Rev2.1 3/29

1. General Description

1.1 Over View

This display is an Active Matrix Electrophoretic Display (AMEPD), with interface and a reference system design. The 2.9" active area contains 296x128 pixels, and has 1-bit B/W full display capabilities. An integrated circuit contains gate buffer, source buffer, interface, timing control logic, oscillator, DC-DC. SRAM.LUT, VCOM and border are supplied with each panel.

1.2 Features

- Support partial refresh
- 296x128 pixels display
- High contrast
- High reflectance
- Ultra wide viewing angle
- Ultra low power consumption
- Pure reflective mode
- Bi-stable display
- Commercial temperature range
- Landscape, portrait modes
- Hard-coat antiglare display surface
- Ultra Low current deep sleep mode
- On chip display RAM
- Low voltage detect for supply voltage
- High voltage ready detect for driving voltage
- Internal temperature sensor
- 10-byte OTP space for module identification
- Waveform stored in On-chip OTP
- Serial peripheral interface available
- On-chip oscillator
- On-chip booster and regulator control for generating VCOM, Gate and Source driving voltage
- I2C signal master interface to read external temperature sensor/built-in temperature sensor

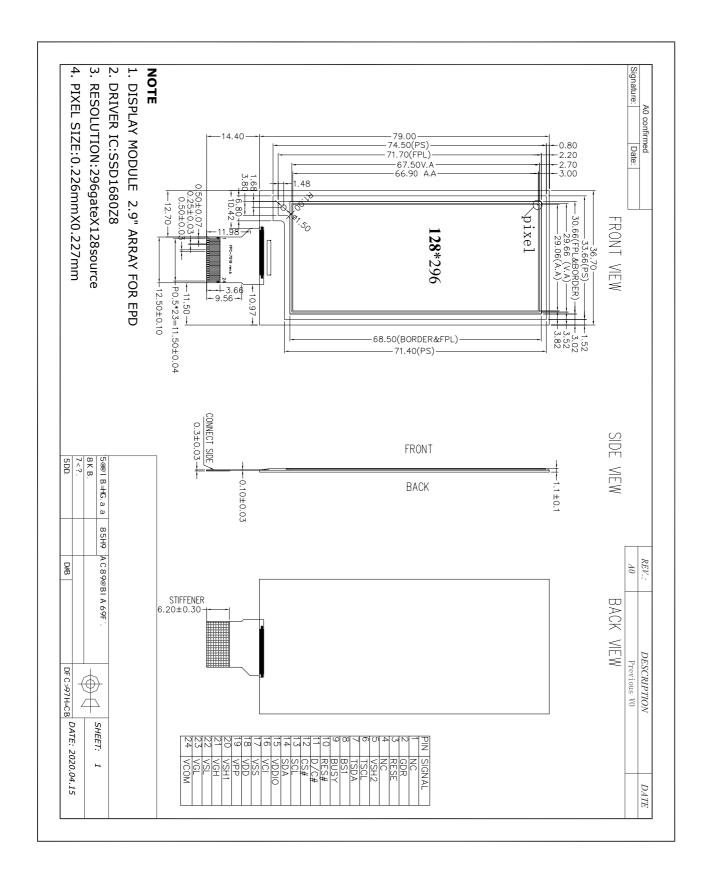

1.3 Mechanical Specifications

| Parameter | Specifications | Unit | Remark |

Rev2.1 6/29

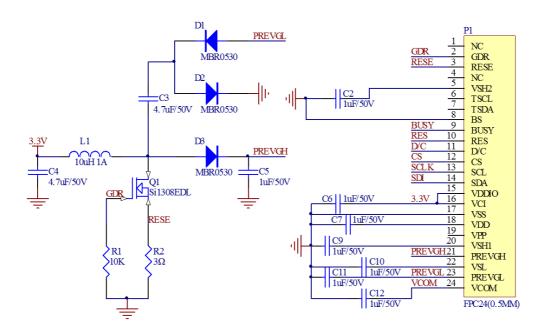

- Note 1.5-1: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication: only when CS# is pulled LOW.
- Note 1.5-2: This pin (D/C#) is Data/Command control pin connecting to the MCU. When the pin is pulled HIGH, the data will be interpreted as data. When the pin is pulled LOW, the data will be interpreted as command.
- Note 1.5-3: This pin (RES#) is reset signal input. The Reset is active low.
- Note 1.5-4: This pin (BUSY) is Busy state output pin. When Busy is High the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin High when the driver IC is working such as:
- Outputting display waveform; or
- Communicating with digital temperature sensor
- Note 1.5-5: This pin (BS1) is for 3-line SPI or 4-line SPI selection. When it is "Low", 4-line SPI is selected. When it is "High", 3-line SPI (9 bits SPI) is selected.

2. Environmental

2.1 HANDLING, SAFETYAND ENVIROMENTAL REQUIREMENTS

WARNING

The display glass may break when it is dropped or bumped on a hard surface. Handle with care. Should the display break, do not touch the electrophoretic material. In case of contact with electrophoretic material, wash with water and soap.

CAUTION

The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components.

Disassembling the display module can cause permanent damage and invalidate the warranty agreements.

IPA solvent can only be applied on active area and the back of a glass. For the rest part, it is not allowed.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.

