capacitive loading.

Excluding delays introduced by external device and PCB, the maximum supported bit rate for SPI master mode (transmit/receive) is $50 \mathrm{Mbit} / \mathrm{s}$.

Excluding delays introduced by external device and PCB, the maximum supported bit rate for SPI slave receive mode is $25 \mathrm{Mbit} / \mathrm{s}$ and for slave transmit mode is $50 \mathrm{Mbits} / \mathrm{s}$.

Table 32. SPI dynamic characteristics[1]
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $105{ }^{\circ} \mathrm{C}$; $V_{D D}=1.8 \mathrm{~V}$ to $3.6 \mathrm{~V} ; C_{L}=10 \mathrm{pF}$ balanced loading on all pins; Input slew $=1 \mathrm{~ns}$, SLEW setting $=$ fast mode for all pins;: Parameters sampled at the $50 \%$ level of the rising or falling edge.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SPI master |  |  |  |  |  |  |
| $t_{\text {DS }}$ | data set-up time |  | 5 | - | - | ns |
| $\mathrm{t}_{\mathrm{DH}}$ | data hold time |  | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{v} \text { (Q) }}$ | data output valid time |  | 5 | - | 13 | ns |
| SPI slave |  |  |  |  |  |  |
| $t_{\text {DS }}$ | data set-up time |  | 5 | - | - | ns |
| $\mathrm{t}_{\mathrm{DH}}$ | data hold time |  | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{v}(\mathrm{Q})}$ | data output valid time |  | 8 | - | 21 | ns |

[1] Based on simulated values. Not tested in production

$\mathrm{T}_{\text {cy(clk) }}=$ CCLK/DIVVAL with CCLK = system clock frequency. DIVVAL is the SPI clock divider. See the LPC55S6x User manual.
Fig 15. SPI master timing

Fig 16. SPI slave timing

### 11.11 High-Speed SPI interface (Flexcomm Interface 8)

The actual SPI bit rate depends on the delays introduced by the external trace, the external device, system clock (CCLK), and capacitive loading. Excluding delays introduced by external device and PCB, the maximum supported bit rate for SPI master mode (transmit/receive) and for SPI slave mode (transmit/receive) is $50 \mathrm{Mbit} / \mathrm{s}$.

Table 33. SPI dynamic characteristics ${ }^{[1]}$
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $105{ }^{\circ} \mathrm{C}$; $V_{D D}=1.8 \mathrm{~V}$ to $3.6 \mathrm{~V} ; C_{L}=10 \mathrm{pF}$ balanced loading on all pins; Input slew $=1 \mathrm{~ns}$, $S L E W$ setting $=$ fast mode for all pins;: Parameters sampled at the $50 \%$ level of the rising or falling edge.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SPI master |  |  |  |  |  |  |
| $t_{\text {DS }}$ | data set-up time |  | 4 | - | - | ns |
| $t_{\text {DH }}$ | data hold time |  | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{V}(\mathrm{Q})}$ | data output valid time |  | 3 | - | 8 | ns |
| SPI slave |  |  |  |  |  |  |
| $t_{\text {DS }}$ | data set-up time |  | 4 | - | - | ns |
| $\mathrm{t}_{\mathrm{DH}}$ | data hold time |  | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{v}(\mathrm{Q})}$ | data output valid time |  | 6 | - | 15 | ns |

[1] Based on simulated values. Not tested in production.

$\mathrm{T}_{\text {cy(clk) }}=$ CCLK/DIVVAL with CCLK = system clock frequency. DIVVAL is the SPI clock divider. See the LPC55S6x User manual.
Fig 17. SPI master timing

Fig 18. SPI slave timing

### 11.12 USART interface

The actual USART bit rate depends on the delays introduced by the external trace, the external device, system clock (CCLK), and capacitive loading. Excluding delays introduced by external device and PCB, the maximum supported bit rate for USART master and slave synchronous mode is $10 \mathrm{Mbit} / \mathrm{s}$. Excluding delays introduced by external device and PCB, the maximum supported bit rate for USART master and slave asynchronous mode is $6.25 \mathrm{Mbit} / \mathrm{s}$.