Mounting Precautions

- (1) It's recommended that you consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module.
- (2) It's recommended that you attach a transparent protective plate to the surface in order to protect the EPD. Transparent protective plate should have sufficient strength in order to resist external force.
- (3) You should adopt radiation structure to satisfy the temperature specification.
- (4) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the PS at high temperature and the latter causes circuit break by electro-chemical reaction.
- (5) Do not touch, push or rub the exposed PS with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of PS for bare hand or greasy cloth. (Some cosmetics deteriorate the PS)
- (6) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach the PS. Do not use acetone, toluene and alcohol because they cause chemical damage to the PS.
- (7) Wipe off saliva or water drops as soon as possible. Their long time contact with PS causes deformations and color fading.

Product specification | The data sheet contains final product specifications.

Rev2.1 9/29

Limiting values

Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information

Where application information is given, it is advisory and dose not form part of the specification.

Product Environmental certification ROHS REMARK

All The specifications listed in this document are guaranteed for module only. Post-assembled operation or component(s) may impact module performance or cause unexpected effect or damage and therefore listed specifications is not warranted after any Post-assembled operation.

Rev2.1 10/29

2.2 Reliability test

| | TEST | CONDITION | METHOD | REMARK |
|----|---|--|-----------------------------|--------|
| 1 | High-Temperature Operation | T=40 ℃ , RH=35%RH, For 240Hr | IEC 60 068-2-2Bb | |
| 2 | Low-Temperature Operation | $T = 0^{\circ}C$ for 240 hrs | IEC 60 068-2-2Ab | |
| 3 | High-Temperature Storage | T=60 °C , RH=35% RH, For 240Hr Test in white pattern | IEC 60 068-2-2Bb | |
| 4 | Low-Temperature Storage | Test in white pattern | IEC 60 068-2-2Ab | |
| 5 | ridificately Operation | T=40 ℃,RH=80%RH,For 168Hr | | |
| h | High Temperature, High- Humidity Storage | T=50°C, RH=80%RH, For 240Hr Test in white pattern | IEC 60 068-2-3CA | |
| 7 | Temperature Cycle | -25 °C (30min)~60 °C (30min), 50 Cycle Test in white pattern | IEC 60 068-2-14NB | |
| 8 | Package Vibration | 10~500Hz Direction: X,Y,Z Duration:1hours in each direction | · | |
| 9 | Package Drop Impact | Drop from height of 122 cm on Concrete surface Drop sequence:1 corner, 3edges, 6face One drop for each. | Full packed for shipment | |
| 10 | UV exposure Resistance | 765 W/m²for 168hrs,40℃ | IEC 60068-2-5 Sa | |
| 11 | Electrostatic discharge | Machine model: $+/-250V,0\Omega,200pF$ | IEC61000-4-2 | |

Actual EMC level to be measured on customer application.

Note1: The protective film must be removed before temperature test.

Note2: Stay white pattern for storage and non-operation test.

Note3: Operation is black/white/red pattern, hold time is 150S.

Note4: The function, appearence, opticals should meet the requirements of the test before and after the test.

Note5: Keep testing after 2 hours placing at 20°C-25°C.

Rev2.1 11/29

3. Electrical Characteristics

3.1 ABSOLUTE MAXIMUM RATING

| Symbol | Parameter | Rating | Unit |
|--------|-----------------------------|--------------|------|
| VCI | Logic supply voltage | -0.5 to +4.0 | V |
| TOPR | Operation temperature range | 0~50 | °C |
| TSTG | Storage temperature range | -25~60 | °C |
| - | Humidity range | 40~70 | %RH |

^{*} Note: Avoid direct sunlight.

Table 3.1-1: Maximum Ratings

Note: Maximum ratings are those values beyond which damages to the device may occur.

Functional operation should be restricted to the limits in the Electrical Characteristics chapter.

Note 3.1-1: The recommended operating temperature should be kept below 50°C

Note 3.1-2: Tstg is the transportation condition, the transport time is within 10 days for $-25^{\circ}\text{C} \sim 0^{\circ}\text{Cor} 30^{\circ}\text{C} \sim 60^{\circ}\text{C}$.

3.2 DC CHARACTERISTICS

The following specifications apply for: VSS=0V, VCI=3.3V, TOPR=25°C.

Symbol Parameter Test Condition Applicable pin Unit Min. Max. Тур. VCI VCI operation voltage VCI 2.2 3.3 3.7 ٧ VIH High level input voltage 0.8VDDIO V SDA, SCL, CS#, D/C#, RES#, BS1 VIL Low level input voltage 0.2VDDIO ٧ VOH ٧ High level output voltage IOH=-100uA 0.9VDDIO BUSY, VOL Low level output voltage IOL = 100uA0.1VDDIO V 1.5 Iupdate Module operating current mA Deep sleep mode VCI=3.3V 2 Isleep uA

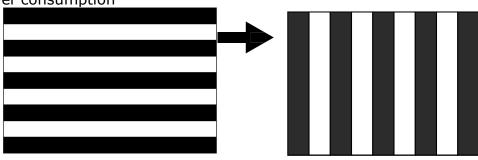

Table 3.2-1: DC Characteristics

The Typical power consumption is measured using associated 25°C waveform with following pattern transition: from horizontal scan pattern to vertical scan pattern. (Note 3.2-1)

- The listed electrical/optical characteristics are only guaranteed under the controller & waveform provided by GooDisplay.
- Vcom value will be OTP before in factory or present on the label sticker.

Note 3.2-1

The Typical power consumption

Rev2.1 12/29

3.3 Serial Peripheral Interface Timing

The following specifications apply for: VSS=0V, VCI=2.2V to 3.7V, TOPR=25°C

Write mode

| Symbol | Parameter | Min | Тур | Max | Unit |
|----------|--|-----|-----|-----|------|
| fSCL | SCL frequency (Write Mode) | | | 20 | MHz |
| tCSSU | Time CS# has to be low before the first rising edge of SCLK | 20 | | | ns |
| tCSHLD | Time CS# has to remain low after the last falling edge of SCLK | 20 | | | ns |
| tCSHIGH | Time CS# has to remain high between two transfers | 100 | | | ns |
| tSCLHIGH | Part of the clock period where SCL has to remain high | 25 | | | ns |
| tSCLLOW | Part of the clock period where SCL has to remain low | 25 | | | ns |
| | Time SI (SDA Write Mode) has to be stable before the next rising edge of SCL | 10 | | | ns |
| | Time SI (SDA Write Mode) has to remain stable after the rising edge of SCL | 40 | | | ns |