Table 34. USART dynamic characteristics ${ }^{[1]}$
$T_{\text {amb }}=-40{ }^{\circ} \mathrm{C}$ to $105{ }^{\circ} \mathrm{C}$; $V_{D D}=1.8 \mathrm{~V}$ to $3.6 \mathrm{~V} ; C_{L}=10 \mathrm{pF}$ balanced loading on all pins; Input slew $=1 \mathrm{~ns}$, $S L E W$ setting $=$ fast-mode for all pins; Parameters sampled at the $50 \%$ level of the rising or falling edge.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| USART master (in synchronous mode) |  |  |  |  |  |  |
| $\mathrm{t}_{\text {su( }{ }^{\text {D }} \text { ) }}$ | data input set-up time |  | 6 | - | - | ns |
| $\mathrm{t}_{\mathrm{h} \text { (D) }}$ | data input hold time |  | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{v} \text { (Q) }}$ | data output valid time |  | 5 | - | 11 | ns |
| USART slave (in synchronous mode) |  |  |  |  |  |  |

Fig 20. SD/MMC and SDIO timing

## 12. Analog characteristics

### 12.1 BODVBAT

Brown-out detector to monitor the voltage of VBAT. If the voltage falls below one of the selected voltages, the BOD asserts an interrupt to the NVIC or issues a reset. Single low threshold detection level (programmable trip low level) is used for either BOD interrupt or BOD reset. Hysteresis control on the BOD is programmable. Please refer to UM11126 for further details.

Table 36. BOD static characteristics
$T_{a m b}=25^{\circ} \mathrm{C}$; based on characterization; not tested in production. Please refer to UM11126 for further details.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |

[1] Linear data collected using a linear histogram technique.
[2] The values listed are typical values and are not guaranteed. Based on characterization. Not tested in production.
[3] $f_{c l k(A D C)}=24 \mathrm{MHz}$, STS $=3$, Power select $=1$, Average setting $=1, \mathrm{f}_{\mathrm{s}}=1 \mathrm{Msample} / \mathrm{s}$
[4] Differential linear results assume offset $0.2 \%$ from VREFL and $0.2 \%$ from VREFH
[5] The differential linearity error $\left(\mathrm{E}_{\mathrm{D}}\right)$ is the difference between the actual step width and the ideal step width.
[6] The integral non-linearity ( $\mathrm{E}_{\mathrm{L}(\mathrm{adj})}$ ) is the peak difference between the center of the steps of the actual and the ideal transfer curve after appropriate adjustment of gain and offset errors.
[7] The offset error ( $E_{0}$ ) is the absolute difference between the straight line which fits the actual curve and the straight line which fits the ideal curve.
[8] The full-scale error voltage or gain error $\left(\mathrm{E}_{\mathrm{G}}\right)$ is the difference between the straight-line fitting the actual transfer curve after removing offset error, and the straight line which fits the ideal transfer curve.
[9] Input data is 1 kHz sine wave, ADC conversion clock 24 MHz , Power Select $=3$, Average setting $=4$.

### 12.2.1 ADC input resistance

Table 38. ADC input resistance
$T_{\text {amb }}=-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$

|  |  | Min | Typ | Max | Unit |
| :--- | ---: | :--- | :--- | :--- | :--- |

[2] On device revision 0A, the hysteresis on the comparator cannot be enabled

Fig 22. Comparator Hysteresis

## 13. Application information

### 13.1 I/O power consumption

I/O pins are contributing to the overall dynamic and static power consumption of the part. If pins are configured as digital inputs, a static current can flow depending on the voltage level at the pin and the setting of the internal pull-up and pull-down resistors. This current can be calculated using the parameters $R_{p u}$ and $R_{p d}$ given in Table 22 for a given input voltage $\mathrm{V}_{\mathrm{I}}$. For pins set to output, the current drive strength is given by parameters $\mathrm{I}_{\mathrm{OH}}$ and $\mathrm{l}_{\mathrm{OL}}$ in Table 22, but for calculating the total static current, you also need to consider any external loads connected to the pin.

I/O pins also contribute to the dynamic power consumption when the pins are switching because the $\mathrm{V}_{D D}$ supply provides the current to charge and discharge all internal and external capacitive loads connected to the pin in addition to powering the I/O circuitry.

The contribution from the I/O switching current $I_{\text {sw }}$ can be calculated as follows for any given switching frequency $f_{s w}$ if the external capacitive load ( $\mathrm{C}_{\mathrm{ext}}$ ) is known (see Table 22 for the internal I/O capacitance):

$$
I_{s w}=V_{D D} \times f_{s w} \times\left(C_{i o}+C_{e x t}\right)
$$

### 13.2 Crystal oscillator

In the crystal oscillator circuit, only the crystal (XTAL) and the capacitances $C_{X 1}$ and $C_{X 2}$ need to be connected externally on XTAL32M_P and XTAL32M_N pins. See Figure 23.

In bypass mode, an external clock (maximum frequency of up to 24 MHz ) can also be connected to XTAL32M_P if XTAL32M_N is left open. External [ $0-\mathrm{VH}$ ] square signal can be applied on the XTAL32M_P pin from 0 V to 850 mV .