Read mode

| Symbol | Parameter | Min | Тур | Max | Unit |
|----------|--|-----|-----|-----|------|
| fSCL | SCL frequency (Read Mode) | | | 2.5 | MHz |
| tCSSU | Time CS# has to be low before the first rising edge of SCLK | 100 | | | ns |
| tCSHLD | Time CS# has to remain low after the last falling edge of SCLK | 50 | | | ns |
| tCSHIGH | Time CS# has to remain high between two transfers | 250 | | | ns |
| tSCLHIGH | Part of the clock period where SCL has to remain high | 180 | | | ns |
| tSCLLOW | Part of the clock period where SCL has to remain low | 180 | | | ns |
| | Time SO(SDA Read Mode) will be stable before the next rising edge of SCL | | 50 | | ns |
| | Time SO (SDA Read Mode) will remain stable after the falling edge of SCL | | 0 | | ns |

Note: All timings are based on 20% to 80% of VDDIO-VSS

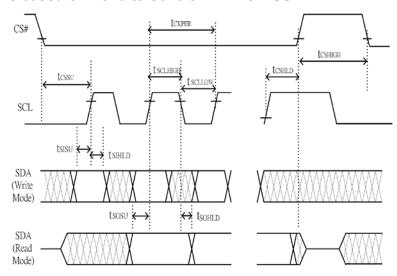

Figure 3.3-1 : Serial peripheral interface characteristics

3.4 Power Consumption

| Parameter | Symbol | Conditions | TYP | Max | Unit | Remark |
|---------------------------------------|--------|------------|-----|-----|------|--------|
| Panel power consumption during update | - | 25℃ | - | 8 | mAs | - |
| Deep sleep mode | - | 25℃ | 1 | 2 | uA | - |

mAs=update average current×update time

Rev2.1 13/29

3.5 MCU Interface

3.5-1) MCU interface selection

The display can support 3-wire/4-wire serial peripheral interface. In the Module, the MCU interface is pin selectable by BS1 pins shown in.

Table 3.5-1: MCU interface selection

| Tubic bib 211100 interface before | | | | | | |
|-----------------------------------|--|--|--|--|--|--|
| BS1 | MPU Interface | | | | | |
| L | 4-lines serial peripheral interface (SPI) | | | | | |
| Н | 3-lines serial peripheral interface (SPI) - 9 bits SPI | | | | | |

3.5-2) MCU Serial Peripheral Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCL, serial data SDA, D/C# and CS#,The control pins status in 4-wire SPI in writing command/data is shown in Table 7- 2 and the write procedure 4-wire SPI is shown in Figue 7-2.

Table 3.5-2: Control pins status of 4-wire SPI

| Function | SCL pin | SDA pin | D/C# pin | CS# pin |
|---------------|---------|-------------|----------|---------|
| Write command | 1 | Command bit | L | L |
| Write data | 1 | Data bit | Н | L |

Note:

- (1) L is connected to VSS and H is connected to VDDIO
- (2) ↑ stands for rising edge of signal

In the write mode, SDA is shifted into an 8-bit shift register on each rising edge of SCL in the order of D7, D6, ... D0. The level of D/C# should be kept over the whole byte. The data byte in the shift register is written to the Graphic Display Data RAM (RAM)/Data Byte register or command Byte register according to D/C# pin.

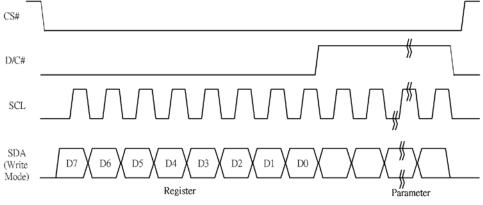

Figure 3.5-1: Write procedure in 4-wire SPI mode

Rev2.1 14/29

In the Read mode:

- 1. After driving CS# to low, MCU need to define the register to be read.
- 2. SDA is shifted into an 8-bit shift register on each rising edge of SCL in the order of D7, D6, ... D0 with D/C# keep low.
- 3. After SCL change to low for the last bit of register, D/C# need to drive to high.
- 4. SDA is shifted out an 8-bit data on each falling edge of SCL in the order of D7, D6, ... D0.
- 5. Depending on register type, more than 1 byte can be read out. After all byte are read, CS# need to drive to high to stop the read operation.

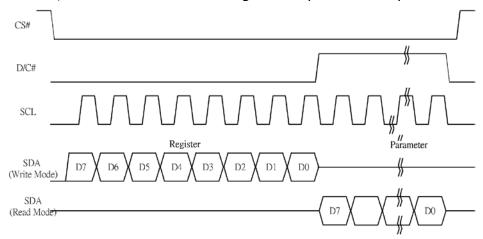

Figure 3.5-2: Read procedure in 4-wire SPI mode

3.5-3) MCU Serial Peripheral Interface (3-wire SPI)

The 3-wire SPI consists of serial clock SCL, serial data SDA and CS#. The operation is similar to 4-wire SPI while D/C# pin is not used and it must be tied to LOW. The control pins status in 3-wire SPI is shown in Table 3.5-3

Table 3.5-3: Control pins status of 3-wire SPI

| Function | SCL pin | SDA pin | D/C# pin | CS# pin |
|------------|---------|----------|----------|---------|
| Write | 1 | Command | Tie LOW | L |
| Write data | 1 | Data bit | Tie LOW | L |

Note:

(1)L is connected to VSS and H is connected to VDDIO

(2)↑ stands for rising edge of signal

In the write operation, a 9-bit data will be shifted into the shift register on each clock rising edge. The bit shifting sequence is D/C# bit, D7 bit, D6 bit to D0 bit. The first bit is D/C# bit which determines the following byte is command or data. When D/C# bit is 0, the following byte is command. When D/C# bit is 1, the following byte is data. shows the write procedure in 3-wire SPI

Rev2.1 15/29

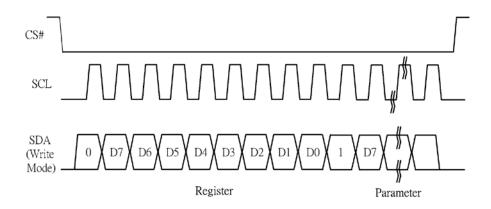

Figure 3.5-3: Write procedure in 3-wire SPI mode

In the Read mode:

- 1. After driving CS# to low, MCU need to define the register to be read.
- 2. D/C#=0 is shifted thru SDA with one rising edge of SCL
- 3. SDA is shifted into an 8-bit shift register on each rising edge of SCL in the order of D7, D6, ... D0.
- 4. D/C#=1 is shifted thru SDA with one rising edge of SCL
- 5. SDA is shifted out an 8-bit data on each falling edge of SCL in the order of D7, D6, ... D0.
- 6. Depending on register type, more than 1 byte can be read out. After all byte are read, CS# need to drive to high to stop the read operation

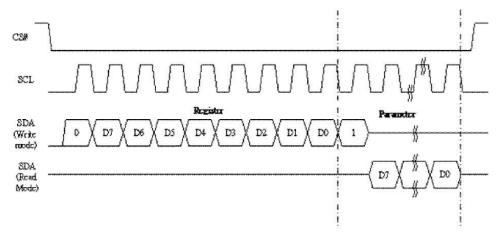

Figure 3.5-4: Read procedure in 3-wire SPI mode

Rev2.1 16/29

3.6 Temperature sensor operation

Following is the way of how to sense the ambient temperature of the module. First, use an external temperature sensor to get the temperature value and converted it into HEX format with below mapping table, then send command 0x1A with the HEX temperature value to the module thru the SPI interface.