Fig 23. Crystal oscillator components
For best results, it is very critical to select a matching crystal for the on-chip oscillator. Load capacitance (CL), series resistance (RS), and drive level (DL) are important parameters to consider while choosing the crystal. After selecting the proper crystal, the external load capacitor $C_{X 1}$ and $C_{X 2}$ values can also be generally determined by the following expression:
$C_{X 1}=C_{X 2}=2 C_{L}-\left(C_{\text {Pad }}+C_{\text {Parasitic }}\right)$
Where:
$C_{L}$ - Crystal load capacitance
CPad - Pad capacitance of the XTAL32M_P and XTAL32M_N pins (~3 pF).
$\mathrm{C}_{\text {Parasitic }}$ - Parasitic or stray capacitance of external circuit.
Although $\mathrm{C}_{\text {Parasitic }}$ can be ignored in general, the actual board layout and placement of external components influences the optimal values of external load capacitors. Therefore, it is recommended to fine tune the values of external load capacitors on actual hardware board to get the accurate clock frequency. For fine tuning, output the RTC Clock to one of the GPIOs and optimize the values of external load capacitors for minimum frequency deviation.

### 13.2.1 Crystal Printed Circuit Board (PCB) design guidelines

- Connect the crystal and external load capacitors on the PCB as close as possible to the oscillator input and output pins of the chip.
- The length of traces in the oscillation circuit should be as short as possible and must not cross other signal lines.
- Ensure that the load capacitors CX1, CX2, and CX3, in case of third overtone crystal usage, have a common ground plane.
- Loops must be made as small as possible to minimize the noise coupled in through the PCB and to keep the parasitics as small as possible.
- Lay out the ground (GND) pattern under crystal unit.
- Do not lay out other signal lines under crystal unit for multi-layered PCB.

### 13.3 RTC oscillator

In the RTC oscillator circuit, only the 32.768 kHz crystal (XTAL) and the capacitances $\mathrm{C}_{\mathrm{X} 1}$ and $\mathrm{C}_{\mathrm{X} 2}$ need to be connected externally on XTAL32K_P and XTAL32K_N. See Figure 24.

In bypass mode, an external clock (maximum frequency of up to 100 kHz ) can also be connected to XTAL32K_P if XTAL32K_N is left open. External [0 - VH] square signal can be applied on the XTAL32K_P pin with $1.1 \mathrm{~V}+/-10 \%$

A external signal below 1.0 V or above 1.2 V cannot be applied

Fig 24. RTC oscillator components
For best results, it is very critical to select a matching crystal for the on-chip oscillator. Load capacitance (CL), series resistance (RS), and drive level (DL) are important parameters to consider while choosing the crystal. After selecting the proper crystal, the external load capacitor $\mathrm{C}_{\mathrm{X} 1}$ and $\mathrm{C}_{\mathrm{X} 2}$ values can also be generally determined by the following expression:

$$
C_{X 1}=C_{X 2}=2 C_{L}-\left(C_{\text {Pad }}+C_{\text {Parasitic }}\right)
$$

Where:
$C_{L}$ - Crystal load capacitance
C $_{\text {Pad }}$ - Pad capacitance of the XTAL32K_P and XTAL32K_N pins (~3 pF).
$\mathrm{C}_{\text {Parasitic }}$ - Parasitic or stray capacitance of external circuit.
Although $\mathrm{C}_{\text {Parasitic }}$ can be ignored in general, the actual board layout and placement of external components influences the optimal values of external load capacitors. Therefore, it is recommended to fine tune the values of external load capacitors on actual hardware board to get the accurate clock frequency. For fine tuning, output the RTC Clock to one of the GPIOs and optimize the values of external load capacitors for minimum frequency deviation.

### 13.3.1 RTC Printed Circuit Board (PCB) design guidelines

- Connect the crystal and external load capacitors on the PCB as close as possible to the oscillator input and output pins of the chip.
- The length of traces in the oscillation circuit should be as short as possible and must not cross other signal lines.
- Ensure that the load capacitors CX1, CX2, and CX3, in case of third overtone crystal usage, have a common ground plane.
- Loops must be made as small as possible to minimize the noise coupled in through the PCB and to keep the parasitics as small as possible.
- Lay out the ground (GND) pattern under crystal unit.
- Do not lay out other signal lines under crystal unit for multi-layered PCB.

## 18. Legal information

### 18.1 Data sheet status

| Document status $\underline{[1][2]}$ | Product status $[$ [3] | Definition |
| :--- | :--- | :--- |
| Objective [short] data sheet | Development | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification | This document contains data from the preliminary specification. |
| Product [short] data sheet | Production | This document contains the product specification. |

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

### 18.2 Definitions

Draft - The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.
Short data sheet - A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.
Product specification - The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 18.3 Disclaimers

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.
In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.
Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes - NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use - NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.
Applications - Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.
Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.
NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.
Limiting values - Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale - NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license - Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control - This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.
Non-automotive qualified products - Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.
In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

### 18.4 Trademarks

Notice: All referenced brands, product names, service names and trademarks are the property of their respective owners.
$\mathrm{I}^{2} \mathrm{C}$-bus - logo is a trademark of NXP B.V.