The temperature value to HEX conversion is as follow:

If the Temperature value MSByte bit D11 = 0, then
 The temperature is positive and value (DegC) = + (Temperature value) / 16

2. If the Temperature value MSByte bit D11 = 1, then

The temperature is negative and value (DegC) = \sim (2's complement of Temperature value) / 16

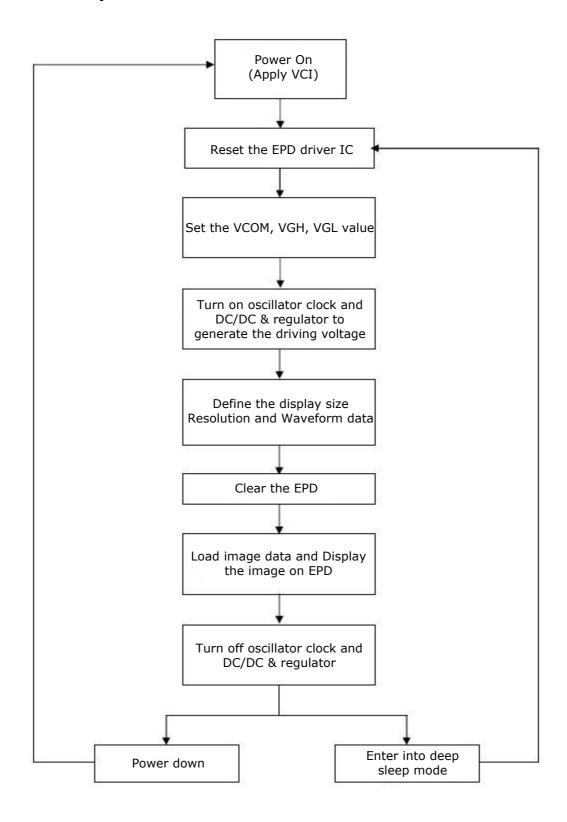

| 12-bit binary (2's complement) | Hexadecimal Value | Decimal Value | Value [DegC] |
|-----------------------------------|----------------------|------------------|-----------------|
| 0111 1111 0000 | 7F0 | 2032 | 127 |
| 0111 1110 1110 | 7EE | 2030 | 126.875 |

Note 6-1: Luminance meter: Eye - One Pro Spectrophotometer

Note 6-2: We don't guarantee 5 years pixels display quality for humidity below 45%RH or above 70%RH; at least update 1 time per day.

Rev2.1 25/29

6.2 Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (R1) and the reflectance in a dark area (Rd)():

R1: white reflectance Rd: dark reflectance

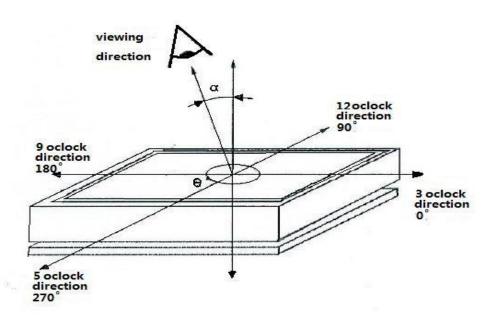

CR = R1/Rd

6.3 Reflection Ratio

The reflection ratio is expressed as:

 $R = Reflectance Factor_{white board} x (L_{center} / L_{white board})$

L $_{center}$ is the luminance measured at center in a white area (R=G =B=1) . L $_{white\;board}$ is the luminance of a standard white board . Both are measured with equivalent illumination source . The viewing angle shall be no more than 2 degrees .

9. Precautions

- (1) Do not apply pressure to the EPD panel in order to prevent damaging it.
- (2) Do not connect or disconnect the interface connector while the EPD panel is in operation.
- (3) Do not touch IC bonding area. It may scratch TFT lead or damage IC function.
- (4) Please be mindful of moisture to avoid its penetration into the EPD panel, which may cause damage during operation.
- (5) If the EPD Panel / Module is not refreshed every 24 hours, a phenomena known as "Ghosting" or "Image Sticking" may occur. It is recommended to refreshed the ESL /EPD Tag every 24 hours in use case. It is recommended that customer ships or stores the ESL / EPD Tag with a completely white image to avoid this issue
- (6) High temperature, high humidity, sunlight or fluorescent light may degrade the EPD panel's performance. Please do not expose the unprotected EPD panel to high temperature, high humidity, sunlight, or fluorescent for long periods of time.
